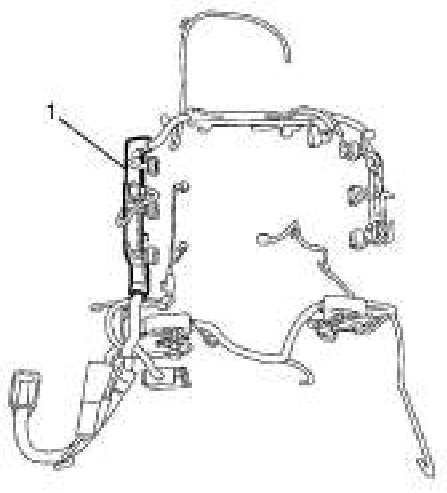
52. Disconnect the left bank intake and exhaust camshaft position actuator valve electrical connectors (5).
53. Disconnect the throttle position sensor electrical connector (1).

Important: Use a suitable tool to detach the engine wiring harness bracket (2) from the locating clip lug on the left bank camshaft cover (3) then slide the engine wiring harness bracket (2) upwards to detach from the left bank camshaft cover (3).

54. Detach the engine wiring harness bracket (2) from the left bank camshaft cover (3).



55. Remove the engine wiring harness (1).

Exhaust Manifold Cleaning and Inspection - Left Side (NT3)

Cleaning Procedure

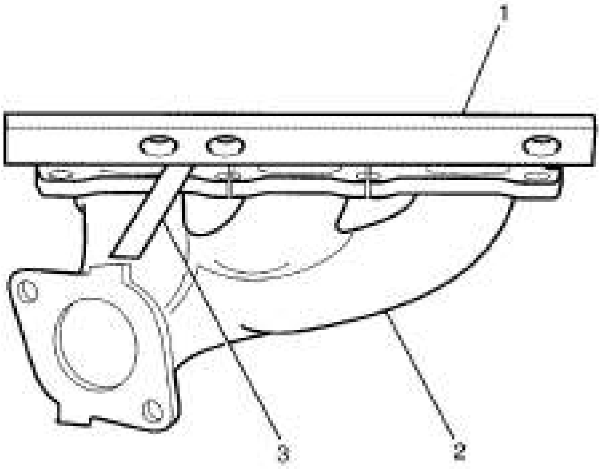
1. Clean the exhaust manifold in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the exhaust manifold with compressed air.

Inspection Procedure

1. Inspect the left exhaust manifold for the following:
   - Damage or corrosion above acceptable tolerances to the exhaust manifold exterior.
   - Damage to the exhaust manifold mounting holes.
   - Damage to the threaded holes for the heat shield.
   - Damage to the exhaust manifold flange bolt holes.
   - Damage to the gasket sealing surfaces.
   - Damage or restrictions within the exhaust passages.
2. Repair or replace the left exhaust manifold and/or components as necessary.



3. Measure the alignment or surface flatness of the exhaust manifold (2) flanges, using a straight edge (1) and a feeler gauge (3). Exhaust manifold surface flatness must not exceed 0.254 mm (0.010 in).
4. If the surface flatness is not within specifications, the exhaust manifold (2) is warped and must be replaced.

Exhaust Manifold Cleaning and Inspection - Right Side (NT3)

Cleaning Procedure

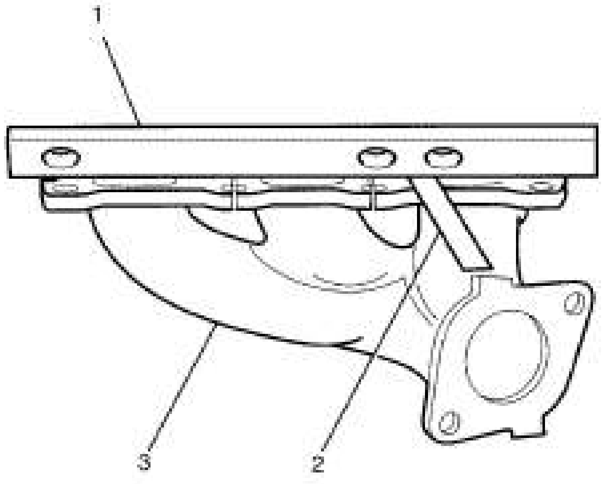
1. Clean the exhaust manifold in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the exhaust manifold with compressed air.

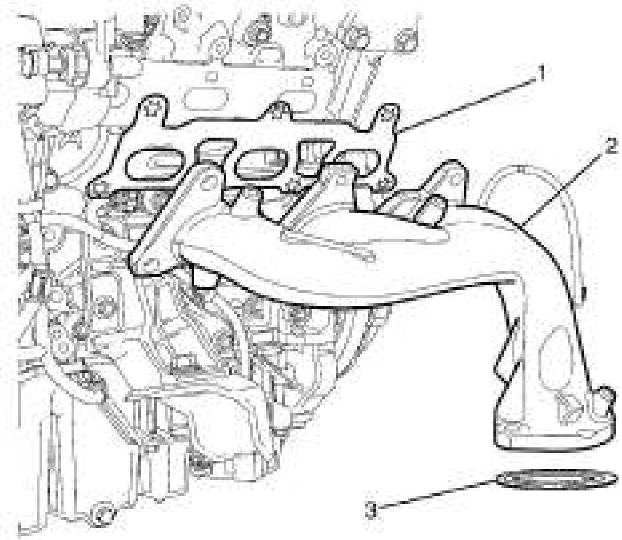
Inspection Procedure

1. Inspect the left exhaust manifold for the following:
   - Damage or corrosion above acceptable tolerances to the exhaust manifold exterior.
   - Damage to the exhaust manifold mounting holes.
   - Damage to the threaded holes for the heat shield.
   - Damage to the exhaust manifold flange bolt holes.
   - Damage to the gasket sealing surfaces.
   - Damage or restrictions within the exhaust passages.
2. Repair or replace the left exhaust manifold and/or components as necessary.



3. Measure the alignment or surface flatness of the exhaust manifold (3) flanges, using a straight edge (1) and a feeler gauge (2). Exhaust manifold surface flatness must not exceed 0.254 mm (0.010 in).
4. If the surface flatness is not within specifications, the exhaust manifold (3) is warped and must be replaced.

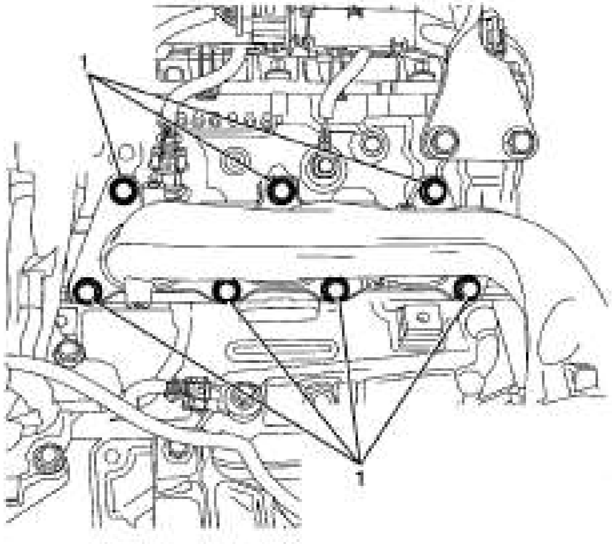
Exhaust Manifold Installation - Left Side (NT3)



1. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

   Notice: Refer to Exhaust System Inspection Notice in the Preface section.

2. Install the exhaust manifold assembly to the engine.



Important: DO NOT fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

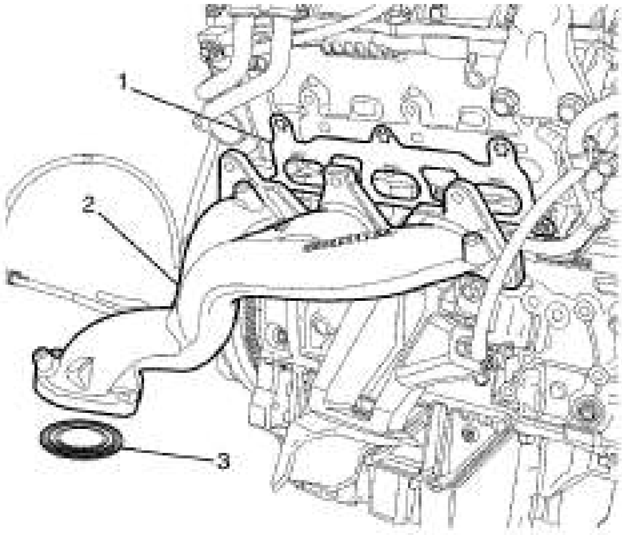
3. Install the NEW exhaust manifold to cylinder head retaining bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

   Tighten
   Tighten the bolts to 20 N·m (15 lb ft).

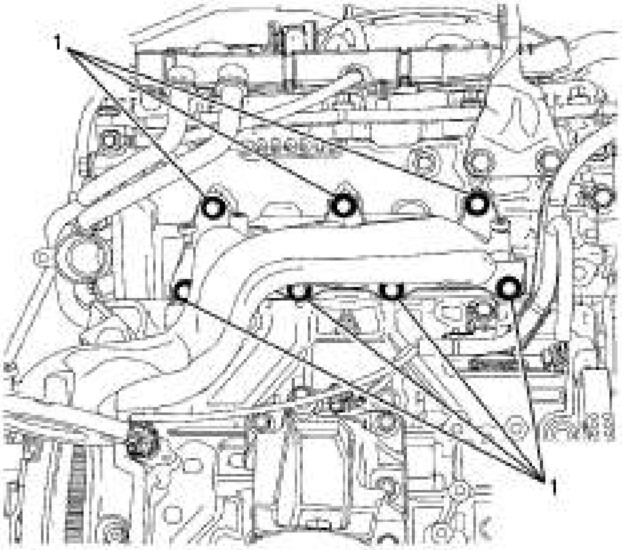
Exhaust Manifold Installation - Right Side (NT3)



1. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

   Notice: Refer to Exhaust System Inspection Notice in the Preface section.

2. Install the exhaust manifold assembly to the engine.



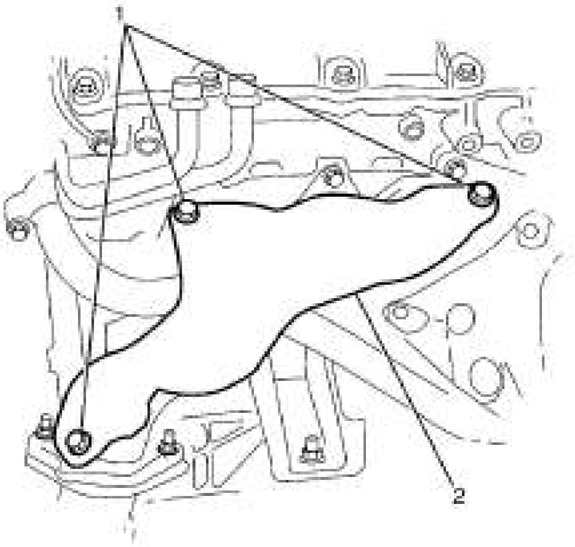
Important: DO NOT fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

3. Install the NEW exhaust manifold to cylinder head retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten
Tighten the bolts to 20 N·m (15 lb ft).



5. Install the exhaust manifold heat shield (2).
6. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

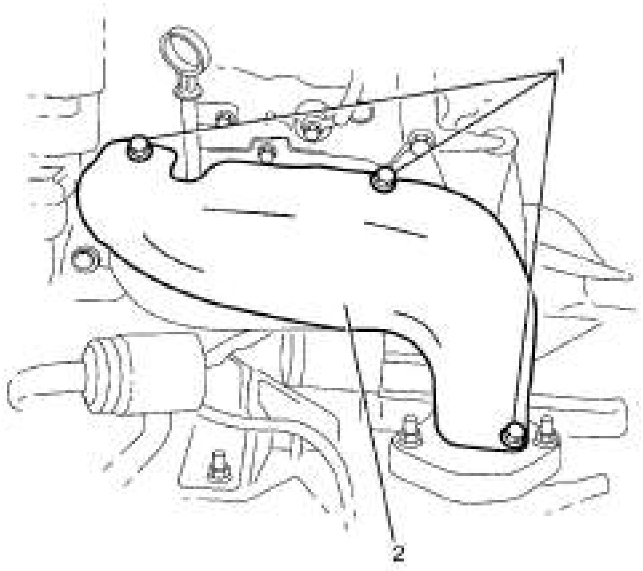
Tighten
Tighten the bolts to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2195311**

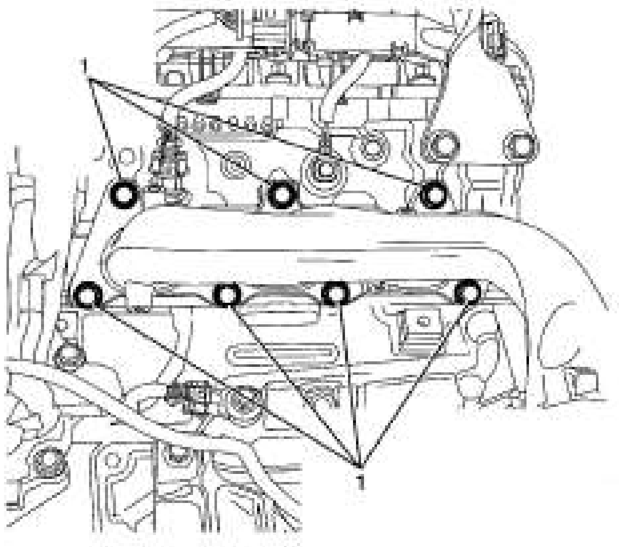
Exhaust Manifold Removal - Left Side (NT3)

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



1. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
2. Remove the exhaust manifold heat shield (2).



3. Loosen the exhaust manifold to cylinder head retaining bolts (1) working from the outside to

the centre.

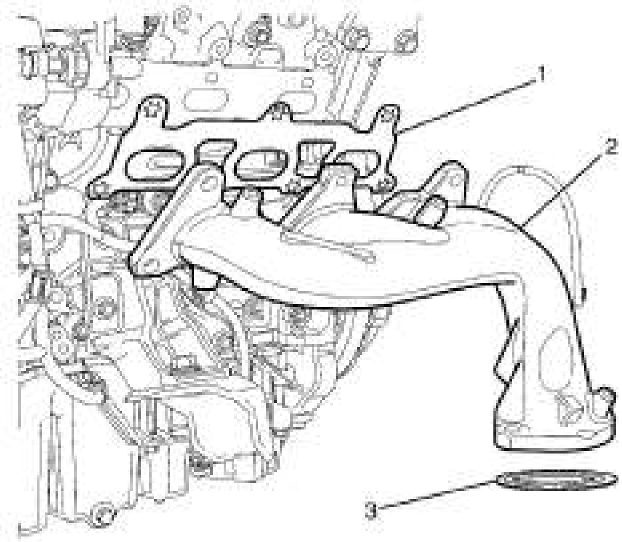
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

4. Remove the exhaust manifold to cylinder head retaining bolts (1).

   Discard the bolts.

   Clean the bolt holes.



Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

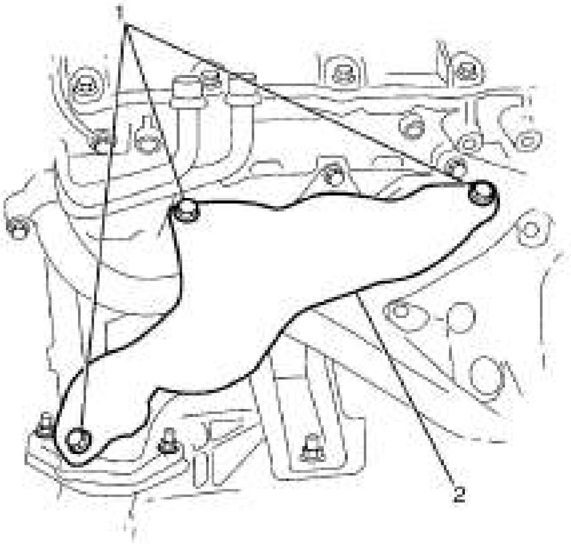
5. Remove the exhaust manifold (2).

   Discard the exhaust manifold gasket (1) and sealing ring (3).

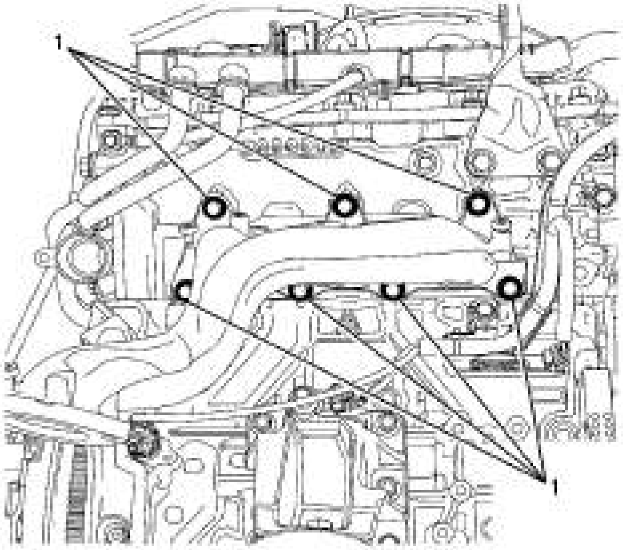
Exhaust Manifold Removal - Right Side (NT3)

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



1. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
2. Remove the exhaust manifold heat shield (2).



3. Loosen the exhaust manifold to cylinder head retaining bolts (1) working from the outside to

the centre.

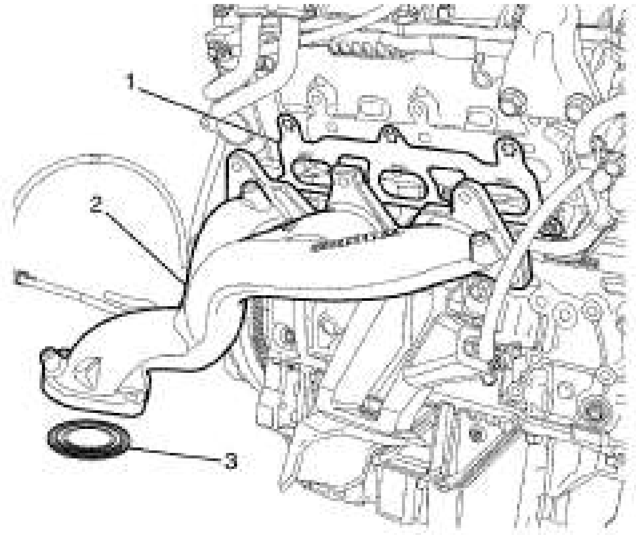
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

4. Remove the exhaust manifold to cylinder head retaining bolts (1).

   Discard the bolts.

   Clean the bolt holes.



Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

5. Remove the exhaust manifold (2).

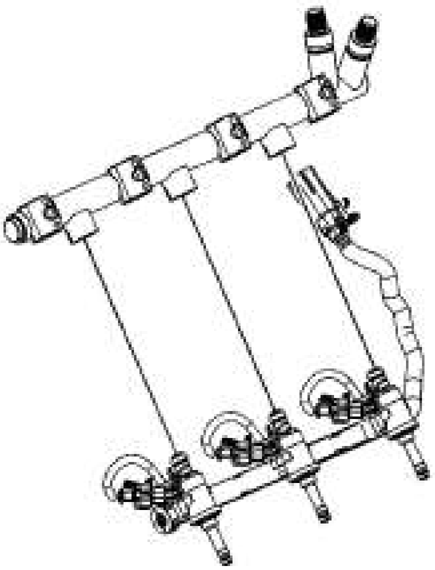
   Discard the exhaust manifold gasket (1) and sealing ring (3).

Fuel Rail and Injectors Cleaning and Inspection (LLT)

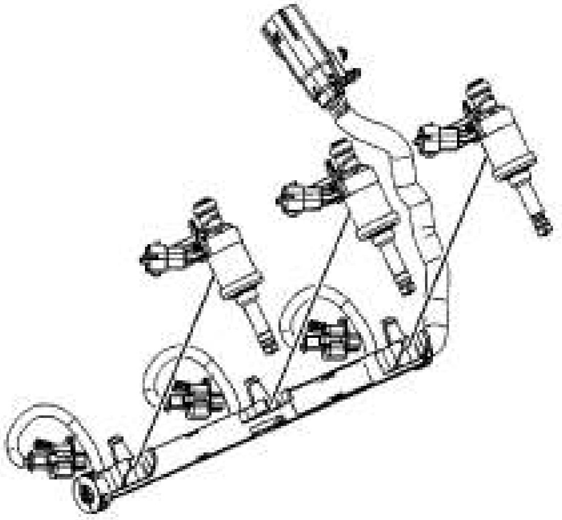
Special Tools

- *EN-47909* Injector Bore and Sleeve Cleaning Kit
- *EN-48266* Injector Seal Installer and Sizer

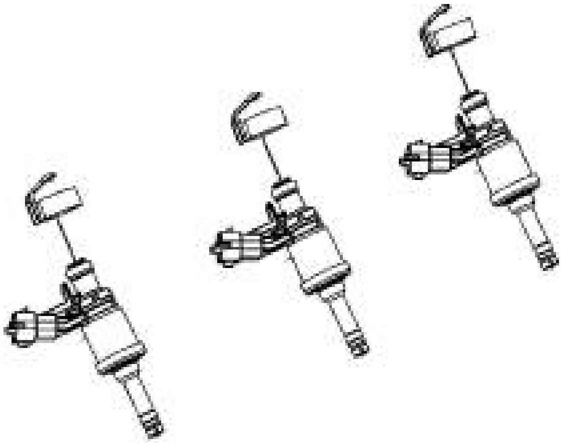
For equivalent regional tools, refer to Special Tools.



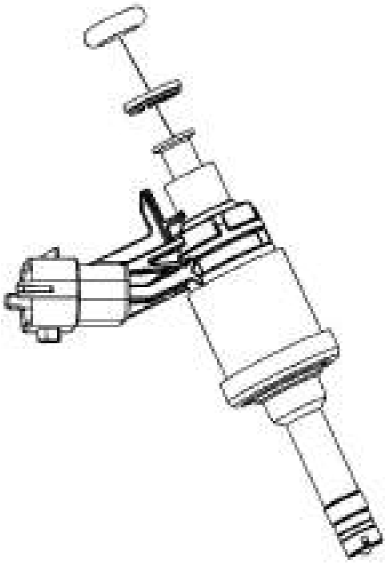
1. Remove the injectors from the fuel rail.



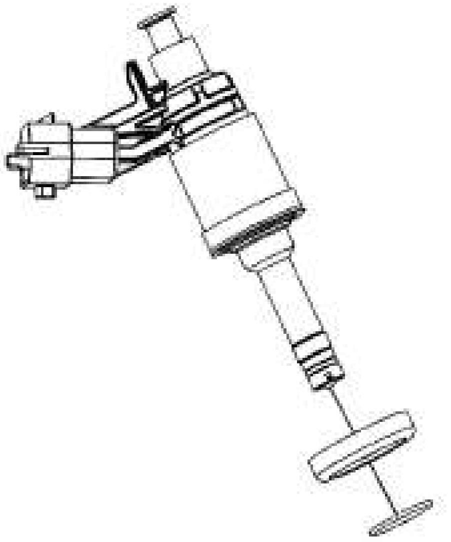
2. Remove the wiring harness from the fuel injectors.



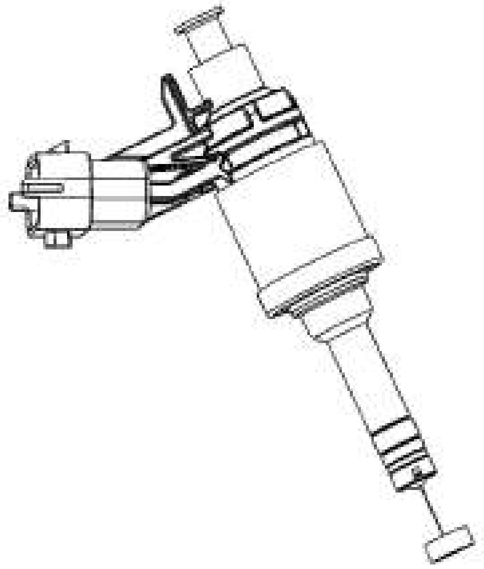
3. Remove and discard the fuel injector hold-down clamp.



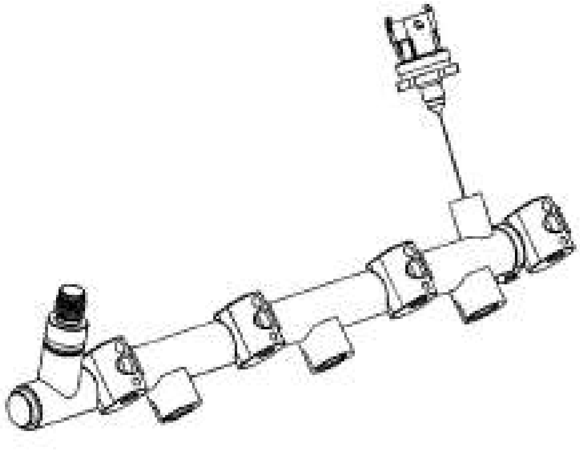
4. Remove and discard the fuel injector O-ring and plastic spacer.



5. Remove and discard the isolator cup and retainer.



6. Remove and discard the fuel injector seal.

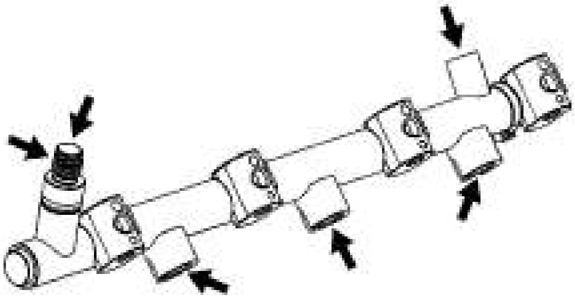


Note: Applying force to the plastic housing of the sensor will destroy the sensor. To tighten or loosen, only apply force to the attached hexagon.

7. Remove and discard the fuel pressure sensor.

   Note: Do not soak or submerge the fuel rail or injectors in solvent.

8. Clean the exterior of the fuel rail and injectors with solvent.



9. Inspect the fuel rail and components for the following conditions:
   - Damage, debris or restrictions to the fuel rail
   - Damage, debris or restrictions to the fuel ports in the fuel rail

- Damage to the mounting area for the fuel rail
- Damage to the fuel rail mounting bolts
- Damage to the threads on the fuel rail feed fitting
- Damage to the threads in the fuel pressure sensor bore

Note: Applying force to the plastic housing of the sensor will destroy the sensor. To tighten or loosen, only apply force to the attached hexagon.

10. Install the fuel pressure sensor.

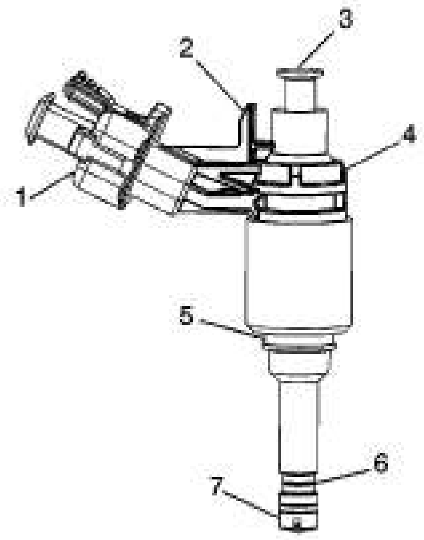
Note: Ensure that the fuel rail threads have been cleaned of any excess fuel, or the NEW fuel injection fuel rail fuel pressure sensor will NOT seal properly.

- Lubricate the threads and the sealing cone in the fuel rail with silicon free engine oil GM P/N 12345610, Canadian P/N 993193, or equivalent.
- Lubricate the threads and the sealing cone on the NEW fuel injection fuel rail fuel pressure sensor with silicon free engine oil GM P/N 12345610, Canadian P/N 993193, or equivalent.
- Install the NEW fuel injection fuel rail fuel pressure sensor hand tight.
- Remove the NEW fuel injection fuel rail fuel pressure sensor, re-lubricate following steps 1 and 2 above.

Caution: Refer to Fastener Caution in the Preface section.

- Install the NEW fuel injection fuel rail fuel pressure sensor.

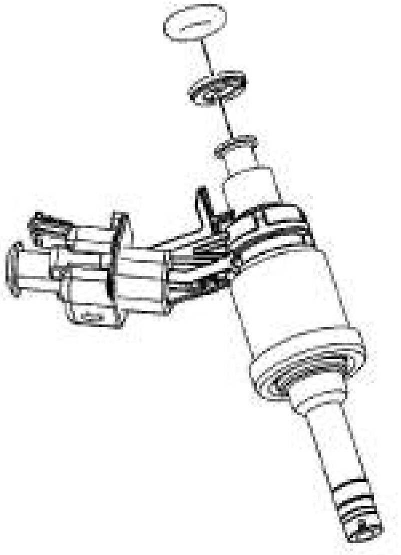
Tighten
Tighten the sensor to 33 N·m (25 lb ft).



11. Inspect the fuel injectors for the following conditions:

- Damage to the fuel injector connector (1)
- Damage to the injector locator tab (2)
- Damage to the fuel inlet cone (3)
- Damage the plastic fuel injector body (4)
- Damage to the isolator cup retainer groove (5)
- Damage to the teflon seal (6)
- Damage to the fuel injector tip (7)

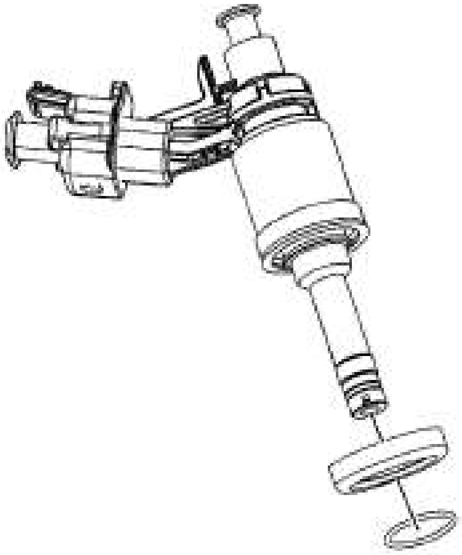
12. Replace the fuel rail or injector if any damage is found. Do not attempt to repair a fuel rail or injector.



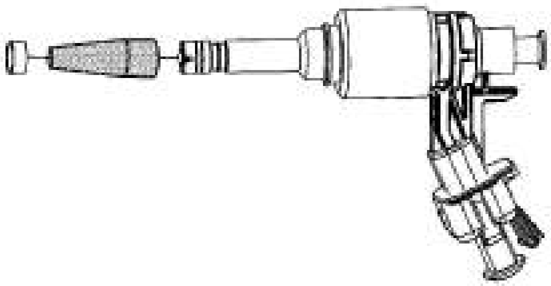
13. Lubricate the NEW O-ring with 5W30 engine oil.

Note: The plastic spacer has a top and a bottom. The top, O-ring sealing area, is wider.

14. Install the NEW plastic spacer and O-ring on the injector.

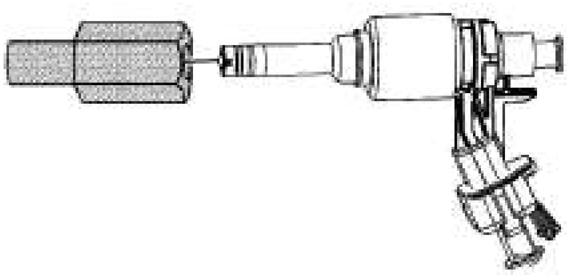


15. Install the isolator cup and retainer.

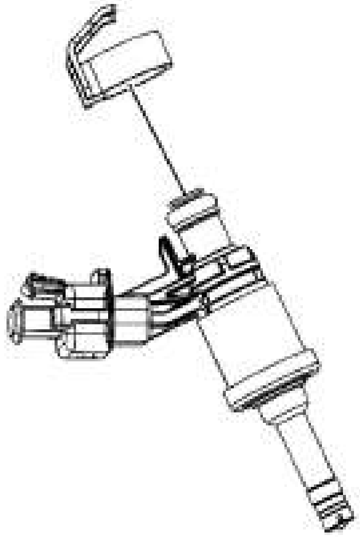


Note: Do not use any type of lubricant when installing the NEW seal.

16. Install a NEW seal on the injector using the EN-48266-1. The seal must be installed/slid into the recessed area of the fuel injector.

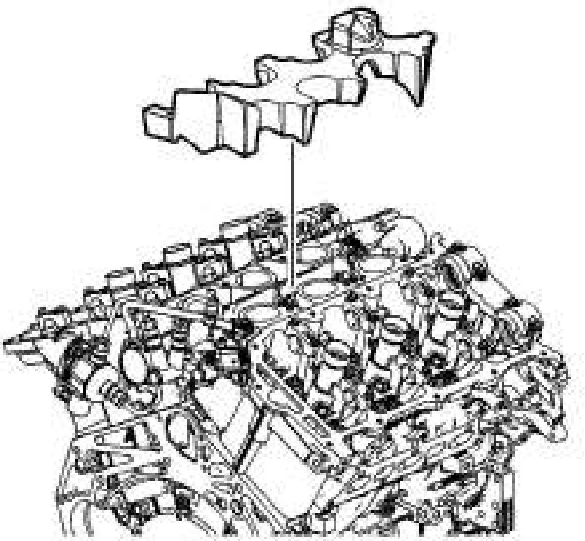


17. Compress the seal with your fingers before resizing the seal using the EN-48266-2.

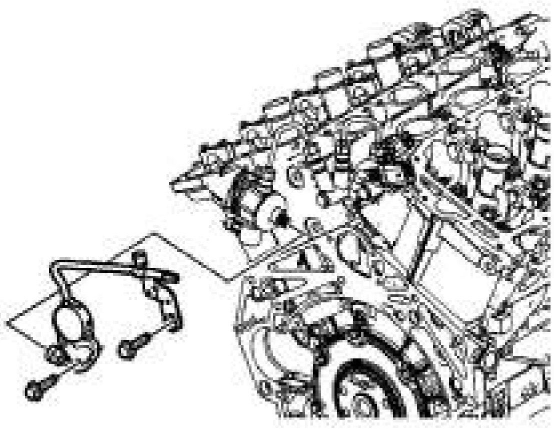


18. Install a NEW fuel injector hold-down clamp.

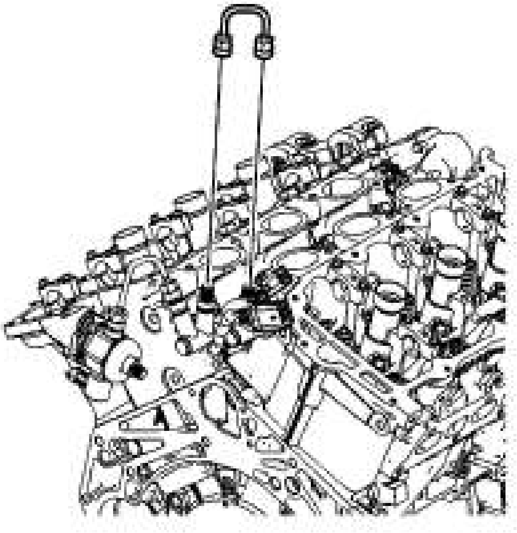
Fuel Feed Pipe Removal (LLT)



1. Remove the fuel rail noise shield.



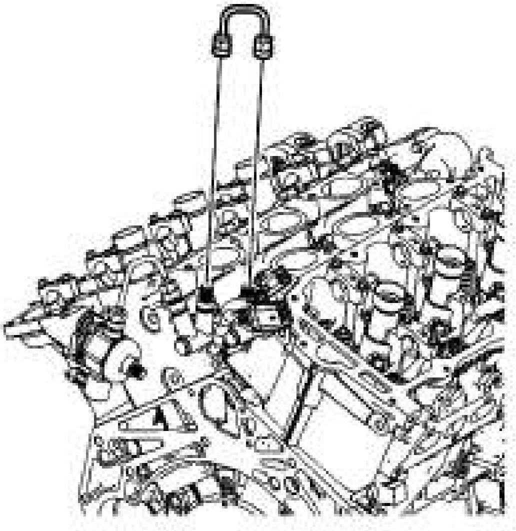
2. Remove the fuel rail wiring connectors from the fuel feed pipe bracket.
3. Remove the fuel feed pipe bolts.
4. Remove the fuel feed pipe.



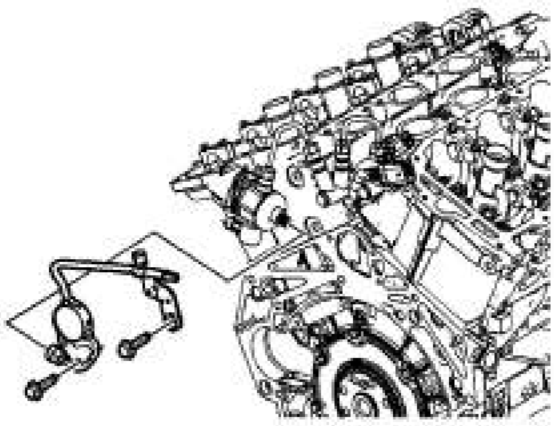
5. Remove the LH to RH fuel rail crossover pipe.

Fuel Feed Pipe Installation (LLT)

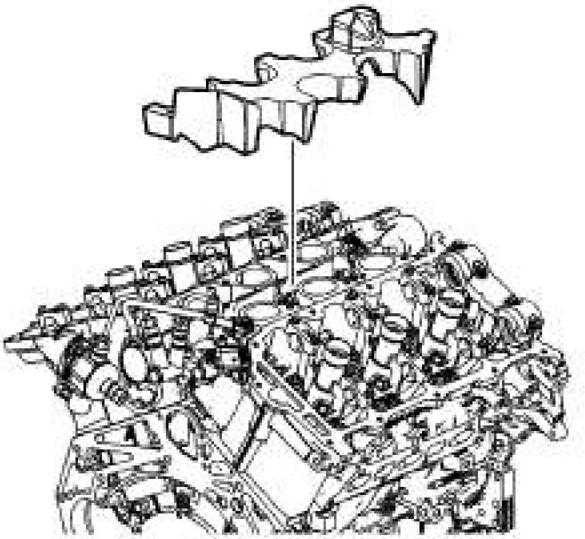
Caution: Refer to Fastener Caution in the Preface section.



1. Install the LH to RH fuel rail crossover pipe and tighten the fuel rail crossover pipe fittings to **30 N·m (22 lb ft)**.

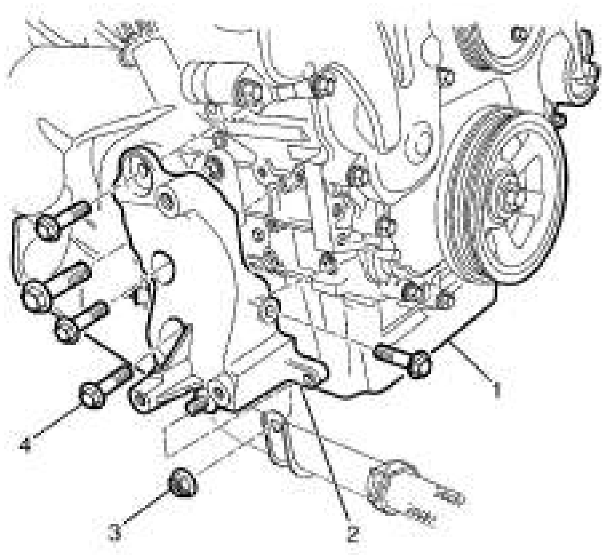


2. Install the fuel feed pipe.
3. Install the fuel feed pipe bolts and tighten to **10 N·m (89 lb in)**.
4. Install the fuel rail wiring connectors to the fuel feed pipe bracket.



5. Install the fuel rail noise shield.

Generator Installation



1. Install the alternator bracket (2) to the engine block.

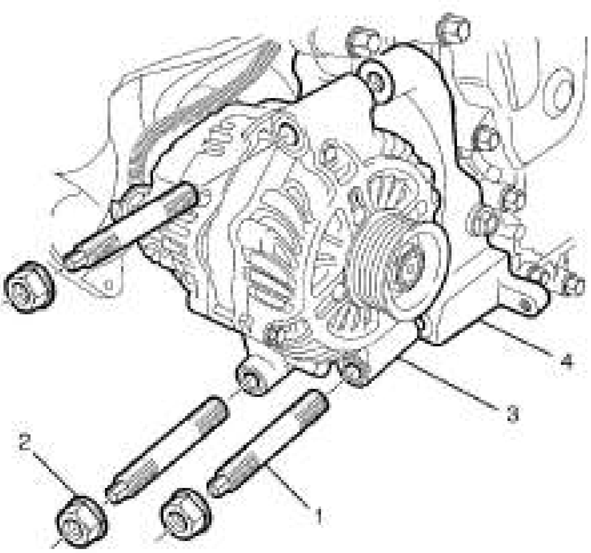
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the alternator bracket to engine block retaining bolts.

   Tighten
   Tighten the bolts to 50 N·m (37 lb ft).

3. Install the coolant inlet pipe to alternator mounting bracket retaining nut (3).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).



4. Position the alternator (3) on the alternator mounting bracket (4).

   Important: The alternator mounting studs (4) have hexagonal outer ends to assist with removal and installation.

5. Install the alternator to alternator bracket retaining studs (1) if required.

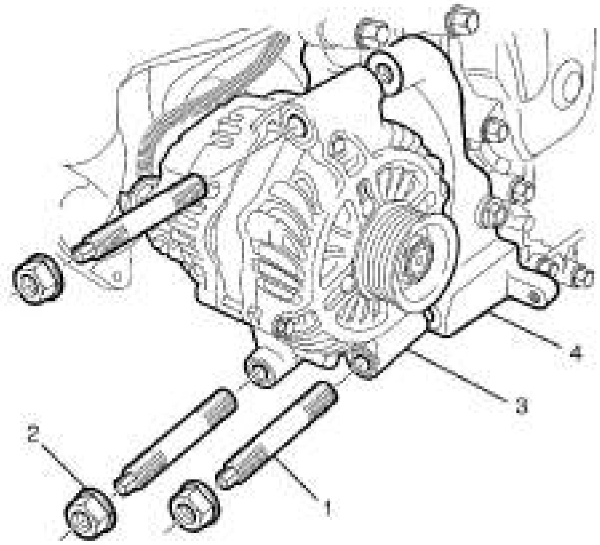
   Tighten
   Tighten the studs to 18 N·m (13 lb ft).

6. Install the alternator to alternator bracket stud retaining nuts (2).

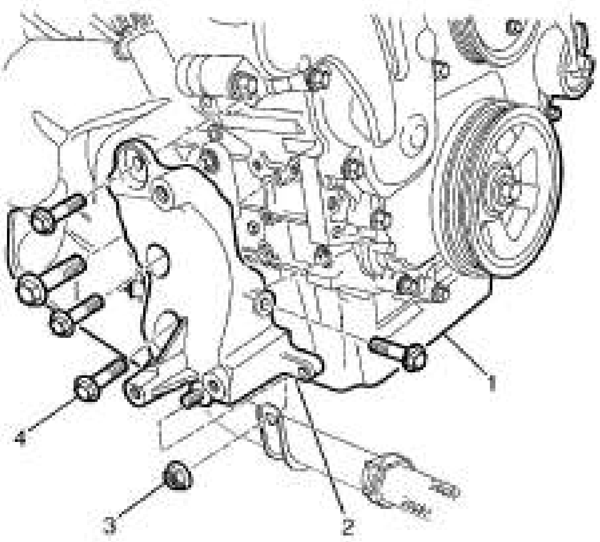
   Tighten
   Tighten the nuts to 18 N·m (13 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977568**

Generator Removal



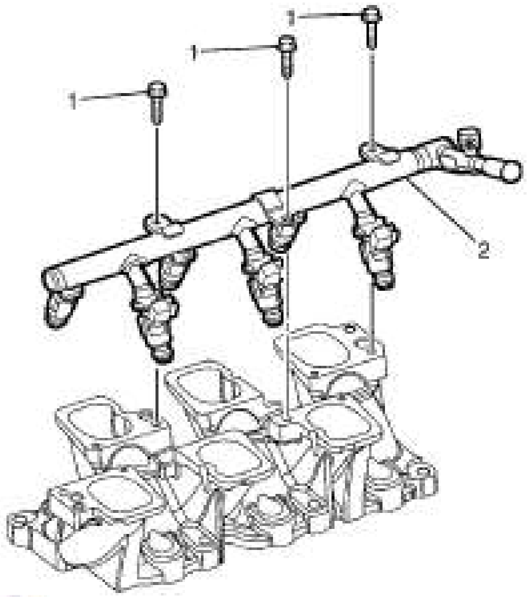
1. Remove the alternator to alternator bracket retaining nuts (2).
2. Remove the alternator to alternator bracket retaining studs (1).
3. Remove the alternator (3) from the alternator bracket (4).



4. Remove the coolant inlet pipe to alternator mounting bracket retaining nut (3)
5. Remove the alternator mounting bracket to cylinder block retaining bolts (4).
6. Remove the alternator mounting bracket (2) from the cylinder block (1).

Intake Manifold Assemble

Lower Intake Manifold Assemble Procedure

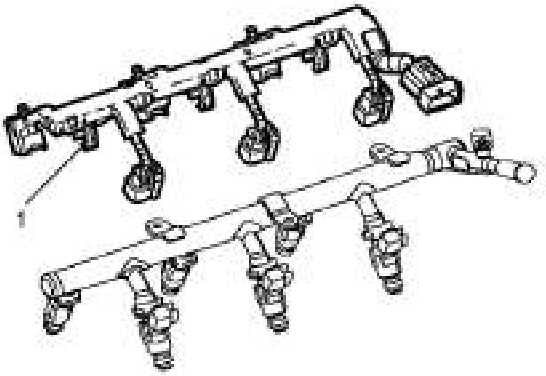


1. Install the fuel injector rail (2).

   Notice: Refer to Fastener Notice in the Preface section.

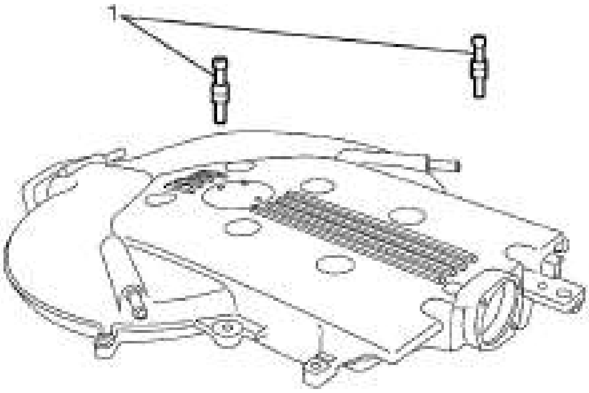
2. Install the fuel injector rail to lower intake manifold retaining bolts (1).

   Tighten
   Tighten the fuel injector rail bolts to 10 N·m (89 lb in).



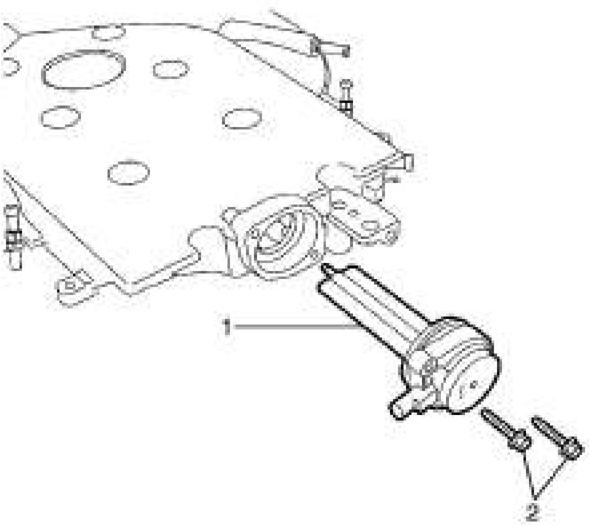
3. Install the fuel injector wiring harness (1).

Upper Intake Manifold Assemble Procedure



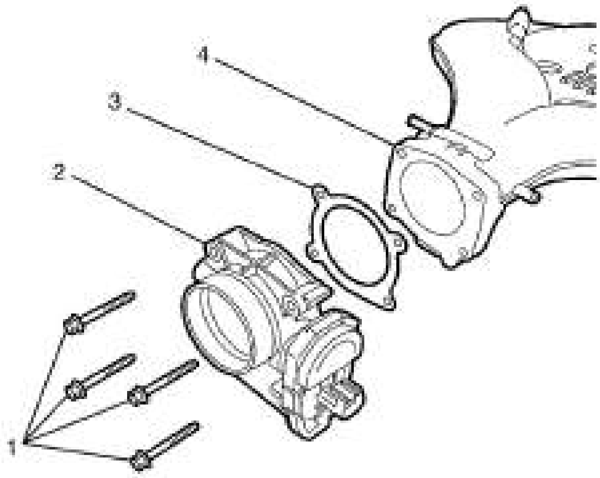
1. Install the engine cover ball studs (1).

   Tighten
   Tighten the engine cover ball studs to 7 N·m (62 lb in).



2. Install the Intake Manifold Runner Control (IMRC) flap (1).
3. Install the IMRC flap to upper intake manifold retaining bolts (2).

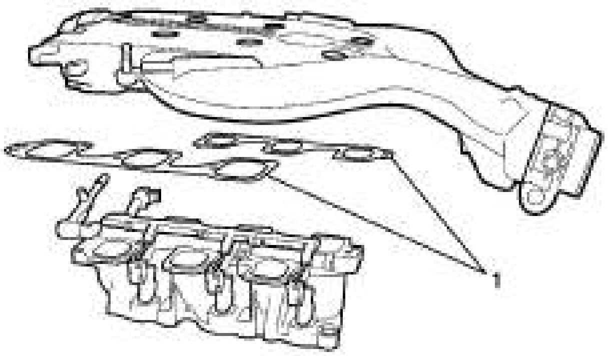
Tighten
Tighten the bolts to 10 N·m (89 lb in).



4. Install the NEW throttle body gasket (3) to the intake manifold (4).
5. Install the throttle body (2).
6. Install the throttle body bolts to upper intake manifold retaining bolts (1).

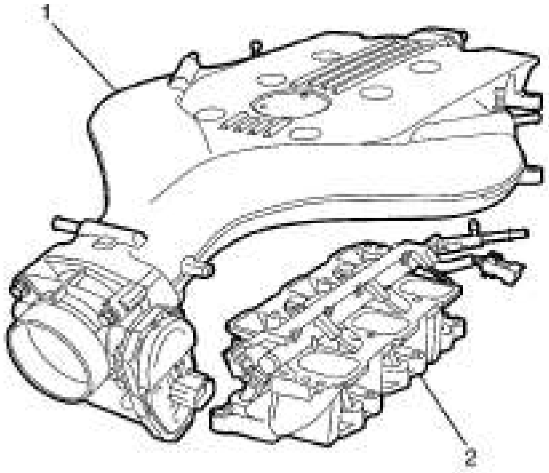
Tighten
Tighten the bolts to 10 N·m (89 lb in).

Upper to Lower Intake Manifold Assemble Procedure

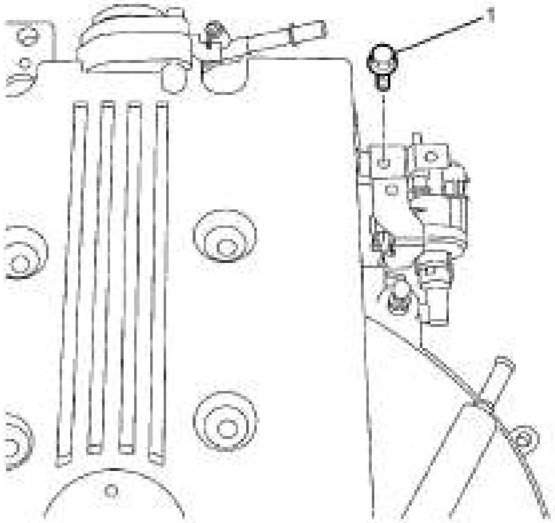


Important: DO NOT reuse the upper-to-lower intake manifold gasket and the intake manifold-to-cylinder head sealing gaskets.

1. Install the NEW upper-to-lower intake manifold gaskets (1).

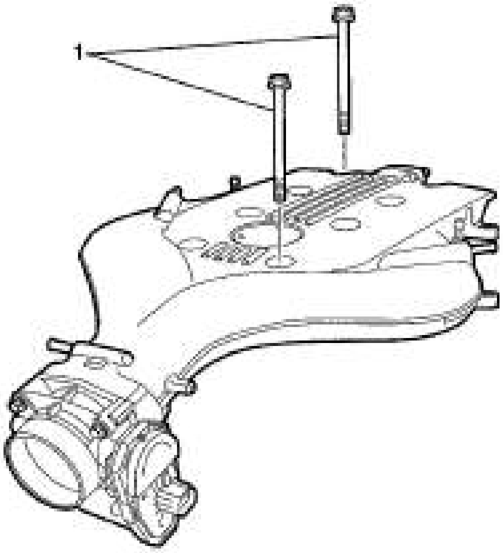


2. Install the upper intake manifold (1) to the lower intake manifold (2).



3. Install the fuel injector wiring harness bracket to upper intake manifold retaining bolt (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



4. Install the upper-to-lower intake manifold retaining bolts (1).

   Tighten
   Tighten bolts to 23 N·m (17 lb ft).

Intake Manifold Cleaning and Inspection

Upper Intake Manifold Cleaning Procedure

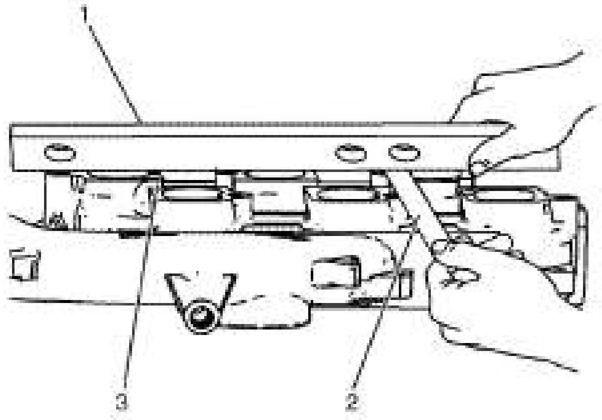
1. Remove any remaining gasket and/or gasket material from the following:
    - Throttle body.
    - Intake manifold.
2. Clean the following intake manifold areas in solvent.
    - Intake manifold gasket sealing areas.
    - Intake manifold passages.
    - Brake booster hose passage.
    - Evaporative emission (EVAP) solenoid passage.
    - Positive Crankcase Ventilation (PCV) vacuum hose passages.

Caution: Refer to Safety Glasses Caution in the Preface section.

3. Dry the upper intake manifold and throttle body with compressed air.

Inspection Procedure

1. Inspect the upper intake manifold for the following conditions:
    - Damage, debris or restrictions to the brake vacuum booster hose port.
    - Damage to the throttle body bolt holes.
    - Damage, debris or restrictions to the PCV system hose ports.
    - Damage to the intake manifold bolt bosses.
    - Damage to the EVAP purge solenoid mounting boss.
    - Damage, debris or restrictions to the EVAP purge solenoid port.
    - Damage, debris or restrictions in the vacuum passage.
    - Damage to the intake manifold runner control flap mounting bosses.
    - Damage, debris or restrictions to the intake manifold runner control flap port.
    - Damage to the intake manifold runner control flap components.
    - Gouges or damage to the upper intake manifold sealing surfaces.
    - Damage to the gasket sealing surface for the throttle body.



2. Inspect the upper intake manifold sealing surface for warpage.
    - 2.1. Locate a straight edge (1) across the upper-to-lower intake manifold sealing surface (3).
    - 2.2. Insert a feeler gauge (2) between the upper-to-lower intake manifold sealing surface (3) and the straight edge (1). An upper intake manifold with warpage in excess of 0.05 mm (0.020 in) must be replaced.
3. Repair or replace the upper intake manifold as necessary.

Lower Intake Manifold Cleaning Procedure

1. Remove any remaining gasket and/or gasket material from the following:
    - Upper-to-lower intake manifold sealing surface.
    - Cylinder head-to-lower intake manifold sealing surface.
2. Clean the following intake manifold areas in solvent.
    - Intake manifold gasket sealing surfaces.
    - Intake manifold passages.

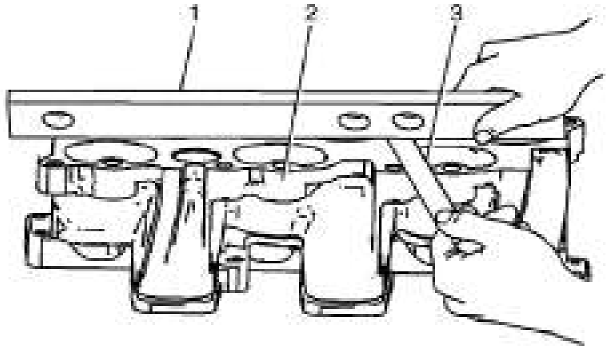
Caution: Refer to Safety Glasses Caution in the Preface section.

3. Dry the intake manifold with compressed air.

Inspection Procedure

1. Inspect the lower intake manifold for the following conditions:
    - Damage, debris or restrictions to the lower intake manifold ports
    - Damage to the fuel rail mounting bolt holes
    - Damage to the fuel rail
    - Gouges or damage to the intake manifold sealing surfaces
    - Damage to the lower intake manifold bolt bosses

- Damage to the fuel injector ports

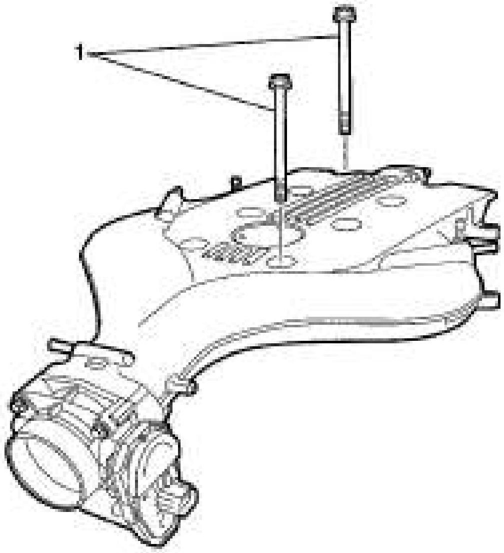


2. Inspect the lower intake manifold sealing surfaces for warpage.
    2.1. Locate a straight edge (1) across the lower intake manifold sealing surfaces (2).
    2.2. Insert a feeler gauge (3) between the lower intake manifold sealing surfaces (2) and the straight edge (1). A lower intake manifold with warpage in excess of 0.5 mm (0.020 in) must be replaced.
3. Repair or replace the lower intake manifold as necessary.

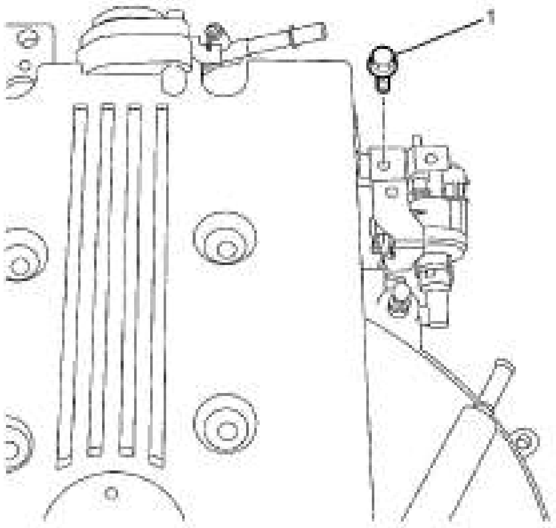
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985122**

Intake Manifold Disassemble

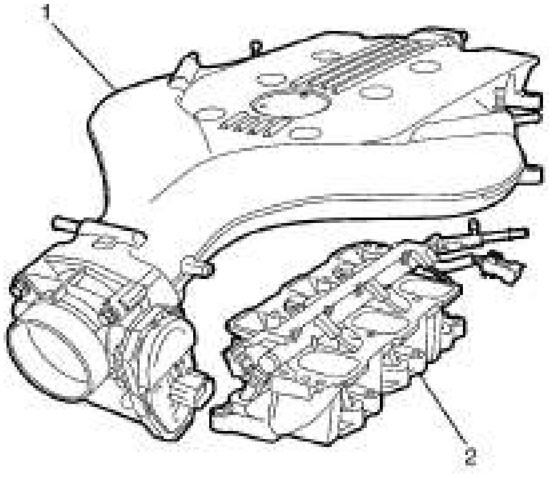
Upper to Lower Intake Manifold Disassemble Procedure



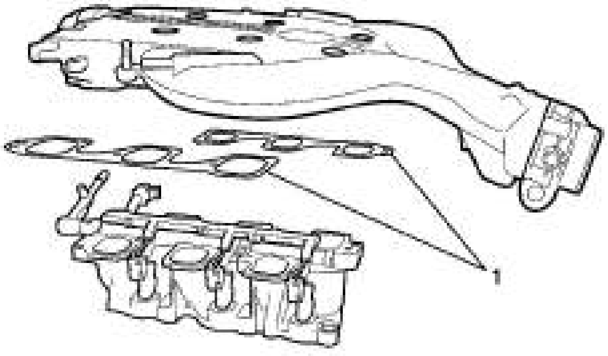
1. Remove the upper-to-lower intake manifold retaining bolts (1).



2. Remove the fuel injector wiring harness bracket to upper intake manifold retaining bolt (1).



3. Remove the upper intake manifold (1) from the lower intake manifold (2).

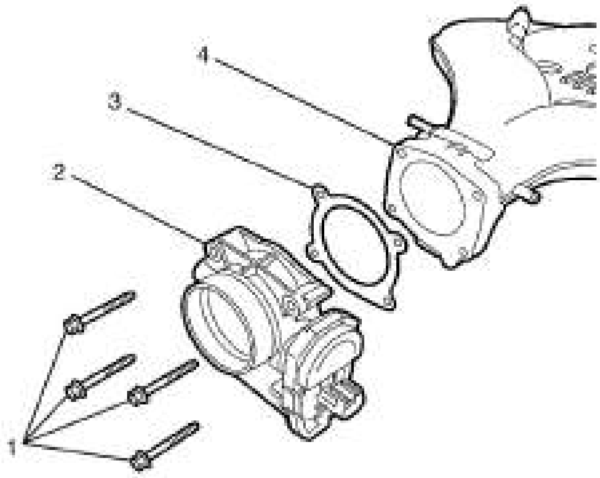


Important: DO NOT reuse the upper-to-lower intake manifold gasket and the intake manifold-to-cylinder head sealing gaskets.

4. Remove the upper-to-lower intake manifold gaskets (1).

   Discard the upper-to-lower intake manifold gaskets (1).

Upper Intake Manifold Disassemble Procedure

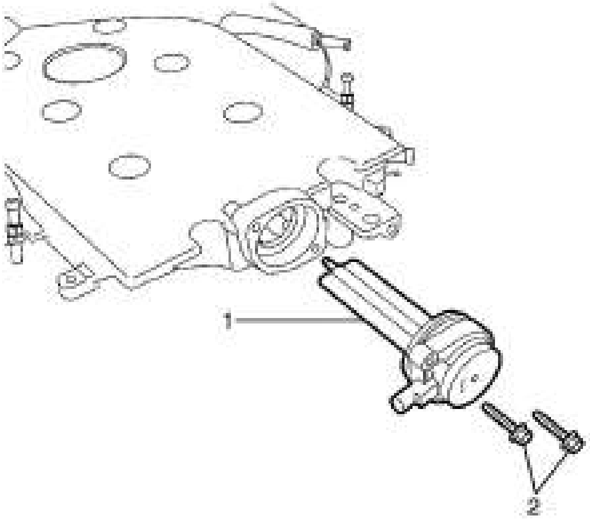


1. Remove the throttle body bolts to upper intake manifold retaining bolts (1).
2. Remove the throttle body (2).

   Important: The throttle body gasket (3) must be discarded whenever the throttle body (2) has been removed from the upper intake manifold (4).

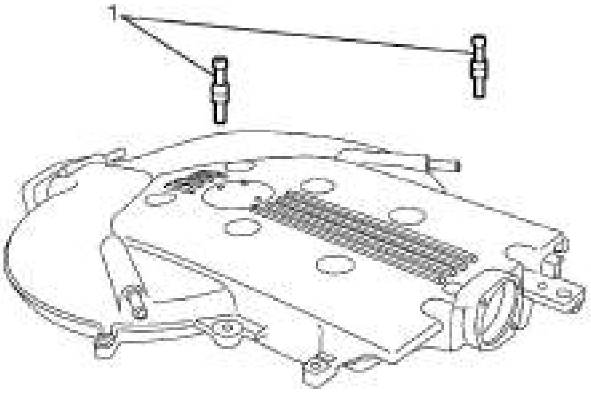
3. Remove the throttle body gasket (3).

   Discard the gasket



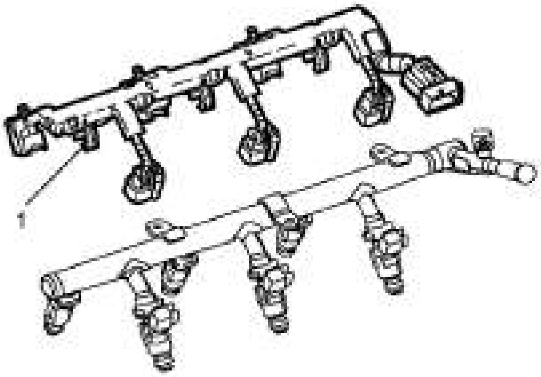
4. Remove the Intake Manifold Runner Control (IMRC) flap to upper intake manifold retaining bolts (2).

5. Remove the IMRC flap (1).

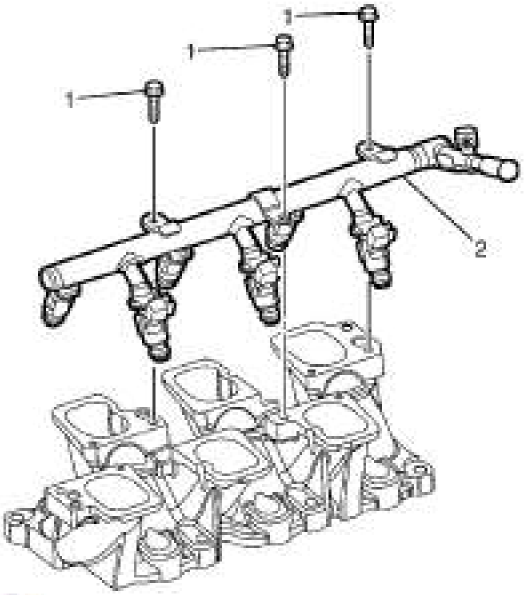


6. Remove the sight shield ball studs (1).

Lower Intake Manifold Disassemble Procedure



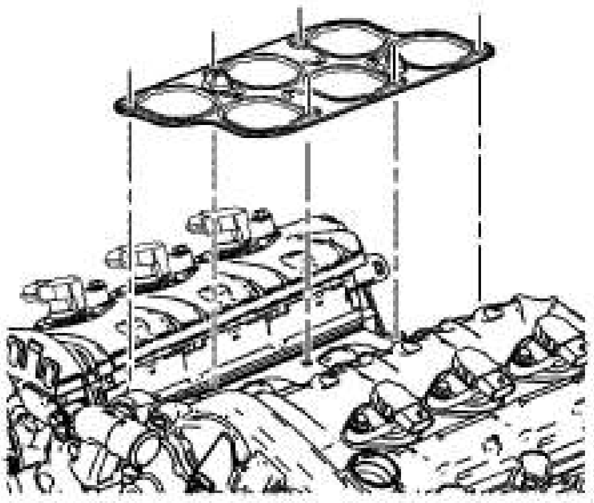
1. Remove the fuel injector wiring harness (1).



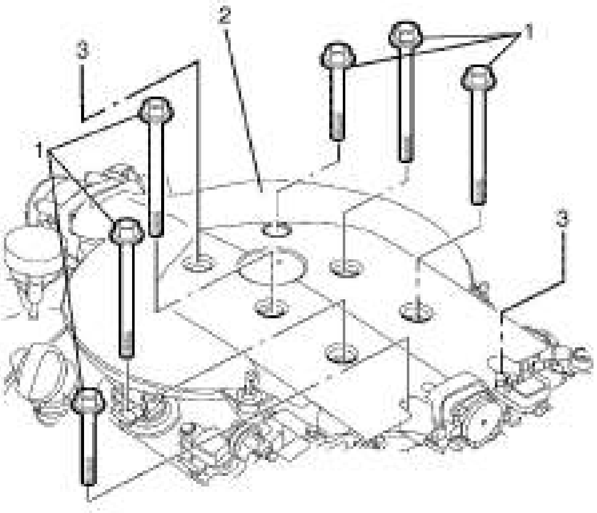
2. Remove the fuel injector rail to lower intake manifold retaining bolts (1).
3. Remove the fuel injector rail (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985169**

Intake Manifold Installation



1. Install the NEW intake manifold gasket.



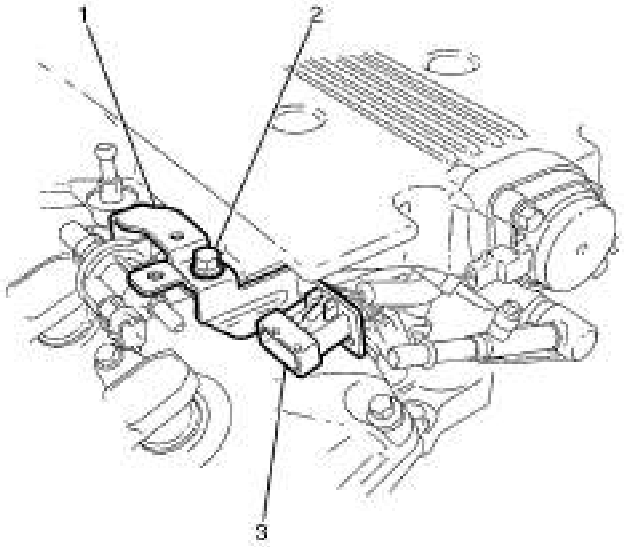
2. Install the intake manifold (2) and the throttle body (3) as an assembly as an assembly.

Notice: Refer to Fastener Notice in the Preface section.

Important: Tighten the intake manifold bolts (1) in a circular pattern starting at the center (long bolts) and moving outward.

3. Install the intake manifold bolts (1).

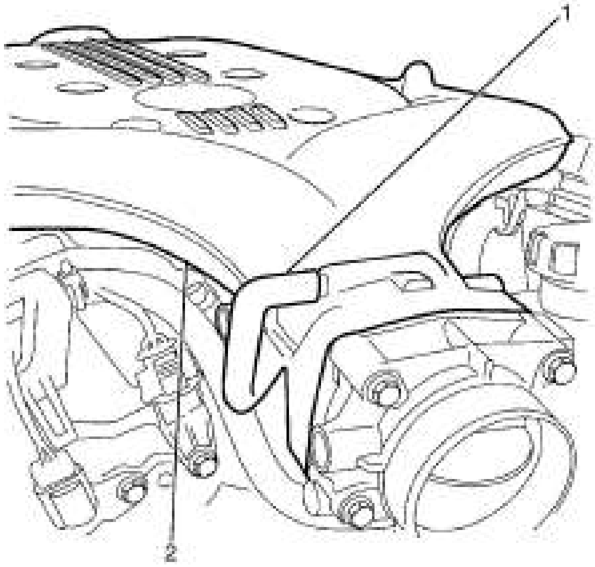
   Tighten
   Tighten the intake manifold bolts to 23 N·m (17 lb ft).



4. Install the fuel injector harness electrical connector/EVAP valve mounting bracket (1).
5. Install the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).

6. Attach the fuel injector harness electrical connector (3) to the fuel injector harness electrical connector/EVAP valve mounting bracket (1).

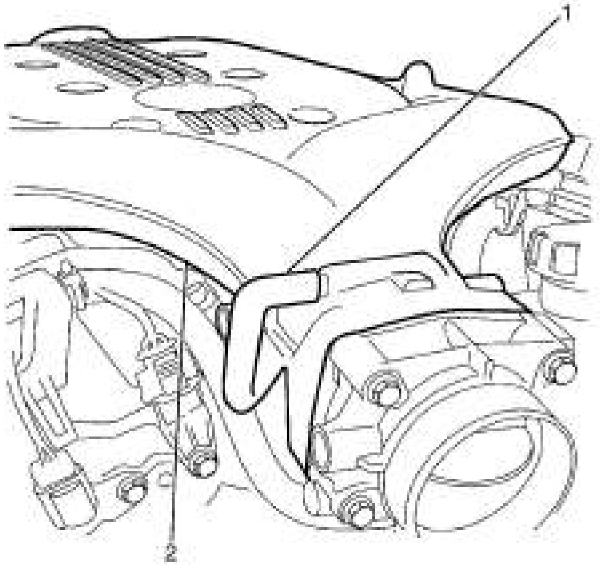


7. Connect the EVAP hose (1) to the upper intake manifold (2).
8. Install the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement .

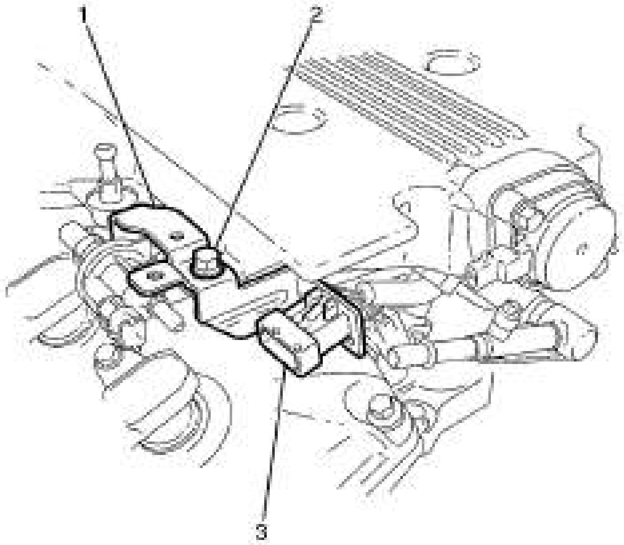
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977579**

Intake Manifold Removal

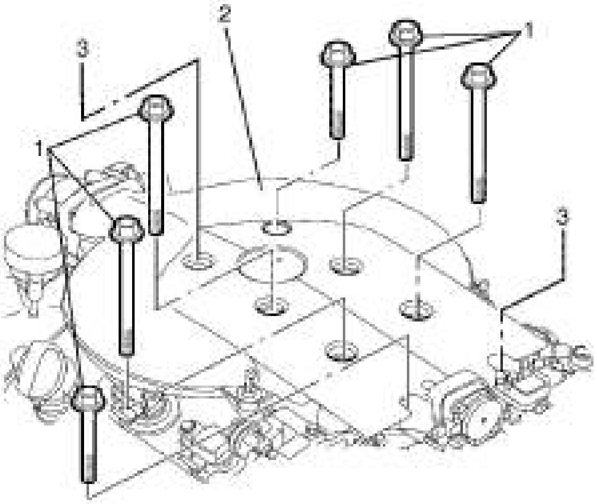
1. Remove the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement .



2. Disconnect the EVAP hose (1) from the intake manifold (2).



3. Remove the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).
4. Detach the fuel injector harness electrical connector (3) from the fuel injector harness electrical connector/EVAP valve mounting bracket (1).
5. Remove the fuel injector harness electrical connector/EVAP valve mounting bracket (1).



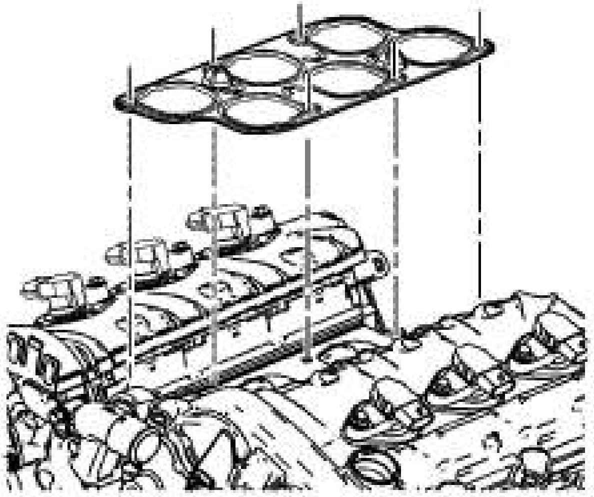
Important:

- DO NOT remove the upper intake manifold to lower intake manifold retaining bolts.
- DO NOT kink or damage the fuel pipe.

6. Remove the intake manifold bolts (1).
7. Remove the intake manifold (2) and the throttle body (3) as an assembly.

Important: The cylinder heads and engine valley must be plugged with a clean lint free cloth to prevent foreign matter entry into the engine.

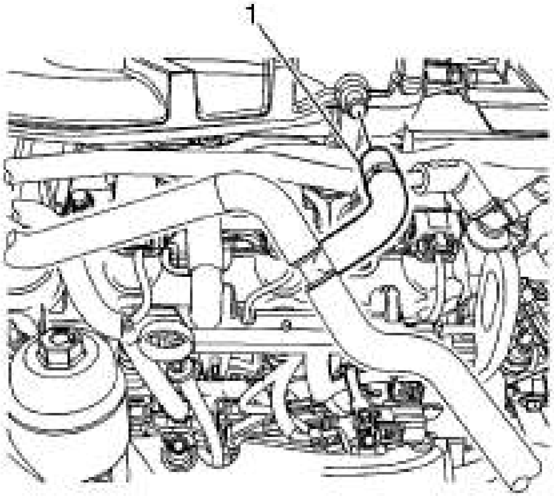
8. Plug the cylinder heads and engine valley with a clean lint free cloth.



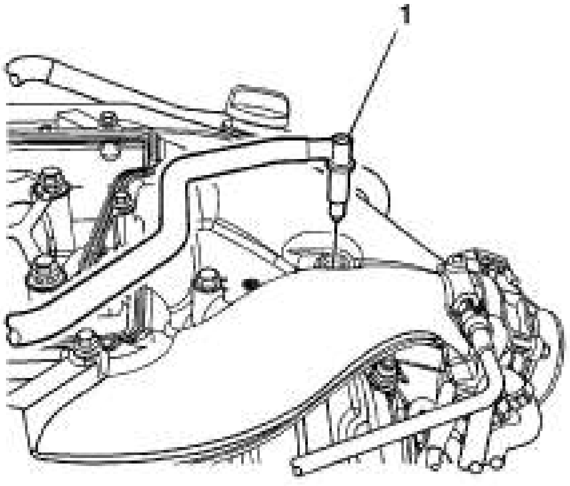
9. Remove the lower intake manifold gasket.

Intake Manifold Replacement (LLT)

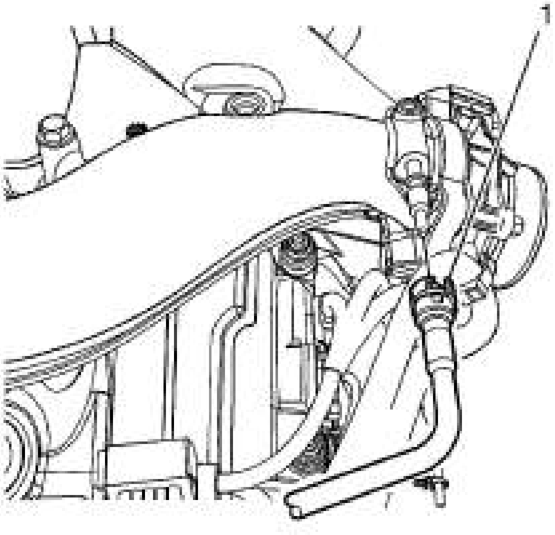
Removal Procedure



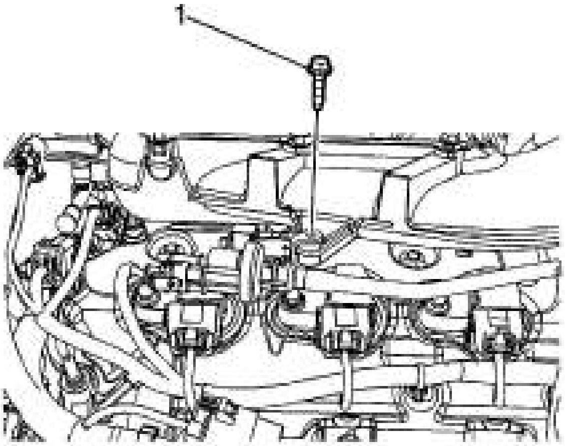
1. Remove the fuel pipe shield. Refer to Fuel Pipe Shield Replacement.
2. Remove the air outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
3. Disconnect the brake booster vacuum hose (1) from the intake manifold.



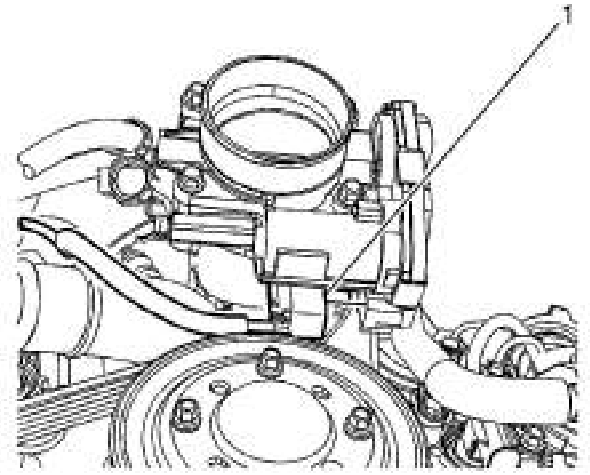
4. Disconnect the positive crankcase ventilation (PCV) hose (1) from the intake manifold.



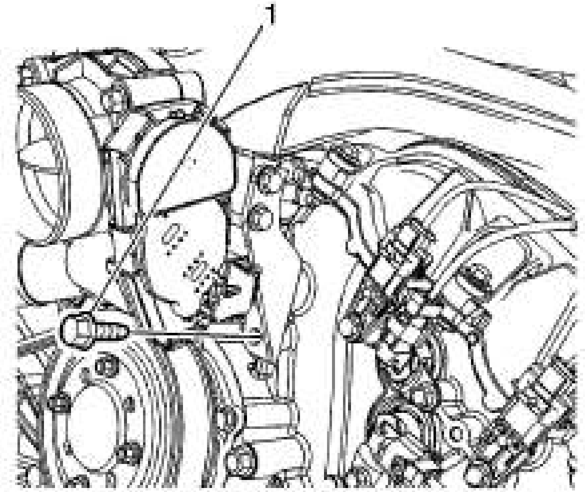
5. Disconnect the purge line (1) from the intake manifold.



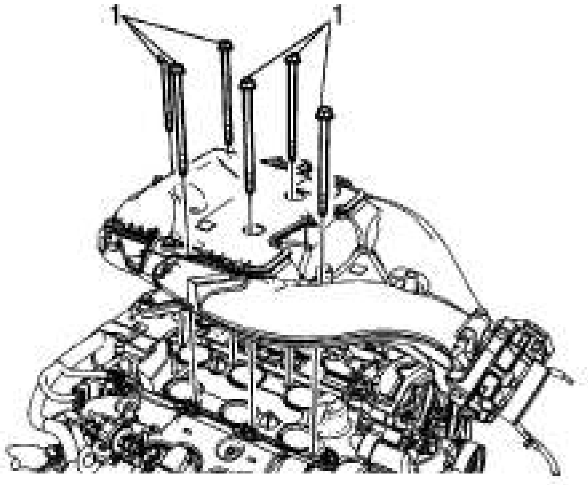
6. Remove the purge solenoid bolt (1) from the intake manifold and set the purge solenoid aside.



7. Disconnect the throttle body electrical connector (1).

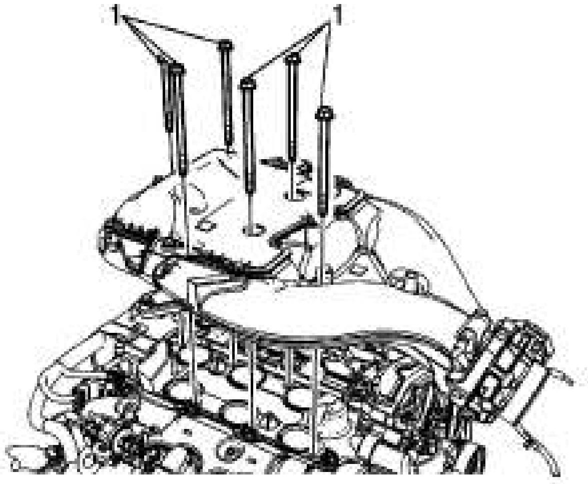


8. Remove the intake manifold bracket bolt (1).
9. Unclip the engine wiring harness from the intake manifold.



10. Remove the intake manifold bolts (1).
11. Remove the intake manifold and gasket.
12. If replacing the intake manifold, disassemble the intake manifold. Refer to Intake Manifold Disassemble.

Installation Procedure



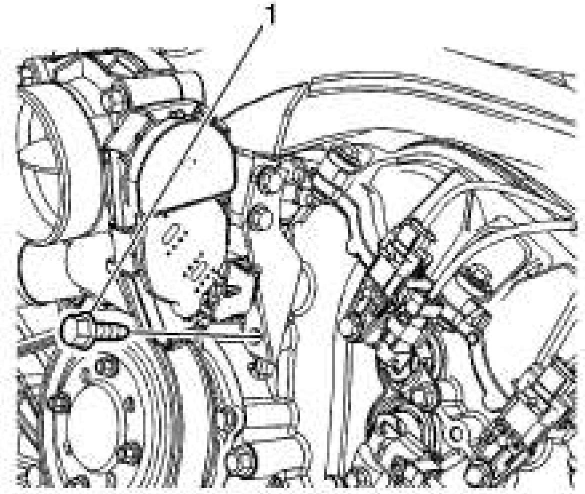
1. If installing a new intake manifold, assemble the intake manifold. Refer to Intake Manifold Assemble.

   Caution: Refer to Fastener Caution in the Preface section.

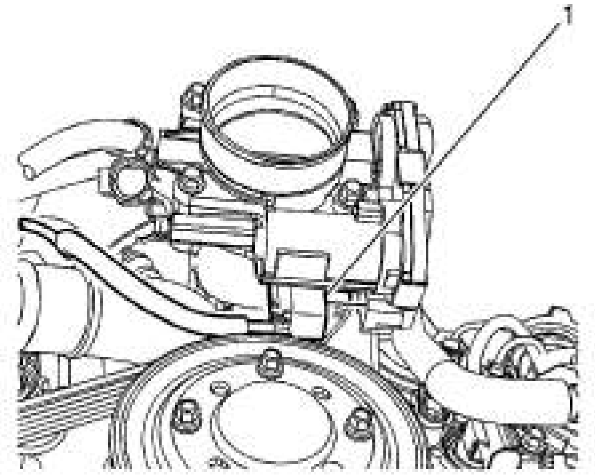
2. Install the NEW intake manifold gasket.

Note: Tighten the intake manifold bolts in a circular pattern starting at the center (long bolts) and moving outward.

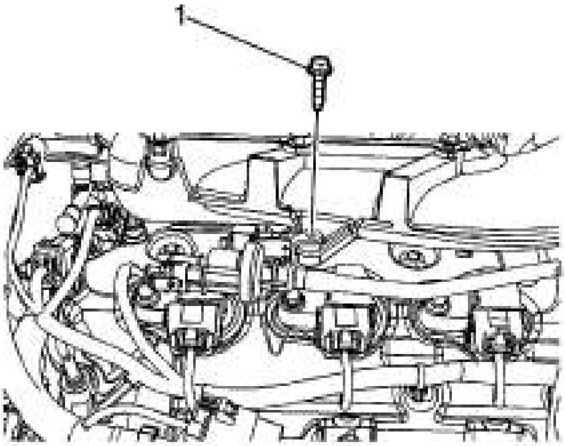
3. Install the intake manifold.
4. Install the intake manifold bolts (1) and tighten to **23 N·m (17 lb ft)**.



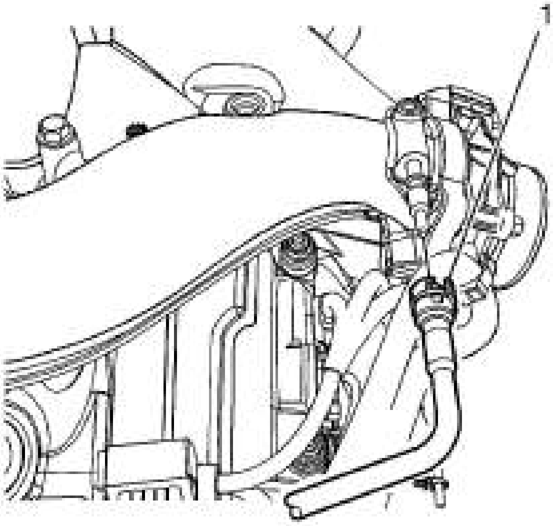
5. Clip the engine wiring harness from the intake manifold.
6. Install the intake manifold bracket bolt (1) and tighten to **23 N·m (17 lb ft)**.



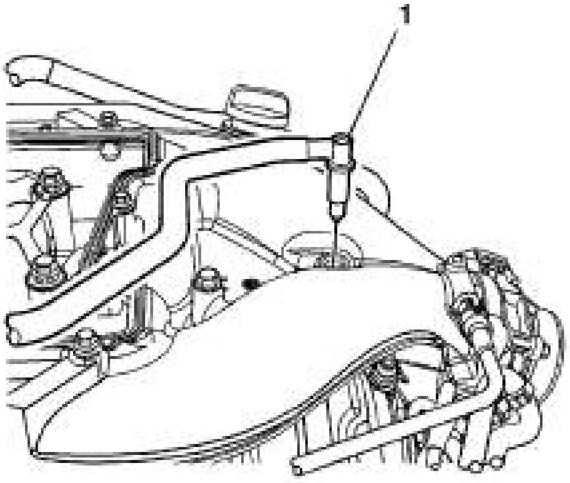
7. Connect the throttle body electrical connector (1).



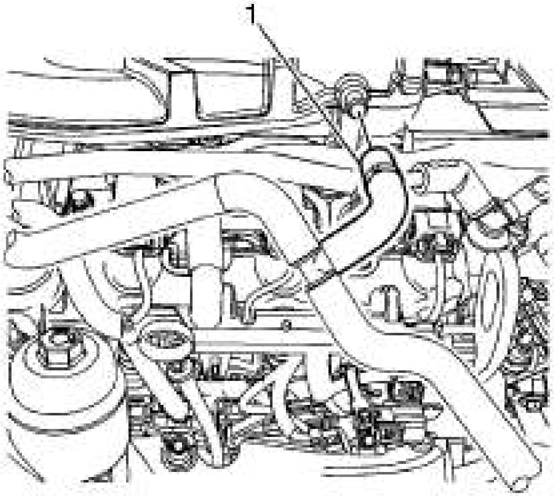
8. Install the purge solenoid bolt (1) to the intake manifold.



9. Connect the purge line (1) to the intake manifold.

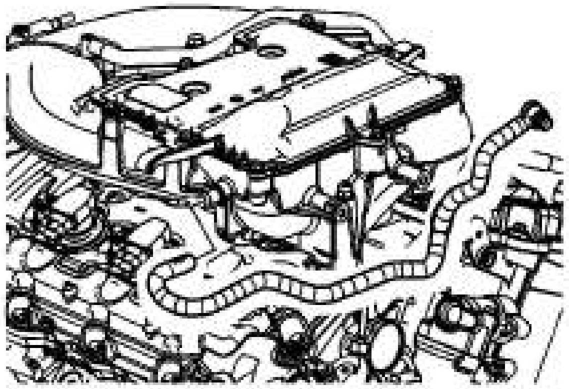


10. Connect the positive crankcase ventilation (PCV) hose (1) to the intake manifold.

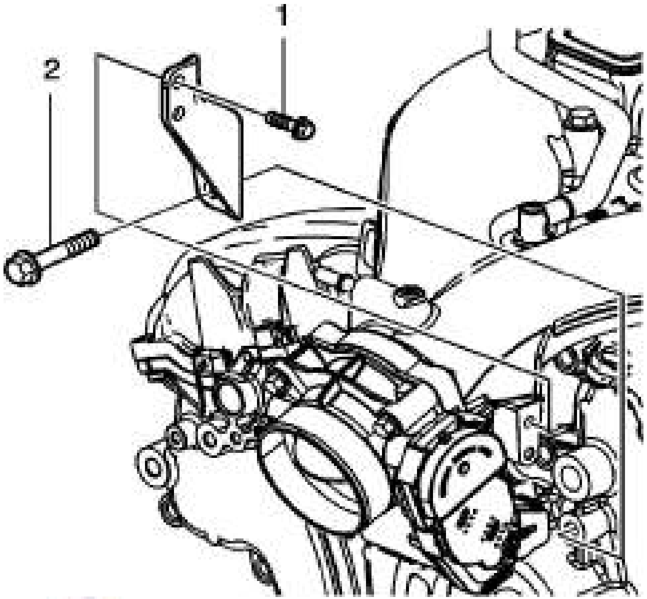


11. Connect the brake booster vacuum hose (1) from the intake manifold.
12. Install Remove the air outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
13. Install the fuel pipe shield. Refer to Fuel Pipe Shield Replacement.

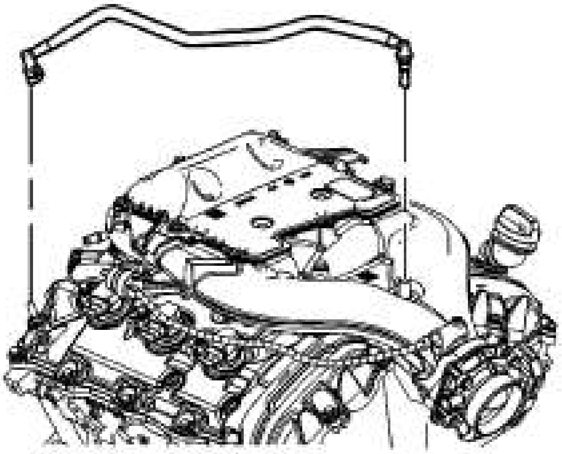
Intake Manifold Removal (LLT)



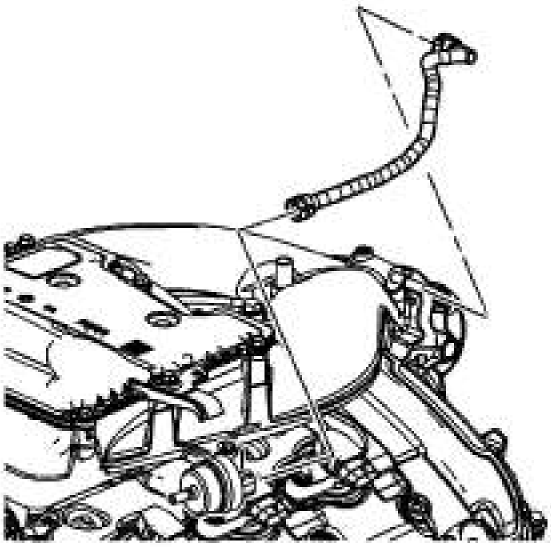
1. Disconnect and remove the brake booster hose from the intake manifold.



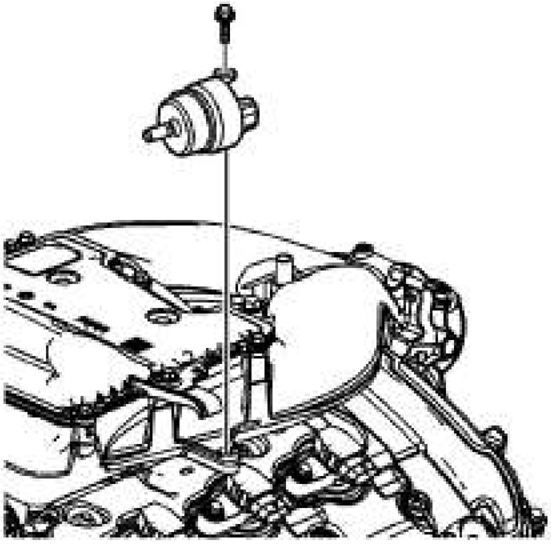
2. Remove the intake manifold brace bolts (1 and 2).
3. Remove the intake manifold brace.



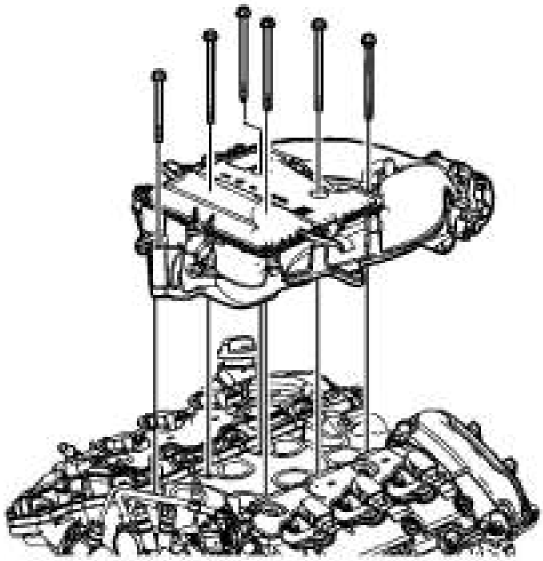
4. Disconnect and remove the positive crankcase ventilation (PCV) tube from the intake manifold and right camshaft cover.



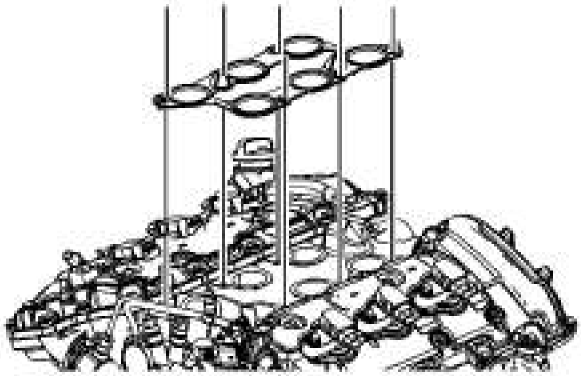
5. Remove the EVAP hose from the intake manifold and EVAP solenoid.



6. Remove the EVAP solenoid bolt.
7. Remove the EVAP solenoid.

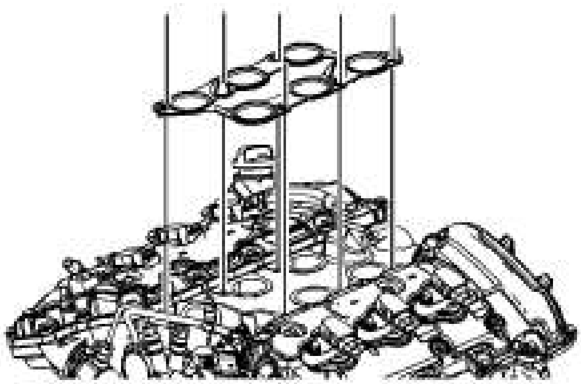


8. Remove the intake manifold bolts.
9. Remove the intake manifold assembly.

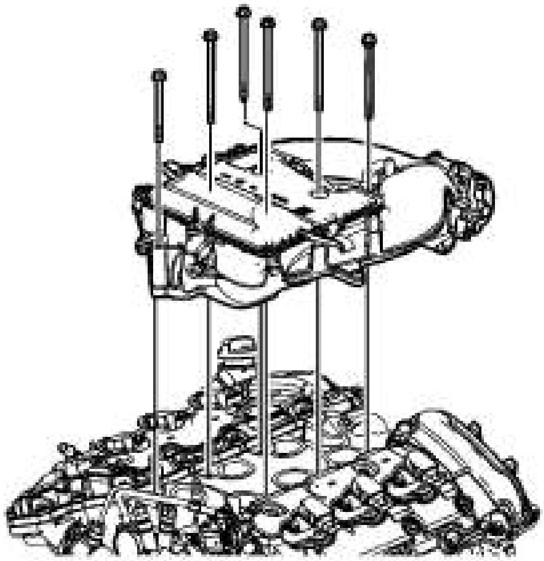


10. Remove and discard the lower intake manifold gasket.

Intake Manifold Installation (LLT)

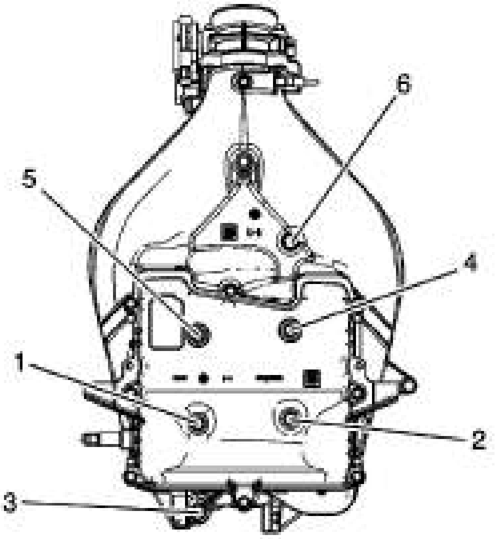


1. Install the NEW intake manifold gasket.

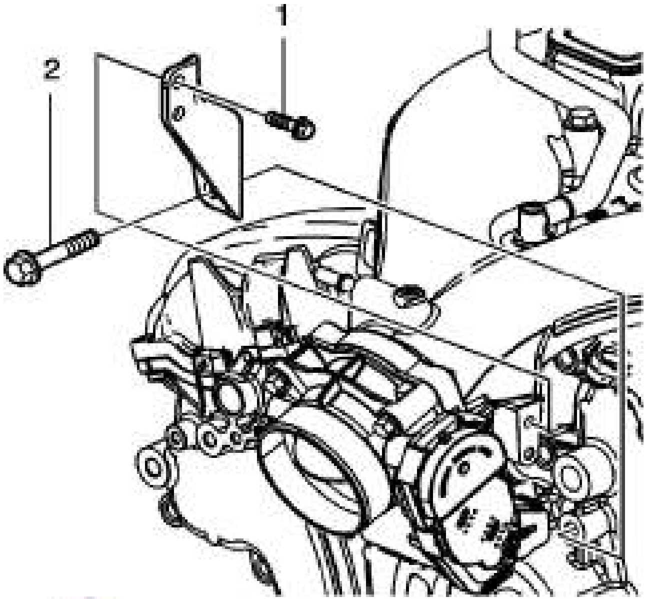


2. Install the intake manifold assembly.
3. Install the intake manifold bolts.

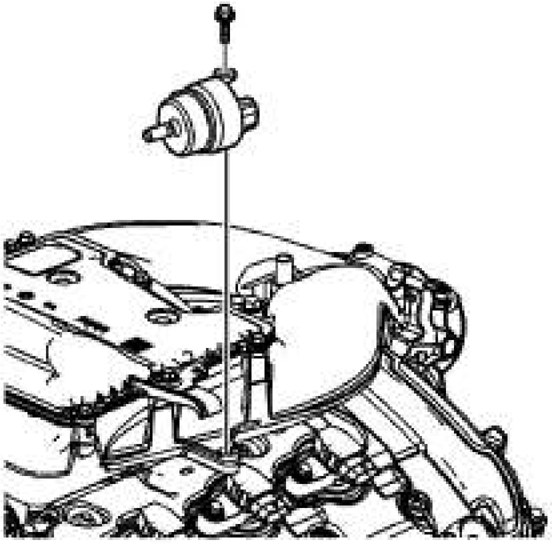
Caution: Refer to Fastener Caution in the Preface section.



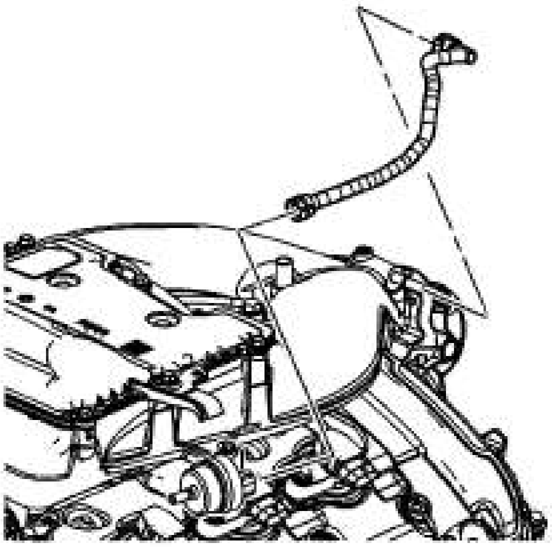
4. Tighten the intake manifold bolts in the sequence shown.
    - 4.1. Tighten the intake manifold bolts in sequence to **23 N·m (17 lb ft)**.
    - 4.2. Tighten the intake manifold bolts a second pass in sequence to **23 N·m (17 lb ft)**.



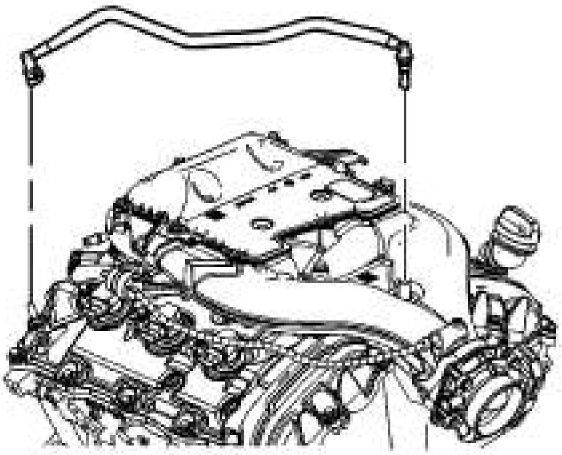
5. Place the intake manifold brace to the engine front cover and intake manifold.
6. Loosely install the bolts.
7. First tighten the intake manifold brace bolt (1) to the intake manifold and tighten to **10 N·m (89 lb in)**.
8. Finally tighten the intake manifold brace bolt (2) to the engine front cover and tighten to **65 N·m (48 lb ft)**.



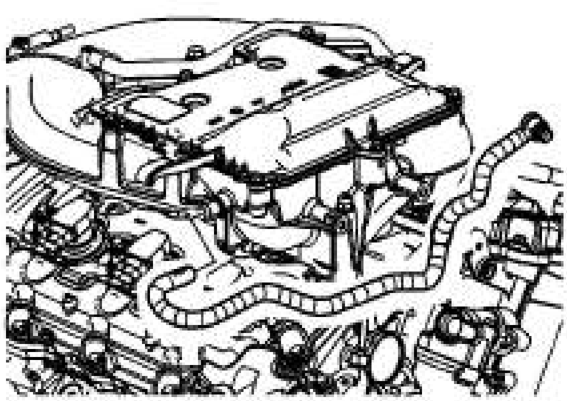
9. Install the evaporative (EVAP) solenoid.
10. Install the EVAP solenoid bolt and tighten to **10 N·m (89 lb in)**



11. Connect the EVAP hose to the upper intake manifold and EVAP solenoid.

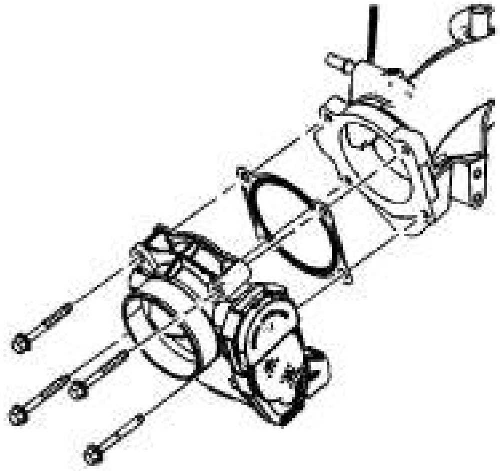


12. Connect the positive crankcase ventilation (PCV) tube assembly to the upper intake manifold and the right camshaft cover.
13. Install the PCV tube assembly bracket bolts and tighten to **10 N·m (89 lb in)**.

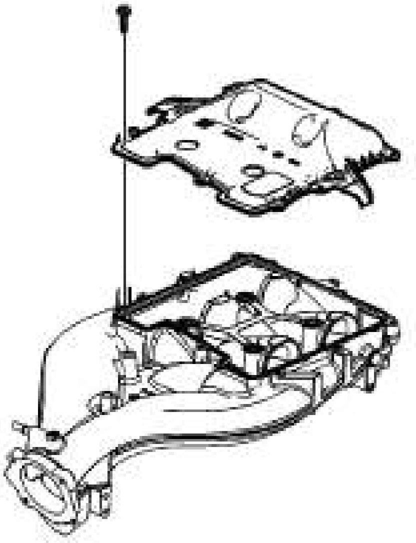


14. Install the brake booster hose to the upper intake manifold.

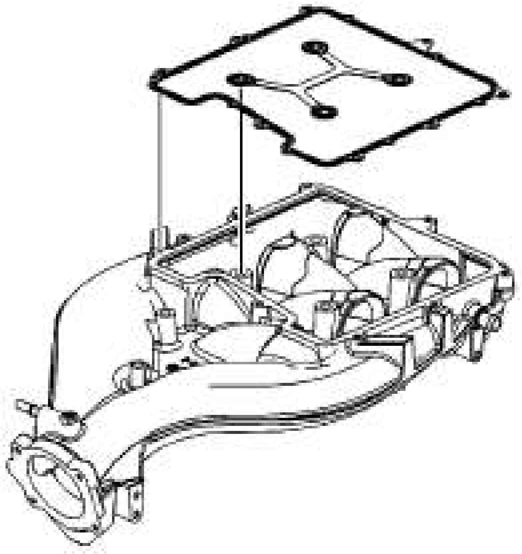
Intake Manifold Disassemble (LLT)



1. Remove the throttle body bolts.
2. Remove the throttle body.
3. Remove and discard the throttle body gasket.



4. Remove the intake manifold cover bolts.
5. Remove the intake manifold cover.



6. Remove and discard the intake manifold cover gaskets.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2134520**

Intake Manifold Cleaning and Inspection (LLt)

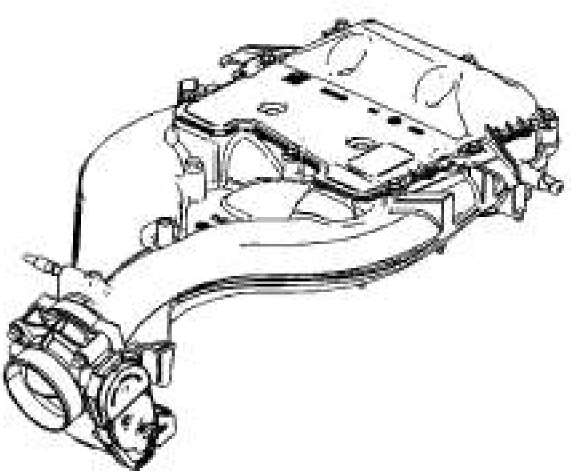
Upper Intake Manifold Cleaning Procedure

1. Remove any remaining gasket and/or gasket material from the following:
   - Throttle body
   - Intake manifold
2. Clean the following intake manifold areas in solvent.
   - Intake manifold gasket sealing areas
   - Intake manifold passages
   - Brake booster hose passage
   - Evaporative emission (EVAP) solenoid passage
   - Positive crankcase ventilation (PCV) vacuum hose passages

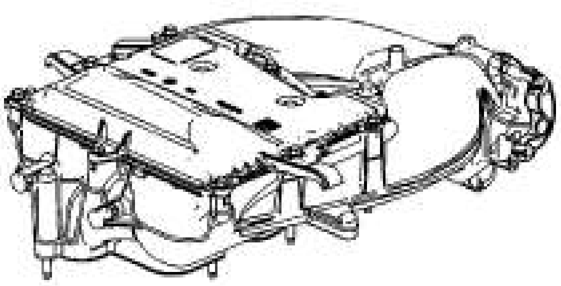
Warning: Refer to Safety Glasses Warning in the Preface section.

3. Dry the upper intake manifold and throttle body with compressed air.

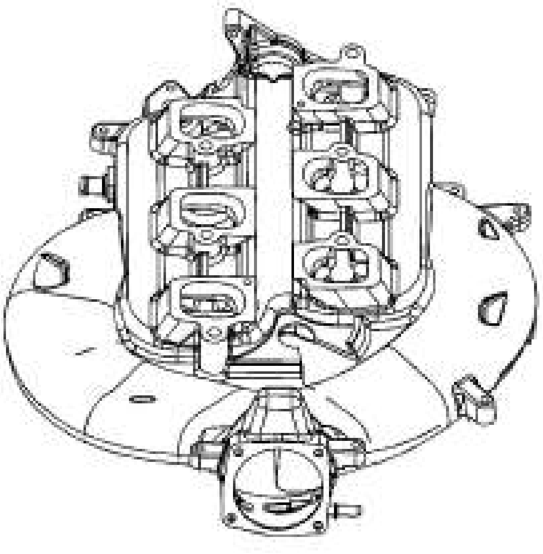
Inspection Procedure



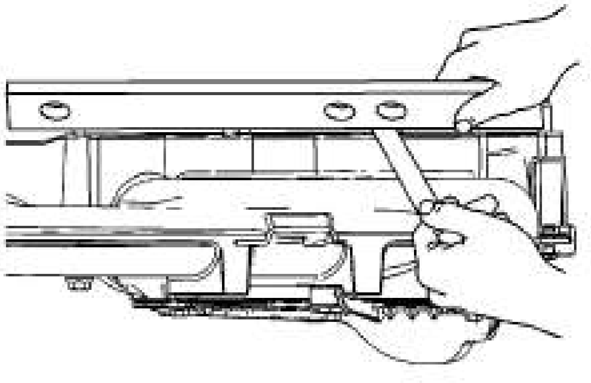
1. Inspect the upper intake manifold for the following conditions:
   - Damage, debris or restrictions to the brake vacuum booster hose port
   - Damage to the throttle body bolt holes
   - Damage, debris or restrictions to the PCV system hose ports
   - Damage to the gasket sealing surface for the intake manifold cover



2. Inspect the upper intake manifold for the following conditions:
   - Damage to the intake manifold bolt bosses
   - Damage to the EVAP purge solenoid mounting boss
   - Damage, debris or restrictions to the EVAP purge solenoid port
   - Damage, debris or restrictions in the vacuum passage

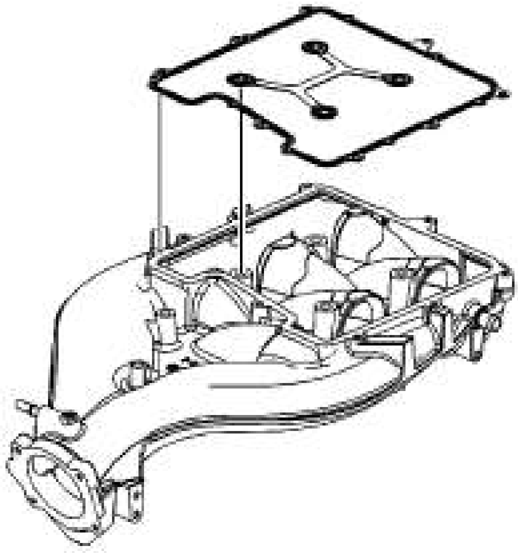


3. Inspect the intake manifold for the following conditions:
   - Gouges or damage to the intake manifold sealing surfaces
   - Damage to the gasket sealing surface for the throttle body

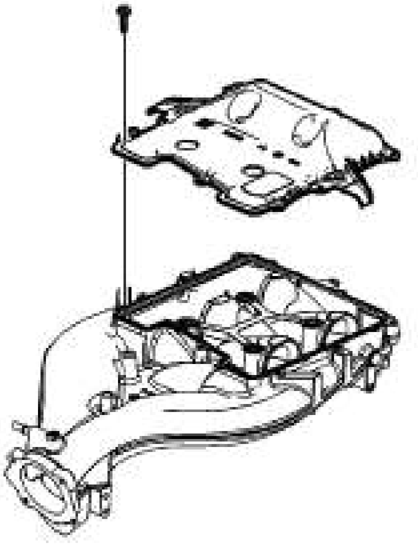


4. Inspect the upper intake manifold sealing surface for warpage.
    4.1. Locate a straight edge across the intake manifold sealing surface.
    4.2. Insert a feeler gage between the upper intake manifold and the straight edge. An intake manifold with warpage in excess of 0.50 mm (0.020 in) must be replaced.
5. Repair or replace the upper intake manifold as necessary.

Intake Manifold Assemble (LLT)



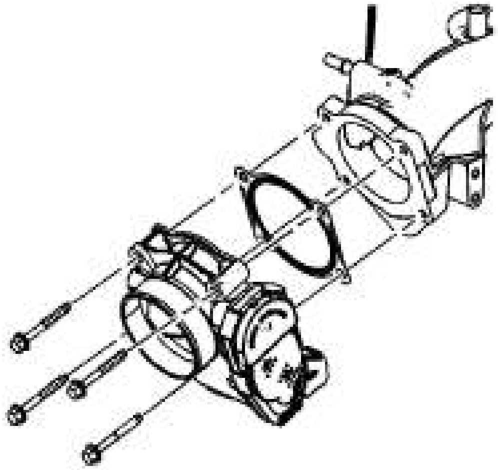
1. Install the NEW intake manifold cover gaskets.



2. Install the intake manifold cover.

Caution: Refer to Fastener Caution in the Preface section.

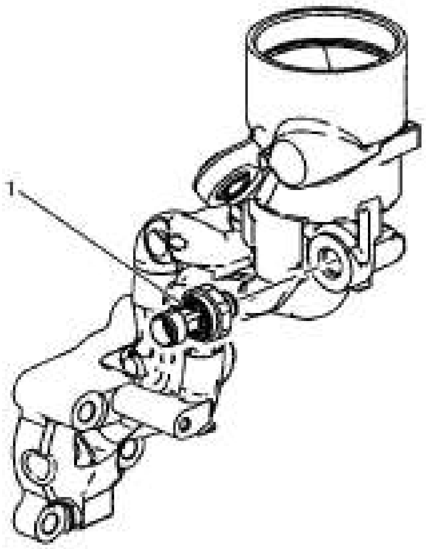
3. Install the intake manifold cover bolts and tighten to **10 N·m (89 lb in)**.



4. Install the NEW throttle body gasket.
5. Install the throttle body.
6. Install the throttle body bolts and tighten to **10 N·m (89 lb in).**.

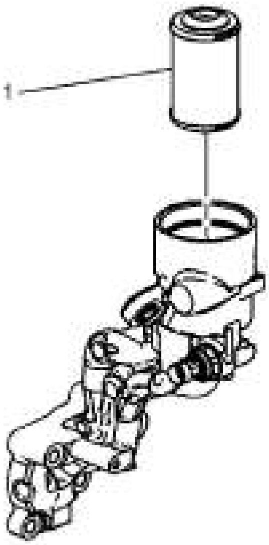
Oil Filter Adapter Assemble

Notice: Refer to Fastener Notice in the Preface section.



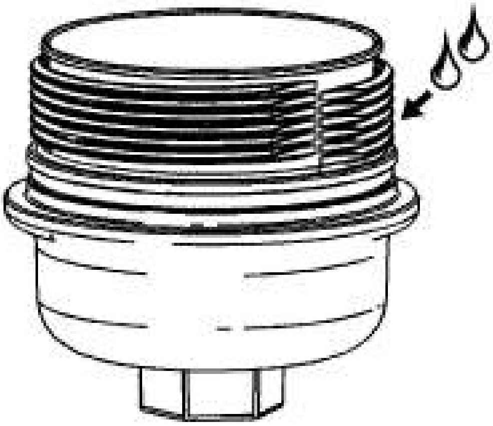
1. Install the oil pressure sender (1).

   Tighten
   Tighten the oil pressure sender to 20 N·m (15 lb in).

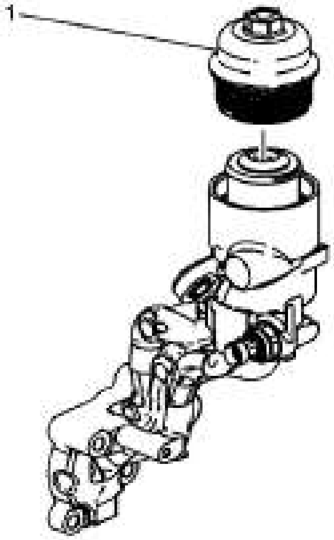


2. Install the NEW oil filter cartridge (1).

   Notice: Refer to General Repair Instructions in the Preface section.



3. Lubricate the oil filter cap threads with clean engine oil.



4. Install the oil filter cap (1).

   Tighten
   Tighten the oil filter cap to 25 N·m (18 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1977609

Oil Filter Adapter Cleaning and Inspection

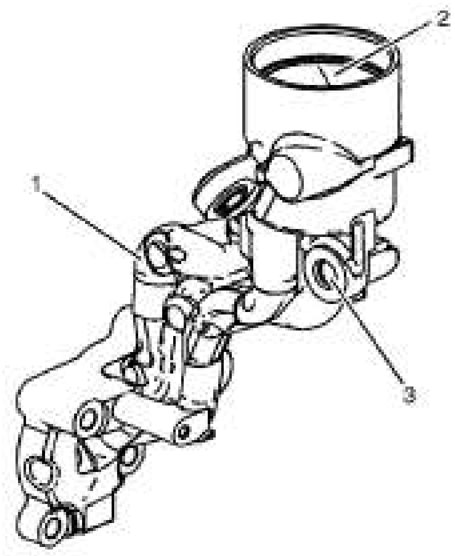
Cleaning Procedure

1. Clean the oil filter adapter components with non-corrosive solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

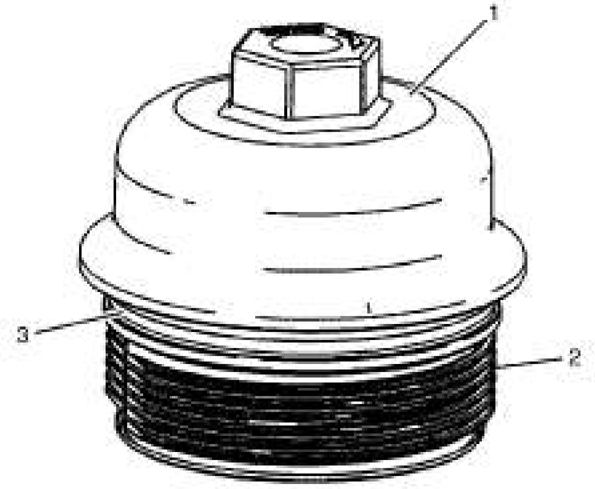
2. Dry the oil filter adapter components with compressed air.

Inspection Procedure

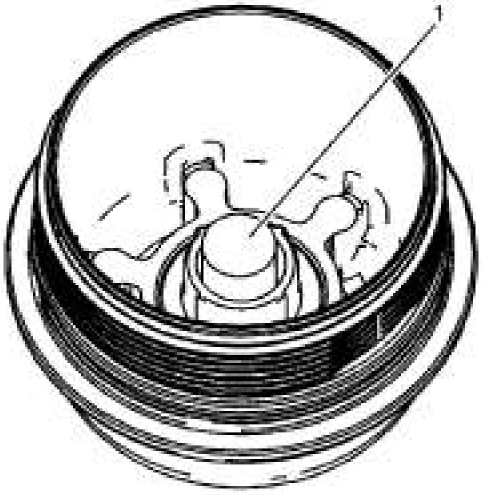


Important: The internal parts of the oil filter adapter are not serviced separately. If wear or damage is noted, replace the entire oil filter adapter assembly.

1. Inspect the oil filter housing for cracks, scoring, casting imperfections (1) and damaged threads (3).
2. Inspect the drain back valve (2) for damage or blockage.



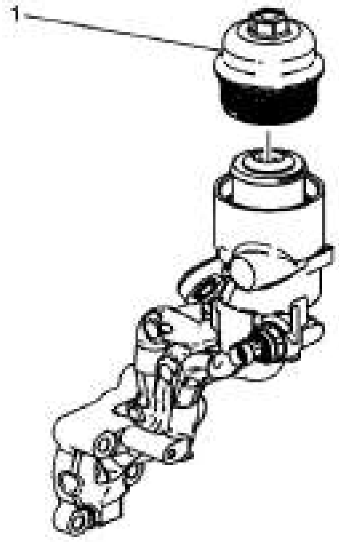
3. Inspect the oil filter cap for cracks, scoring, casting imperfections (1) and damaged threads (2). Replace as necessary.
4. Inspect the oil filter cap O-ring (3) for damage. Replace as necessary.



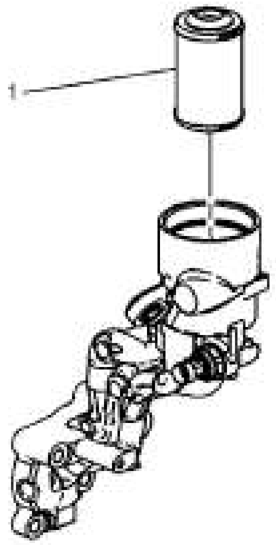
5. Inspect the bypass valve (1) for damage or blockage.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977669**

Oil Filter Adapter Disassemble

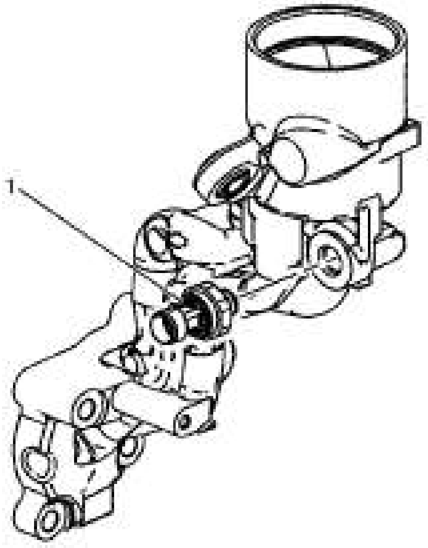


1. Remove the oil filter cap (1).



2. Remove the oil filter cartridge (1).

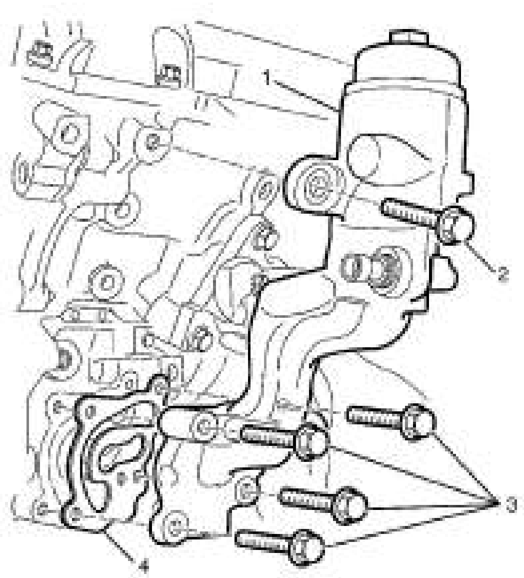
   Discard the oil filter cartridge (1).



3. Remove the oil pressure sender (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995382**

Oil Filter Adapter Installation



1. Position a NEW oil filter adapter gasket (4) onto the oil filter adapter (1).
2. Install the M8 lower oil filter adapter to cylinder block retaining bolts (3).
3. Loosely tighten the M8 lower oil filter adapter to cylinder block retaining bolts (3).
4. Install the M10 upper oil filter adapter to cylinder head retaining bolt (2).
5. Loosely tighten the M10 upper oil filter adapter to cylinder head retaining bolt (2).

   Notice: Refer to Fastener Notice in the Preface section.

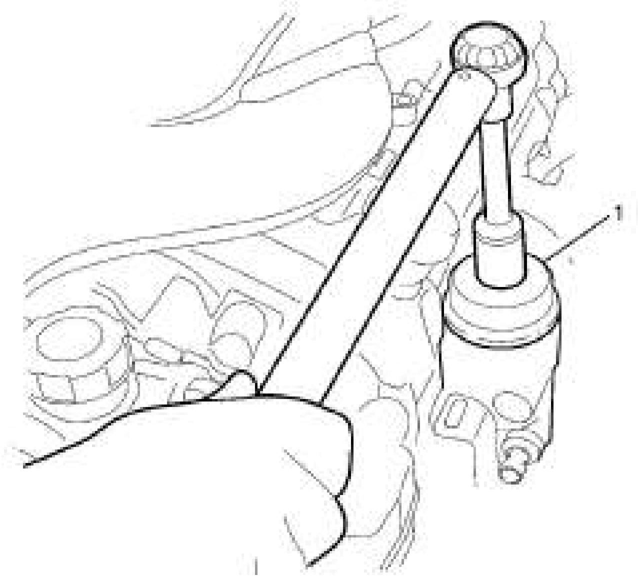
6. Tighten the M8 lower oil filter adapter to cylinder block retaining bolts (3).

   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).

   Notice: Refer to Fastener Notice in the Preface section.

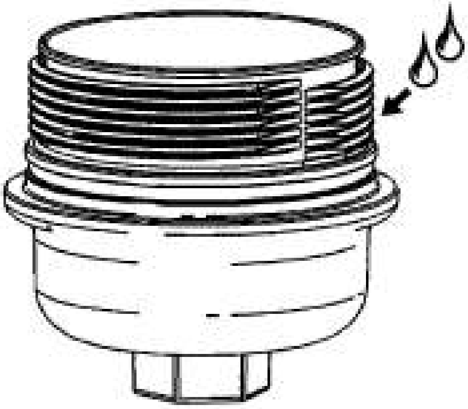
7. Tighten the M10 upper oil filter adapter to cylinder head retaining bolt (2).

   Tighten
   Tighten the bolt to 58 N·m (42 lb ft).

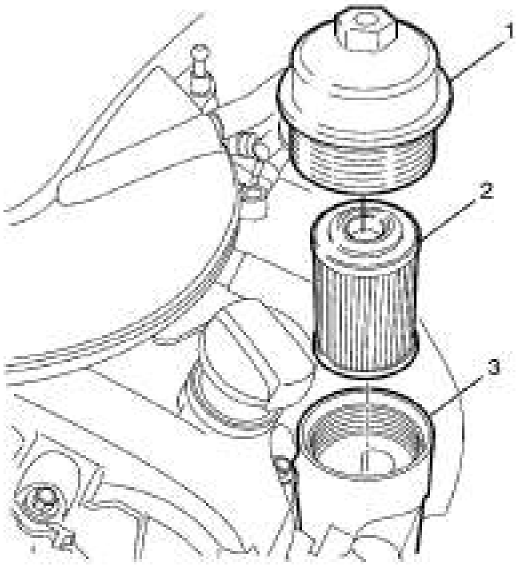


8. Remove the oil filter cap (1).

   Notice: Refer to General Repair Instructions in the Preface section.



9. Lubricate the oil filter cap threads with clean engine oil.



10. Install the NEW oil filter cartridge (2).

    Notice: Refer to General Repair Instructions in the Preface section.

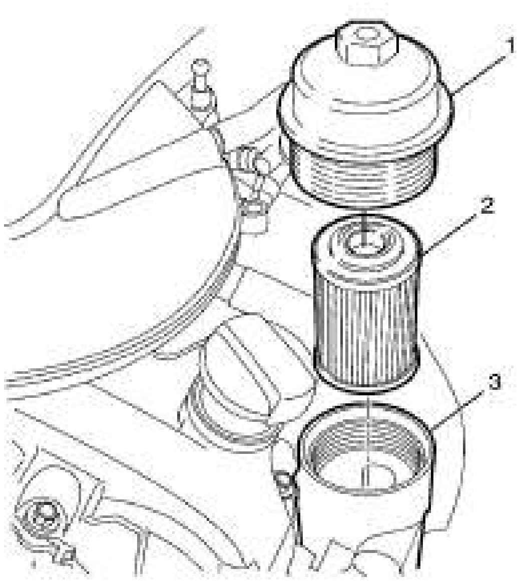
    Important: Use a six-point socket to install the oil filter cap.

11. Install the oil filter adapter cap (1) to the engine oil filter adapter (3).

    Tighten
    Tighten the oil filter cap to 25 N·m (18 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977650**

Oil Filter Adapter Removal

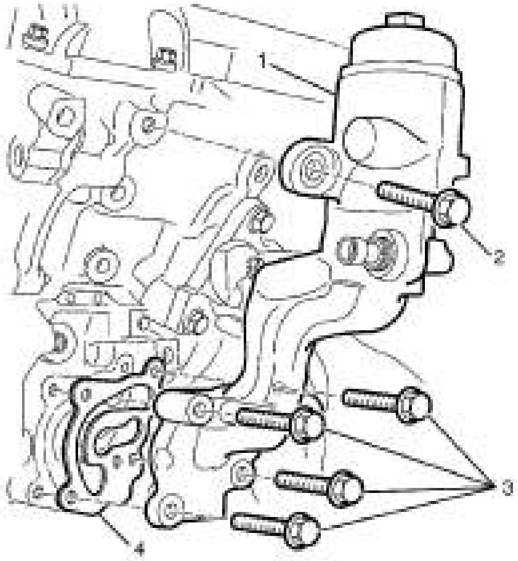


Important: Use a six-point socket to remove the oil filter cap (1).

1. Remove the oil filter adapter cap (1) from the engine oil filter adapter (3).
2. Remove the oil filter cartridge (2).

   Discard the oil filter cartridge (2).

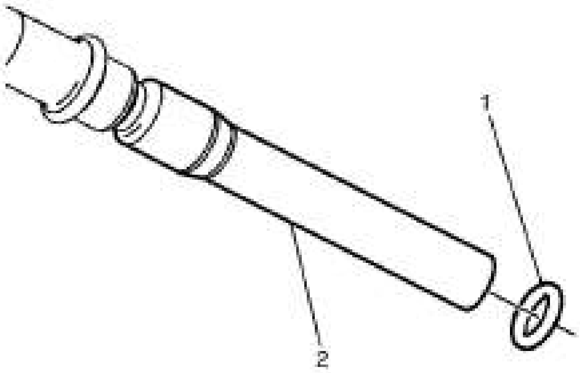
3. Re-install the oil filter cap.



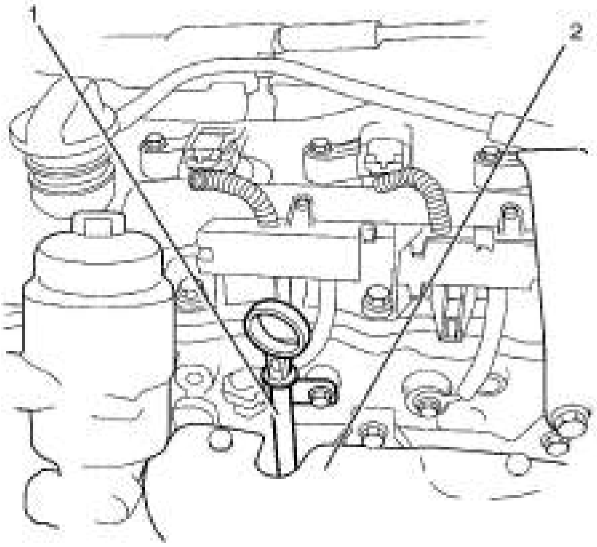
4. Remove the M8 oil filter adapter to cylinder block retaining bolts (3).
5. Remove the M10 oil filter adapter to cylinder head retaining bolt (2).
6. Remove the oil filter adapter (1).
7. Remove and discard the oil filter adapter gasket (4).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985172**

Oil Level Indicator and Tube Installation

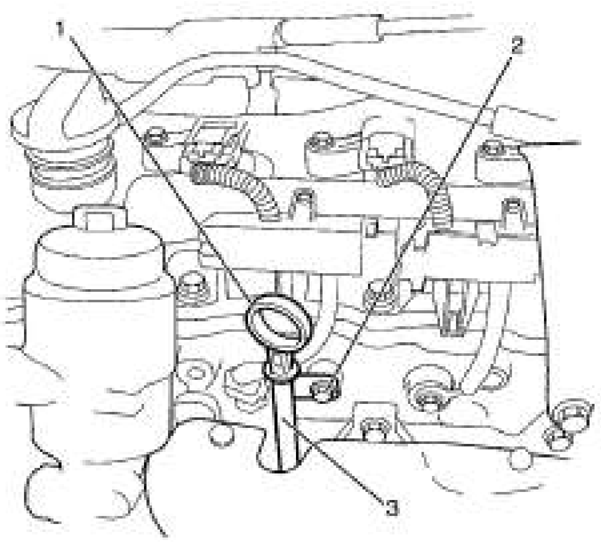


1. Install a NEW O-ring (2) on the oil level indicator tube (1).



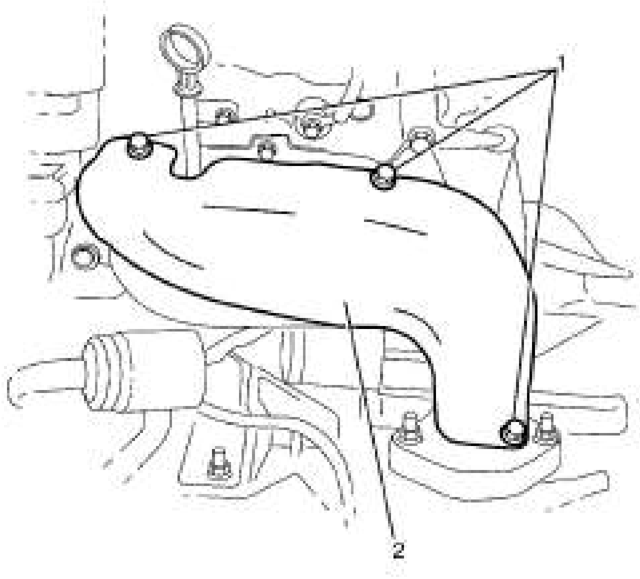
2. Install the oil level indicator and tube (1) by sliding the oil level indicator and tube (1) down through the exhaust manifold (2).

Notice: Refer to Fastener Notice in the Preface section.



3. Install the oil level indicator tube bracket to cylinder head retaining bolt (2).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).

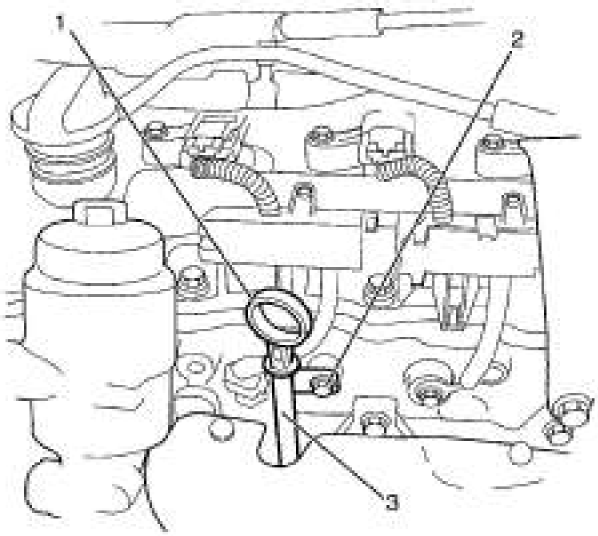


4. Install the exhaust manifold heat shield (2).
5. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

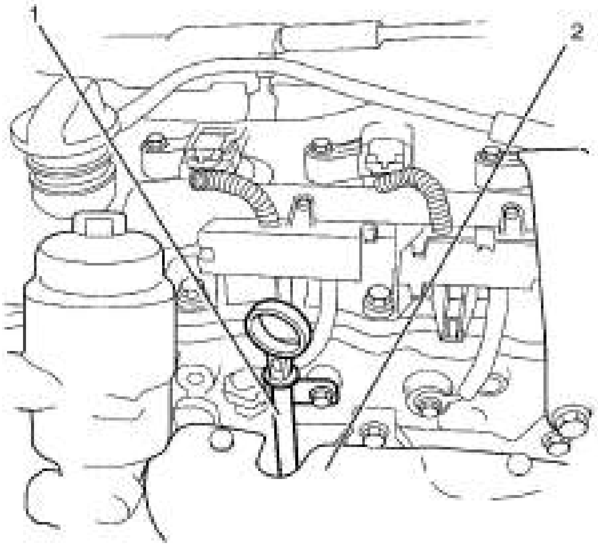
   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977572**

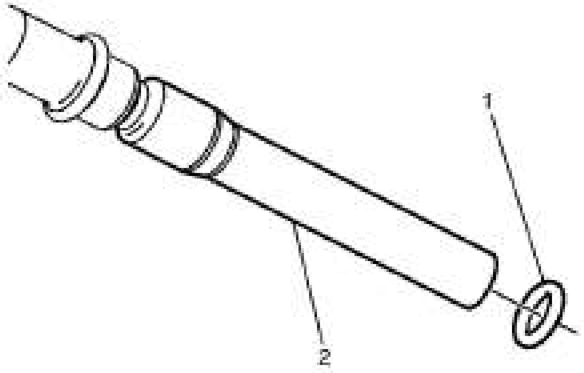
Oil Level Indicator and Tube Removal



1. Remove the oil level indicator tube bracket to cylinder head retaining bolt (2).
2. Remove the oil level indicator (1) from the oil level indicator tube (3).
3. Remove the knock sensor. Refer to Knock Sensor Replacement - Bank 2.

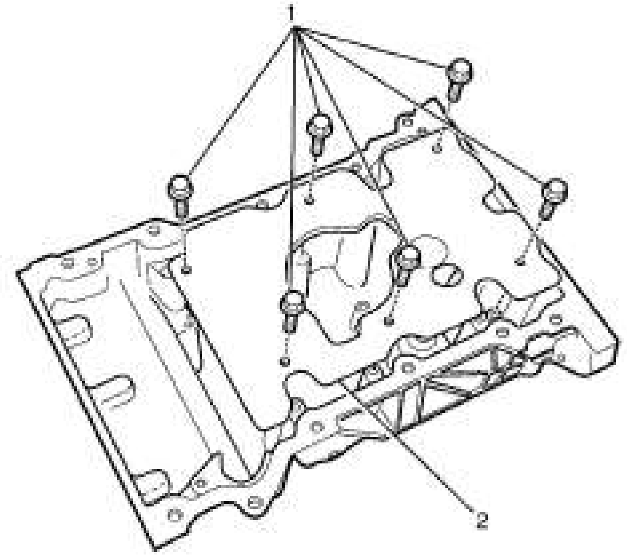


4. Remove the oil level indicator tube (1) up through the exhaust manifold (2).



5. Remove and discard the O-ring (1) from the oil level indicator tube (2) if damaged.

Oil Pan Assemble

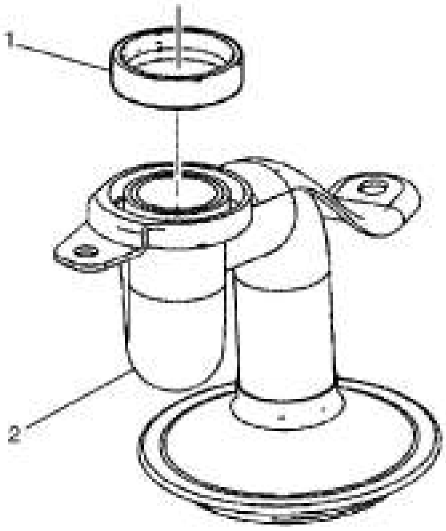


1. Install the oil pan baffle (2).

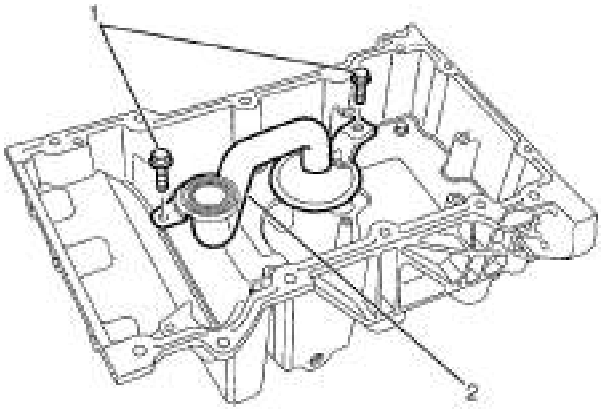
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the oil pan baffle to oil pan retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

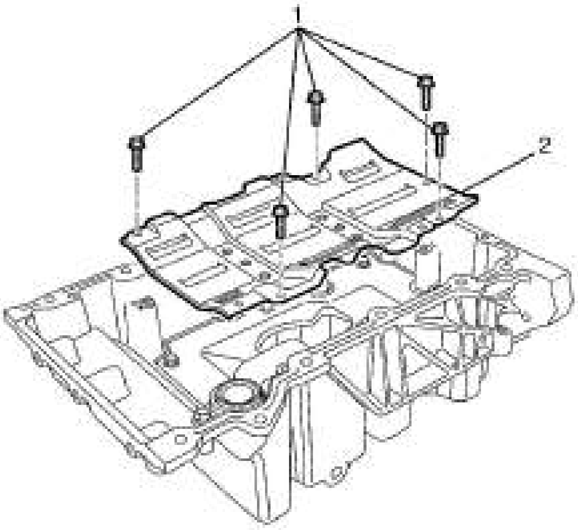


3. Install a NEW oil suction pipe seal (1) onto the oil suction pipe (2).



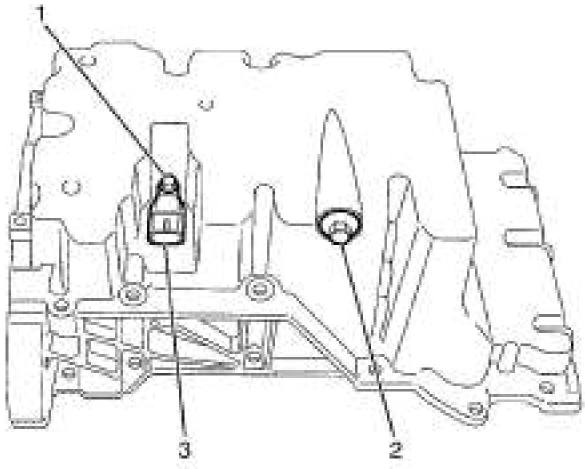
4. Install the oil suction pipe (2).
5. Install the oil suction pipe to oil pan retaining bolts (1).

Tighten
Tighten the bolts to 10 N·m (89 lb in).



6. Install the oil pan scraper (2).
7. Install the oil pan scraper to oil pan retaining bolts (1).

Tighten
Tighten the oil pan scraper bolts to 10 N·m (89 lb in).



8. Install the oil pan drain plug (2).

   Tighten
   Tighten the oil pan drain plug to 20 N·m (15 lb ft).

9. Install the oil level sensor (3).
10. Install the oil level sensor to oil pan retaining bolt (1).

    Tighten
    Tighten the bolt to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1996245**

Oil Pan Cleaning and Inspection

Tools Required

J 28410 Gasket Remover

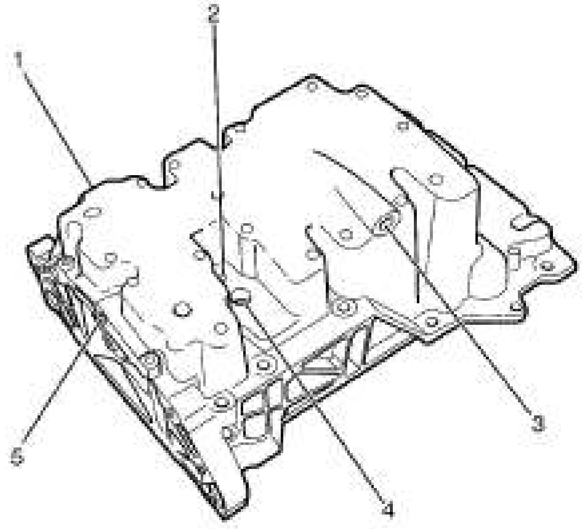
Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant using J 28410
2. Clean the oil pan and oil pan components in solvent.
3. Clean out any debris from the bolt holes.

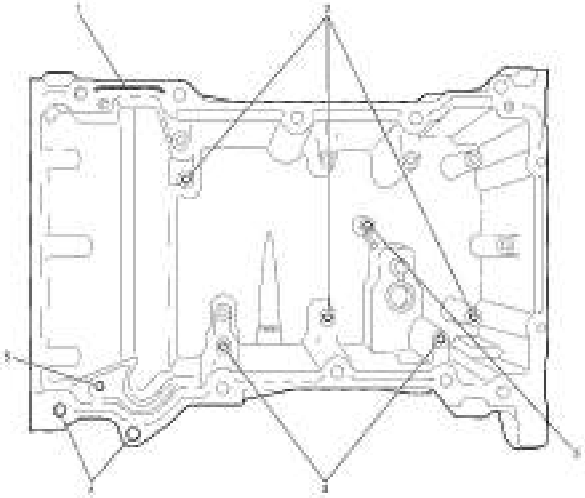
   Caution: Refer to Safety Glasses Caution in the Preface section.

4. Dry the oil pan and oil pan components with compressed air.

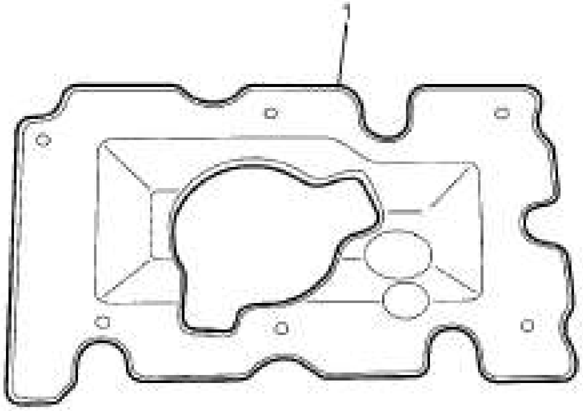
Inspection Procedure



1. Inspect the exterior of the oil pan for the following conditions:
   - Damage to the drain plug or drain plug hole (3).
   - Damage to the transmission mounting bosses (5).
   - Damage to the oil level/condition sensor bolt hole threads (2).
   - Damage to the oil level/condition sensor hole (4).
   - Dents or damage to the exterior (1).

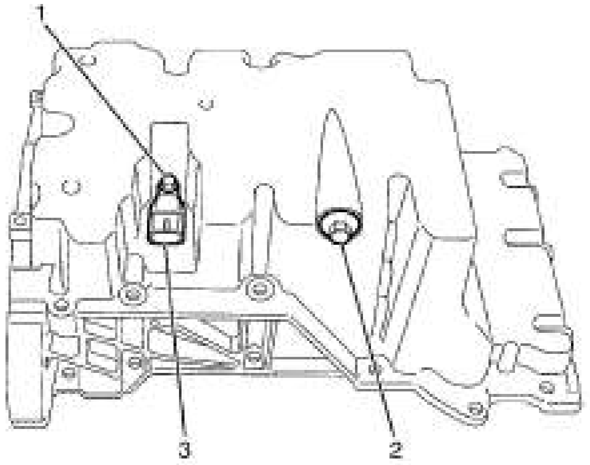


2. Inspect the interior of the oil pan for the following conditions:
   - Gouges or damage to the oil pan sealing surfaces (1).
   - Damage to the oil pan baffle mounting bosses (2).
   - Damage to the bolt holes (3).
   - Damage to the oil suction pipe mounting bosses (4).
   - Damage to the oil pan scraper mounting bosses (5).
3. Inspect the oil pan scraper for damage.

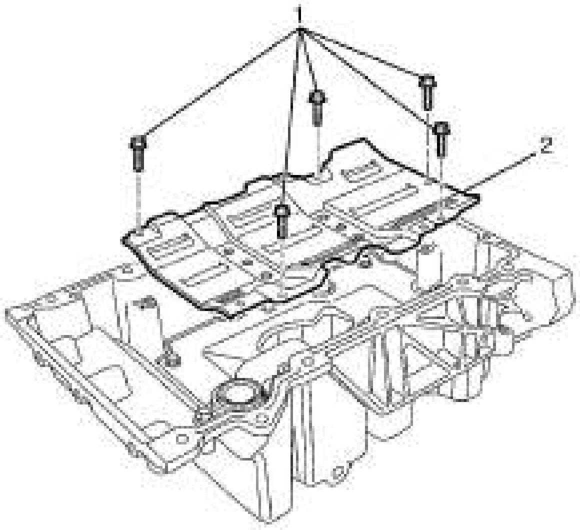


4. Inspect the oil pan baffle (1) for damage.
5. Repair or replace the oil pan and/or oil pan components as necessary.

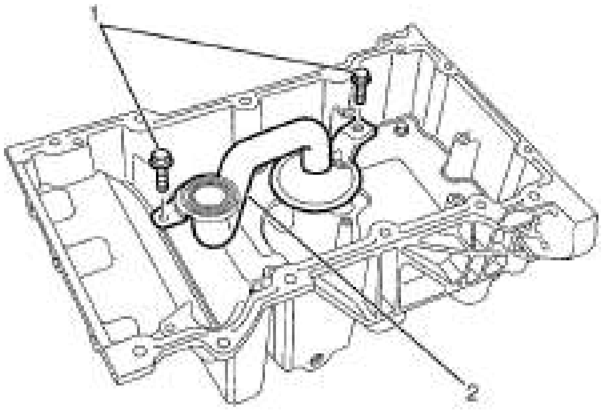
Oil Pan Disassemble



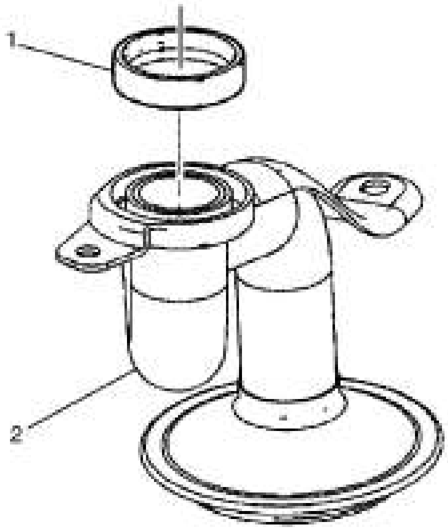
1. Remove the oil level sensor to oil pan retaining bolt (1).
2. Remove the oil level sensor (3).
3. Remove the oil pan drain plug (2).



4. Remove the oil pan scraper to oil pan retaining bolts (1).
5. Remove the oil pan scraper (2).



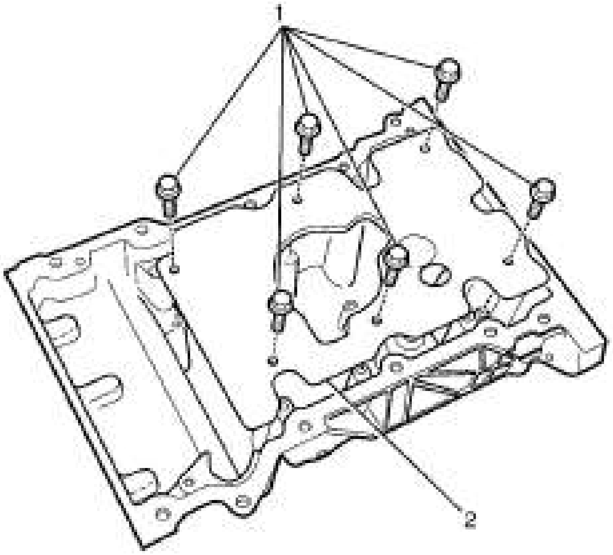
6. Remove the oil suction pipe to oil pan retaining bolts (1).
7. Remove the oil suction pipe (2).



Important: The oil suction pipe seal (1) is a single use component and must be discarded whenever the oil suction pipe (2) is removed.

8. Remove the oil suction pipe seal (1) from the oil suction pipe (2).

   Discard the oil suction pipe seal (1).



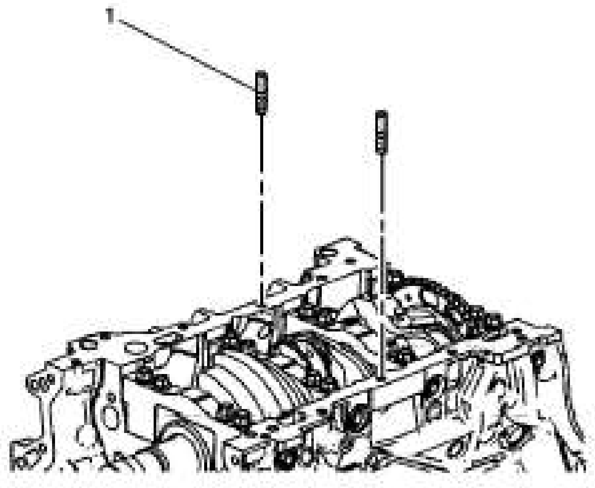
9. Remove the oil pan baffle to oil pan retaining bolts (1).
10. Remove the oil pan baffle (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995347

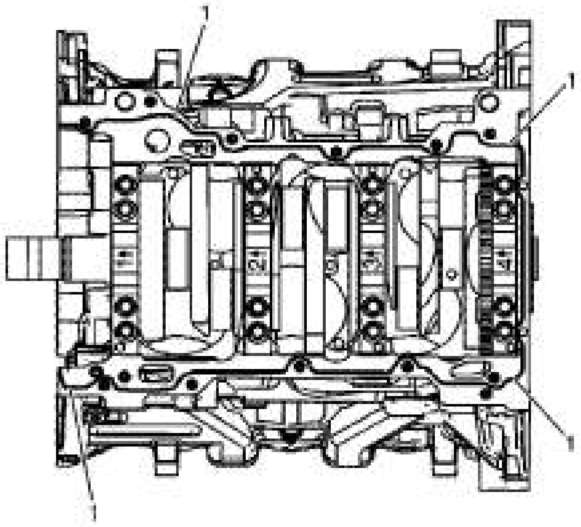
Oil Pan Installation

Tools Required

EN 46109 Guide Pin Set

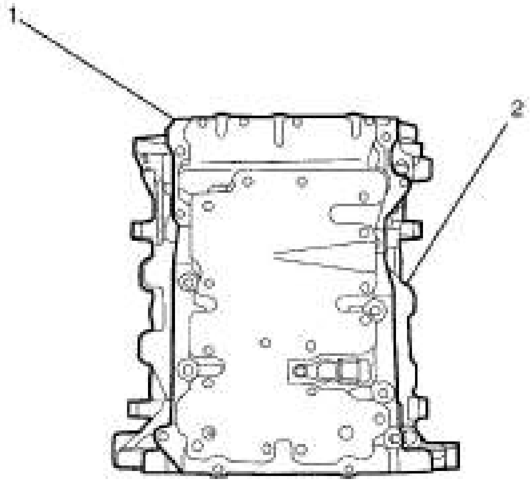


1. Install the 8 mm (0.315 in) guides from the EN 46109 (1) into the center oil pan rail bolt hole on each side of the cylinder block.

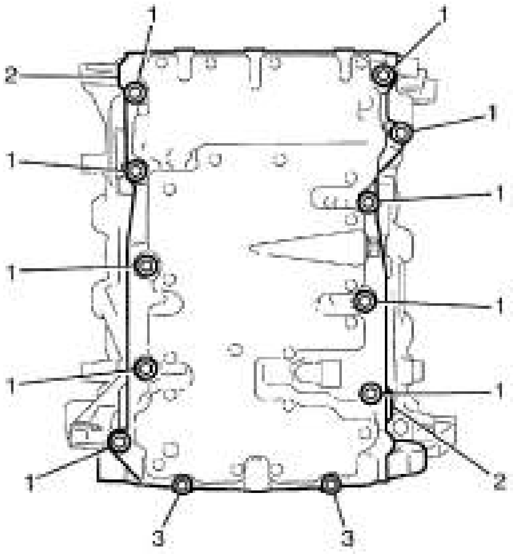


2. Place a 3 mm (0.118 in) bead of RTV sealant (1) on the block pan rail and the crankshaft

rear oil seal housing.

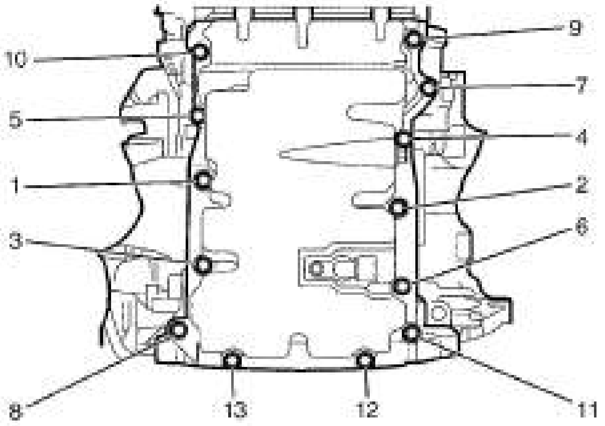


3. Position the oil pan (1) onto the block (2).
4. Remove the EN 46109 mm (0.315 in) guides from the cylinder block.



5. Loosely install the M8 oil pan to cylinder block retaining bolts (1).
6. Loosely install the M6 oil pan to crankshaft rear oil seal housing retaining bolts (3).

Notice: Refer to Fastener Notice in the Preface section.

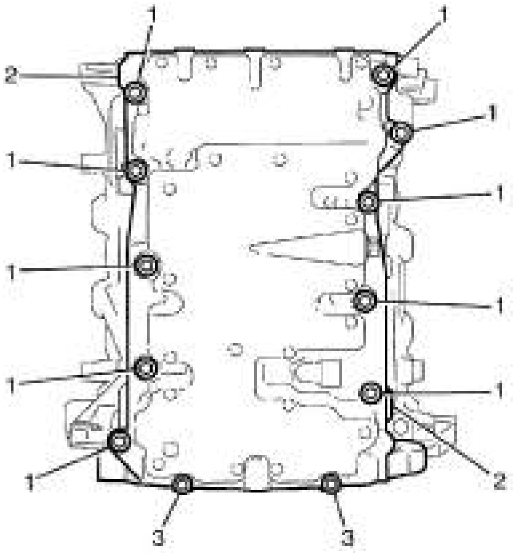


7. Install and tighten the M8 oil pan to cylinder block retaining bolts (1-11) and the M6 oil pan to crankshaft rear oil seal housing retaining bolts (12, 13) in the sequence shown.

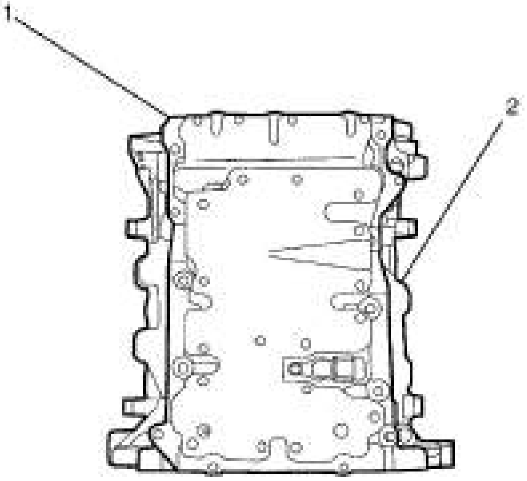
   Tighten

   1. Tighten the M8 bolts (1-11) to 23 N·m (17 lb ft).
   2. Tighten the M6 bolts (12, 13) to 10 N·m (89 lb in).

Oil Pan Removal

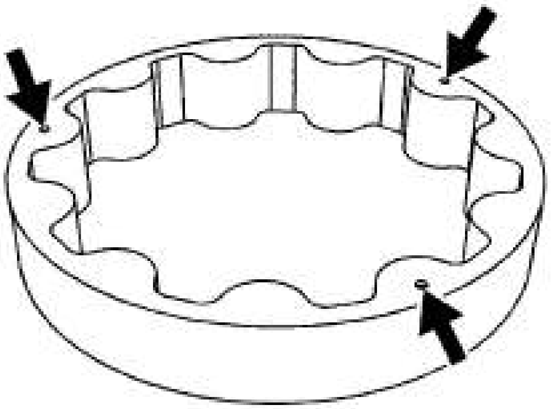


1. Remove the M8 oil pan to cylinder block retaining bolts (1).
2. Remove the M6 oil pan to crankshaft rear oil seal housing retaining bolts (3).
3. Using the pry points located at the edge of the oil pan (2) shear the RTV sealant.



4. Remove the oil pan (1) from the cylinder block (2).

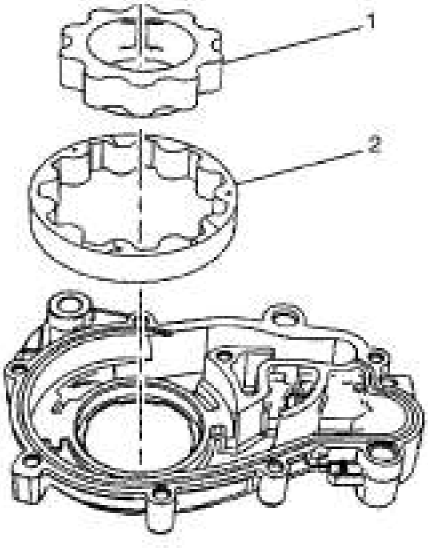
Oil Pump Assemble



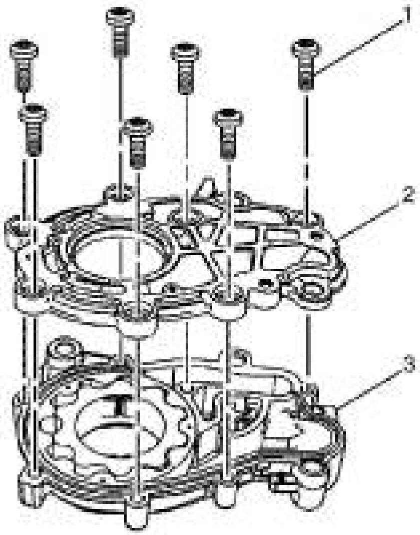
Important:

- There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must be replaced. DO NOT reuse a disassembled oil pump or a serviceable oil pump with a primary camshaft drive chain lower guide that needs to be replaced.
- The primary camshaft drive chain lower guide is not a serviceable component. If the primary camshaft drive chain lower guide must be replaced, the oil pump must be replaced.

1. The dimpled surface must be face-up in the pump body.



2. Install the inner oil pump drive gear (1) and the outer oil pump driven gear (2) in the pump cover in the same orientation as removed.

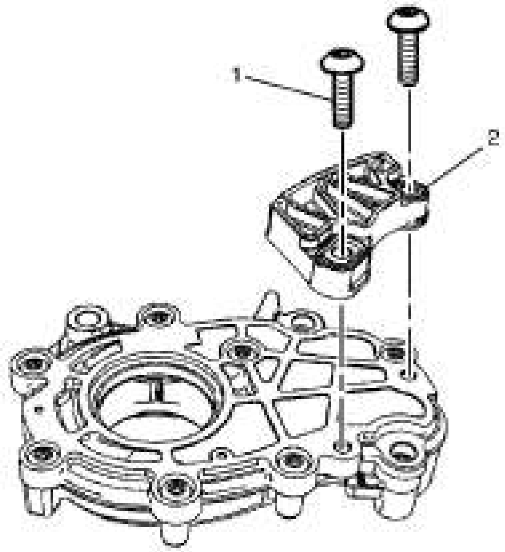


3. Install the oil pump cover (2) to the oil pump housing (3).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the oil pump cover to oil pump housing retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



Important: The primary camshaft drive chain lower guide is not a serviceable component. If the primary camshaft drive chain lower guide is to be reused, the primary camshaft drive chain lower guide is not to be removed from the oil pump cover. If the primary camshaft drive chain lower guide must be replaced, the oil pump must be replaced.

5. Install the primary camshaft drive chain lower guide (2).
6. Install the primary camshaft drive chain lower guide to oil pump retaining bolts (1).

Tighten
Tighten the bolts to 13 N·m (115 lb in).

Oil Pump Cleaning and Inspection

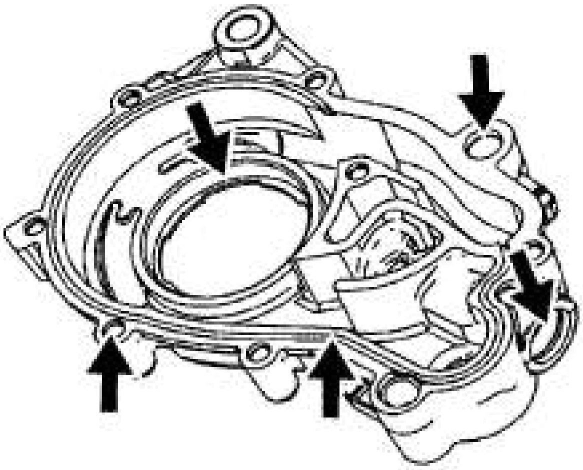
Cleaning Procedure

1. Clean the oil pump components with non-corrosive solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

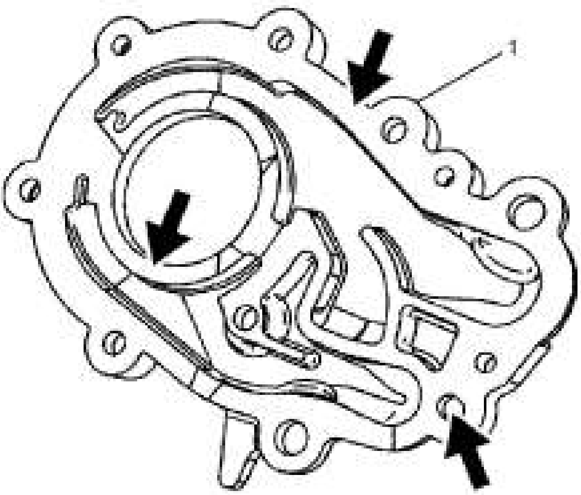
2. Dry the oil pump components with compressed air.

Inspection Procedure

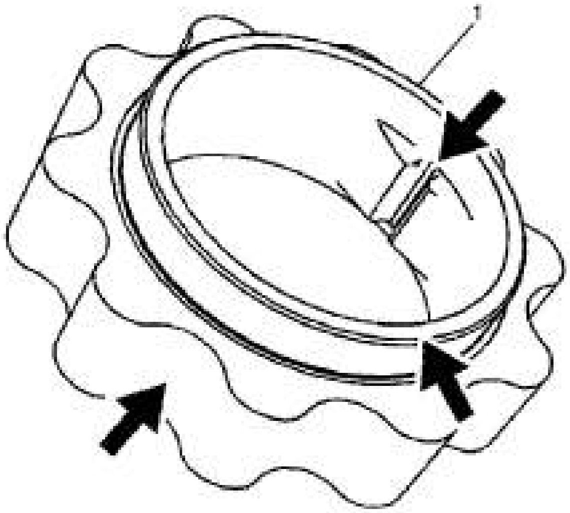


Important: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

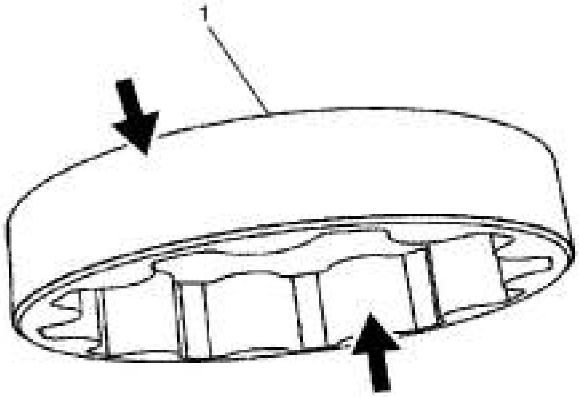
1. Inspect the oil pump housing for damage.



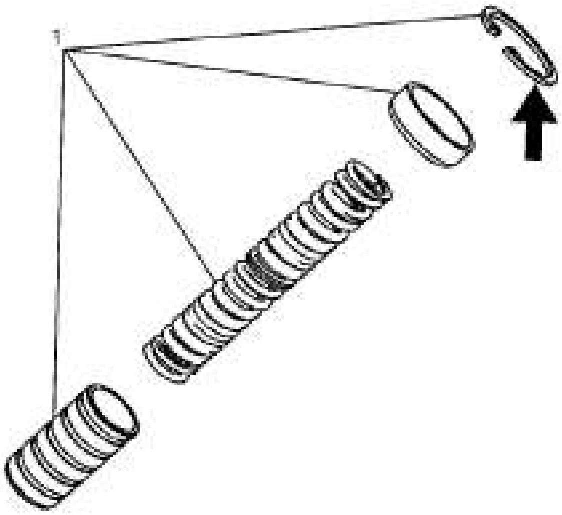
2. Inspect the oil pump cover (1) for damage.



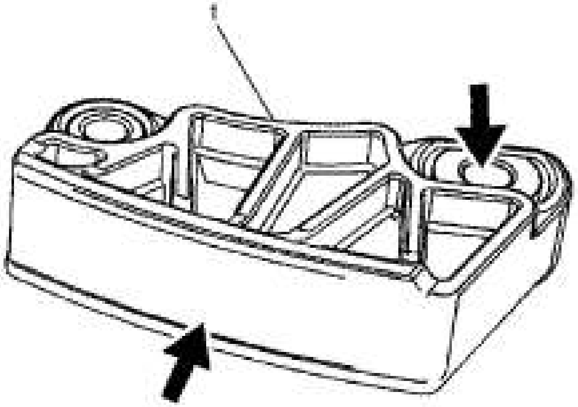
3. Inspect the inner drive gear (1) for damage. If inner diameter damage is found, ensure the crankshaft is also inspected.



4. Inspect the outer driven gear (1) for damage.



5. Inspect the oil pump relief valve components (1) for debris or damage.

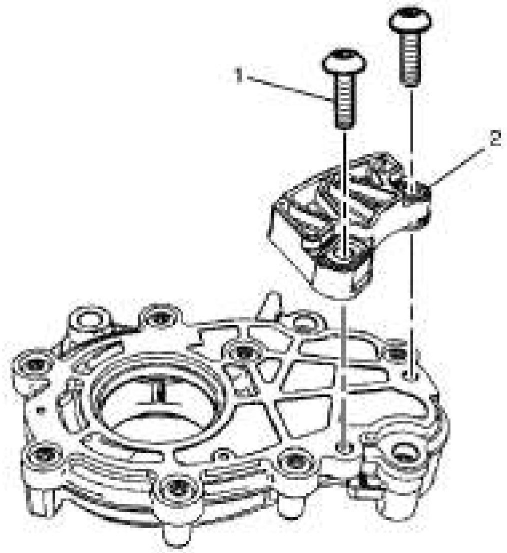


6. Inspect the primary camshaft drive chain lower guide (1) for damage. If replacement of the primary camshaft drive chain lower guide (1) is necessary, replace the entire oil pump assembly. The primary camshaft drive chain lower guide (1) is not serviceable separately.
7. If debris or damage is present within the oil pump, further inspection of all of the engine components is necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977542**

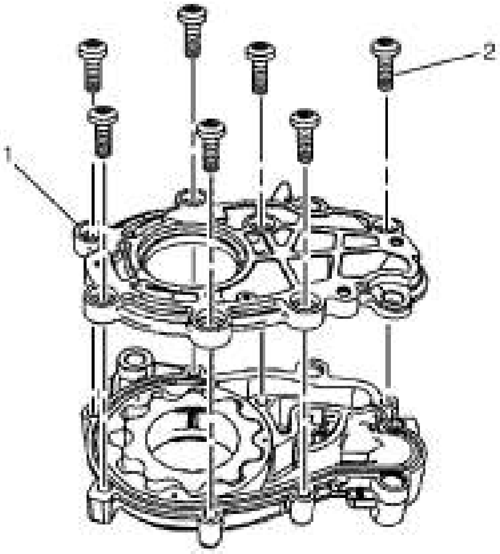
Oil Pump Disassemble

Important: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

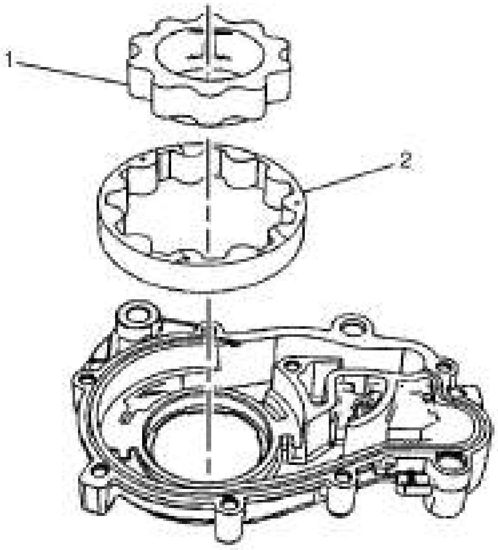


Important: The primary camshaft drive chain lower guide is not a serviceable component. If the primary camshaft drive chain lower guide is to be reused, the primary camshaft drive chain lower guide is not to be removed from the oil pump cover. If the primary camshaft drive chain lower guide must be replaced, the oil pump must be replaced.

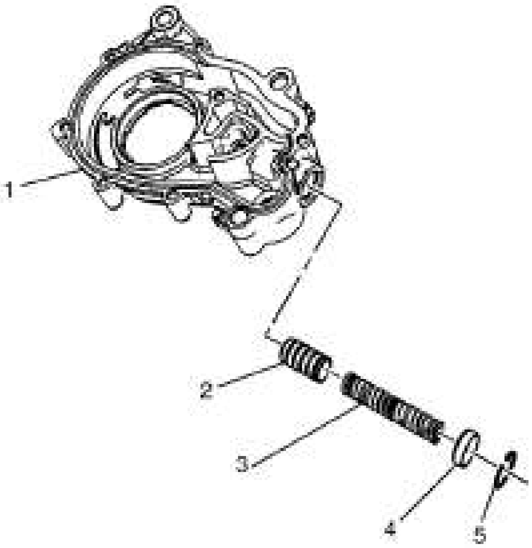
1. Remove the primary camshaft drive chain lower guide to oil pump retaining bolts (1).
2. Remove the primary camshaft drive chain lower guide (2).



3. Remove the oil pump cover to the oil pump housing retaining bolts (2).
4. Remove the oil pump cover (1).

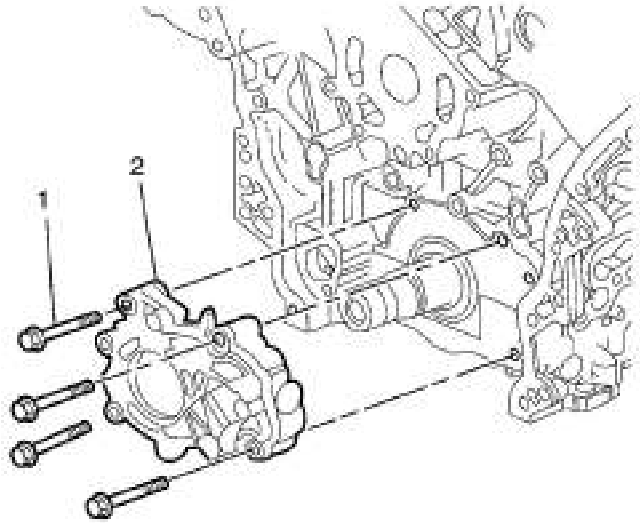


5. Remove the inner oil pump drive gear (1).
6. Remove the outer oil pump driven gear (2).



7. Remove the clip (5), holding the cap (4), for the oil relief valve components.
8. Remove the cap (4), spring (3) and plunger (2) from the oil pump housing (1).

Oil Pump Installation



1. Align the oil pump gerotor with the crankshaft flats and install the oil pump (2).
2. Align the oil pump (2) body mounting holes.

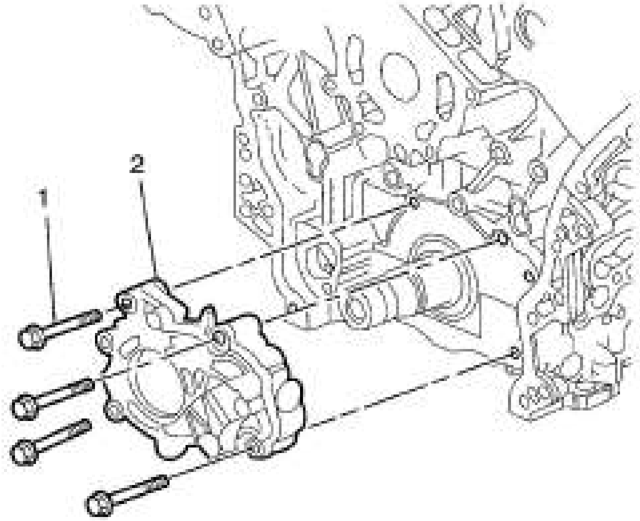
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the oil pump to cylinder block retaining bolts (1).

   Tighten
   Tighten bolts to 23 N·m (17 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977602**

Oil Pump Removal



1. Remove the oil pump to cylinder block retaining bolts (1).
2. Remove the oil pump (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977611**

Oil Pump Suction Pipe and Screen Cleaning and Inspection

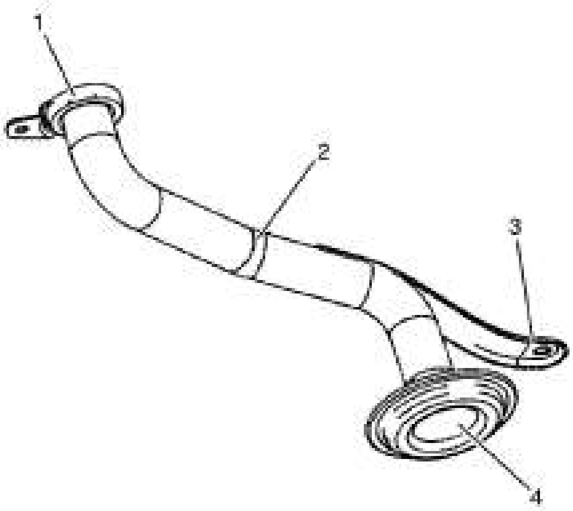
Cleaning Procedure

1. Clean the oil pump pipe and screen with solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the oil pump pipe and screen with compressed air.

Inspection Procedure



1. Inspect the mounting surface (1) for possible leakage paths.
2. Inspect the oil pump pipe tube (2) for cracks, imperfections and/or damage.
3. Inspect the oil pump pipe support bracket (3) for cracks or damage.
4. Inspect the oil pump screen (4) for blockage, foreign material, tears, cracks and/or damage.

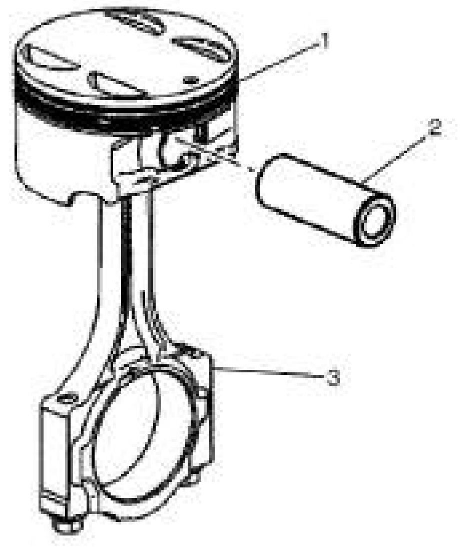
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977536**

Piston and Connecting Rod Assemble

Tools Required

- EN 46121 Connecting Rod Guide Pin Set
- EN-46745 Piston Pin Clip Remover/Installer

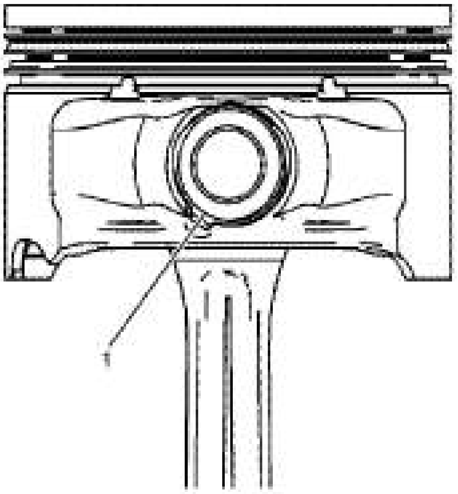
Piston and Piston Pin Installation Procedure



Important:

- The arrow located on top of the piston must point toward the front of the cylinder block.
- The connecting rod is non-directional and may be assembled/reassembled to the piston in either direction.

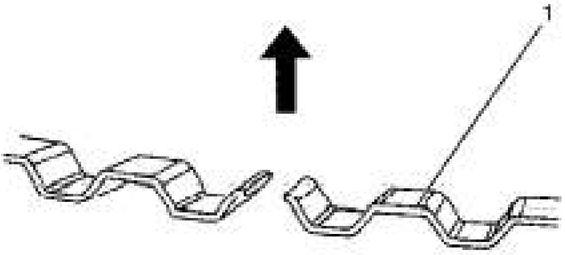
1. Lubricate the piston pin (2) bores in the piston (1) and the connecting rod (3) with clean engine oil.
2. Assemble the piston (1) and piston pin (2) to the connecting rod (3). Correctly orient the piston (1) when reusing a marked connecting rod (3).
3. Align the piston pin (2) bore with the connecting rod (1) pin bore.
4. Slide the piston pin (2) into the piston (1) and the connecting rod (3).



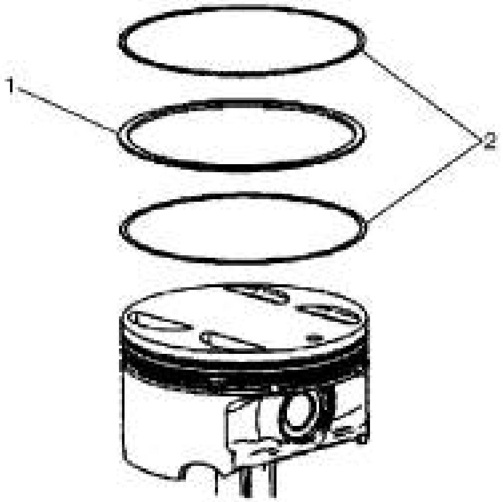
Important: New piston pin retainers must be used. Never reuse the piston pin retainers.

5. Install NEW piston pin retainers using the EN-46745 . Align the EN-46745 to the notch (1) in the piston.
6. Ensure that the piston pin retainers are fully seated in their grooves.
7. Repeat these procedures for the remaining pistons.

Piston Ring Installation Procedure



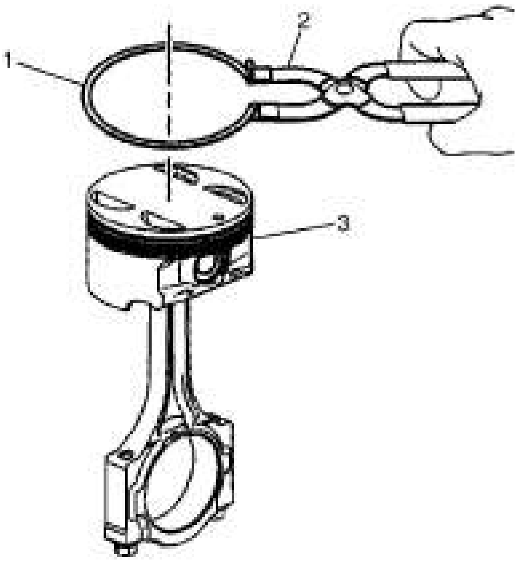
1. Correctly orient the oil control ring expander (1) as shown before installation. The ends of the oil control ring expander (1) must be facing toward the top of the piston.



2. Using a piston ring expander, install the oil control ring assembly using the following procedure:
   2.1. Install the expander ring (1).

   Important: Make sure that you DO NOT overexpand the piston ring. Overexpanding the piston rings will distort or crack the rings.

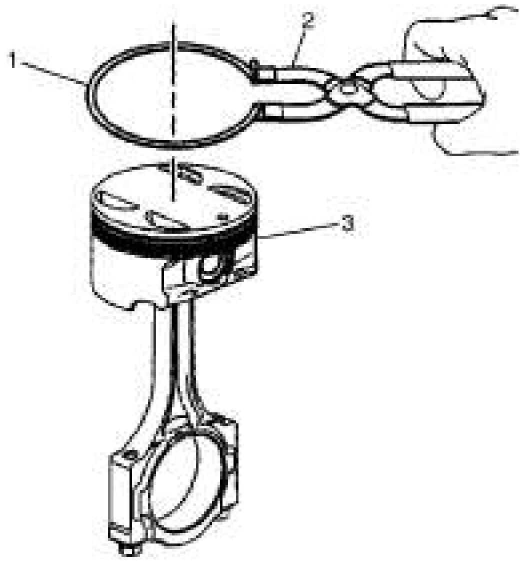
   2.2. Install the 2 oil scraper rings (2). Expand the rings only enough to clear the piston diameter.



Important: Make sure that you DO NOT overexpand the piston ring. Overexpanding the piston rings will distort or crack the rings.

Important: Install the second piston ring (1) onto the piston (3) using the ring expander (2).

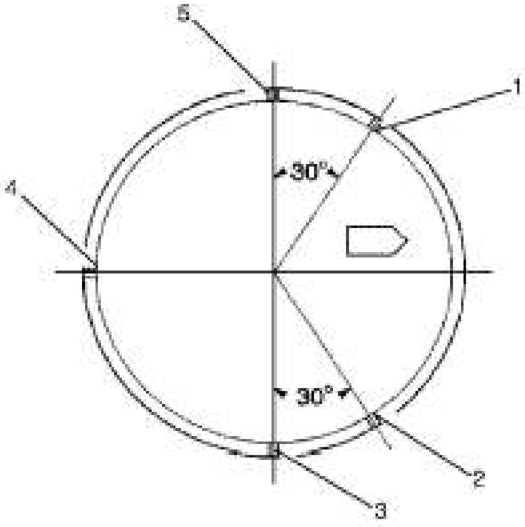
3. Install the second piston ring (1) onto the piston (3).



Important: Make sure that you DO NOT overexpand the piston ring. Overexpanding the piston rings will distort or crack the rings.

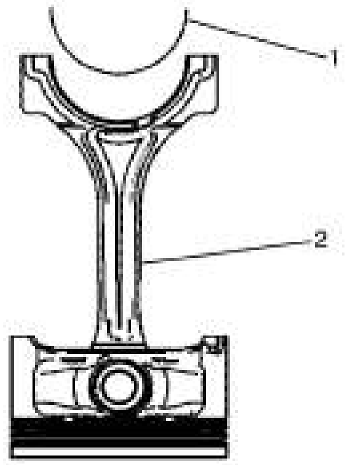
Important: Install the top piston ring (1) onto the piston (3) using the ring expander (2).

4. Install the top piston ring (1) onto the piston (3).



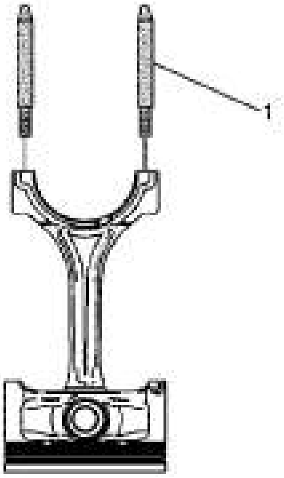
5. Once the rings are installed, set the ring gaps for the oil control, second and top ring as follows. Use the piston location arrow for reference.
    5.1. Lower oil control ring - position (1).
    5.2. Upper oil control ring - position (2).
    5.3. Top Ring - position (3).
    5.4. Oil control ring expander - position (4).
    5.5. Second ring - position (5).

Connecting Rod Bearing Installation Procedure

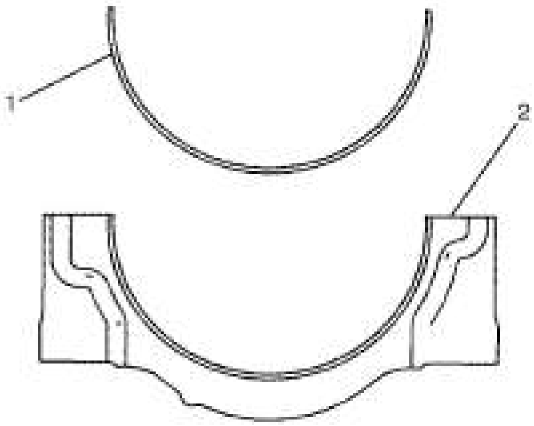


Important: If the connecting rod bearings (1) have been used in a running engine, you must replace them with NEW connecting rod bearings (1) for reassembly.

1. Clean the connecting rod (2) and the connecting rod cap bearing bore with a lint-free cloth.
2. Clean all the oil from behind the connecting rod bearing (1) halves.
3. Install new upper connecting rod bearings (1) into position. Roll the connecting rod bearings (1) into position so that the lock tang engages the alignment slot. The connecting rod bearings (1) must fit flush in the connecting rod (2).



4. Install the EN 46121 (1) into the connecting rod bolt holes.



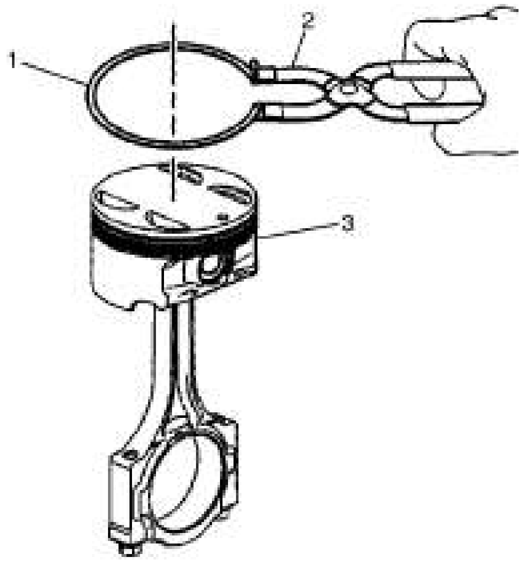
5. Install new lower connecting rod bearings (1) into position in the connecting rod cap (2). Roll the connecting rod bearings (1) into position so that the lock tang engages the alignment slot. The bearings must fit flush with the connecting rod cap (2).

Piston and Connecting Rod Disassemble

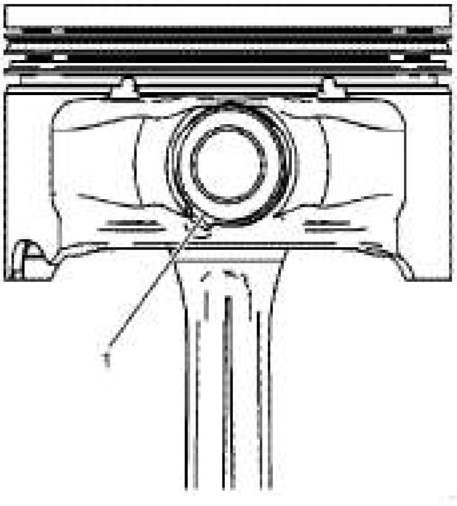
Tools Required

EN-46745 Piston Pin Clip Remover/Installer

> **Notice:** Refer to General Repair Instructions in the Preface section.



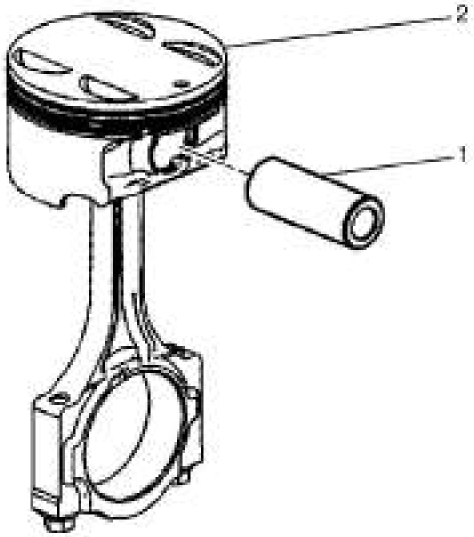
1. Remove the piston rings (2) from the piston (3) using a piston ring expander (1). Place each ring in a clean shop towel for storage.



Important:

- The connecting rod is non-directional and may be assembled/reassembled to the piston in either direction.
- DO NOT reuse the piston pin retainers.

2. Using the EN-46745 , remove the piston pin retainers by using the removal access notch (1) in the side of the piston. Discard the piston pin retainers.



3. Slide the piston pin (1) out of the piston (2). The piston will disconnect from the connecting rod.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1977535

Piston, Connecting Rod, and Bearing Cleaning and Inspection

Cleaning Procedure

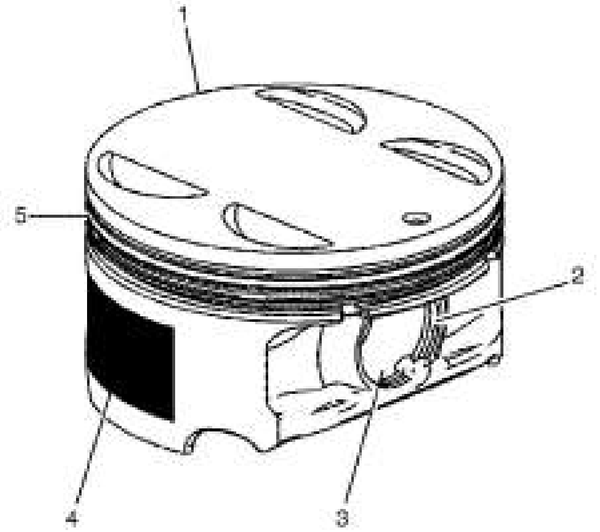
Important: DO NOT wire brush any part of the piston.

1. Clean the piston skirts and the pins with a cleaning solvent.
2. Clean the piston ring grooves with a groove cleaner. Ensure that the oil ring holes and slots are clean.

Caution: Refer to Safety Glasses Caution in the Preface section.

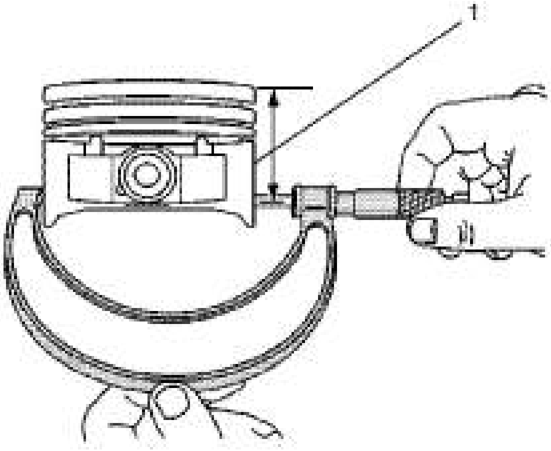
3. Dry the piston with compressed air.

Piston Inspection Procedure

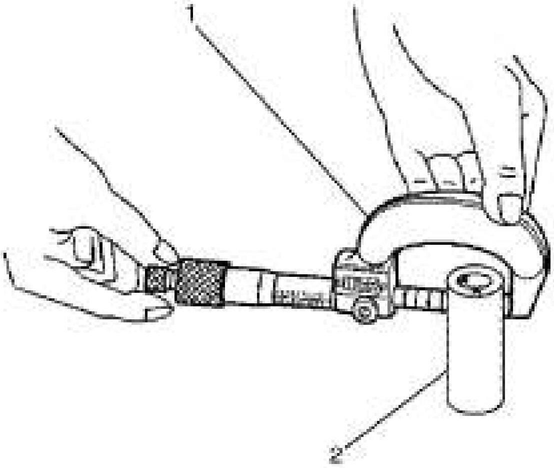


1. Inspect the pistons for the following conditions:
   - Cracked ring lands, skirts or pin bosses
   - Ring grooves for nicks, burrs that may cause binding (5)
   - Warped or worn ring lands (5)
   - Piston pin retainer grooves for burrs (2)
   - Eroded areas at the top of the piston (1)
   - Scuffed or damaged skirt coating (4)
   - Worn piston pin bores or worn piston pins (3)
2. Replace pistons that show any signs of damage or wear above acceptable tolerances.

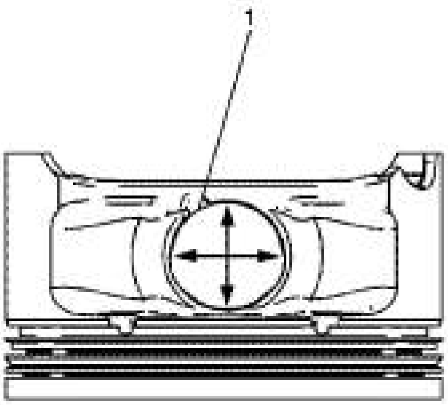
Piston Measurement Procedure



1. Measure piston width using the following procedure:
    1.1. Using an outside micrometer, measure the width of the piston at 30 mm (1.181 in) below the crown, top (1), at the thrust surfaces of the piston, perpendicular to the piston pin centerline.
    1.2. Compare the measurement of the piston to its original cylinder by subtracting the piston width from the cylinder diameter.
    1.3. Compare your results with the Engine Mechanical Specifications.
    1.4. If the clearance obtained through measurement is greater than the provided specifications and the cylinder bores are within specification, replace the piston.

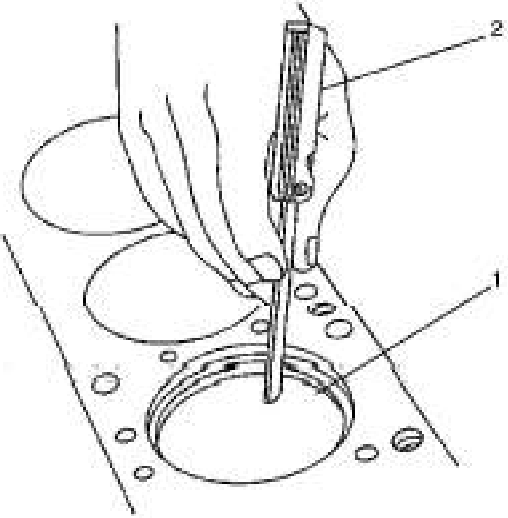


2. Measure the piston pin bore to piston pin (2) clearances using the following procedure:
    2.1. Piston pin bores and pins must be free of varnish or scuffing.
    2.2. Use an outside micrometer (1) to measure the piston pin in the piston contact areas.

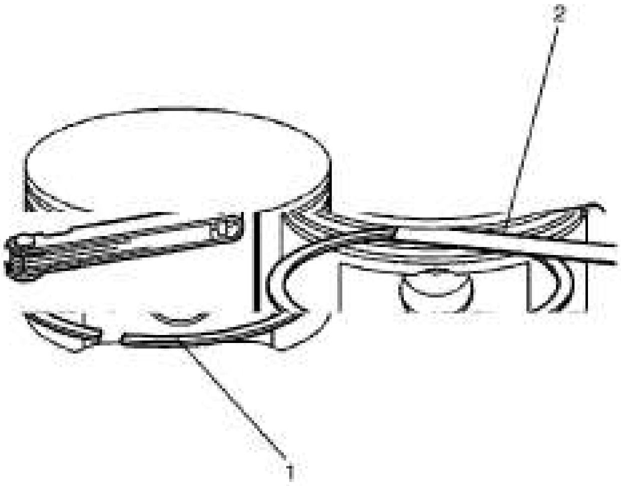


3. Using an inside micrometer, measure the piston pin bore (1). Compare your result with the piston pin diameter and piston pin to piston pin bore clearance listed in the Engine Mechanical Specifications.
4. If the clearance is above acceptable tolerances, determine which piece is out of specification and replace as necessary.
5. You must replace the piston if any of its dimensions are out of specification.
6. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Piston Ring Measurement Procedure



1. Measure the piston ring end gap using the following procedure:
   1.1. Place the piston ring (1) in the area of the bore where the piston ring will travel approximately 25 mm (1 in) down from the deck surface. Make sure that the piston ring (1) is square with the cylinder bore by positioning the piston ring (1) with the piston head.
   1.2. Measure the end gap of the piston ring (1) with feeler gauges (2). Refer to Engine Mechanical Specifications.
   1.3. If the clearance exceeds the provided specifications, the piston rings (1) must be replaced.
   1.4. Repeat the procedure for all the piston rings (1).



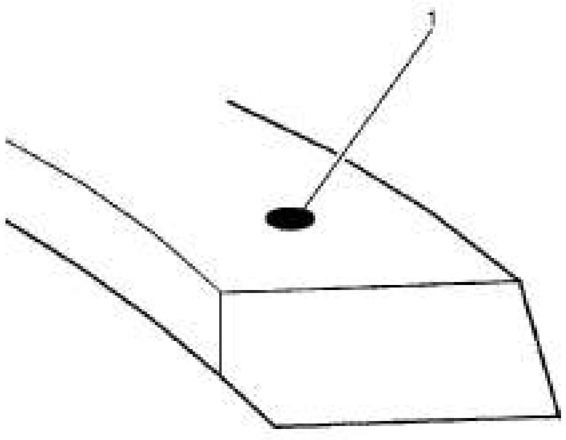
2. Measure the piston ring (1) side clearance using the following procedure:

2.1. Roll the piston ring (1) entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring (1), replace the piston ring (1).

2.2. With the piston ring (1) on the piston, use feeler gauges (2) to check clearance at multiple locations.

2.3. Compare the measurements with piston ring side clearance listed in the Engine Mechanical Specifications.

2.4. If the clearance is greater than specifications, replace the piston ring (1).



3. There is a locating dimple (1) on the compression rings near the end for identification. Install the compression rings with the dimple facing up.
4. If the new ring does not reduce the clearance to the correct specification, install a new piston.
5. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

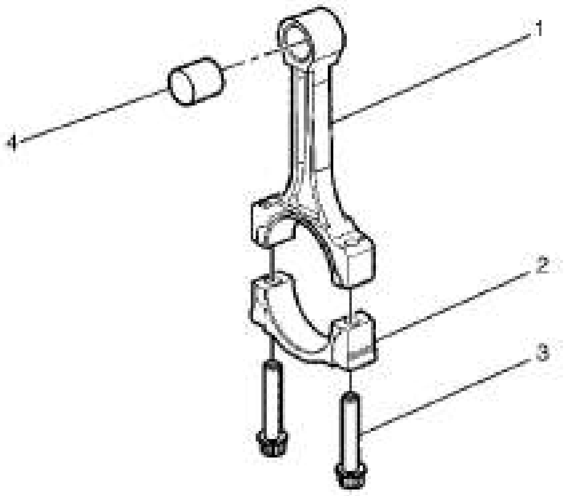
Connecting Rod Cleaning Procedure

1. Clean the connecting rods in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the connecting rod using compressed air.
3. Remove the connecting rod cap and clean the threads.
4. Remove the connecting rod bearing and discard. Never reuse a connecting rod bearing used in a running engine.

Connecting Rod Visual Inspection Procedure



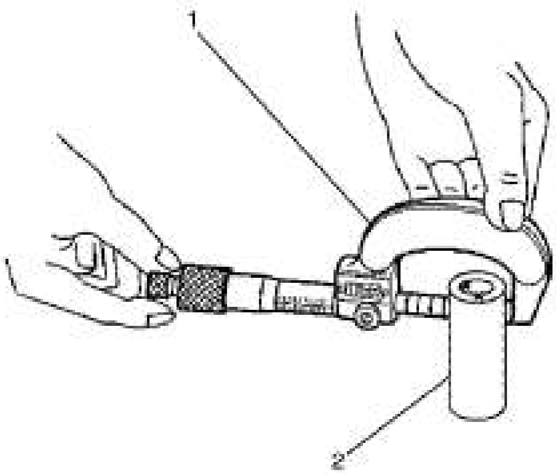
1. Inspect the piston pin bushing (4) for scoring or damage.
2. Inspect the connecting rod beam (1) for twisting or bending.
3. Inspect the rod cap (2) for any nicks or damage caused by possible interference.
4. Inspect for scratches or abrasion on the rod bearing seating surface.

   Important: DO NOT scrape the rod or rod cap.

5. If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper.
6. Inspect the connecting rod bolts (3) for damage or stretching.

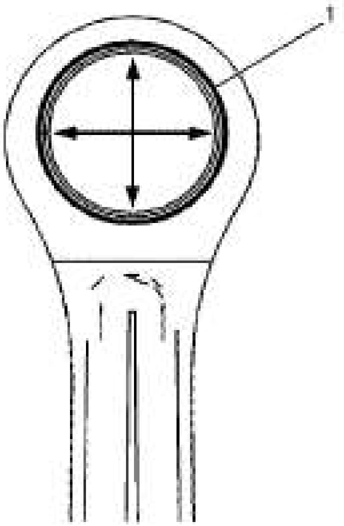
Connecting Rod Measurement Procedure

Piston Pin End



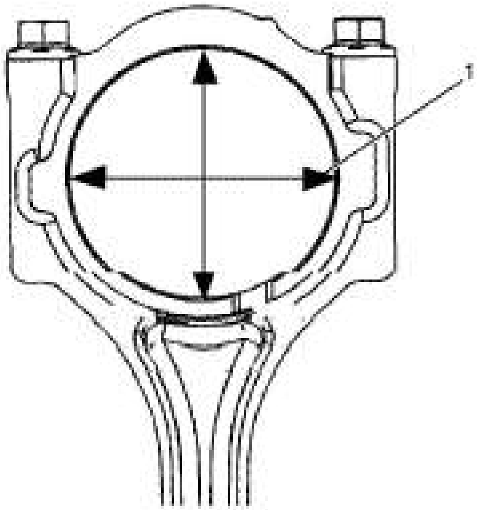
Important: Measurements of all components should be taken with the components at normal room temperature.

1. Using an outside micrometer (1), take 2 measurements of the piston pin (2) in the area of the connecting rod contact.



2. Using an inside micrometer, measure the connecting rod piston pin bore (1).
3. Subtract the piston pin diameter from the piston pin bore (1).
4. Compare the clearance measurements with the Engine Mechanical Specifications.
5. If the clearance is above acceptable tolerances, replace the piston pin. If a new pin does not resolve the clearance condition, replace the connecting rod.

Connecting Rod Crankshaft Bearing End

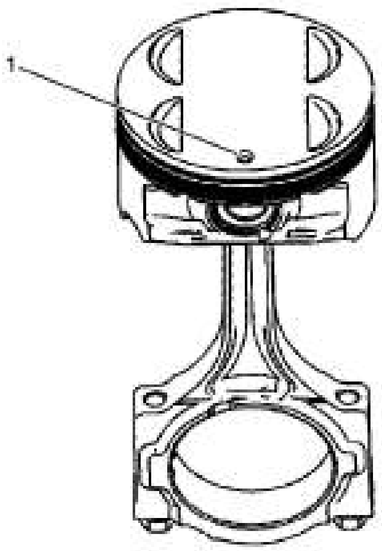


Important: Measurements of all components should be taken with the components at normal room temperature.

1. Using an inside micrometer, measure the connecting rod crankshaft bearing bore (1).
2. Compare the bore measurements with the Engine Mechanical Specifications.
3. Replace the connecting rod if the connecting rod crankshaft bearing bore (1) is out of specifications. DO NOT recondition the connecting rod.

Piston, Connecting Rod, and Bearing Installation

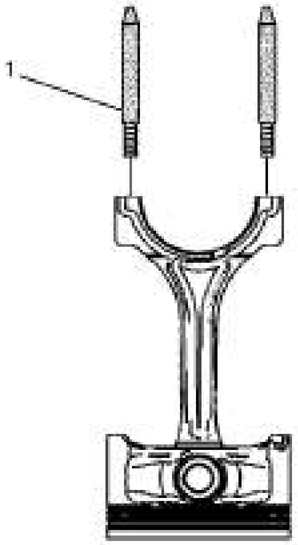
Piston and Connecting Rod Assembly Procedure



1. Liberally lubricate the cylinder walls, piston rings and piston skirts with engine oil.

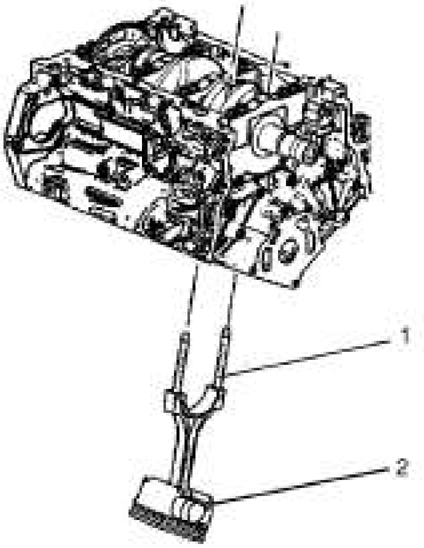
   Important: The piston is directional and must be installed in the cylinder block in the correct direction.

2. Select the correctly numbered piston/connecting rod assembly for the cylinder. A dot (1) showing proper piston orientation is located on the top of the piston.



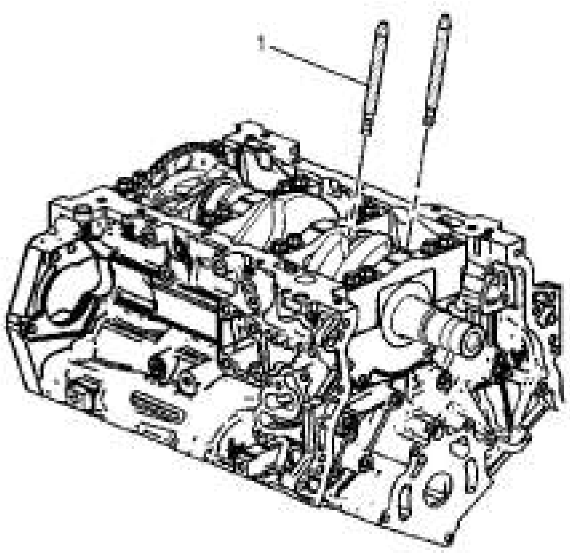
Important: If the connecting rod bearings have been used in a running engine, you must replace them with NEW connecting rod bearings for reassembly.

3. Install the connecting rod bearing into the connecting rod.
4. Install the EN 46121 (1) into the connecting rod bolt holes.
5. Compress the piston rings using a commercially available ring compressor.



Important: Extreme care must be used when installing the piston (2) and connecting rod in order to be sure the rod does not scrape or nick the cylinder bore, the oil jets, or the crankshaft surfaces.

6. Using both hands, slowly guide the piston (2) and connecting rod assembly into the cylinder from the top and bottom of the cylinder. DO NOT allow the connecting rod to contact the cylinder wall.
7. When the ring compressor contacts the deck surface, gently tap the piston (2) into the cylinder using the handle end of a dead-blow hammer. Guide the connecting rod onto the crankshaft bearing journal using the EN 46121 (1) while gently tapping the piston (2) into the cylinder with a soft-blow hammer.



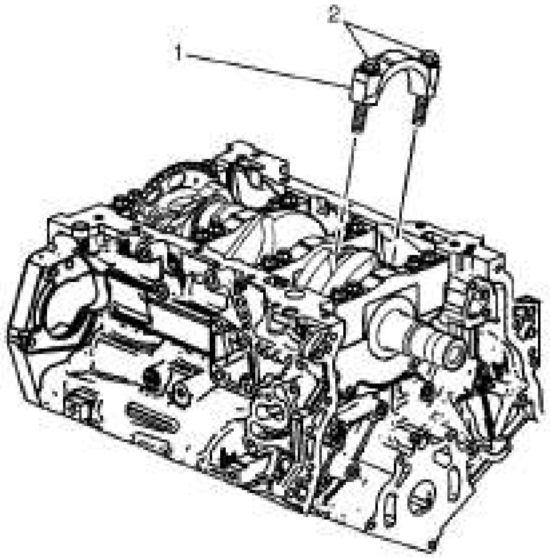
8. Remove the EN 46121 (1) from the connecting rod bolt holes.

Connecting Rod Bearing Clearance Measurement Procedure - Using Plastic Gaging

Important: Connecting rod bearings that have been run in an engine should NEVER be reused.

Important: Prior to final assembly it is the clearance of the new connecting rod bearings must be checked.

1. Place a length of fresh, room temperature plastic gauging material all the way across the connecting rod bearing journal.
2. Install the connecting rod bearing into the connecting rod cap.



Important: The connecting rod is non-directional therefore the connecting rod bearing lock tangs can face inboard or outboard.

3. Install the connecting rod end cap (1) on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the connecting rod.

   Notice: Refer to Fastener Notice in the Preface section.

   Notice: Refer to General Repair Instructions in the Preface section.

   Important: Reuse the old connecting rod bolts (2) ONLY for measuring the connecting rod bearing clearance.

4. Install the connecting rod bolts (2) into the connecting rod cap (1).

   Tighten
   Tighten the connecting rod bolts to 30 N·m (22 lb ft).

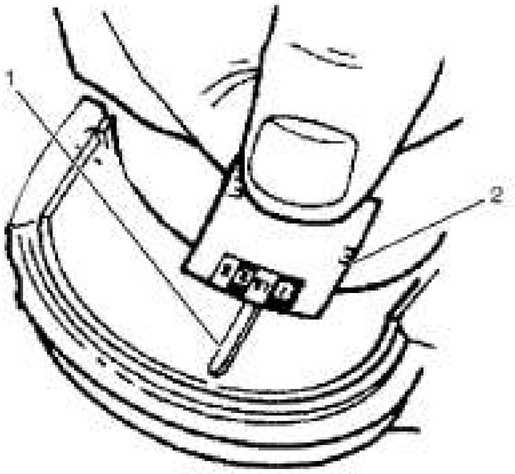
5. Loosen the connecting rod bolts (2) until the torque reading is zero.
6. Re-tighten the connecting rod bolts (2).
   6.1. First Pass

   Tighten
   Tighten the connecting rod bolts to 25 N·m (18 lb ft).

   6.2. Final Pass

   Tighten
   Tighten the connecting rod bolts an additional 110 degrees using the J 45059 .

7. Allow the assembly to sit for at least 2 minutes.
8. Remove the connecting rod cap bolts (2).
9. Remove the connecting rod cap (1).

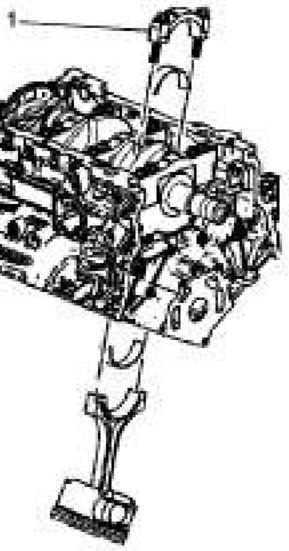


10. Determine the connecting rod bearing clearance by comparing the width of the flattened plastic gauging material (1) at its widest point with the graduation on the gauging material container (2).
11. Compare your measurements with the engine mechanical specifications. Refer to Engine Mechanical Specifications. If the new bearings DO NOT provide the proper crankshaft to connecting rod bearing clearance, inspect the following:
    - 11.1. Re-measure the crankshaft connecting rod journals for the correct specified size and ensure the proper new bearings are being installed. If the crankshaft connecting rod journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.
    - 11.2. Re-measure the connecting rod bearing bore diameter to ensure proper size. The connecting rod is not machinable and the connecting rod must be replaced if out of specification.
12. Clean the plastic gaging material from the connecting rod bearing journals using a soft lint-free cloth.

Connecting Rod Final Assembly Procedure

1. Guide the connecting rod away from the crankshaft connecting rod journal in order to lubricate the crankshaft connecting rod bearing journal.
2. Apply a liberal amount of clean engine oil to the crankshaft connecting rod bearing journal.
3. Guide the connecting rod to the crankshaft connecting rod journal.
4. Install the connecting rod end cap on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the rod.

   Notice: Refer to Fastener Notice in the Preface section.



Important: DO NOT reuse the old connecting rod bolts.

5. Install the NEW connecting rod bolts into the connecting rod cap (1).

   Tighten
   Tighten the NEW connecting rod bolts to 30 N·m (22 lb ft).

6. Loosen the connecting rod bolts until the torque reading is zero.
7. Re-tighten the connecting rod bolts.
   7.1. First Pass

   Tighten
   Tighten the connecting rod bolts to 25 N·m (18 lb ft).

   7.2. Final Pass

   Tighten
   Tighten the connecting rod bolts an additional 110 degrees using the J 45059 .

8. During and after installation, ensure each piston is positioned properly in the correct cylinder. The locating arrow on the top of each piston must be pointing toward the front of the cylinder block.
9. Repeat these procedures for the remaining piston/connecting rod assemblies using the EN 46111 in order to rotate the crankshaft.

Piston, Connecting Rod, and Bearing Removal

Tools Required

EN 46121 Connecting Rod Guide Pin Set

Important:

- An arrow/dot showing correct piston orientation is located on the top of the piston.
- If the connecting rod bearings have been used in a running engine, you must replace them with NEW connecting rod bearings for reassembly.

1. Before removing the connecting rods, check the connecting rod side clearance using the following procedure:
    1.1. Tap the connecting rod to one end of the crankshaft journal with a dead-blow or wooden hammer.

    1.2. Using feeler gages, measure the clearance between the crankshaft counterweight and the connecting rod.

    1.3. The connecting rod side clearance should not exceed specifications. Refer to Engine Mechanical Specifications .

    1.4. If the end play exceeds the specified limits, measure the width of the crankpin end of the connecting rod. Refer to Piston, Connecting Rod, and Bearing Cleaning and Inspection .

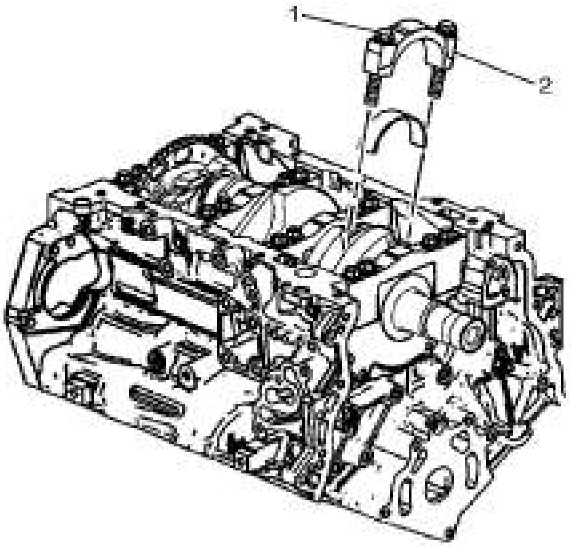
    1.5. If the connecting rod width is significantly smaller than specified and extreme wear is present on the side of the connecting rod, replace the connecting rod.

    1.6. If the connecting rod width is within specification and scoring above acceptable tolerances is present on the crankshaft journals, replace the crankshaft.
2. Using a marker, number each piston face. Draw an arrow along the centerline of the piston pointing toward the front of the cylinder block.

   Notice: Refer to General Repair Instructions in the Preface section.

3. Mark the cylinder number on the connecting rod and the connecting rod cap with a scribe, paint stick or permanent marker.

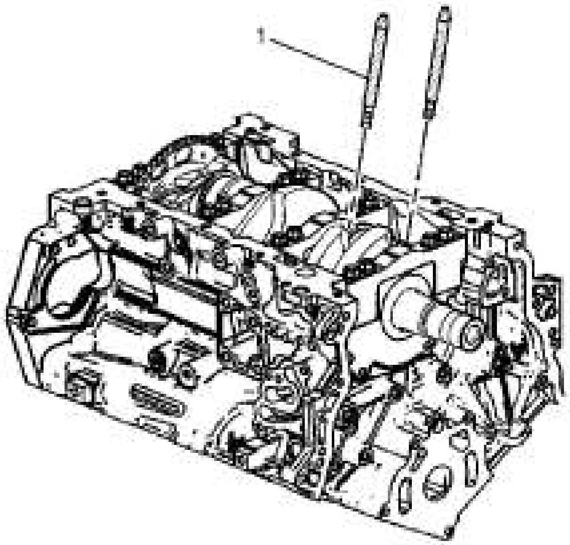
   Notice: Refer to General Repair Instructions in the Preface section.



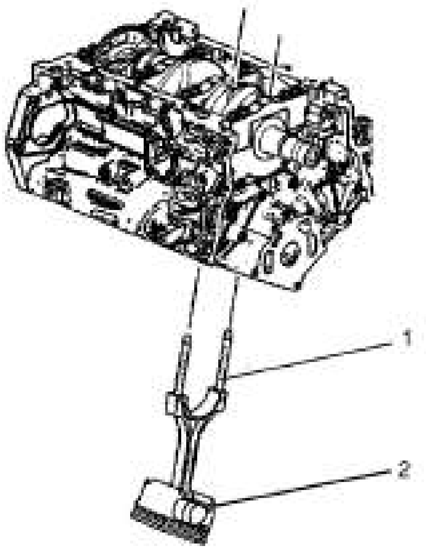
4. Remove the connecting rod bolts (1).

   Important: The connecting rod caps (2) must remain with the original connecting rod.

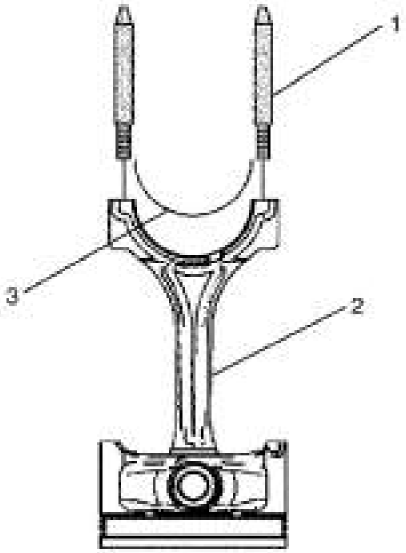
5. Remove the connecting rod cap (2).



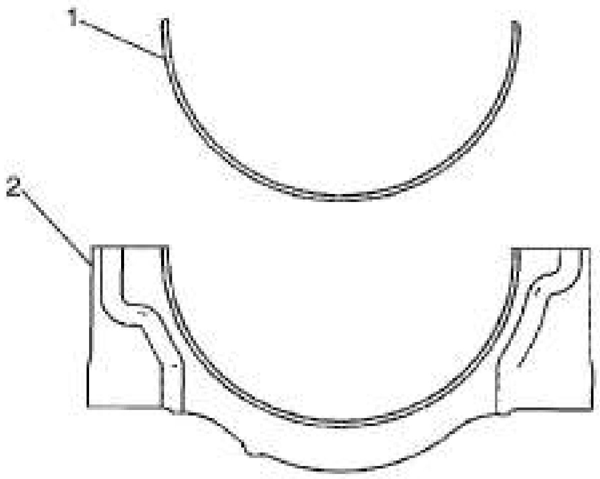
6. Install the EN 46121 (1) into the connecting rod bolt holes.



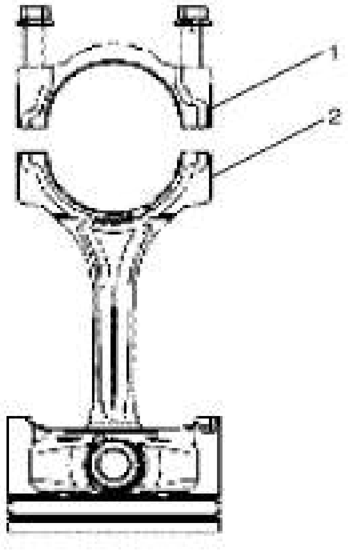
7. Using the EN 46121 1 (1), push the connecting rod and piston assembly (2) through the top of the cylinder. DO NOT scratch the crankshaft journal or cylinder wall and DO NOT damage the oil jets when removing the connecting rod and piston assembly (2).



8. Remove the EN 46121 (1) from the connecting rod bolt holes.
9. Remove the upper connecting rod bearing (3) from the connecting rod (2).

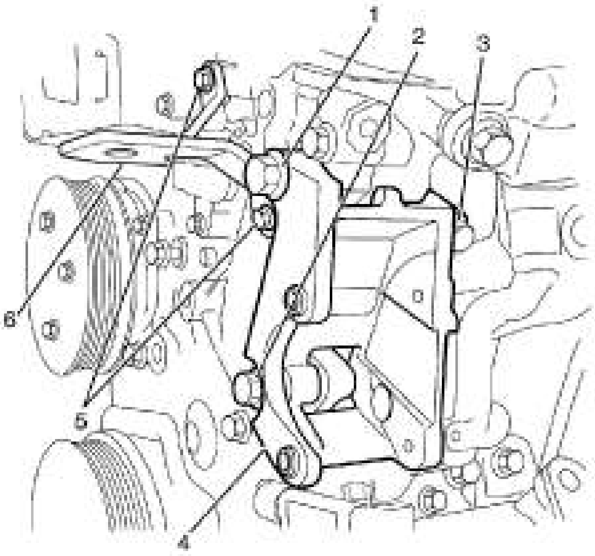


10. Remove the lower connecting rod bearing (1) from the connecting rod cap (2).



11. Reattach the connecting rod cap (1) to the connecting rod (2) to prevent damage to their mating surfaces. The connecting rod cap (1) and connecting rod (2) are a matched set and must be kept together.

Power Steering Pump Installation

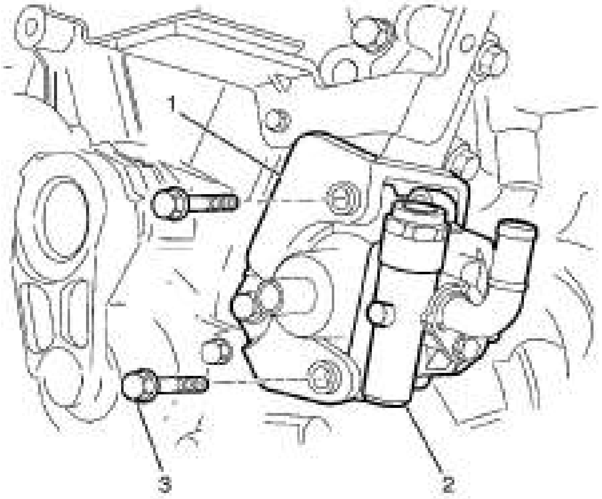


1. Install the power steering pump bracket (2).
2. Install the NEW power steering bracket to cylinder head retaining bolts (1).

   Tighten
   Tighten the bolts to 58 N·m (43 lb ft).

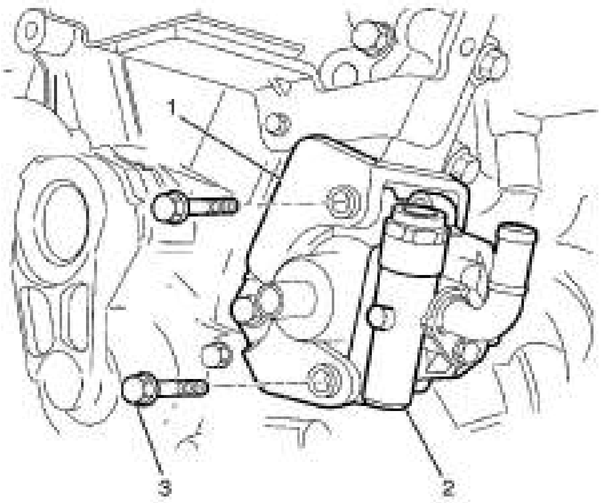
3. Install the power steering fluid reservoir bracket (4).
4. Install the NEW power steering fluid reservoir bracket to engine front cover retaining bolts (3).

   Tighten
   Tighten the bolts to 9 N·m (80 lb ft).

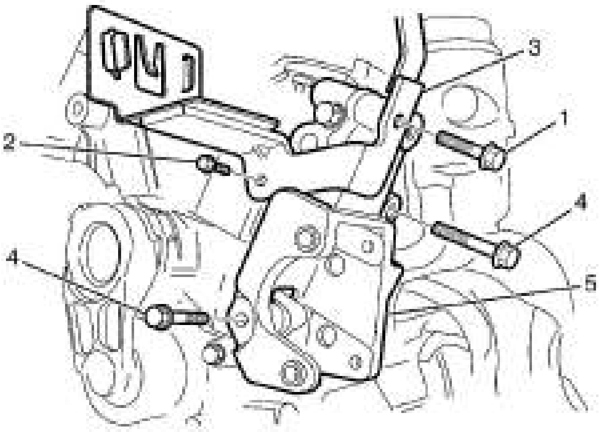


5. Install the power steering pump (2) to the power steering pump mounting bracket (3).
6. Install the power steering pump to mounting bracket retaining bolts (1).

Power Steering Pump Removal



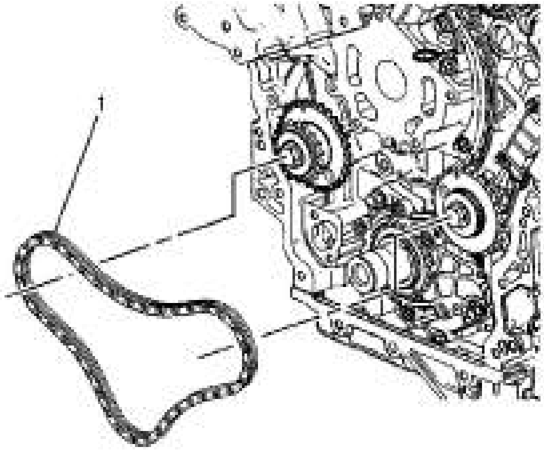
1. Remove the power steering pump to mounting bracket retaining bolts (3).
2. Remove the power steering pump (2) from the power steering pump mounting bracket (1).



3. Remove the power steering reservoir bracket to cylinder head retaining bolt (1).
4. Remove the power steering reservoir bracket to engine front cover retaining bolt (2).
5. Remove the power steering reservoir bracket (3).
6. Remove the power steering pump bracket to cylinder head retaining bolts (4).
7. Remove the power steering pump bracket (5).

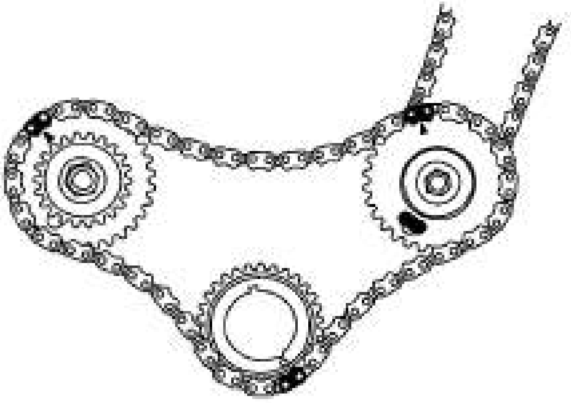
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985140**

Primary Camshaft Intermediate Drive Chain Installation

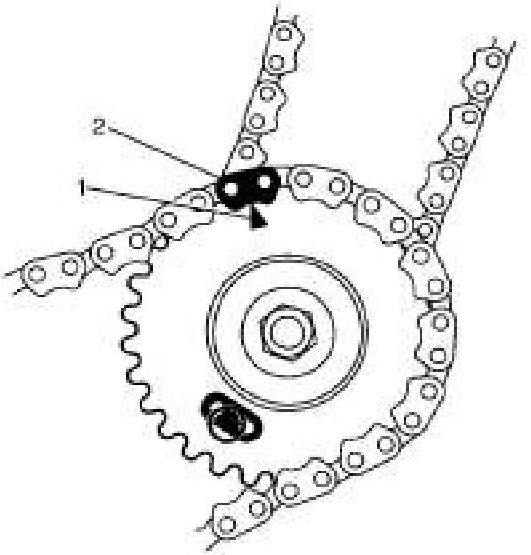


Important: Ensure that the crankshaft is in the stage one timing drive assembly position.

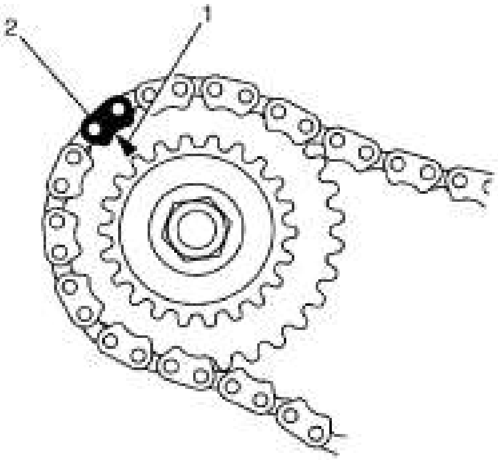
1. Install the primary camshaft drive chain (1).



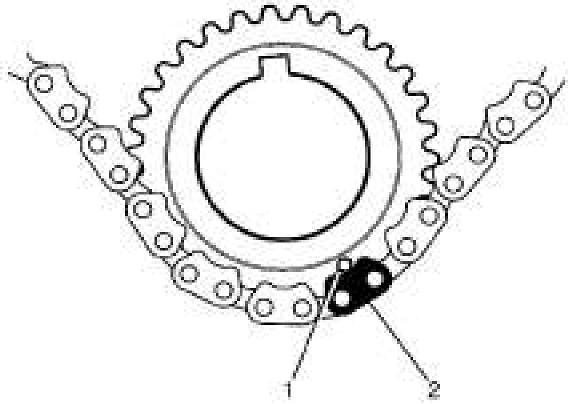
2. Wrap the primary camshaft drive chain around the large sprockets of each camshaft intermediate drive chain idler and the crankshaft sprocket.



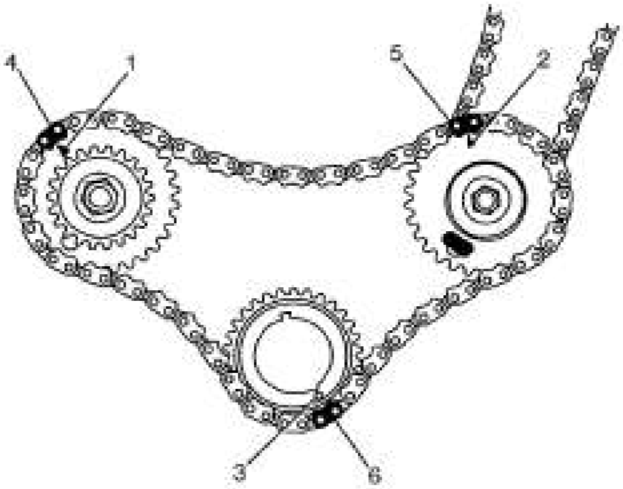
3. The left camshaft intermediate drive chain idler timing mark (1) will align with a timing camshaft drive chain link (2).



4. The right camshaft intermediate drive chain idler timing mark (2) will align with a timing camshaft drive chain link (1).



5. The crankshaft sprocket timing mark (2) will align with a timing camshaft drive chain link (1).



6. Ensure all the timing marks (2, 3, 6) are properly aligned with the timing camshaft drive chain links (1, 4, 5).

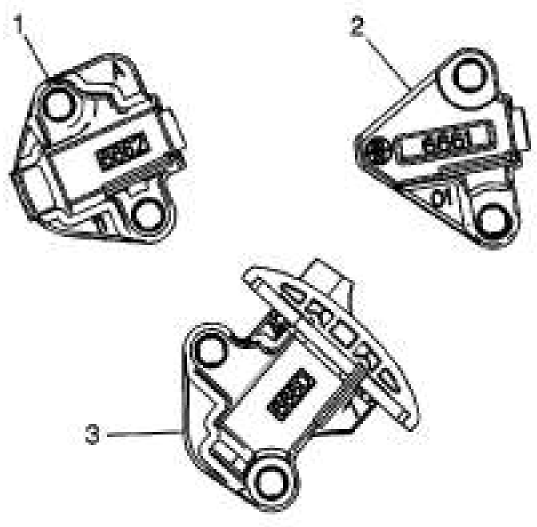
2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2135823**

Primary Camshaft Intermediate Drive Chain Tensioner Installation (LLT)

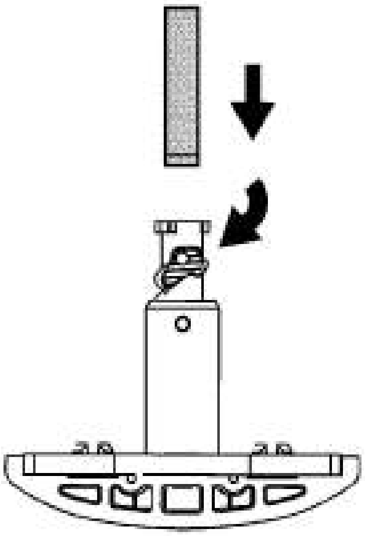
Special Tools

- *EN 46112* Tensioner Retraction Pins
- *EN-48383* Camshaft Retaining Tools
- *EN-48589* Crankshaft Rotation Socket
- *J 45027* Tensioner Tool

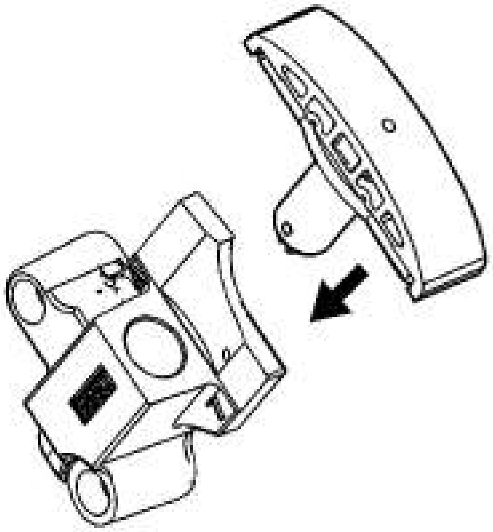
  For equivalent regional tools, refer to Special Tools.



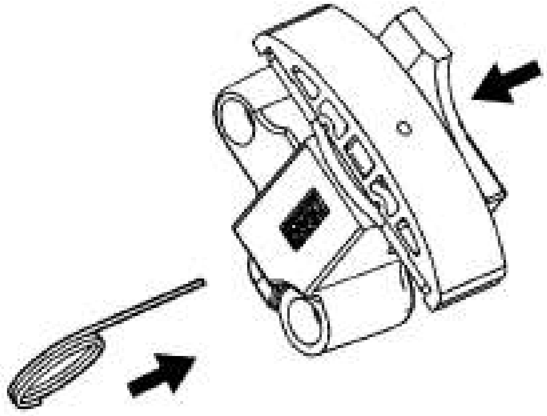
1. Ensure that the primary camshaft drive chain tensioner (3) is being installed.



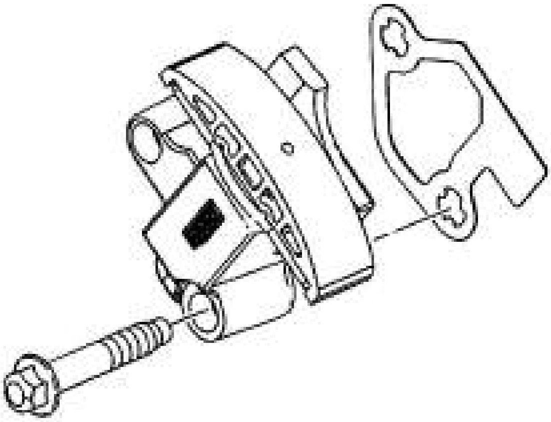
2. Using the *J 45027* tool , reset the primary camshaft drive chain tensioner plunger.



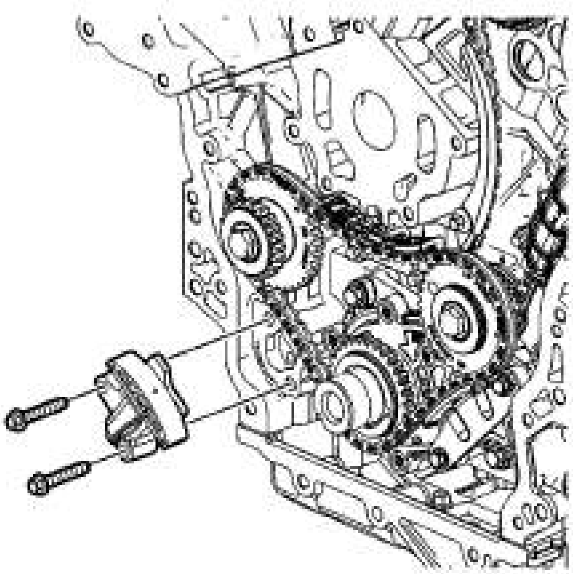
3. Install the plunger into the primary camshaft drive chain tensioner body.



4. Compress the plunger into the body and lock the primary camshaft drive chain tensioner by inserting the *EN 46112* pins into the access hole in the side of the primary camshaft drive chain tensioner body.
5. Slowly release pressure on the primary camshaft drive chain tensioner. The primary camshaft drive chain tensioner should remain compressed.

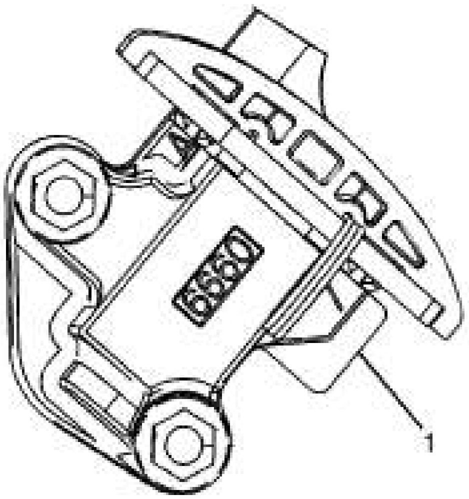


6. Install a NEW primary camshaft drive chain tensioner gasket to the primary camshaft drive chain tensioner.
7. Install the primary camshaft drive chain tensioner bolts through the primary camshaft drive chain tensioner and gasket.
8. Ensure the primary camshaft drive chain tensioner mounting surface on the engine block does not have any burrs or defects that would degrade the sealing of the NEW primary camshaft drive chain tensioner gasket.



9. Place the primary camshaft drive chain tensioner into position and loosely install the bolts to the block.

Caution: Refer to Fastener Caution in the Preface section.

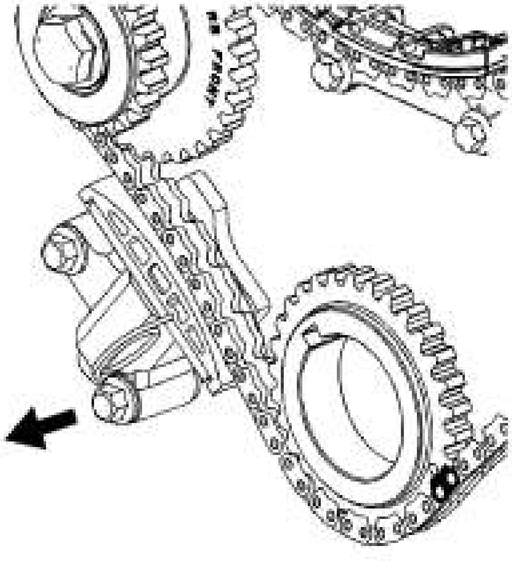


10. Verify the proper placement of the primary camshaft drive chain tensioner gasket tab (1).
    10.1. First Pass

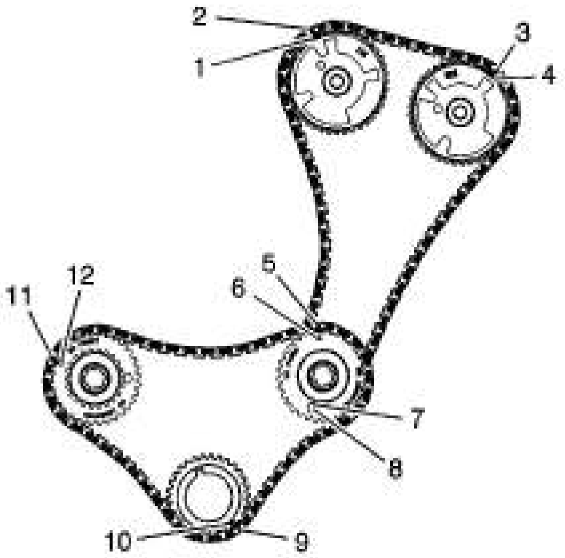
    Tighten the primary camshaft drive chain tensioner bolts to **5 N·m (44 lb in).**

    10.2. Final Pass

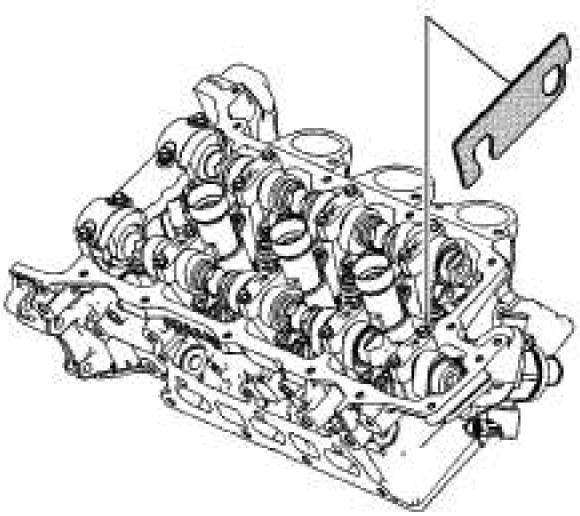
Tighten the primary camshaft drive chain tensioner bolts to **23 N·m (17 lb ft)**.



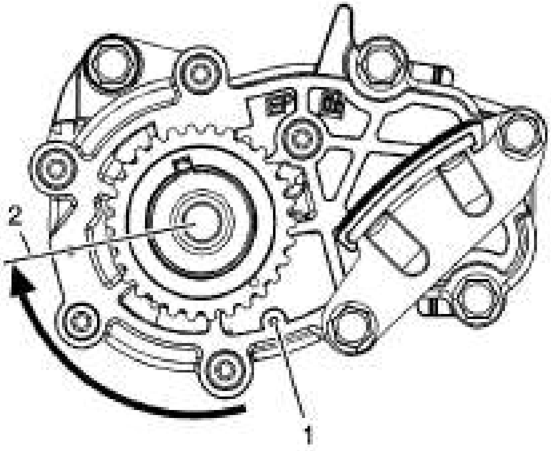
11. Release the primary camshaft drive chain tensioner by pulling out the *EN 46112* pins and unlocking the tensioner plunger.



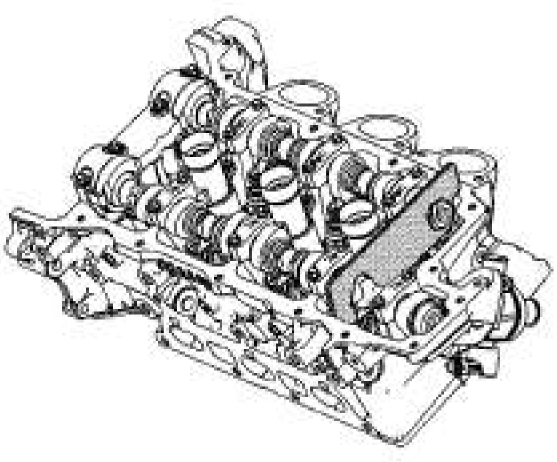
12. Verify the primary and left secondary camshaft drive chain timing mark alignments (1-12). Also refer to Camshaft Timing Drive Chain Alignment Diagram.



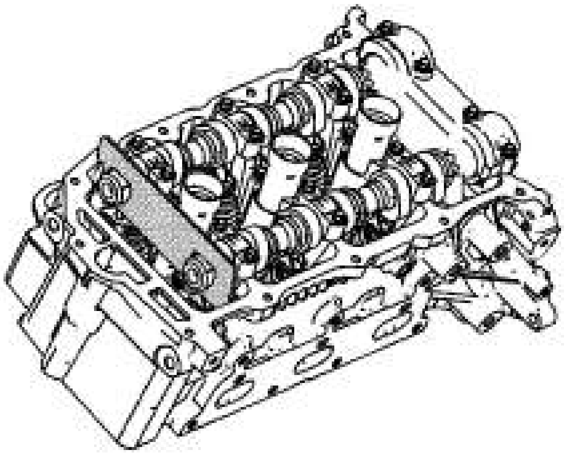
13. Remove the EN 48383-1 from the rear of the left camshafts.



14. Using the *EN-48589* socket , rotate the crankshaft and crankshaft sprocket from the stage 1 alignment position (1) to the stage 2 alignment position (2), 115 crankshaft degrees, in order to install the right secondary camshaft drive chain components.

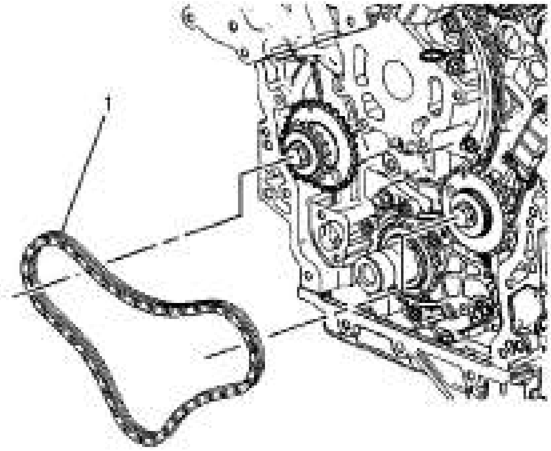


15. Install the EN 48383-2 onto the rear of the left camshafts.



16. Install the EN 48383-3 onto the rear of the right camshafts.

Primary Camshaft Intermediate Drive Chain Removal

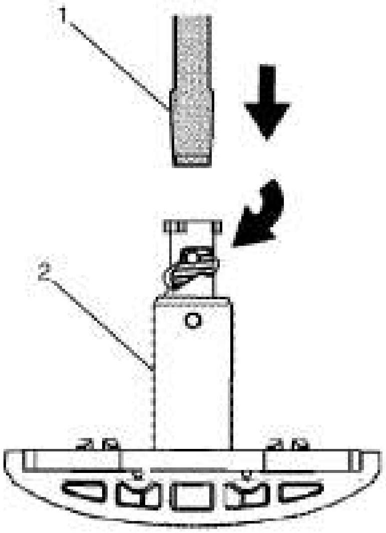


Remove the primary camshaft drive chain (1).

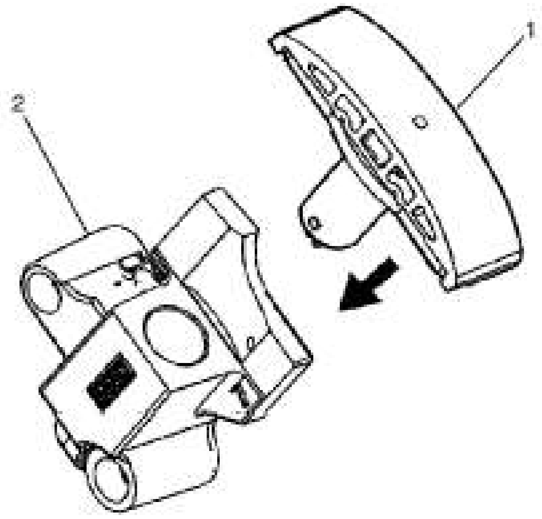
Primary Camshaft Intermediate Drive Chain Tensioner Installation

Tools Required

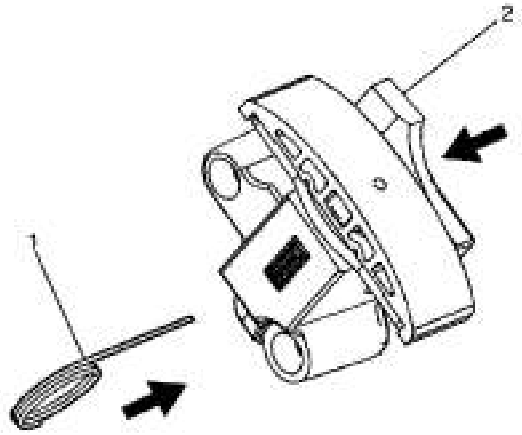
- EN 46105 Camshaft Locking Tools
- EN 46111 Crankshaft Rotation Socket
- EN 46112 Tensioner Retraction Pins
- J 45027 Tensioner Tool



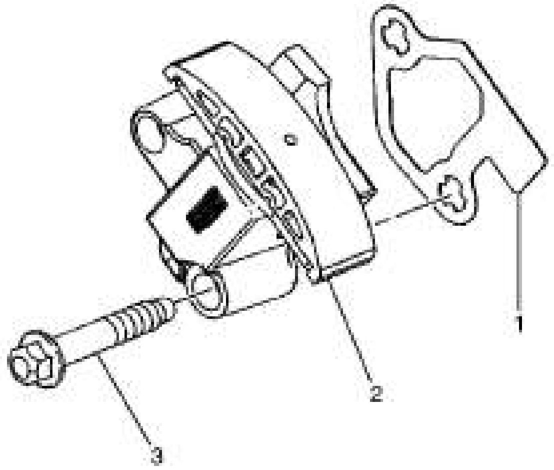
1. Using the J 45027 (1) reset the primary camshaft drive chain tensioner plunger (2).



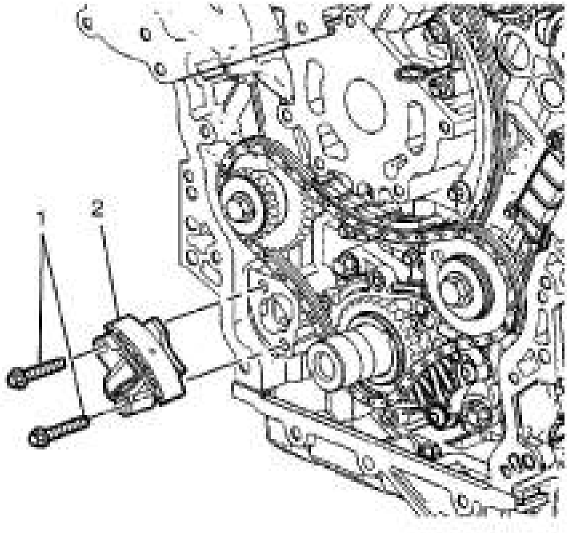
2. Install the plunger (1) into the primary camshaft drive chain tensioner body (2).



3. Compress the plunger into the body and lock the primary camshaft drive chain tensioner (2) by inserting the EN 46112 (1) into the access hole in the side of the primary camshaft drive chain tensioner (2).
4. Slowly release pressure on the primary camshaft drive chain tensioner. The primary camshaft drive chain tensioner should remain compressed.

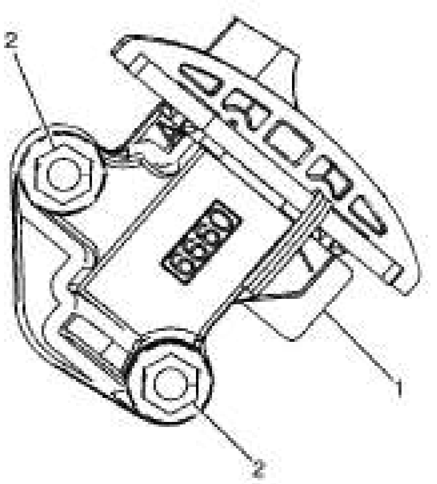


5. Install a NEW primary camshaft drive chain tensioner gasket (1) to the primary camshaft drive chain tensioner (2).
6. Install the primary camshaft drive chain tensioner bolts (3) through the primary camshaft drive chain tensioner (2) and gasket (1).
7. Ensure the primary camshaft drive chain tensioner mounting surface on the engine block does not have any burrs or defects that may degrade the sealing of the NEW primary camshaft drive chain tensioner gasket (1).



8. Place the primary camshaft drive chain tensioner (2) into position and loosely install the primary camshaft drive chain tensioner to cylinder block retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.

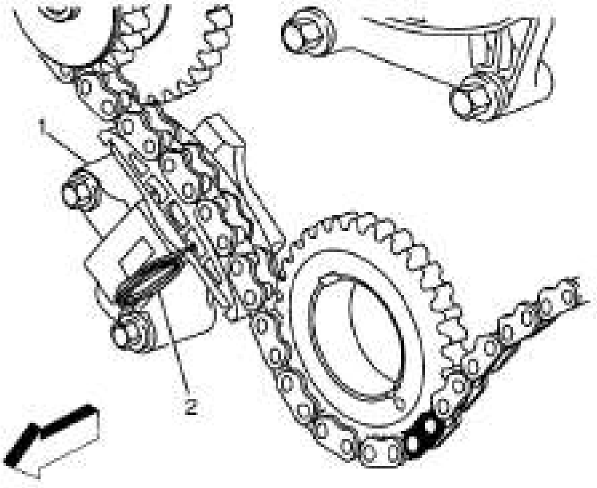


9. Verify the proper placement of the primary camshaft drive chain tensioner gasket tab (1).
10. Tighten the primary camshaft drive chain tensioner to cylinder block retaining bolts (2)
    10.1. First Pass

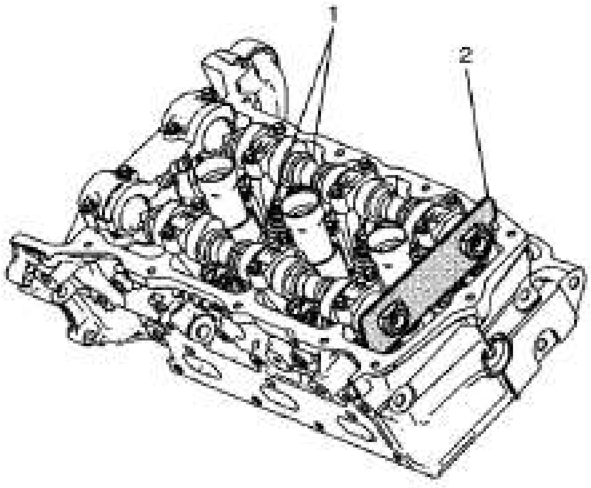
    Tighten
    Tighten the bolts to 5 N·m (44 lb in).

    10.2. Final Pass

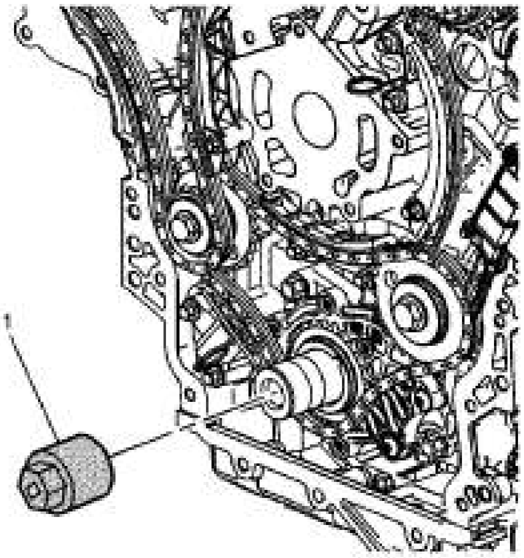
    Tighten
    Tighten the bolts to 23 N·m (17 lb ft).



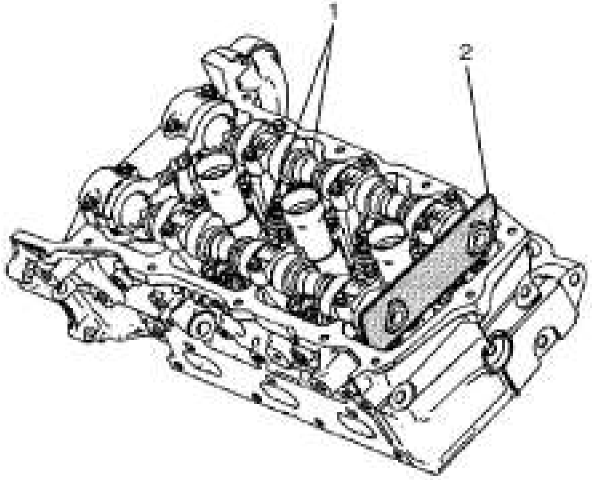
11. Release the primary camshaft drive chain tensioner (1) by pulling out the EN 46112 (2).
12. Verify the primary and left secondary camshaft drive chain timing mark alignments (1-12). Refer to Camshaft Timing Drive Chain Alignment Diagram .



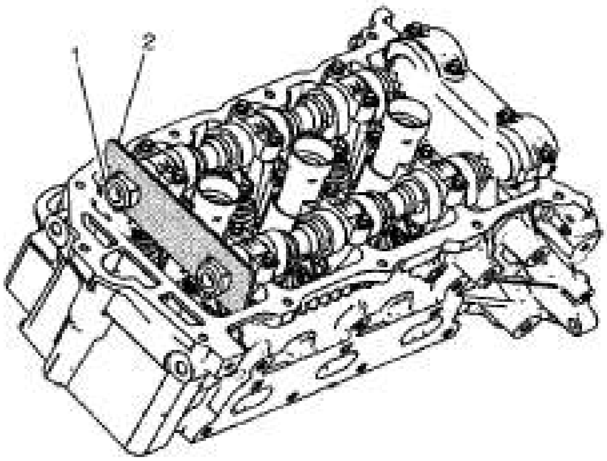
13. Remove the EN 46105 (2) from the rear of the left hand camshafts (1).



14. Using the EN 46111 (1) rotate the crankshaft and crankshaft sprocket from the stage one alignment position (1) to the stage two alignment position, 115 crankshaft degrees, in order to install the right secondary camshaft drive chain components.

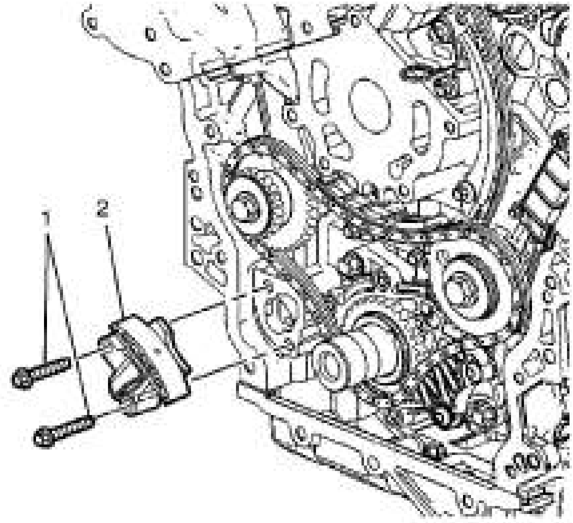


15. Install the EN 46105 (2) onto the rear of the left hand camshafts (1).

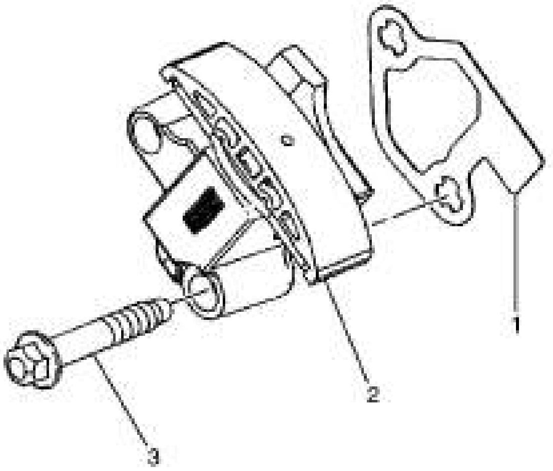


16. Install the EN 46105 (2) onto the rear of the right hand camshafts (1).

Primary Camshaft Intermediate Drive Chain Tensioner Removal



1. Remove the primary camshaft drive chain tensioner to cylinder block retaining bolts (1).
2. Remove the primary camshaft drive chain tensioner (2).



3. Remove the primary camshaft drive chain tensioner bolts (3) from the primary camshaft drive chain tensioner (2) and gasket (1).

Important: The primary camshaft drive chain tensioner gasket (1) must be discarded whenever the primary camshaft drive chain tensioner (2) has been removed from the cylinder block.

4. Remove the primary camshaft drive chain tensioner gasket (1) from the primary camshaft drive chain tensioner (2).

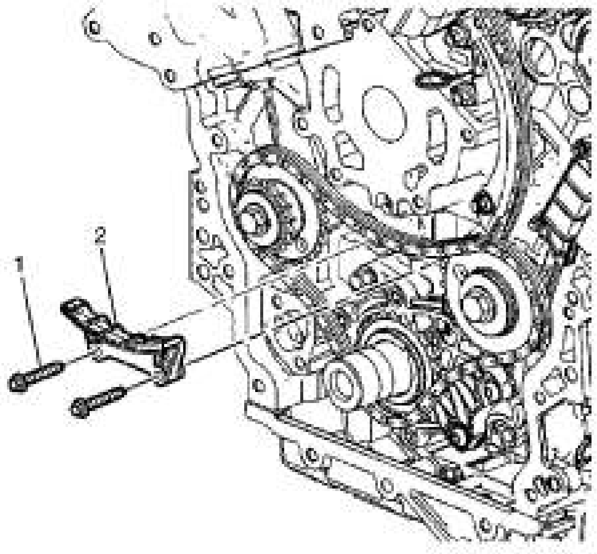
   Discard the gasket.

5. Inspect the primary camshaft drive chain tensioner mounting surface on the engine block for burrs or any defects that may degrade the sealing of the NEW primary camshaft drive chain tensioner gasket.

Primary Timing Chain Guide Installation - Lower

DO NOT remove the primary camshaft drive chain lower guide. The primary camshaft drive chain lower guide is not serviceable separately. If the primary camshaft drive chain lower guide must be replaced, the oil pump must be replaced.

Primary Timing Chain Guide Installation - Upper



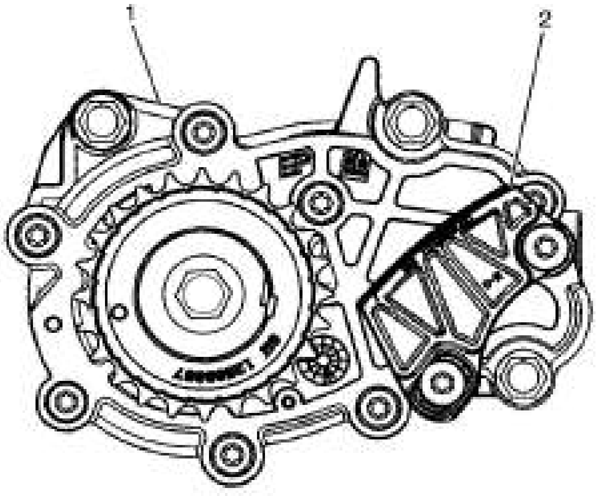
1. Install the primary camshaft drive chain upper guide (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the primary camshaft drive chain upper guide to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).

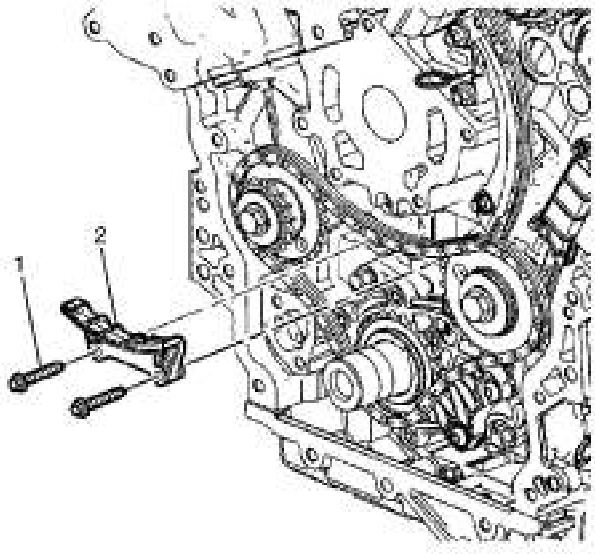
Primary Timing Chain Guide Removal - Lower



DO NOT remove the primary camshaft drive chain lower guide (2). The primary camshaft drive chain lower guide (2) is not serviceable separately. If the primary camshaft drive chain lower guide (2) must be replaced, the oil pump (1) must be replaced.

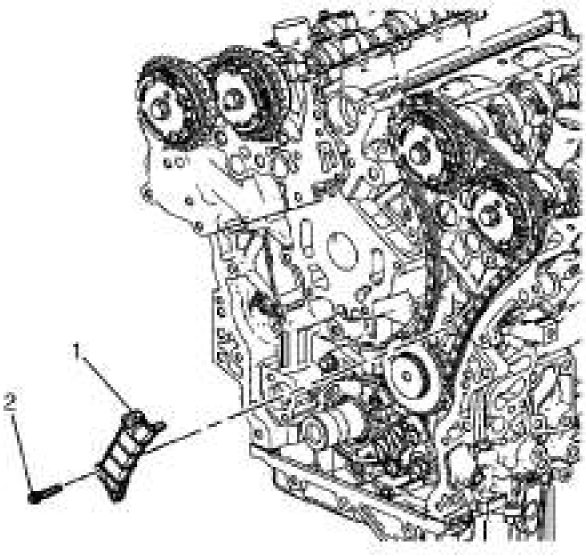
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977586**

Primary Timing Chain Guide Removal - Upper



1. Remove the primary camshaft drive chain upper guide to cylinder block retaining bolts (1).
2. Remove the primary camshaft drive chain upper guide (2).

Secondary Camshaft Drive Chain Guide Installation - Left Side



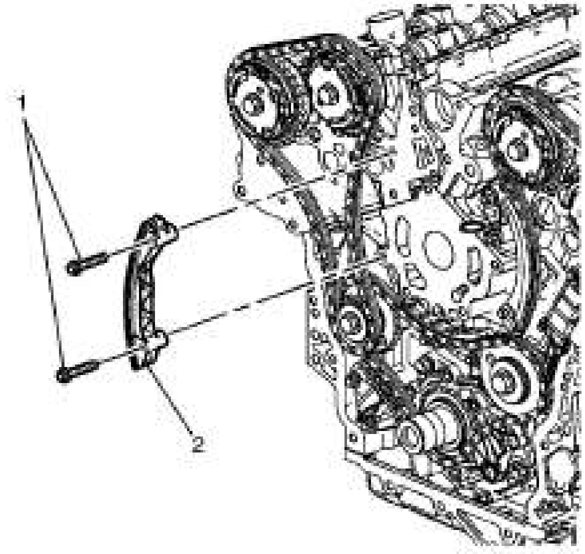
1. Install the left secondary camshaft drive chain guide (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the secondary camshaft drive chain guide to cylinder block retaining bolts (2).

   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).

Secondary Camshaft Drive Chain Guide Installation - Right Side



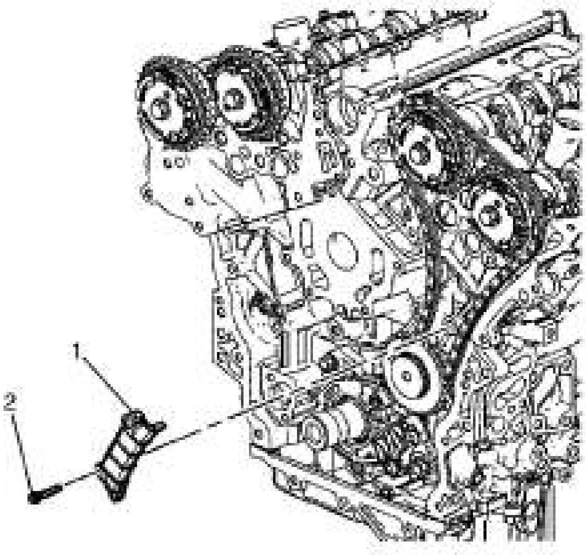
1. Position the right secondary camshaft drive chain guide (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the secondary camshaft drive chain guide to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).

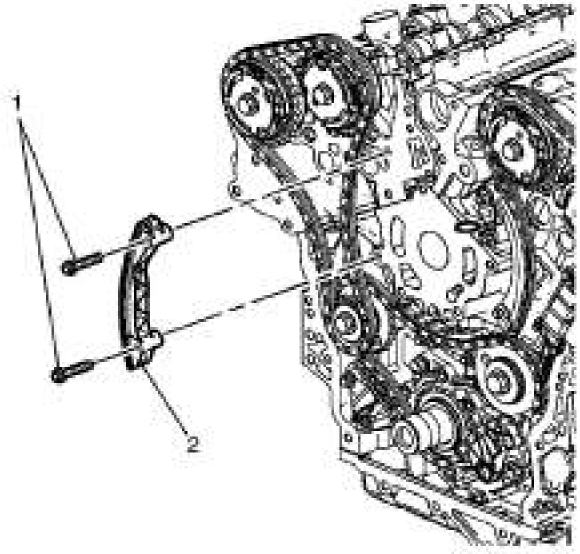
Secondary Camshaft Drive Chain Guide Removal - Left Side



1. Remove the left secondary camshaft drive chain guide to cylinder block retaining bolts (2).
2. Remove the left secondary camshaft drive chain guide (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977584**

Secondary Camshaft Drive Chain Guide Removal - Right Side



1. Remove the right secondary camshaft drive chain guide to cylinder block retaining bolts (1).
2. Remove the right secondary camshaft drive chain guide (2).

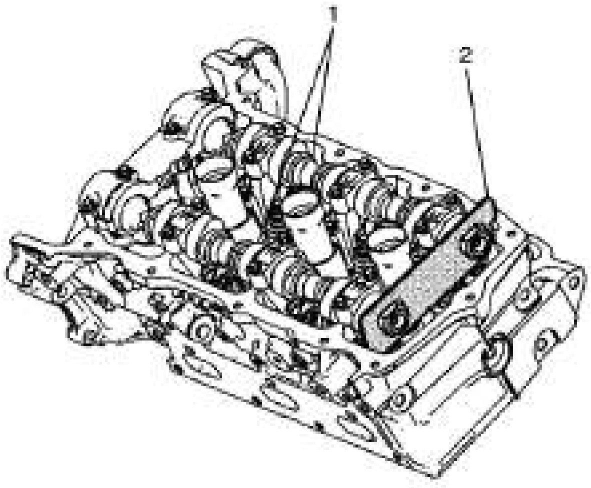
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995364**

Secondary Camshaft Drive Chain Installation - Left Side

Secondary Camshaft Drive Chain Installation - Left Side (LY7)

Tools Required

- EN 46105 Camshaft Locking Tools
- EN 46111 Crankshaft Rotation Socket

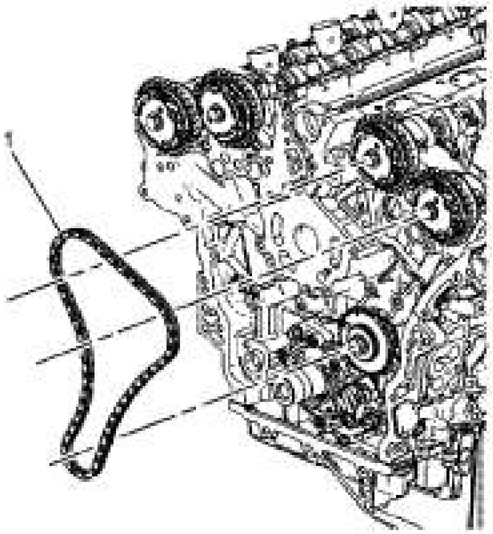


Important: There should be no need to rotate the camshafts (1) more than 10 degrees. Using the hex cast into the camshaft (1) rotate the camshaft (1) in order to install the EN 46105 (2).

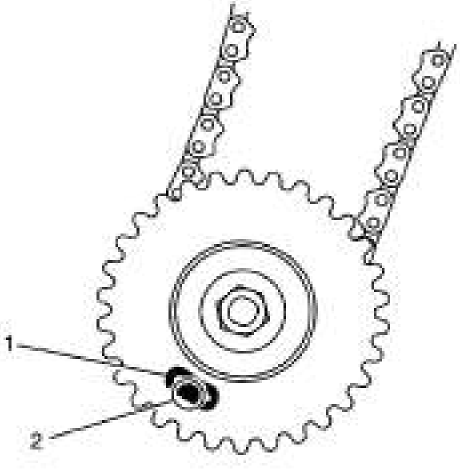
1. Install the EN 46105 (2) onto the rear of the left camshafts (1).

   Important: All camshafts (1) must be locked in place before installation of any camshaft drive chains.

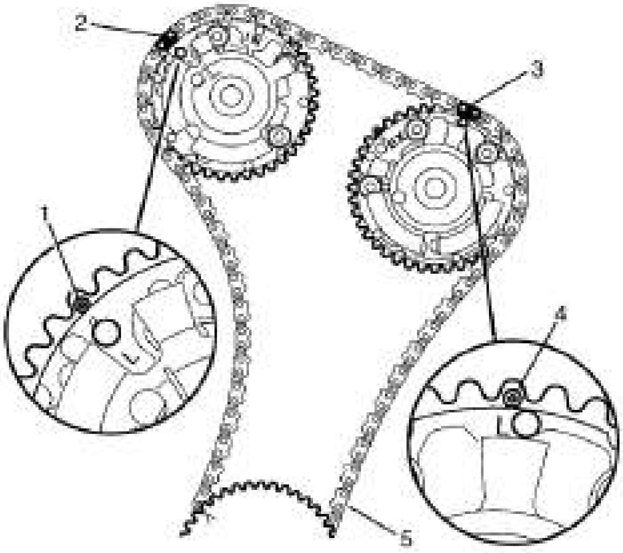
2. Make sure that the EN 46105 (2) is fully seated onto the camshafts (1).
3. Make sure that the crankshaft is in the stage one timing drive assembly position using the EN 46111 . Refer to Camshaft Timing Drive Chain Alignment Diagram Stage One.



4. Install the left secondary camshaft drive chain (1).



5. Place the left secondary camshaft drive chain around the inner sprocket of the left camshaft intermediate drive chain idler with the timing camshaft drive chain link (1) aligned to the alignment access hole (2) made in the left camshaft intermediate drive chain idler outer sprocket.
6. Wrap the secondary camshaft drive chain around both left actuator drive sprockets.
7. Make sure there are 10 links between the timing camshaft drive chain links for the camshaft position actuator solenoid sprockets.

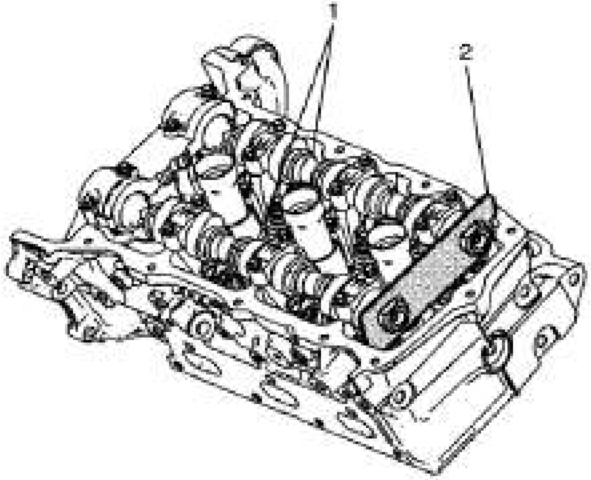


8. Align the left exhaust camshaft position actuator solenoid sprocket alignment circle mark (4) with the timing camshaft drive chain link (3).
9. Align the left intake camshaft position actuator solenoid sprocket alignment circle mark (1) with the timing camshaft drive chain link (2).
10. There will be 22 links between the left camshaft intermediate drive chain idler timing camshaft drive chain link and the left intake camshaft position actuator solenoid sprocket timing camshaft drive chain link.

Secondary Camshaft Drive Chain Installation - Left Side (LE0, LW2)

Tools Required

- EN 46105 Camshaft Locking Tools
- EN 46111 Crankshaft Rotation Socket

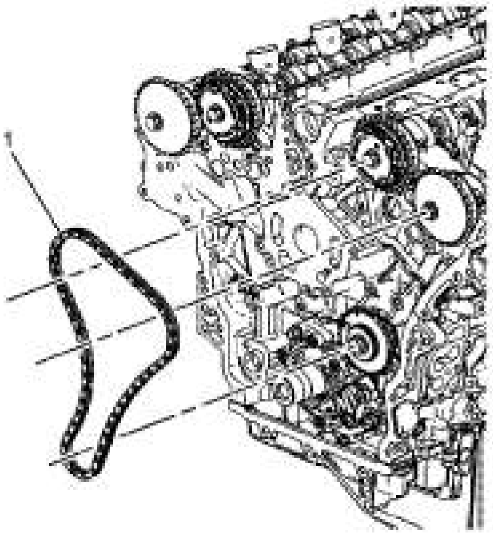


Important: There should be no need to rotate the camshafts (1) more than 10 degrees. Using the hex cast into the camshaft (1) rotate the camshaft (1) in order to install the EN 46105 (2).

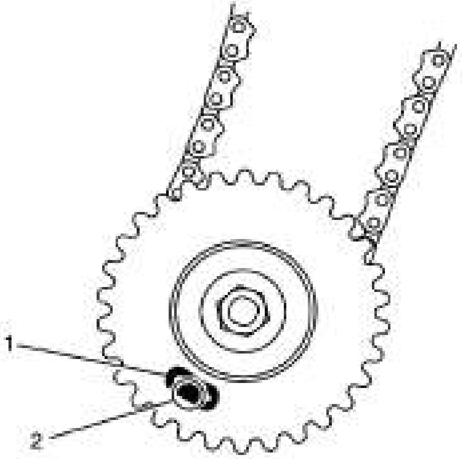
1. Install the EN 46105 (2) onto the rear of the left camshafts (1).

   Important: All camshafts (1) must be locked in place before installation of any camshaft drive chains.

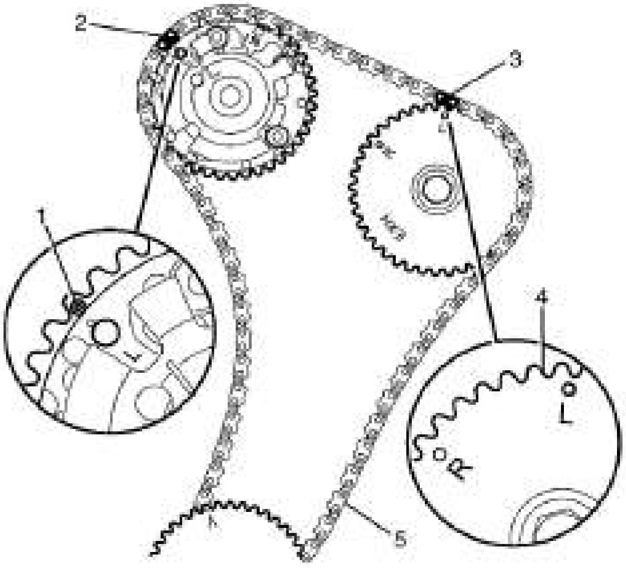
2. Make sure that the EN 46105 (2) is fully seated onto the camshafts (1).
3. Make sure that the crankshaft is in the stage one timing drive assembly position using the EN 46111 . Refer to Camshaft Timing Drive Chain Alignment Diagram Stage One.



4. Install the left secondary camshaft drive chain (1).



5. Place the left secondary camshaft drive chain around the inner sprocket of the left camshaft intermediate drive chain idler with the timing camshaft drive chain link (1) aligned to the alignment access hole (2) made in the left camshaft intermediate drive chain idler outer sprocket.
6. Wrap the secondary camshaft drive chain around the left intake camshaft position actuator solenoid sprocket and the left exhaust camshaft sprocket.
7. Make sure there are 10 links between the timing camshaft drive chain links for the left intake camshaft position actuator solenoid sprocket and the left exhaust camshaft sprocket.



8. Align the left exhaust camshaft sprocket alignment circle mark (4) with the timing camshaft drive chain link (3).
9. Align the left intake camshaft position actuator solenoid sprocket alignment circle mark (1) with the timing camshaft drive chain link (2).
10. There will be 22 links between the left camshaft intermediate drive chain idler timing

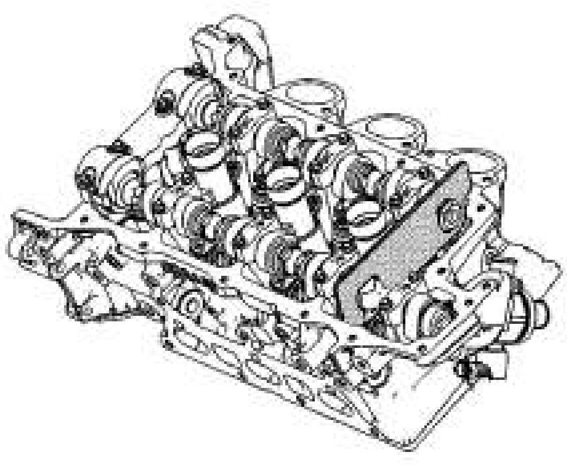
camshaft drive chain link and the left intake camshaft position actuator solenoid sprocket timing camshaft drive chain link.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2003834**

Secondary Camshaft Drive Chain Installation - Left Side (LLT or LCS)

Special Tools

- EN-48383 Camshaft Retaining Tools
- EN-48589 Crankshaft Rotation Socket

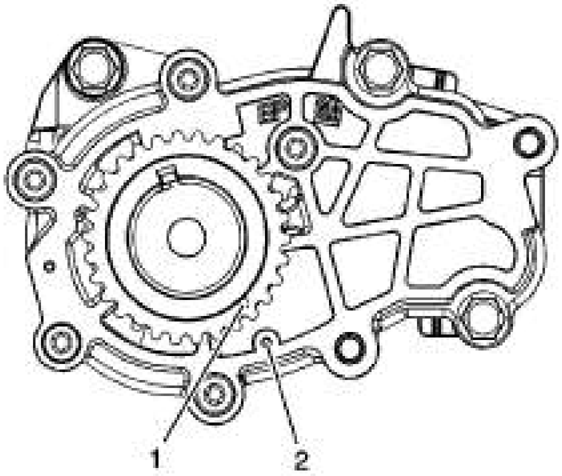


Important: There should be no need to rotate the camshaft more than 10 degrees. Using the hex cast into the camshaft rotate the camshaft in order to install the EN-48383 .

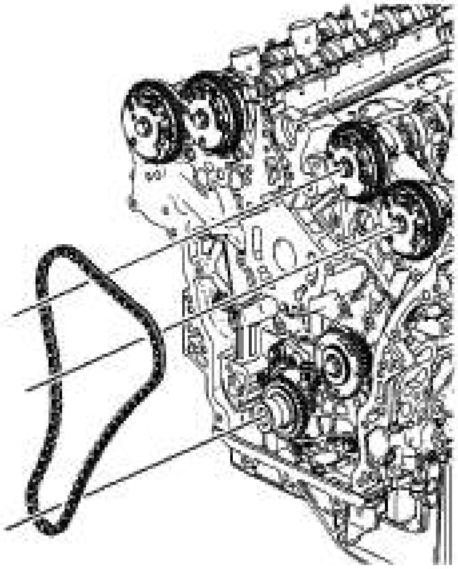
1. Install the EN 48383-1 onto the rear of the left camshafts.

   Important: All camshafts must be locked in place before installation of any camshaft drive chains.

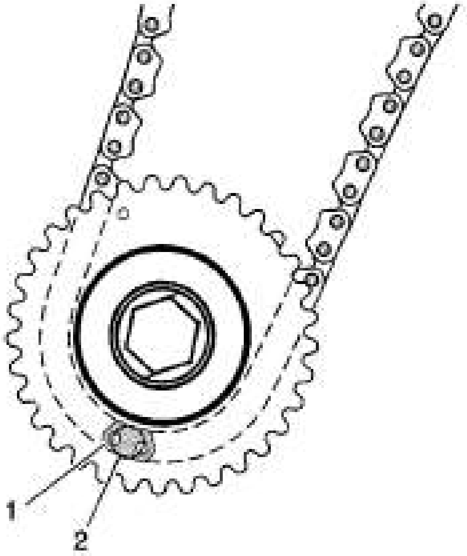
2. Ensure that the EN 48383-1 is fully seated onto the camshafts.



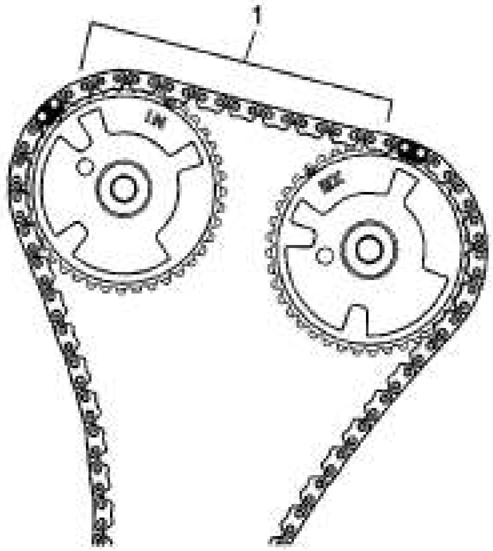
3. Ensure the crankshaft is in the stage one timing position with the crankshaft sprocket timing mark (1) aligned to the stage one timing mark on the oil pump cover (2) using the EN-48589 . Refer to Camshaft Timing Drive Chain Alignment Diagram.



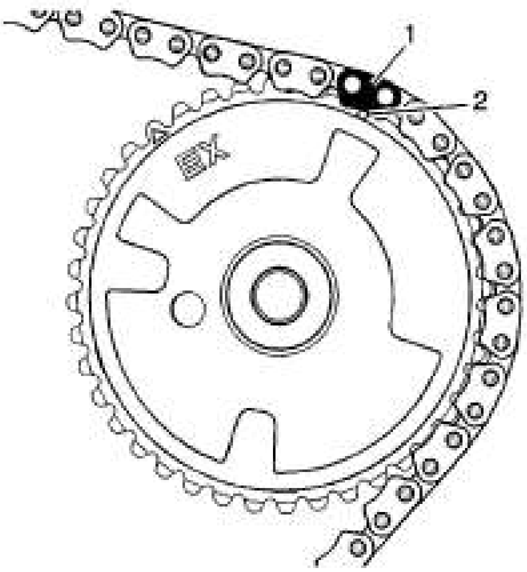
4. Install the left secondary camshaft drive chain.



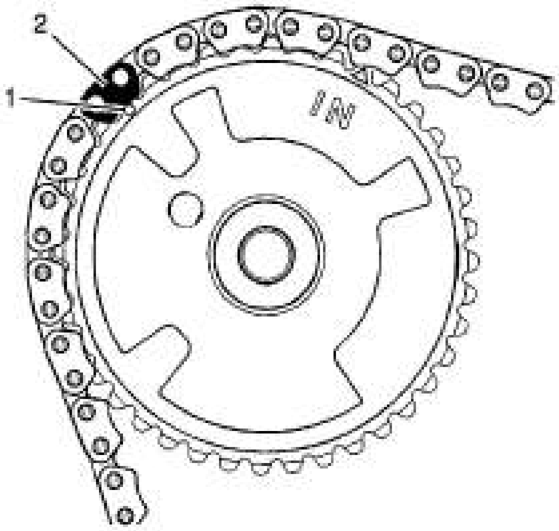
5. Place the left secondary camshaft drive chain around the inner sprocket of the left camshaft intermediate drive chain idler with the timing camshaft drive chain link (1) aligned to the alignment access hole (2) made in the left camshaft intermediate drive chain idler outer sprocket.



6. Wrap the secondary camshaft drive chain around both left actuator drive sprockets.
7. Ensure there are 10 links (1) between the timing camshaft drive chain links for the camshaft position actuator sprockets.



8. Align the left exhaust camshaft position actuator sprocket alignment circle mark (2) with the timing camshaft drive chain link (1).

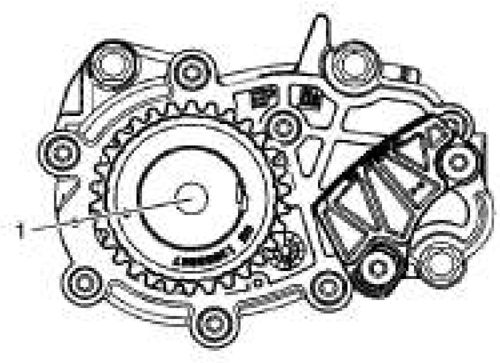


9. Align the left intake camshaft position actuator sprocket alignment circle mark (1) with the timing camshaft drive chain link (2).

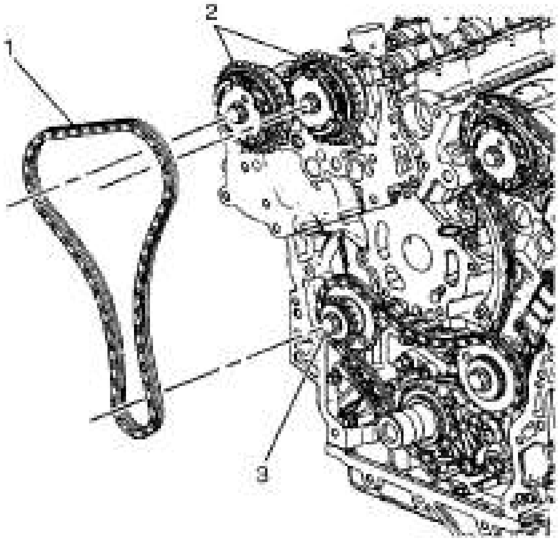
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1985150

Secondary Camshaft Drive Chain Installation - Right Side

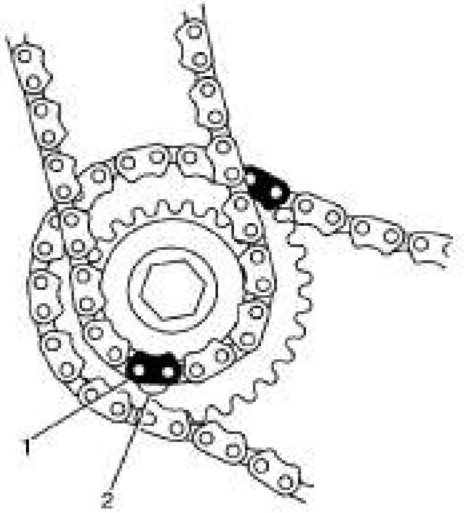
Secondary Camshaft Drive Chain Installation - Right Side (LY7)



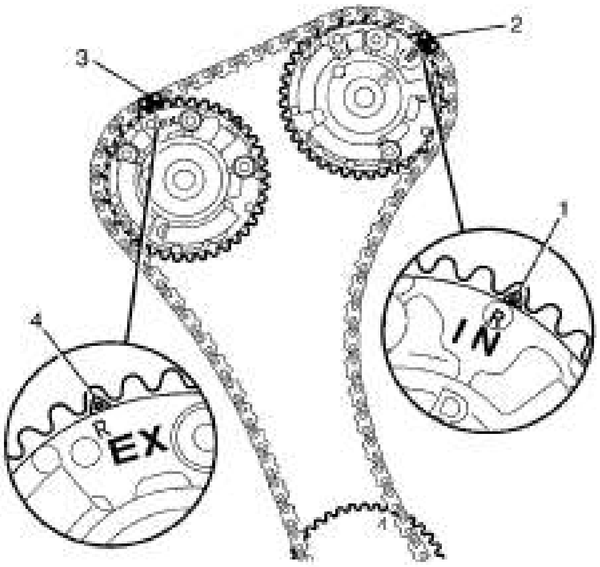
1. Ensure that the crankshaft is in the stage two timing drive assembly position (1).



2. Install the right secondary camshaft drive chain (1).



3. Place the secondary camshaft drive chain around the right camshaft intermediate drive chain idler outer sprocket, aligning the timing camshaft drive chain link (1) with the alignment access hole (2) made in the right camshaft intermediate drive chain idler inner sprocket.
4. Wrap the secondary camshaft drive chain around both right actuator drive sprockets.

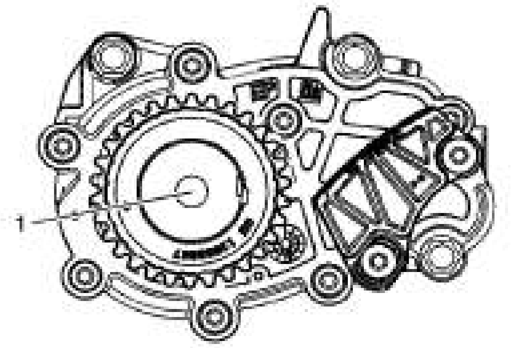


Important: Make sure there are 10 links between the timing camshaft drive chain links for the camshaft position actuator solenoid sprockets.

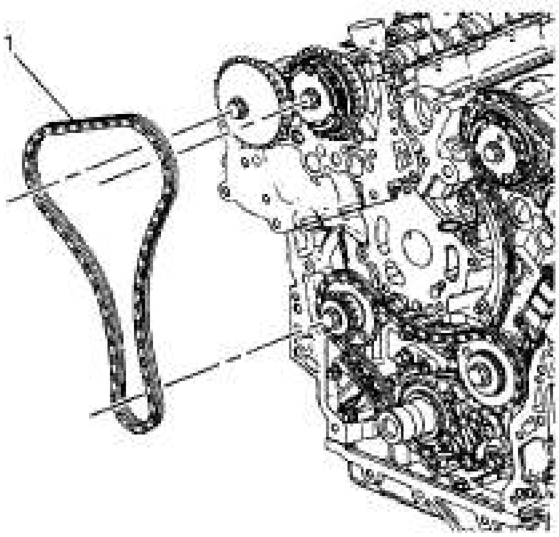
5. Align the right exhaust camshaft position actuator solenoid sprocket alignment triangle mark (1) with the timing camshaft drive chain link (2).
6. Align the right intake camshaft position actuator solenoid sprocket alignment triangle mark (4) with the timing camshaft drive chain link (3).
7. There will be 22 links between the right camshaft intermediate drive chain idler timing

camshaft drive chain link and the right exhaust camshaft position actuator solenoid sprocket timing camshaft drive chain link.

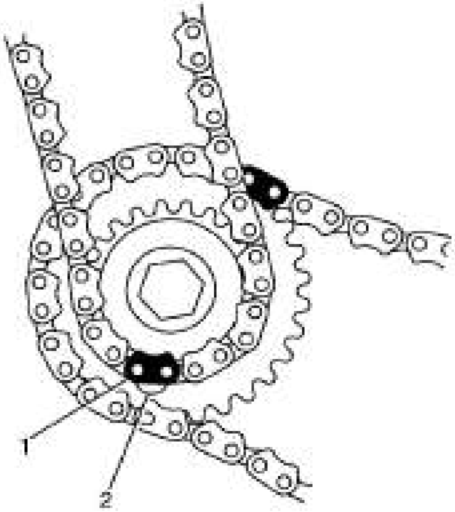
Secondary Camshaft Drive Chain Installation - Right Side (LE0, LW2)



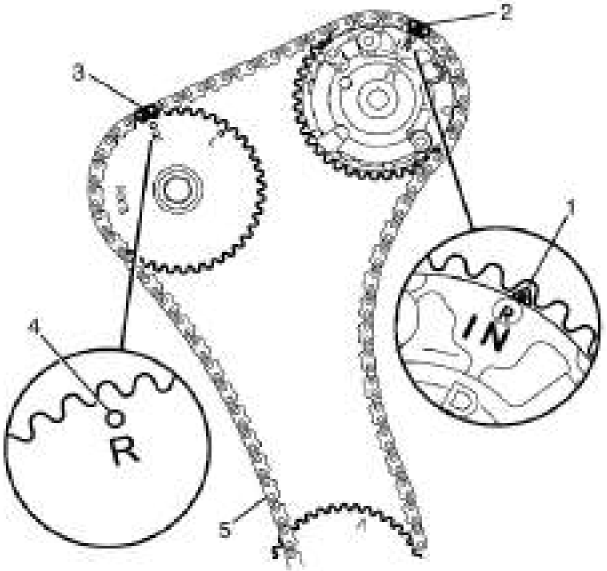
1. Ensure that the crankshaft is in the stage two timing drive assembly position (1).



2. Install the right secondary camshaft drive chain (1).



3. Place the secondary camshaft drive chain around the right camshaft intermediate drive chain idler outer sprocket, aligning the timing camshaft drive chain link (1) with the alignment access hole (2) made in the right camshaft intermediate drive chain idler inner sprocket.
4. Wrap the secondary camshaft drive chain around the right intake camshaft position actuator solenoid sprocket and the right exhaust camshaft sprocket.
5. Make sure there are 10 links between the timing camshaft drive chain links for the right intake camshaft position actuator solenoid sprocket and the right exhaust camshaft sprocket.



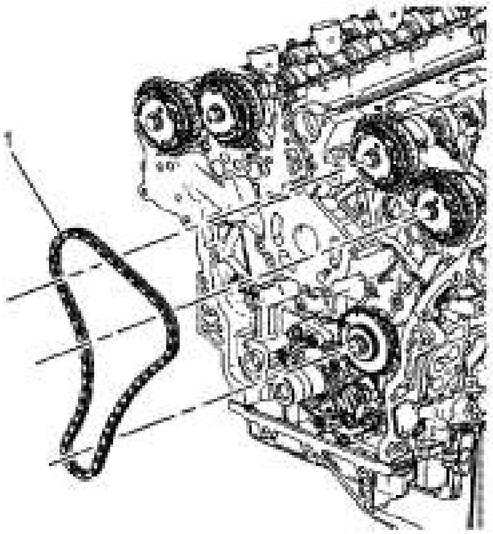
Important: Make sure there are 10 links between the timing camshaft drive chain links for the camshaft position actuator solenoid sprockets.

6. Align the right exhaust camshaft sprocket alignment circle mark (1) with the timing camshaft

drive chain link (2).

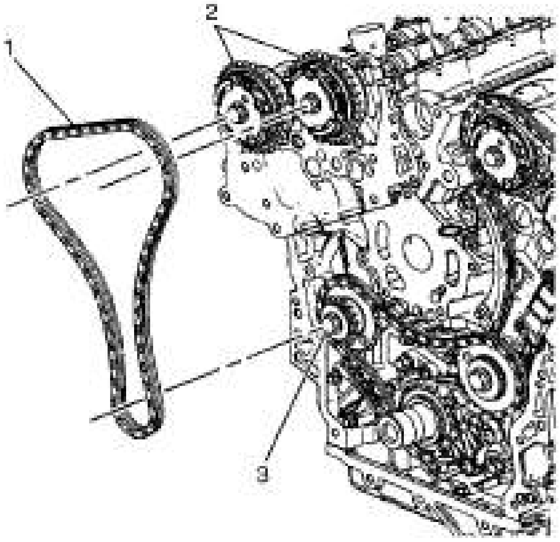
7. Align the right intake camshaft position actuator solenoid sprocket alignment triangle mark (4) with the timing camshaft drive chain link (3).
8. There will be 22 links between the right camshaft intermediate drive chain idler timing camshaft drive chain link and the right exhaust camshaft sprocket timing camshaft drive chain link.

Secondary Camshaft Drive Chain Removal - Left Side



Remove the left secondary camshaft drive chain (1).

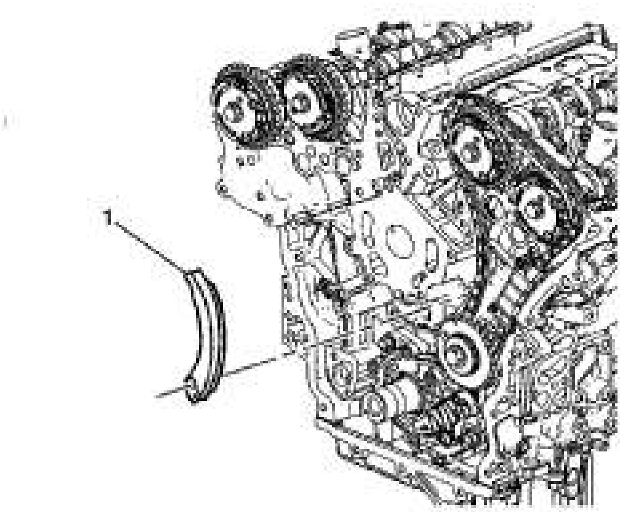
Secondary Camshaft Drive Chain Removal - Right Side



Remove the right secondary camshaft drive chain (1) from the right camshaft position actuators (2) and the right camshaft intermediate drive chain idler sprocket (3).

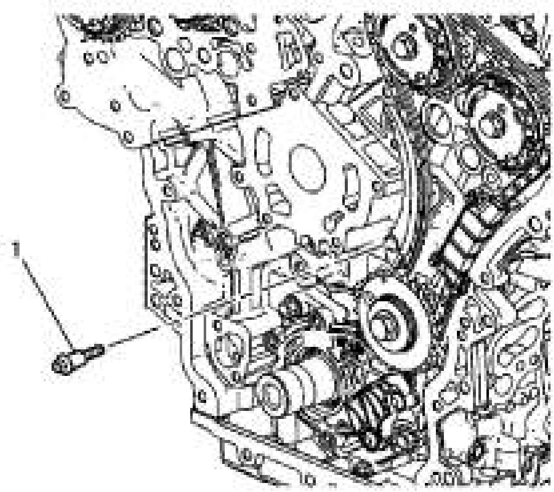
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985137**

Secondary Camshaft Drive Chain Shoe Installation - Left Side



1. Install the left secondary camshaft drive chain shoe (1).

   Notice: Refer to Fastener Notice in the Preface section.



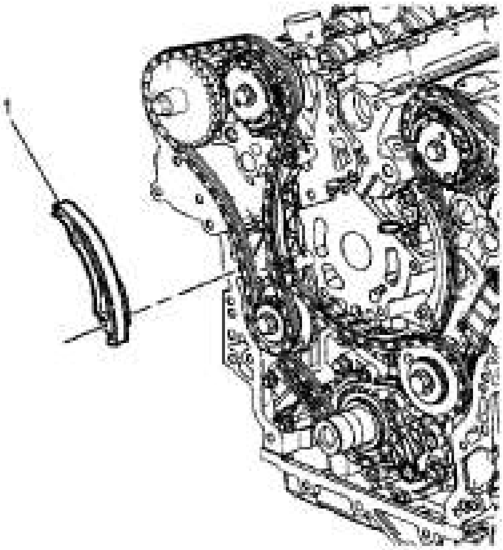
2. Install the secondary camshaft drive chain shoe to cylinder block retaining bolt (1).

Tighten

Tighten the bolt to 23 N·m (17 lb ft).

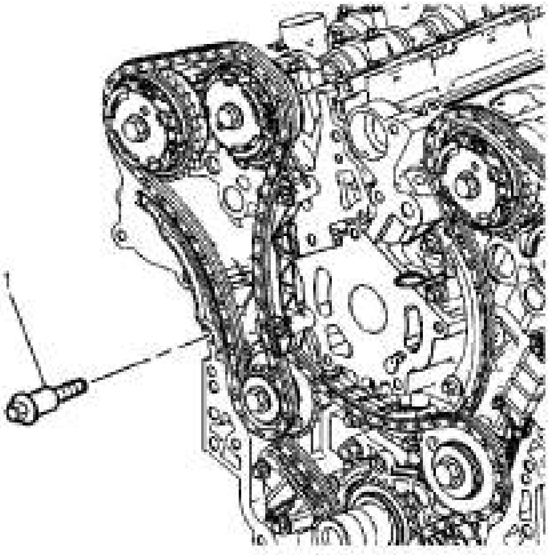
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1985156

Secondary Camshaft Drive Chain Shoe Installation - Right Side



1. Position the right secondary camshaft drive chain shoe (1).

Notice: Refer to Fastener Notice in the Preface section.



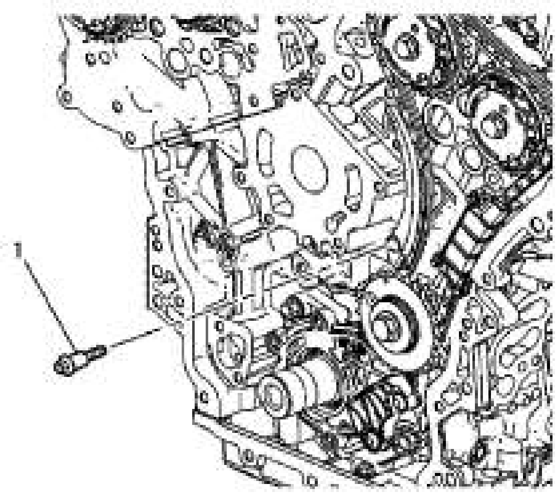
2. Install the right secondary camshaft drive chain shoe to cylinder block retaining bolt (1).

Tighten

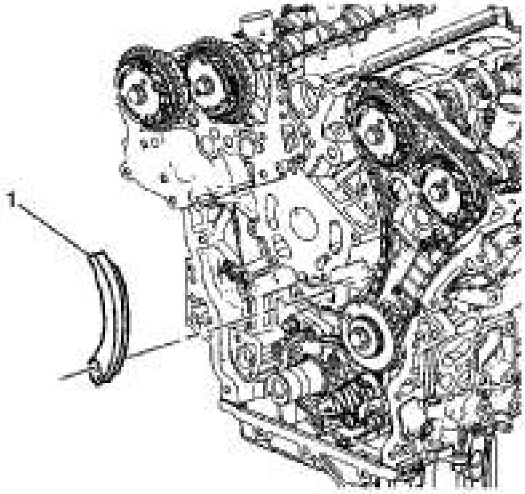
Tighten the bolt to 23 N·m (17 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995320**

Secondary Camshaft Drive Chain Shoe Removal - Left Side

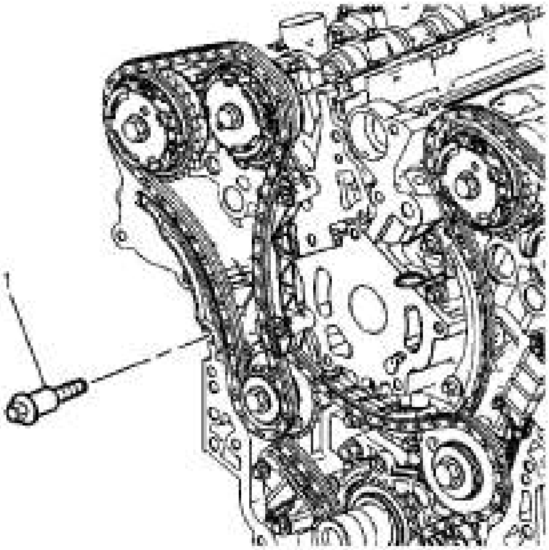


1. Remove the left secondary camshaft drive chain shoe to cylinder block retaining bolt (1).

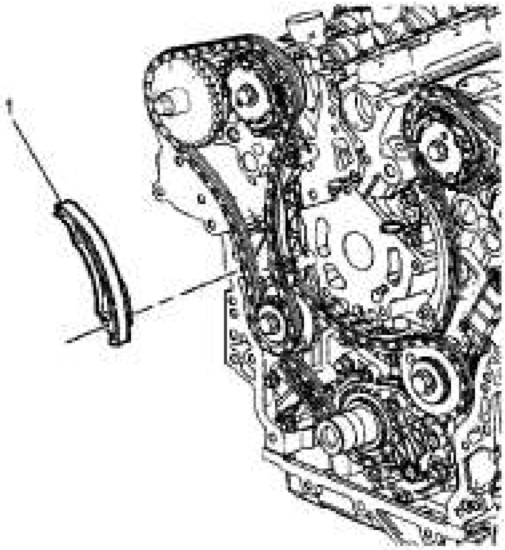


2. Remove the left secondary camshaft drive chain shoe (1).

Secondary Camshaft Drive Chain Shoe Removal - Right Side



1. Remove the right secondary camshaft drive chain shoe to cylinder block retaining bolt (1).



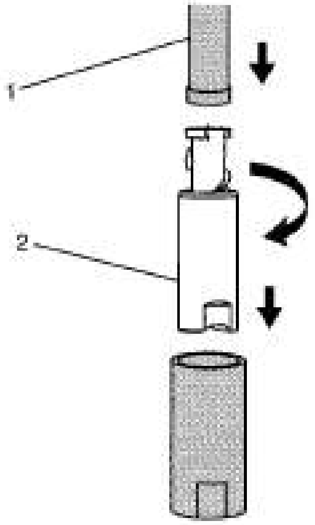
2. Remove the right secondary camshaft drive chain shoe (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995366**

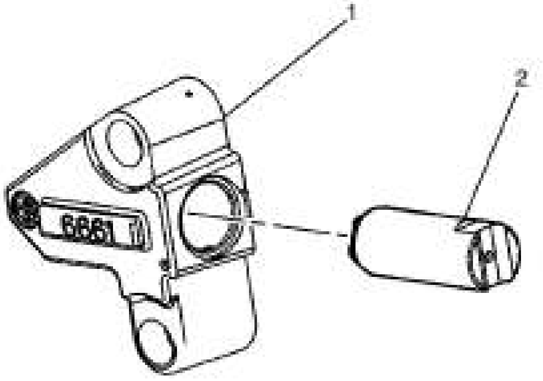
Secondary Camshaft Drive Chain Tensioner Installation - Left Side

Tools Required

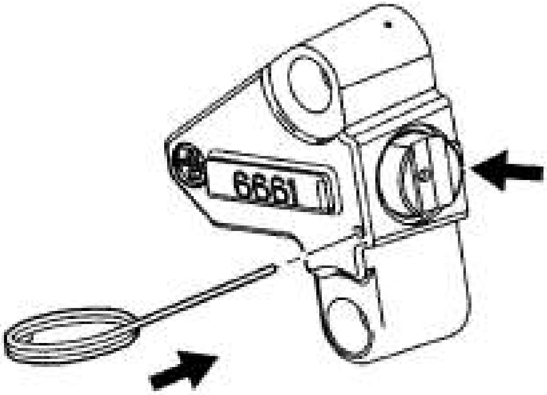
- EN 46112 Tensioner Retraction Pins
- J 45027 Tensioner Tool



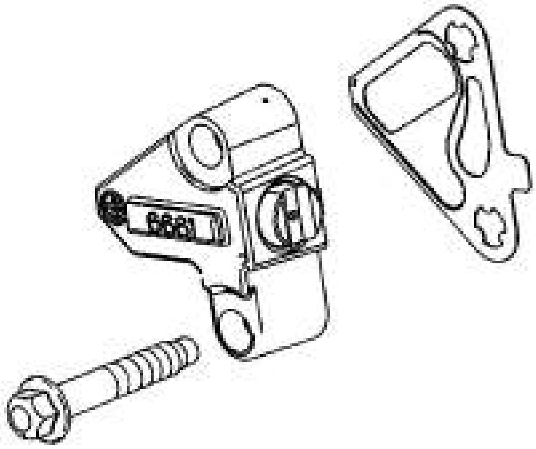
1. Using the J 45027 (1) reset the left secondary camshaft drive chain tensioner plunger (2).



2. Install the plunger (2) into the left secondary camshaft drive chain tensioner body (1).

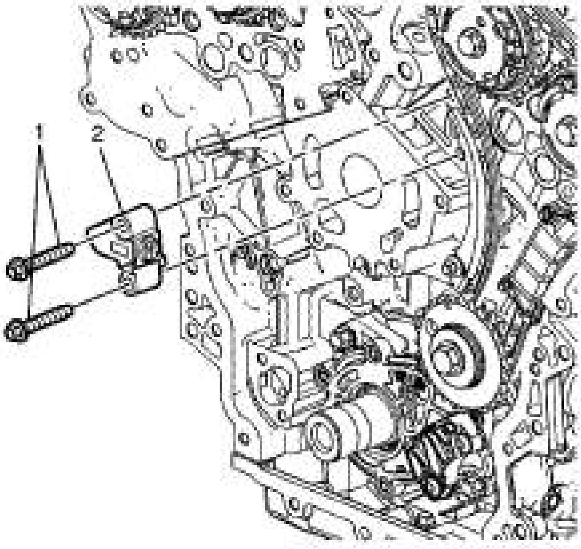


3. Compress the plunger into the body and lock the left secondary camshaft drive chain tensioner by inserting the EN 46112 into the access hole in the side of the left secondary camshaft drive chain tensioner body.
4. Slowly release pressure on the left secondary camshaft drive chain tensioner. The left secondary camshaft drive chain tensioner should remain compressed.



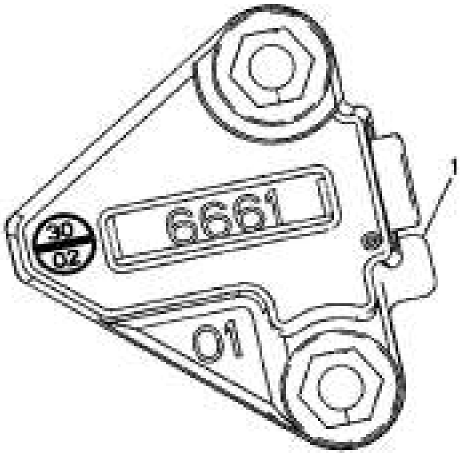
5. Install a NEW left secondary camshaft drive chain tensioner gasket to the left secondary camshaft drive chain tensioner.
6. Install the left secondary camshaft drive chain tensioner bolts through the left secondary camshaft drive chain tensioner and gasket.
7. Ensure the left secondary camshaft drive chain tensioner mounting surface on the left

cylinder head does not have any burrs or defects that may degrade the sealing of the NEW left secondary camshaft drive chain tensioner gasket.



8. Place the left secondary camshaft drive chain tensioner (2) into position and loosely install the secondary camshaft drive chain tensioner to cylinder block retaining bolts (1) to the block.

   Notice: Refer to Fastener Notice in the Preface section.

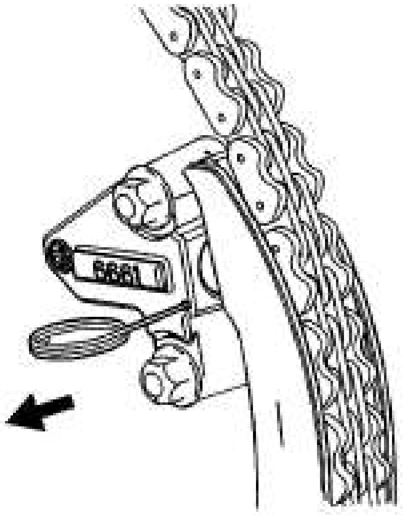


9. Verify the proper placement of the left secondary camshaft drive chain tensioner gasket tab (1).
   9.1. First Pass

Tighten
Tighten the left secondary camshaft drive chain tensioner bolts to 5 N·m (44 lb in).

9.2. Final Pass

Tighten
Tighten the left secondary camshaft drive chain tensioner bolts to 23 N·m (17 lb ft).



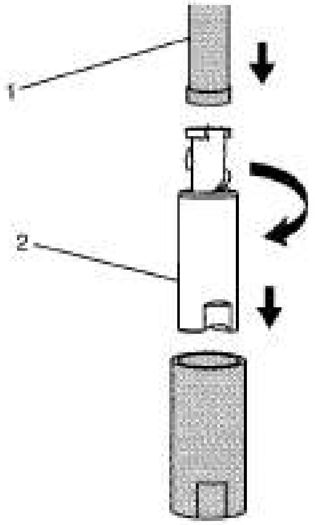
10. Release the left secondary camshaft drive chain tensioner by pulling out the EN 46112 and unlocking the tensioner plunger.
11. Verify the left secondary camshaft drive chain timing mark alignments. Refer to Camshaft Timing Drive Chain Alignment Diagram .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995372**

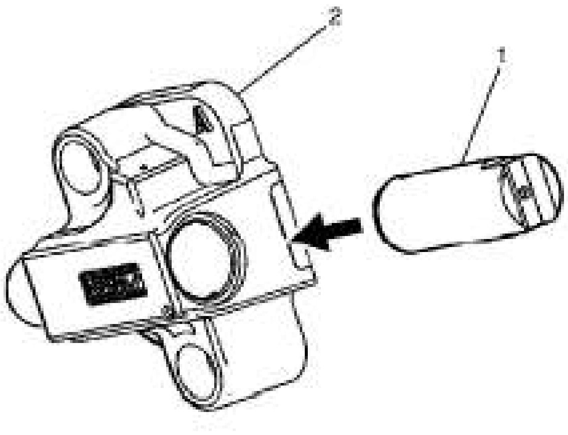
Secondary Camshaft Drive Chain Tensioner Installation - Right Side

Tools Required

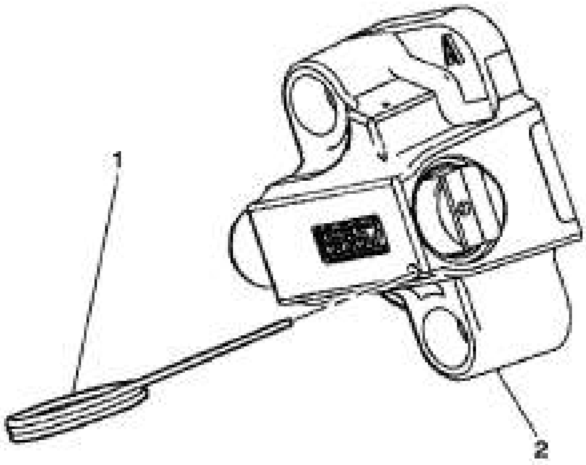
- EN 46112 Tensioner Retraction Pins
- J 45027 Tensioner Tool



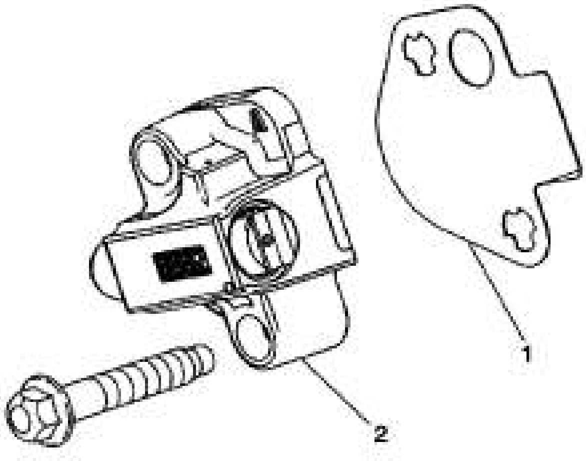
1. Using the J 45027 reset the right secondary camshaft drive chain tensioner plunger.



2. Install the plunger (1) into the right secondary camshaft drive chain tensioner body (2).

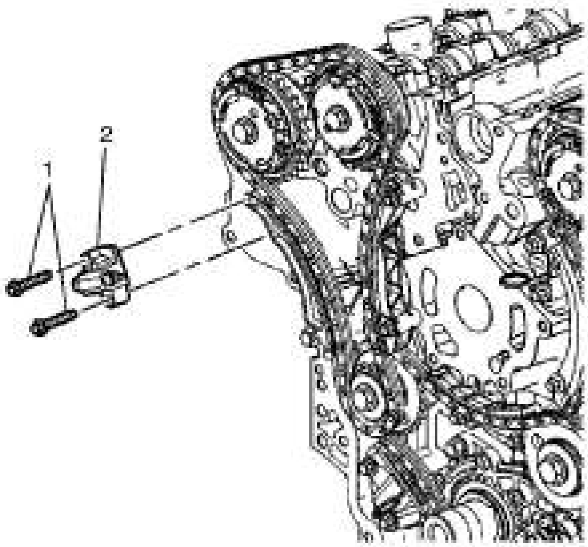


3. Compress the plunger into the body and lock the right secondary camshaft drive chain tensioner (2) by inserting the EN 46112 (1) into the access hole in the side of the right secondary camshaft drive chain tensioner (2).
4. Slowly release pressure on the right secondary camshaft drive chain tensioner (2). The right secondary camshaft drive chain tensioner (2) should remain compressed.



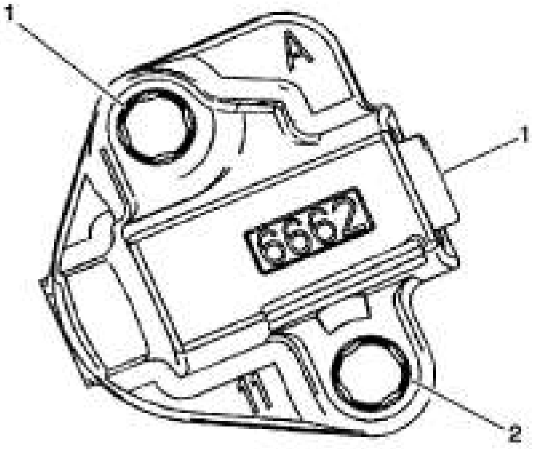
5. Install a NEW right secondary camshaft drive chain tensioner gasket (1) to the right secondary camshaft drive chain tensioner (2).
6. Install the right secondary camshaft drive chain tensioner bolts through the right secondary camshaft drive chain tensioner (2) and gasket (1).
7. Ensure the right secondary camshaft drive chain tensioner (2) mounting surface on the right

cylinder head does not have any burrs or defects that may degrade the sealing of the NEW right secondary camshaft drive chain tensioner gasket (1).



8. Place the right secondary camshaft drive chain tensioner (2) into position and loosely install right secondary camshaft drive chain tensioner to cylinder block retaining bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.

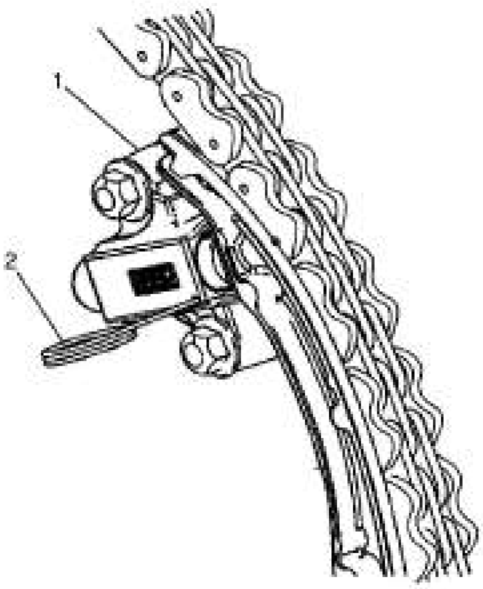


9. Verify the proper placement of the right secondary camshaft drive chain tensioner gasket tab (1).
10. Tighten the right secondary camshaft drive chain tensioner to cylinder block retaining bolts (2).
    10.1. First Pass

Tighten
Tighten the bolts to 5 N·m (44 lb in).

10.2. Final Pass

Tighten
Tighten the bolts to 23 N·m (17 lb ft).



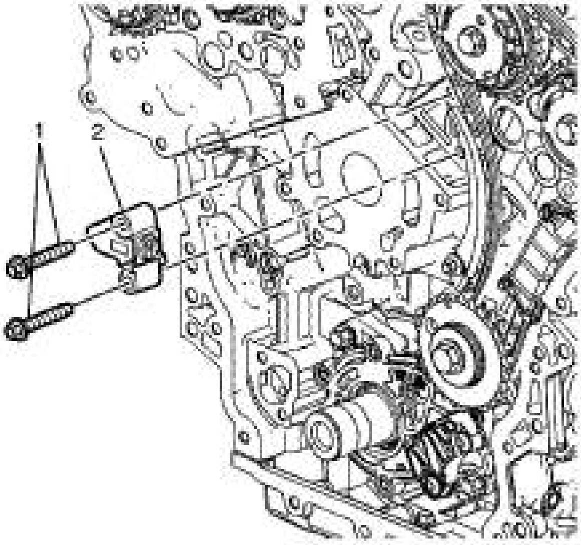
11. Release the right camshaft drive chain tensioner by pulling out the EN 46112 and unlocking the tensioner plunger.

Notice: Refer to General Repair Instructions in the Preface section.

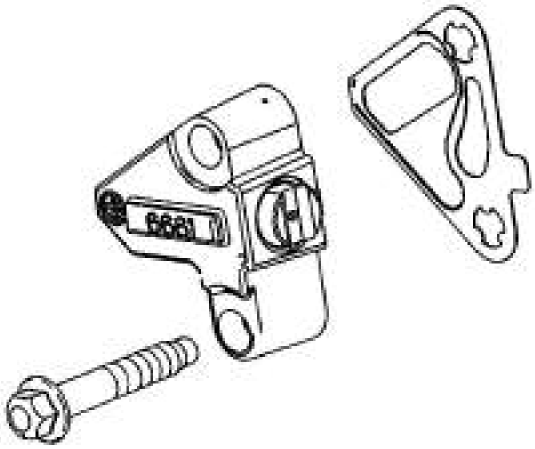
12. Verify all primary and secondary camshaft drive chain timing mark alignments. Refer to Camshaft Timing Drive Chain Alignment Diagram .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977665**

Secondary Camshaft Drive Chain Tensioner Removal - Left Side



1. Remove the left secondary camshaft drive chain tensioner to cylinder block retaining bolts (1).
2. Remove the left secondary camshaft drive chain tensioner (2).



Important: The left secondary camshaft drive chain tensioner gasket must be discarded whenever the left secondary camshaft drive chain tensioner has been removed from the cylinder block.

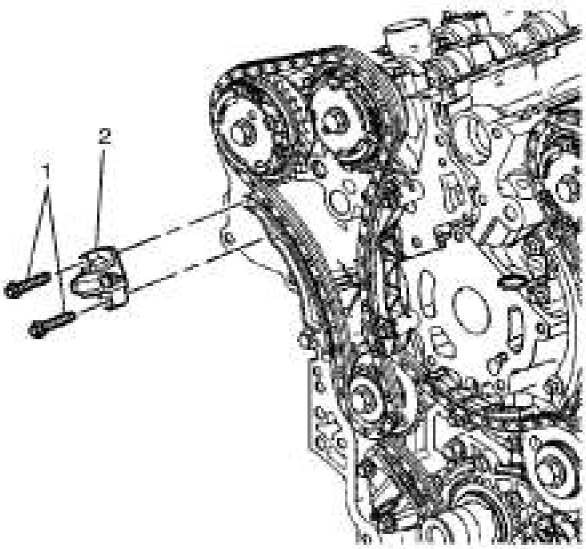
3. Remove left secondary camshaft drive chain tensioner gasket from the left secondary camshaft drive chain tensioner.

   Discard the gasket.

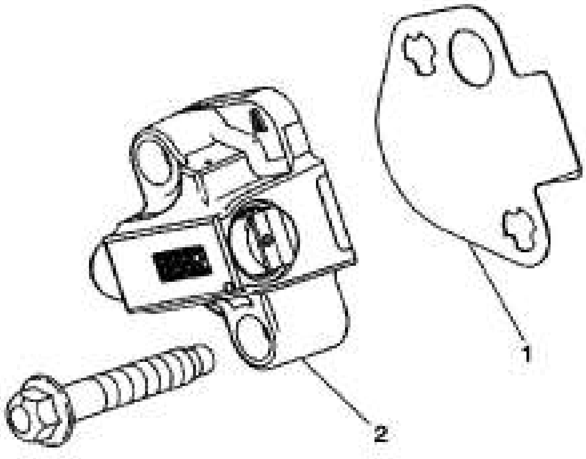
4. Inspect the left secondary camshaft drive chain tensioner mounting surface on the left cylinder head for burrs or any defects that may degrade the sealing of the NEW left secondary camshaft drive chain tensioner gasket.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1977675

Secondary Camshaft Drive Chain Tensioner Removal - Right Side



1. Remove the right secondary camshaft drive chain tensioner to cylinder block retaining bolts (1).
2. Remove the right secondary camshaft drive chain tensioner (2).



Important: The right secondary camshaft drive chain tensioner gasket (2) must be discarded whenever the right secondary camshaft drive chain tensioner (1) has been removed from the cylinder block.

3. Remove the right secondary camshaft drive chain tensioner gasket (1) from the right secondary camshaft drive chain tensioner (2).

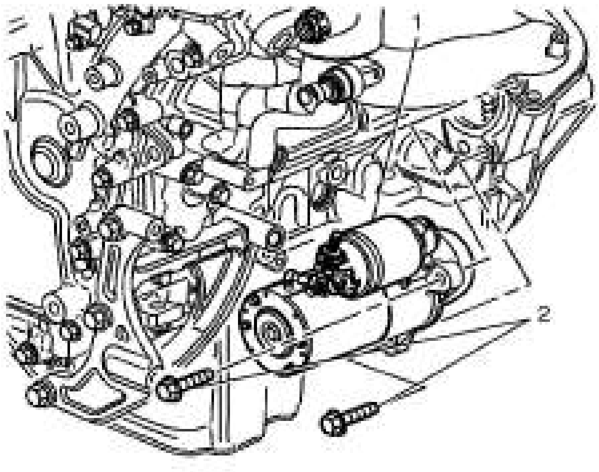
   Discard the gasket.

4. Inspect the right secondary camshaft drive chain tensioner mounting surface on the right cylinder head for burrs or any defects that may degrade the sealing of the NEW right secondary camshaft drive chain tensioner gasket.

Service Prior to Assembly

- Dirt will cause premature wear of the rebuilt engine. Clean all the components.
- Use the correct tools to measure the components when checking for wear above acceptable tolerances. Components not within the manufacturer's specification must be repaired or replaced.
- When the components are reinstalled into an engine, return the components to their original location, position, and direction.
- During assembly, lubricate all the moving parts with clean engine oil (unless otherwise specified). This will provide initial lubrication when the engine is first started.

Starter Installation



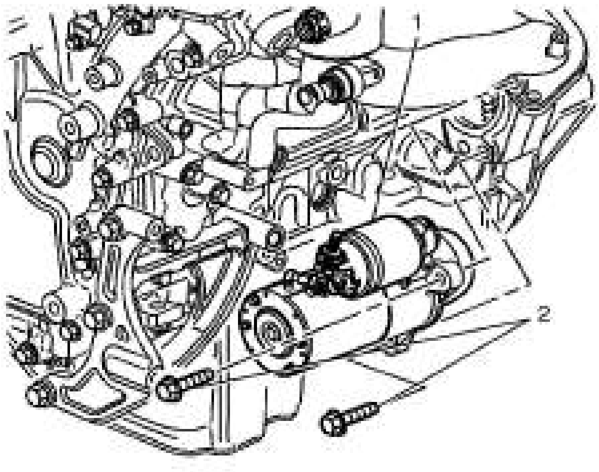
1. Install the starter motor (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the starter motor to cylinder block retaining bolts (2).

   Tighten
   Tighten the bolts to 58 N·m (42 lb ft).

Starter Removal

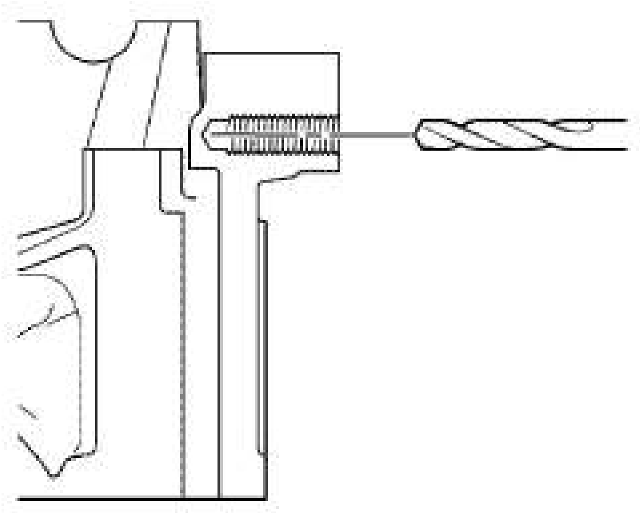


1. Remove the starter motor to cylinder block retaining bolts (2).
2. Remove the starter motor (1).

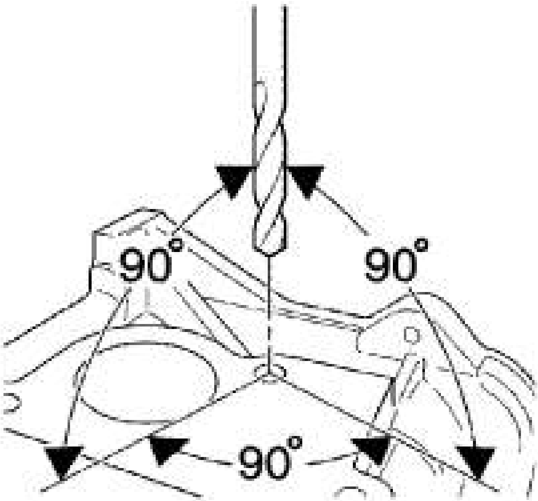
Thread Repair

Tools Required

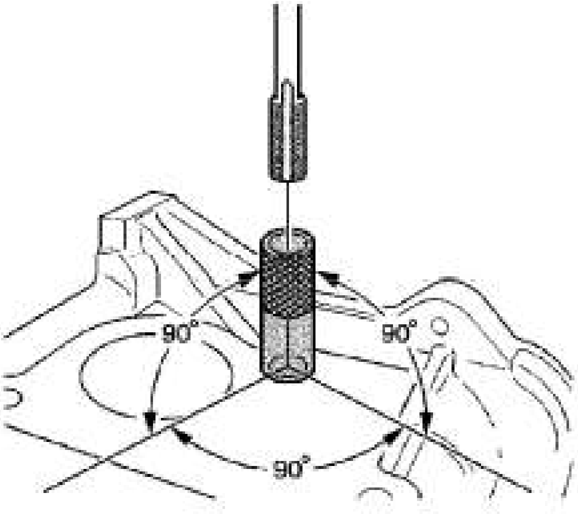
- J 42385-700 High Feature Thread Repair Kit
- J 42385-2000 Thread Insert Kit
- J 43965 Thread Repair Extension Kit
- The thread repair process involves a solid, thin walled, self-locking, carbon steel, bushing type insert. During the insert installation process, the installation driver tool cold-rolls the bottom internal threads and expands the bottom external threads of the insert into the base material. This action mechanically locks the insert into place.
- The drill bit and counter bore tool from the tool kit J 42385-700 and J 42385-2000 is designed for use with either a suitable tap wrench or drill motor. Limited access and larger hole repair may process better using a tap wrench. An extension from kit J 43965 may also be necessary to drive the thread repair tooling dependent on access to the hole being repaired. Use only a tap wrench when tapping the hole and during installation of the insert.



1. It is critical that the drilling, counterboring and tapping of the hole to be repaired follows the same centerline as the original hole.



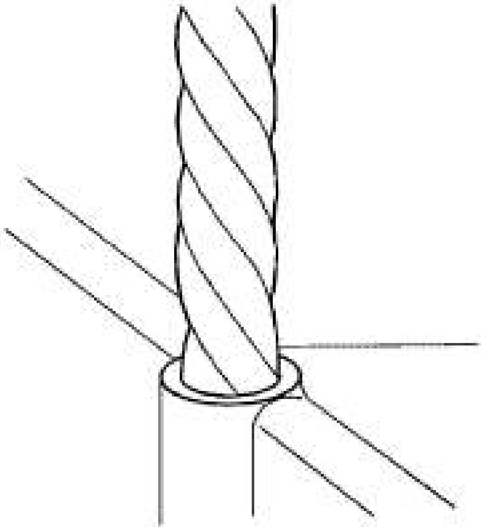
2. During the drilling and tapping of the hole being repaired ensure the tooling is consistently machining perpendicular to the surface of the base material.



3. If the threaded hole being repaired has a base surface perpendicular to the hole centerline, tapping guides are available to aid in tapping the hole.

Tap Size	Tap Guide	Tape Size	Tape Guide	Tap Size	Tape Guide
--	J 42385-	--	J 42385-	--	J 42385-
6 x 1.0	729	10 x 1.5	731	14 x 1.5	736
8 x 1.25	730	12 x 1.5	732	20 x 1.5	737

Standard Thread Repair - Flush Hole



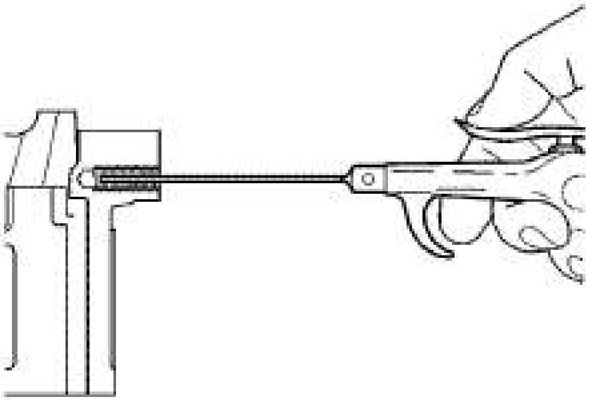
Important:

- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- DO NOT drill any further than the original hole depth.

1. Drill out the threads of the damaged hole.

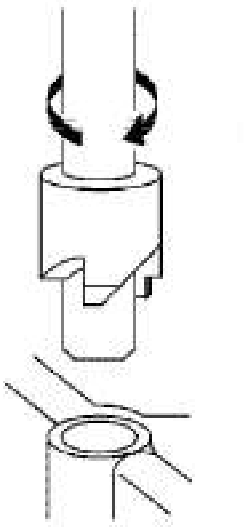
Specifications

- M6 inserts require a minimum drill depth of 15 mm (0.59 in).
- M8 inserts require a minimum drill depth of 20 mm (0.79 in).
- M10 inserts require a minimum drill depth of 23.5 mm (0.93 in).



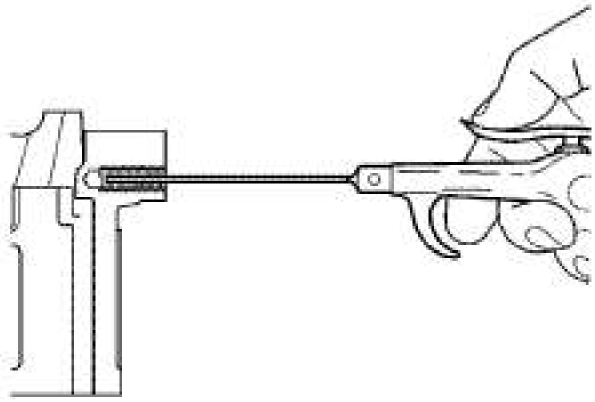
Important: All chips must be removed from the drilled hole prior to tapping.

2. Using compressed air, clean out any chips.



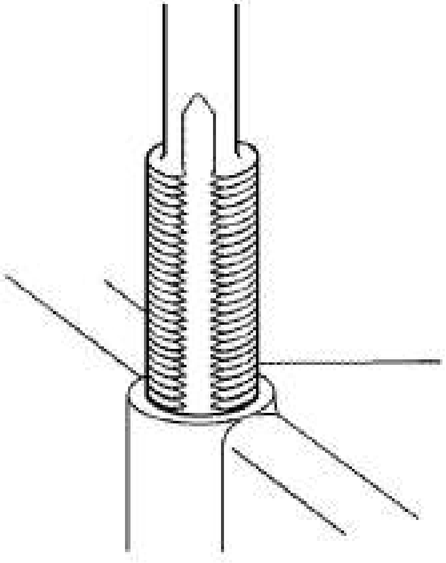
Important: A correctly counterbored hole will show a slight burnishing on the surface of the base material for 360 degrees around the drilled hole.

3. Counterbore the drilled hole to the full depth permitted by the tool (1).



Important: All chips must be removed from the drilled hole prior to tapping.

4. Using compressed air, clean out any chips.



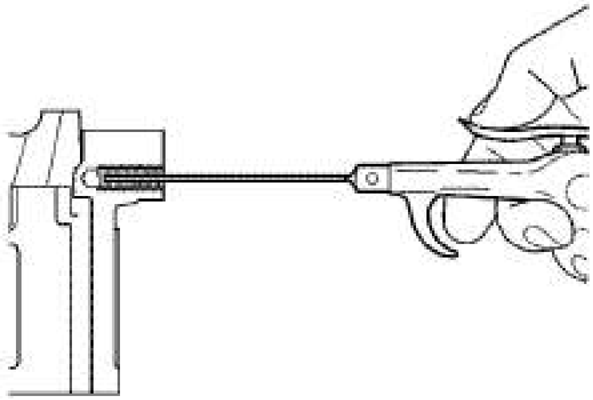
Important:

- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

5. Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

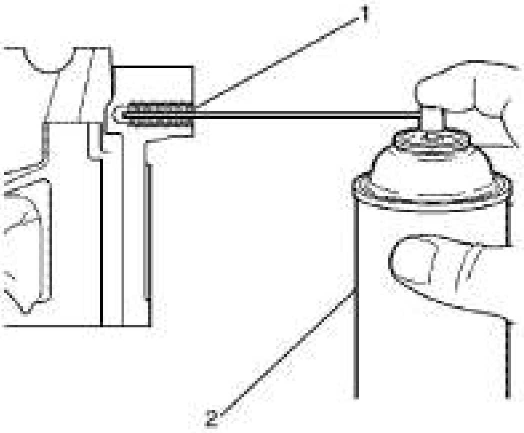
Specifications

- M6 inserts require a minimum tap depth of 15 mm (0.59 in).
- M8 inserts require a minimum tap depth of 20 mm (0.79 in).
- M10 inserts require a minimum tap depth of 23.5 mm (0.93 in).

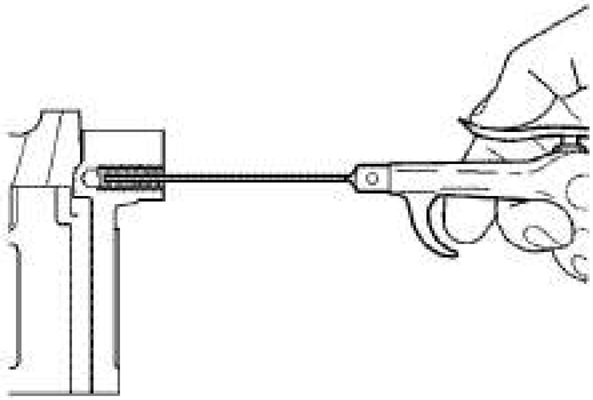


Important: All chips must be removed from the tapped hole prior to insert installation.

6. Using compressed air, clean out any chips.

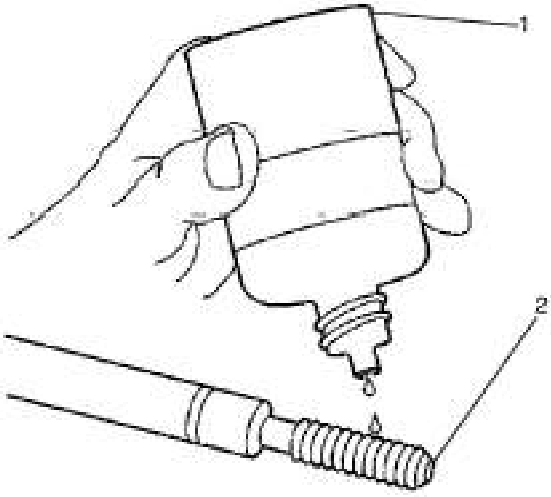


7. Spray a commercially available thread cleaner (2) into the tapped hole (1).



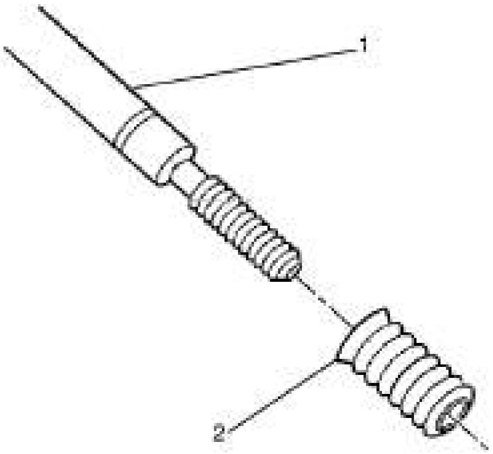
Important: All chips must be removed from the tapped hole prior to insert installation.

8. Using compressed air, clean out any chips.

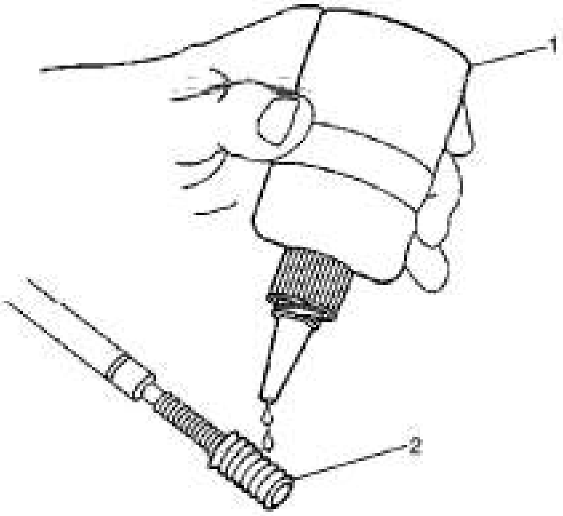


Important: DO NOT allow oil or other foreign material to contact the Outside Diameter (OD) of the insert.

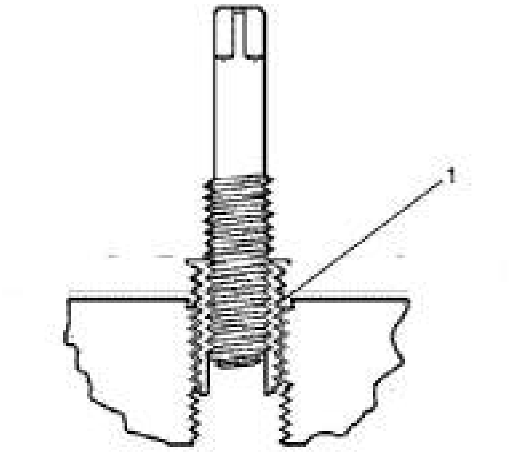
9. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



10. Install the insert (2) onto the driver installation tool (1).



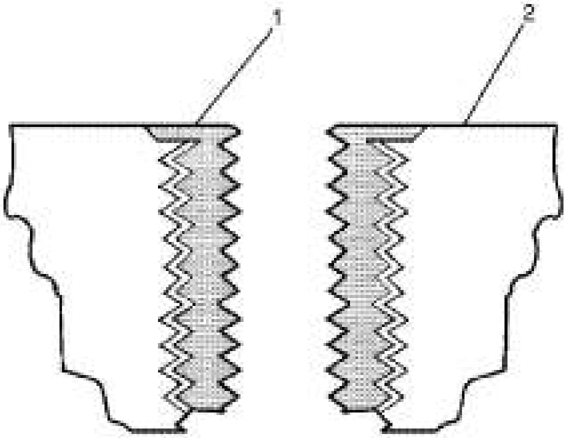
11. Apply threadlock sealant LOCTITE 277® or equivalent (1) to the insert OD threads (2).



12. Install the insert (1) into the tapped hole by hand only.

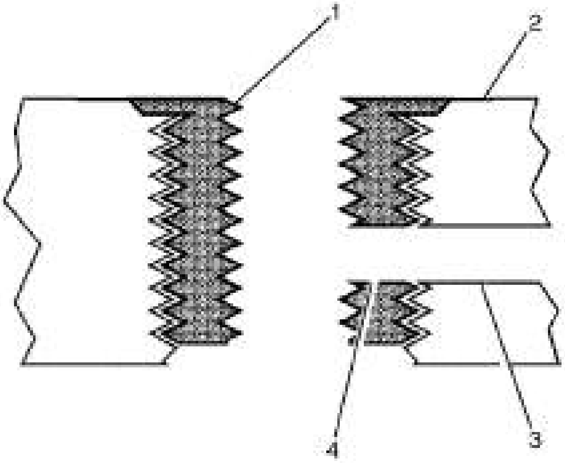
    Install the insert until the flange of the insert contacts the counterbored surface. Continue to rotate the installer tool (1) through the insert.

    The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.



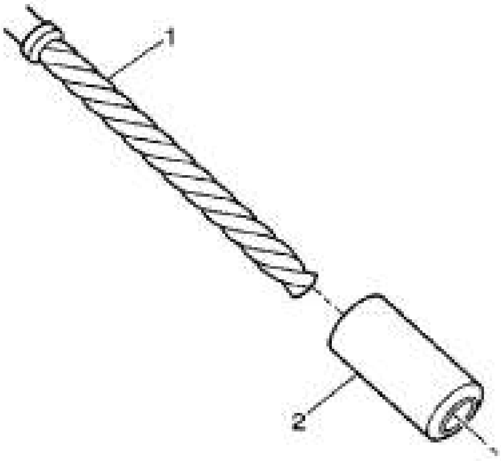
13. Inspect the insert for correct installation into the hole.

    A correctly installed insert (1) will be either flush or slightly below flush with the surface of the base material (2).

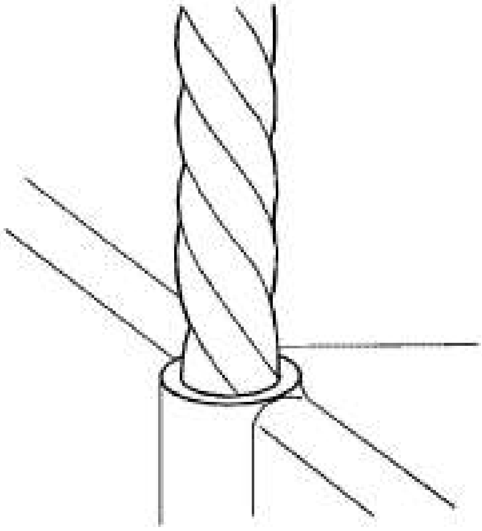


14. Any installed insert that restricts or blocks an oil or engine coolant passage (3) will need to have the oil or engine coolant passage drilled out (4) to the original size of the oil or engine coolant passage. After drilling the restriction or blockage, clean out any chips and thread the installation driver tool through the insert again to remove any burrs caused by the drilling of the oil or engine coolant passage.

Recessed Thread Repair



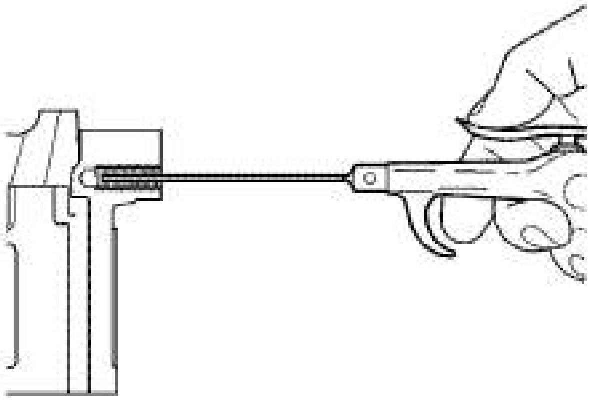
1. Install a stop collar (2) on the counterbore drill (1), if required.



Important:

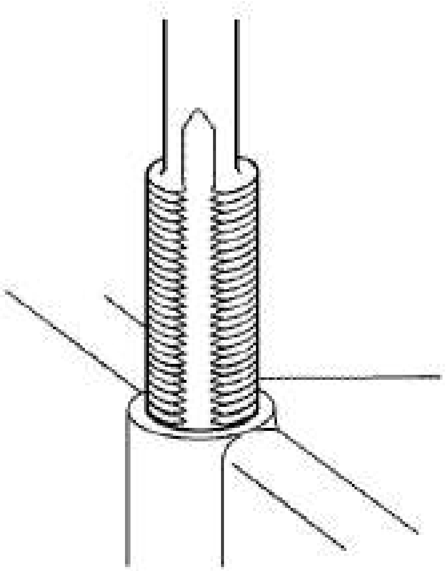
- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- Drill the hole until the stop collar contacts the surface of the base material.

2. Drill out the threads of the damaged hole.



Important: All chips must be removed from the drilled hole prior to tapping.

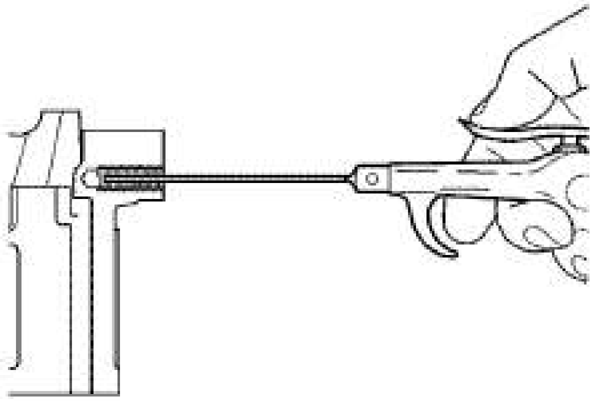
3. Using compressed air, clean out any chips.



Important:

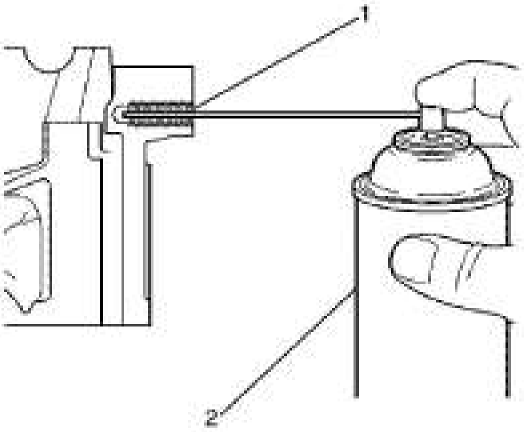
- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

4. Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

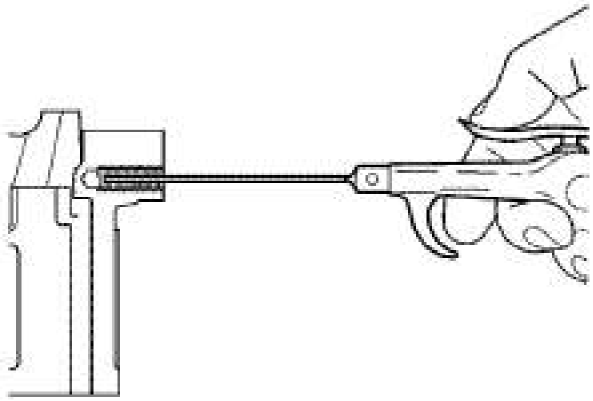


Important: All chips must be removed from the tapped hole prior to insert installation.

5. Using compressed air, clean out any chips.

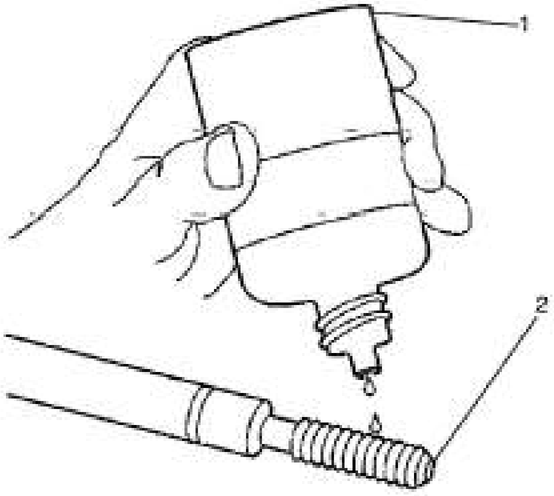


6. Spray a commercially available thread cleaner (2) into the tapped hole (1).



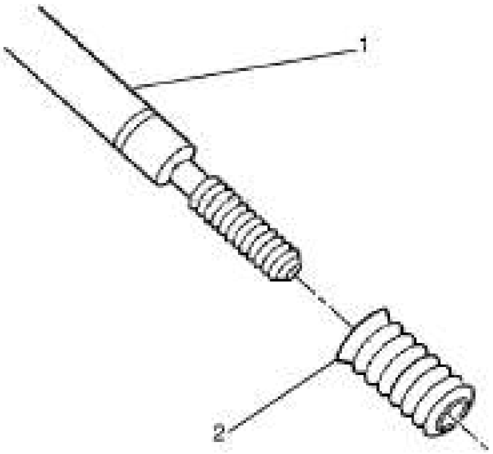
Important: All chips must be removed from the tapped hole prior to insert installation.

7. Using compressed air, clean out any chips.

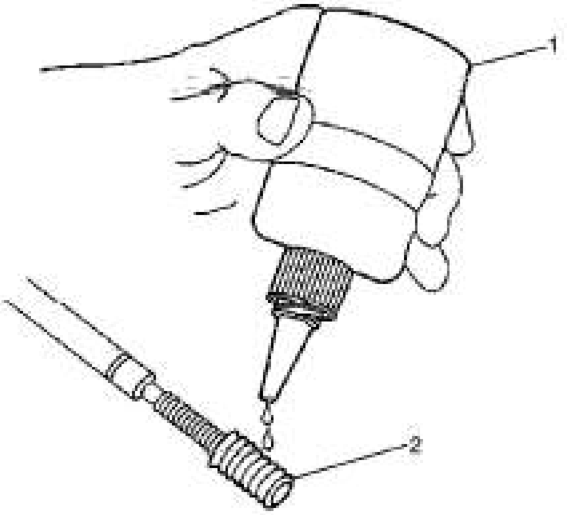


Important: DO NOT allow oil or other foreign material to contact the Outside Diameter (OD) of the insert.

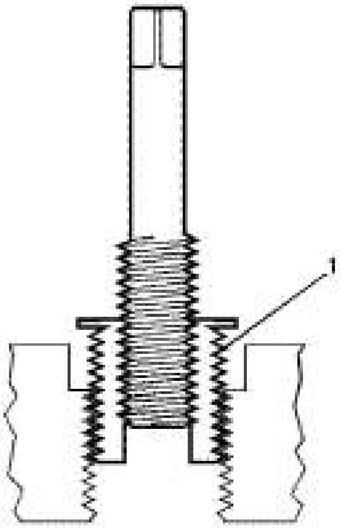
8. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



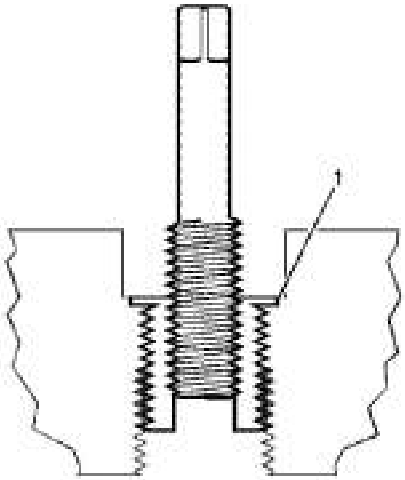
9. Install the insert (2) onto the driver installation tool (1).



10. Apply threadlock sealant LOCTITE 277® or equivalent (1) to the insert OD threads (2).

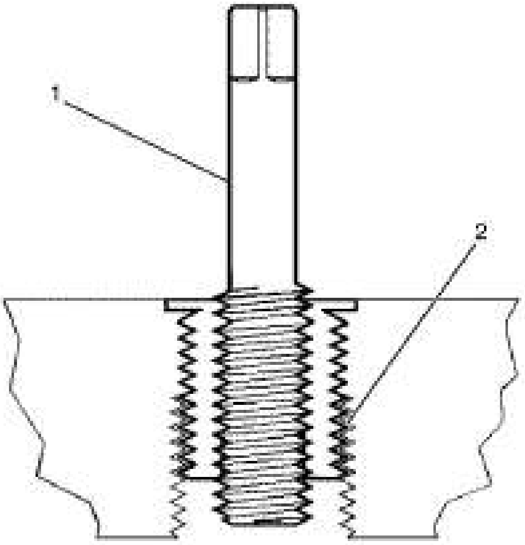


11. Install the insert (1) into the tapped hole by hand only.



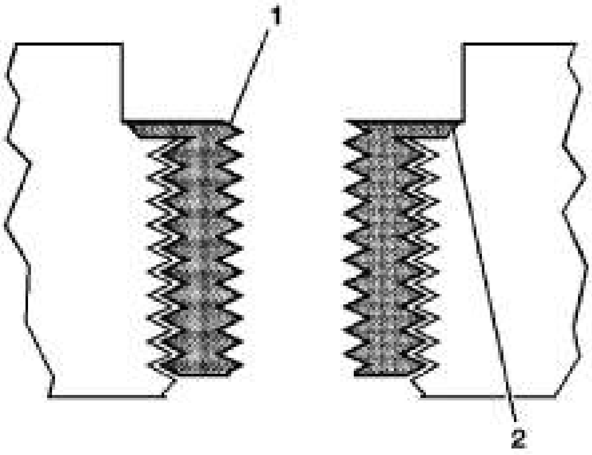
Important: If the insert will not thread down until the flange contacts the counterbored surface remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining chips and/or incorrect tapping.

12. Install the insert until the flange (1) of the insert contacts the counterbored surface.

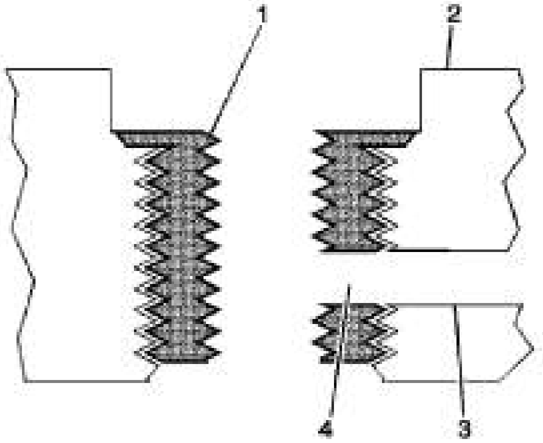


Important: The driver installation tool will tighten up before screwing completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

13. Continue to rotate the driver installation tool (1) through the insert (2).

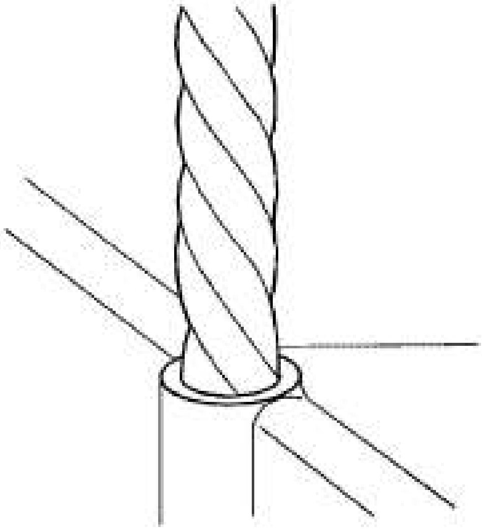


14. Inspect the insert (1) for correct installation (2) into the tapped hole.



15. Any installed insert that restricts or blocks an oil or engine coolant passage (3) will need to have the oil or engine coolant passage drilled out (4) to the original size of the oil or engine coolant passage. After drilling the restriction or blockage, clean out any chips and thread the installation driver tool through the insert again to remove any burrs caused by the drilling of the oil or engine coolant passage.

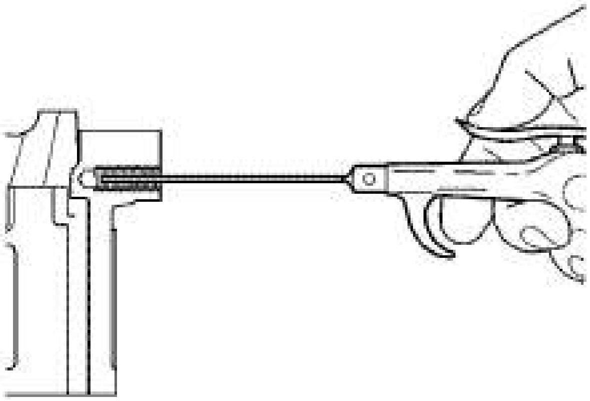
Tapered Pipe Thread Repair



Important:

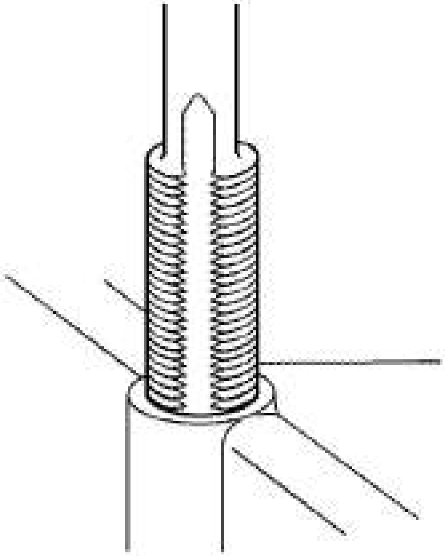
- The thread repair insert for tapered pipe threads is coated with a clear silver zinc coating.
- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- Drill the hole until the stop collar contacts the surface of the base material.

1. Drill out the threads of the damaged hole.



Important: All chips must be removed from the drilled hole prior to tapping.

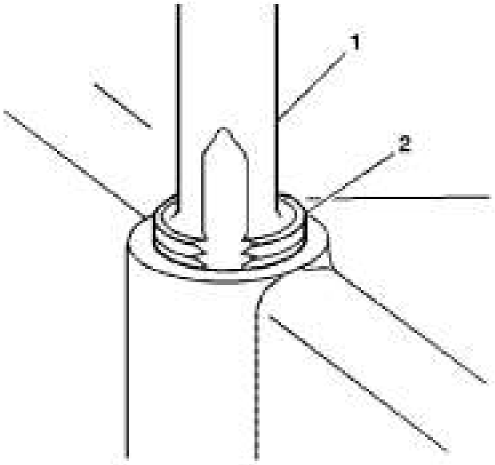
2. Using compressed air, clean out any chips.



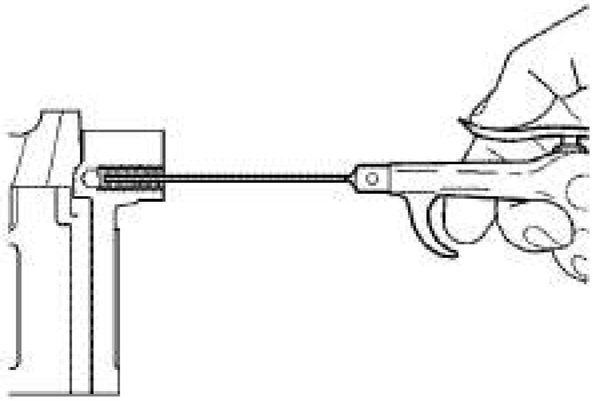
Important:

- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

3. Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

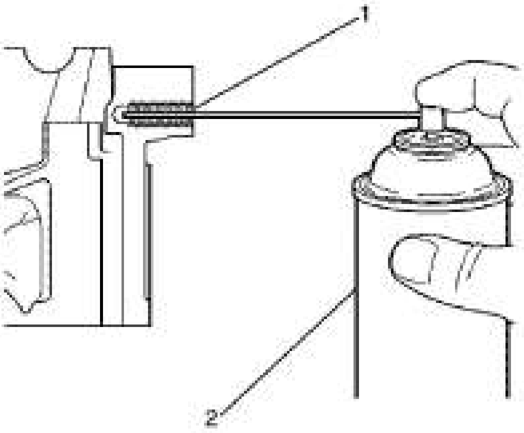


4. Tap the drilled hole until the threads at the top of the tap (1) are down to the surface of the base material (2).

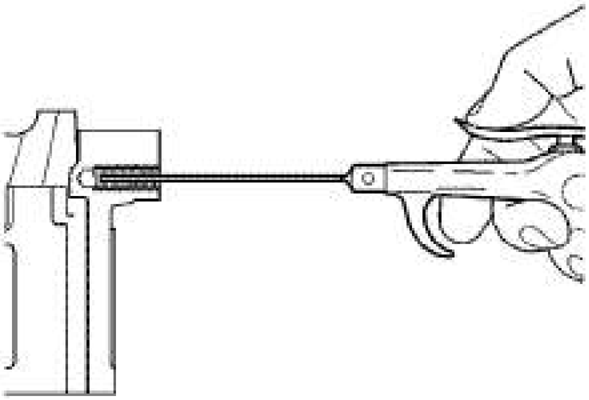


Important: All chips must be removed from the tapped hole prior to insert installation.

5. Using compressed air, clean out any chips.

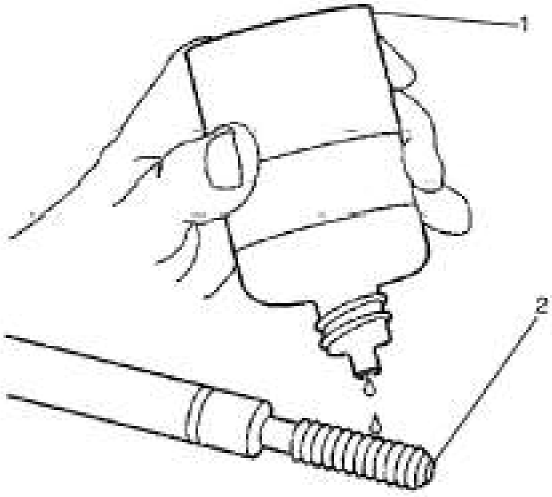


6. Spray a commercially available thread cleaner (2) into the tapped hole (1).



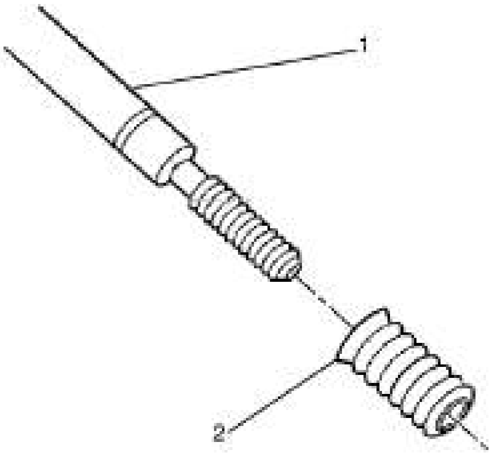
Important: All chips must be removed from the tapped hole prior to insert installation.

7. Using compressed air, clean out any chips.

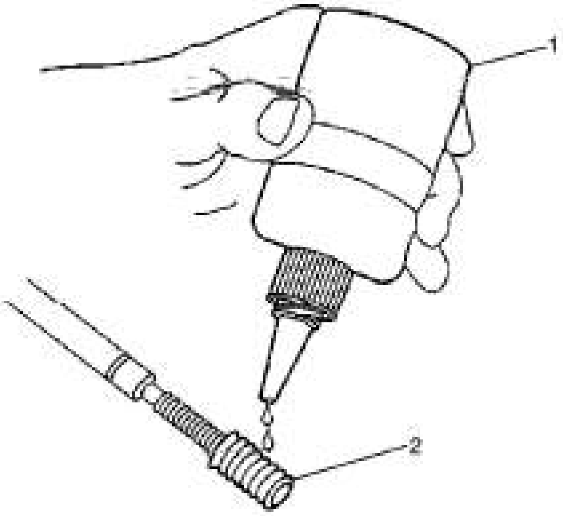


Important: DO NOT allow oil or other foreign material to contact the Outside Diameter (OD) of the insert.

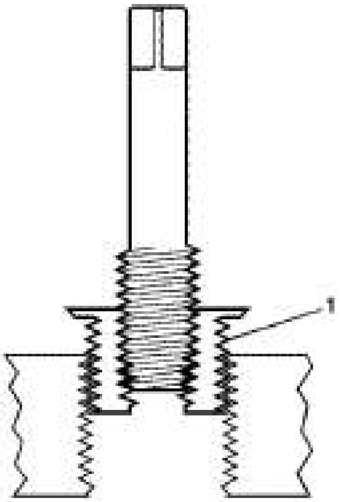
8. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



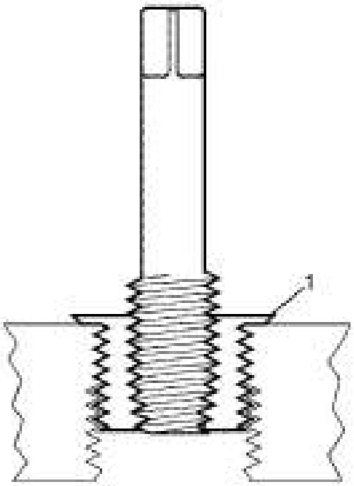
9. Install the insert (2) onto the driver installation tool (1).



10. Apply threadlock sealant LOCTITE 277® or equivalent (1) to the insert OD threads (2).

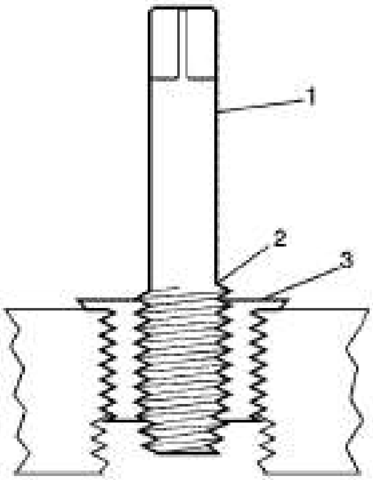


11. Install the insert (1) into the tapped hole by hand only.



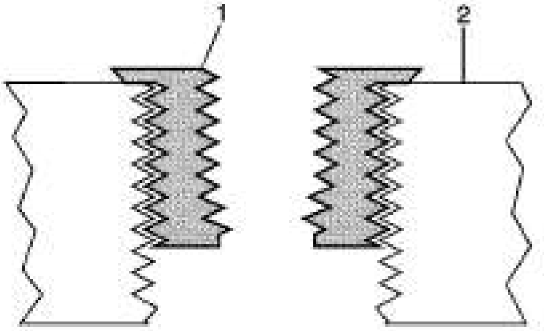
Important: If the insert will not thread down until the flange contacts the surface of the base material remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining chips and/or incorrect tapping.

12. Install the insert until the flange (1) of the insert contacts the surface of the base material.

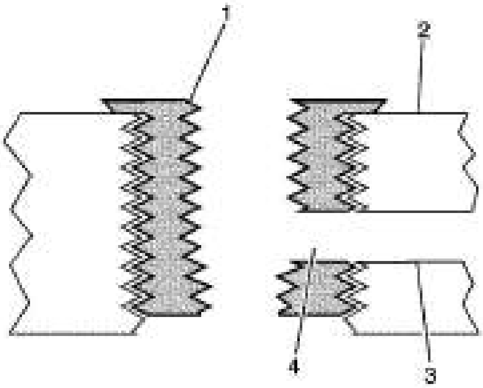


Important: The driver installation tool will tighten up before screwing completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

13. Continue to rotate the driver installation tool (1) until the top of the threaded section (2) is level with the top of the insert (3).



14. Inspect the insert (1) for correct installation (2) into the tapped hole.

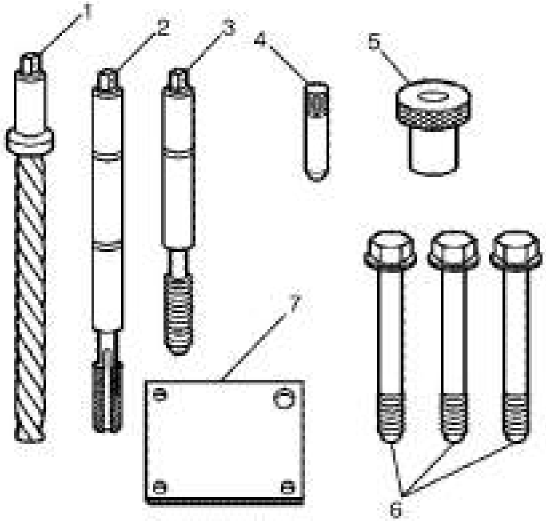


15. Any installed insert that restricts or blocks an oil or engine coolant passage (3) will need to have the oil or engine coolant passage drilled out (4) to the original size of the oil or engine coolant passage. After drilling the restriction or blockage, clean out any chips and thread the installation driver tool through the insert again to remove any burrs caused by the drilling of the oil or engine coolant passage.

Cylinder Head Bolt Hole Thread Repair

Tools Required

- J 42385-700 High Feature Thread Repair Kit
- J 42385-2000 Thread Insert Kit
-



- The cylinder head bolt hole thread repair tooling are in the kits J 42385-2000 and J 42385-700 . The cylinder head bolt hole thread repair components consist of the following:

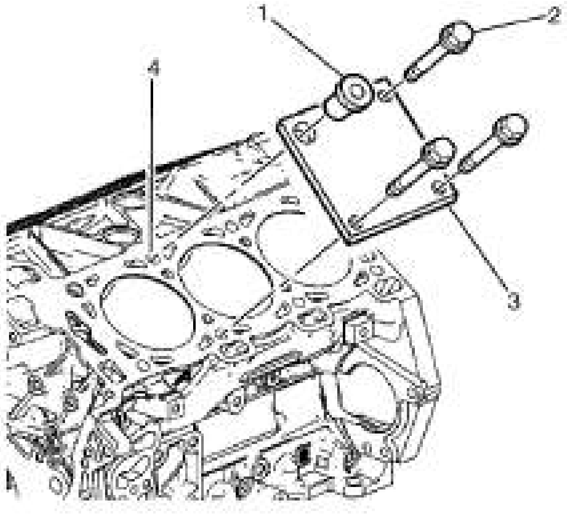
- J 42385-723 Drill (1)
- J 42385-724 Tap (2)
- J 42385-725 Installation driver (3)
- J 42385-303 Alignment pin (4)
- J 42385-302 Bushing (5)
- J 42385-733 Bolts (6)
- J 42385-401 Fixture plate (7)

Caution: Refer to Safety Glasses Caution in the Preface section.

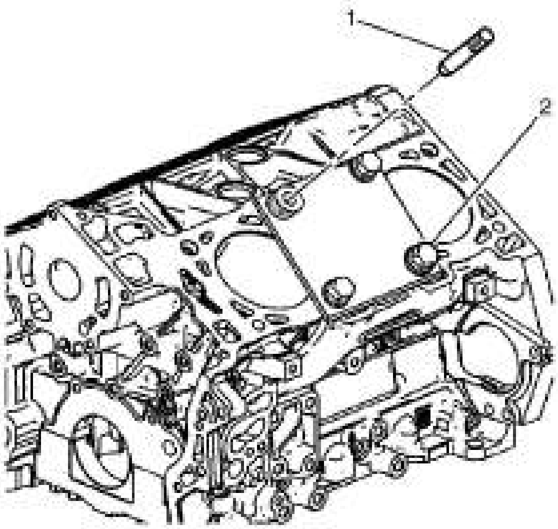
Important:

- Remove the fixture plate prior to installing the insert with the installer tool.
- The use of a cutting type fluid such as WD 40®; or equivalent is recommended when performing the drilling, counterboring and tapping procedures.

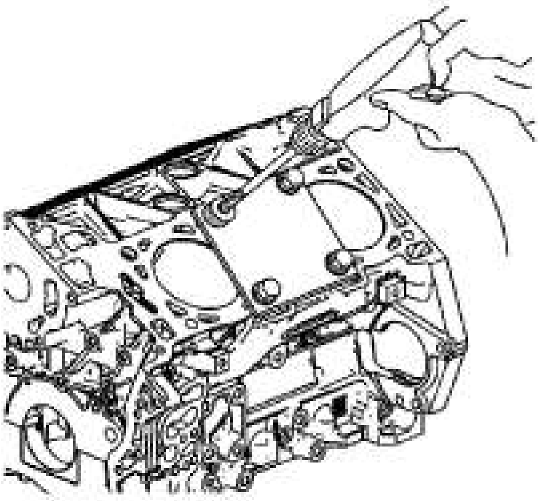
- When installed to the correct depth, the flange of the insert will be seated against the counterbore of the drilled/tapped hole.



1. Position the fixture plate (3) with the bushing (1) installed over the cylinder head bolt hole to be repaired (4).
2. Loosely install the fixture plate bolts (2) into the remaining cylinder head bolt holes.



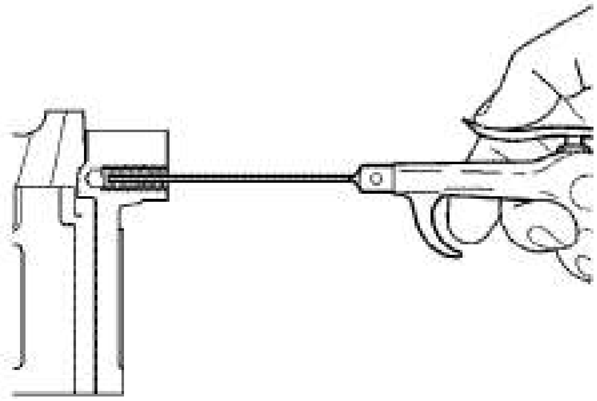
3. Position the alignment pin (1) through the bushing and into the cylinder head bolt hole.
4. With the alignment pin in the desired cylinder head bolt hole, tighten the fixture retaining bolts (2).
5. Remove the alignment pin (1) from the cylinder head bolt hole.



Important:

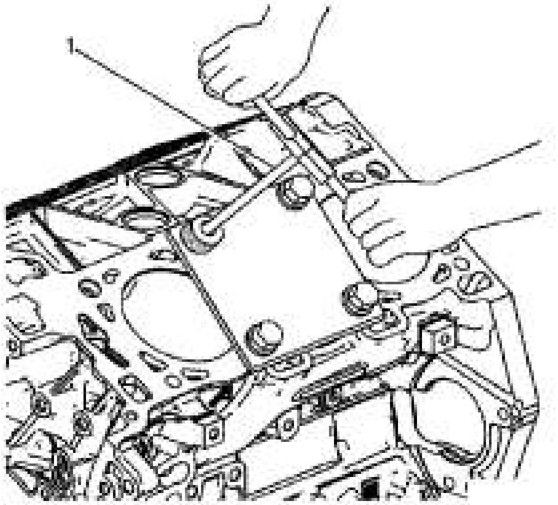
- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- Drill the hole until the stop collar contacts the top of the drill bushing.

6. Drill out the threads of the damaged hole.



Important: All chips must be removed from the drilled hole prior to tapping.

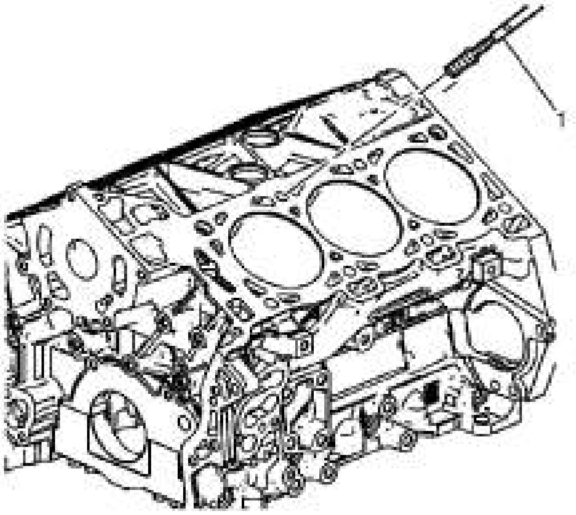
7. Using compressed air, clean out any chips.



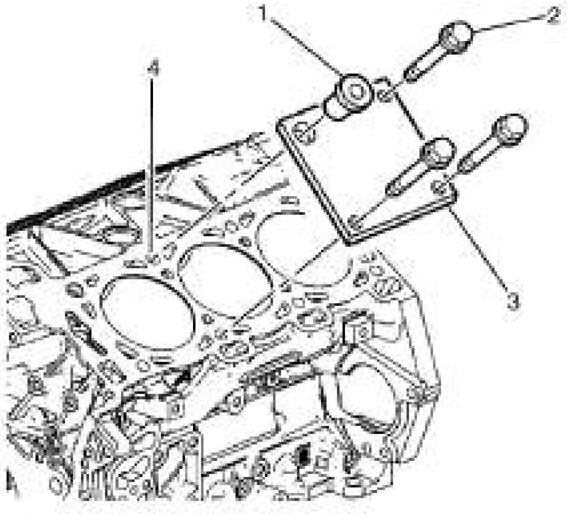
Important:

- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

8. Using a suitable tapping wrench (1), tap the threads of the drilled hole by hand only.

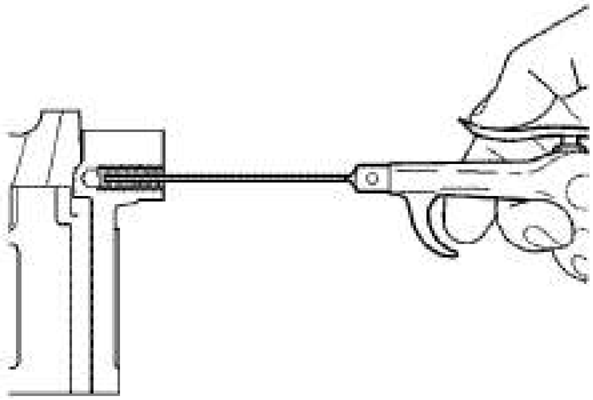


9. In order to tap the new threads for the insert to the correct depth, rotate the tap into the cylinder head bolt hole until the mark (1) on the tap aligns with the top of the drill bushing.



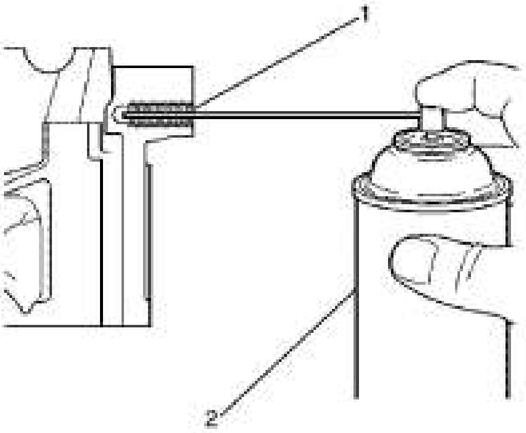
Important: Remove the fixture plate prior to installing the insert with the installer tool.

10. Remove the fixture plate bolts (2).
11. Remove the fixture plate (3) and bushing (1).

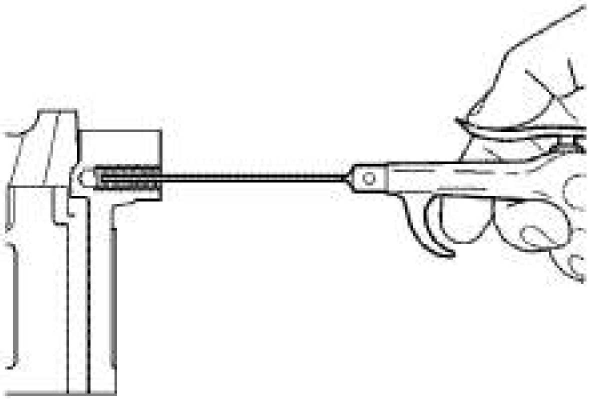


Important: All chips must be removed from the tapped hole prior to insert installation.

12. Using compressed air, clean out any chips.

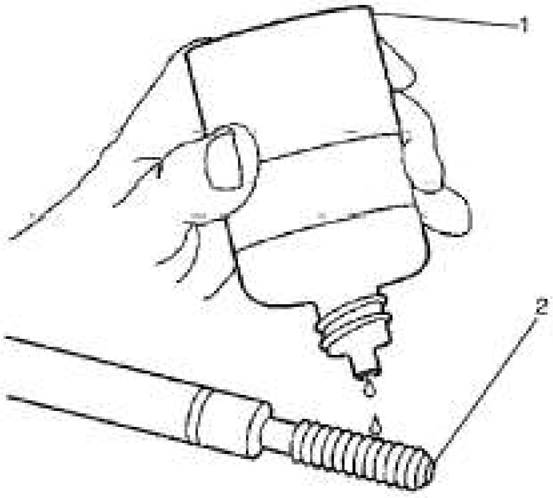


13. Spray a commercially available thread cleaner (2) into the tapped hole (1).



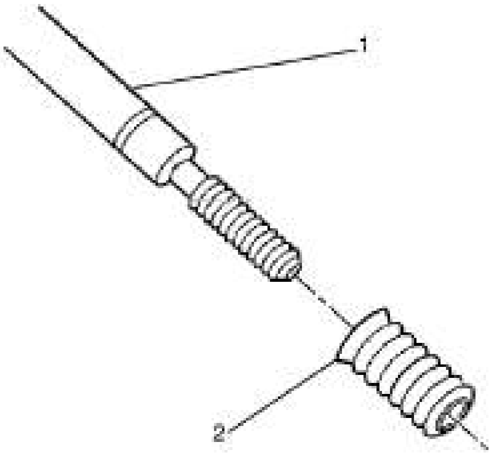
Important: All chips must be removed from the tapped hole prior to insert installation.

14. Using compressed air, clean out any chips.

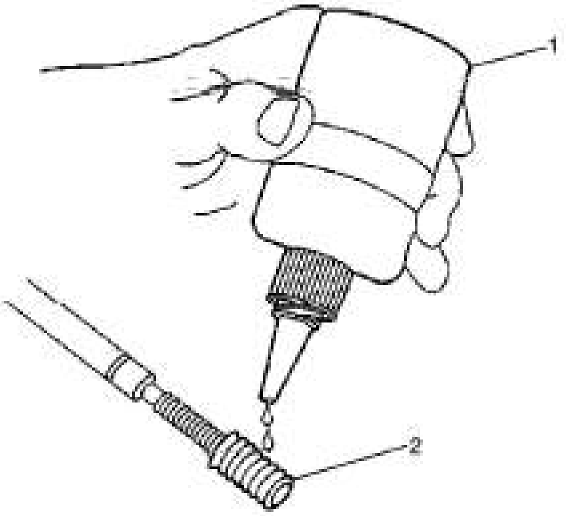


Important: DO NOT allow oil or other foreign material to contact the outside diameter (OD) of the insert.

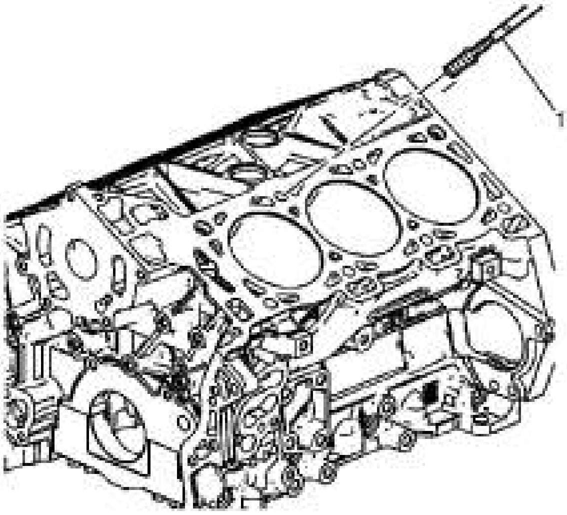
15. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



16. Install the insert (2) onto the driver installation tool (1).



17. Apply threadlock sealant such as LOCTITE 277® ; or equivalent (1) to the insert OD threads (2).



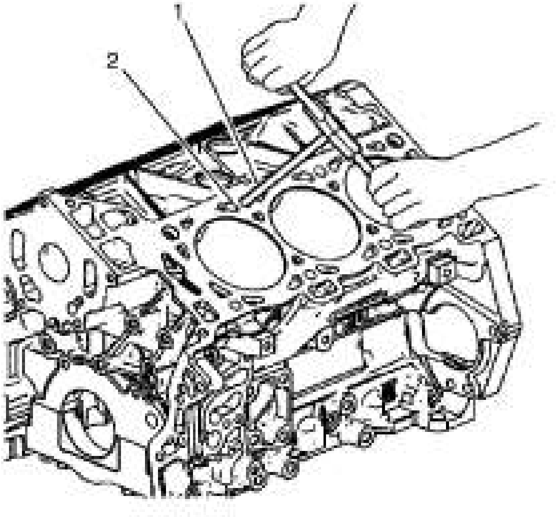
18. Install the insert and installation driver (1) into the tapped hole by hand only.
19. Start the insert into the threaded hole.

    Important: If the insert will not thread down until the flange contacts the counterbored surface remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining chips and/or incorrect tapping.

20. Install the insert until the flange of the insert contacts the counterbored surface.

    Important: The driver installation tool will tighten up before screwing completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

21. Continue to rotate the driver installation tool through the insert.

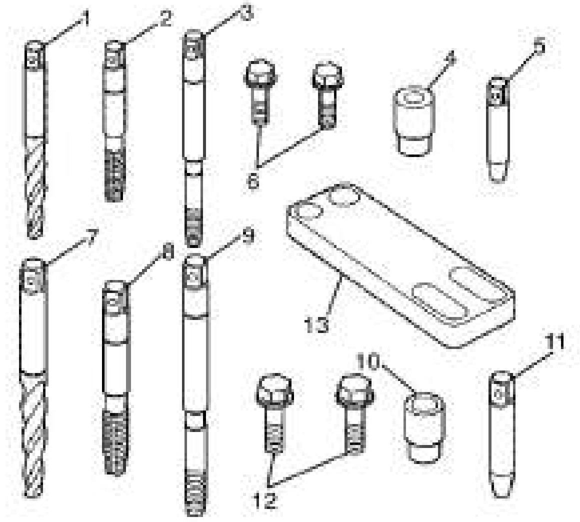


22. In order to completely form the new threads in the insert, rotate the driver installation tool through the insert until the mark (1) on the driver installation tool aligns with the surface of the cylinder block deck (2).
23. Inspect the insert for correct installation into the tapped hole.

Crankshaft Main Bolt Hole Thread Repair

Tools Required

- J 42385-700 High Feature Thread Repair Kit
- J 42385-2000 Thread Insert Kit



Important:

- In order to repair some crankshaft main bolt holes it will be necessary to mount the fixture plate upside down.
- DO NOT remove the fixture plate prior to installing the insert with the installation driver. The fixture plate remains in position throughout the thread repair process.

The crankshaft main bearing bolt hole thread repair tooling are in the kits J 42385-2000 and J 42385-700 . The crankshaft main bearing bolt hole thread repair components consist of the following:

- J 42385-702 Drill (1) for outboard holes
- J 42385-703 Tap (2) for outboard holes
- J 42385-704 Installation driver (3) for outboard holes
- J 42385-726 Bushing (4) for outboard holes
- J 42385-727 Alignment pin (5) for outboard holes

- J 42385-728 Bolts (6) for outboard holes
- J 42385-720 Drill (7) for inboard holes
- J 42385-721 Tap (8) for inboard holes
- J 42385-722 Installation driver (9) for inboard holes
- J 42385-713 Bushing (10)
- J 42385-308 Alignment pin (11)
- J 42385-734 Bolts (12)
- J 42385-712 Fixture plate (13)

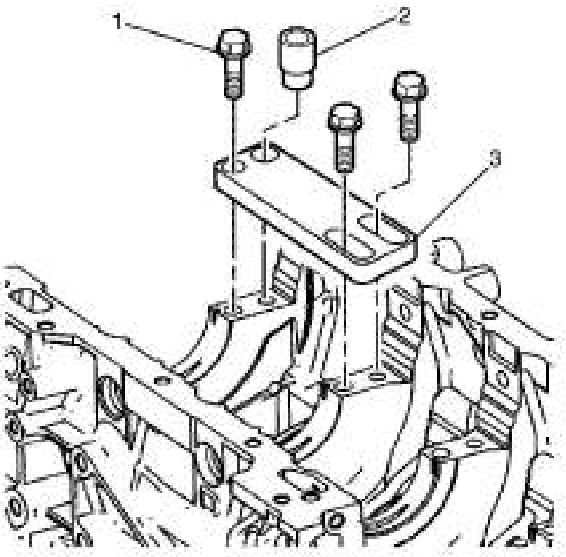
Outboard Bolt Holes

Caution: Refer to Safety Glasses Caution in the Preface section.

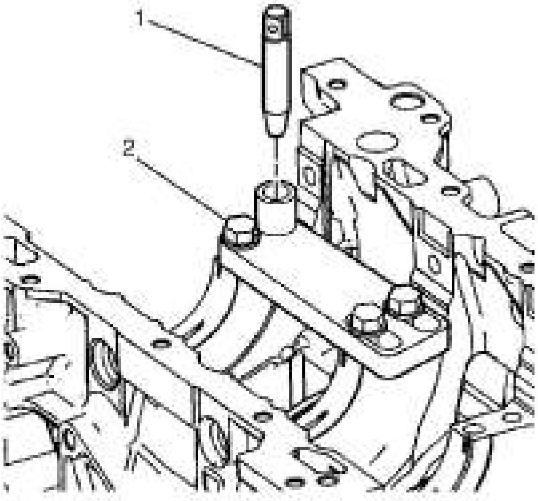
Important:

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counterboring and tapping procedures.

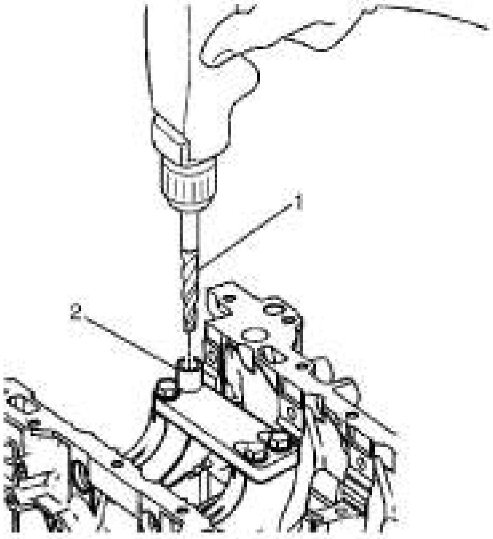
- When installed to the correct depth, the flange of the insert will be seated against the counterbore of the drilled/tapped hole.



1. Position the fixture plate (3) with the bushing (2) installed over the crankshaft main cap bolt hole to be repaired.
2. Loosely install the fixture plate bolts (1) into the remaining crankshaft main cap bolt holes.



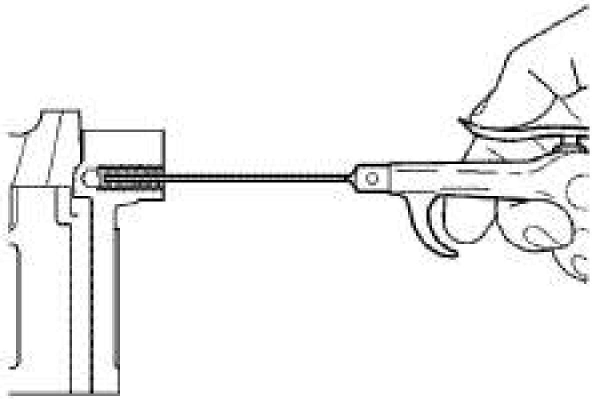
3. Position the alignment pin (1) through the bushing and into the crankshaft main cap bolt hole.
4. With the alignment pin in the desired crankshaft main cap bolt hole, tighten the fixture retaining bolts (2).
5. Remove the alignment pin (1) from the crankshaft main cap bolt hole.



Important:

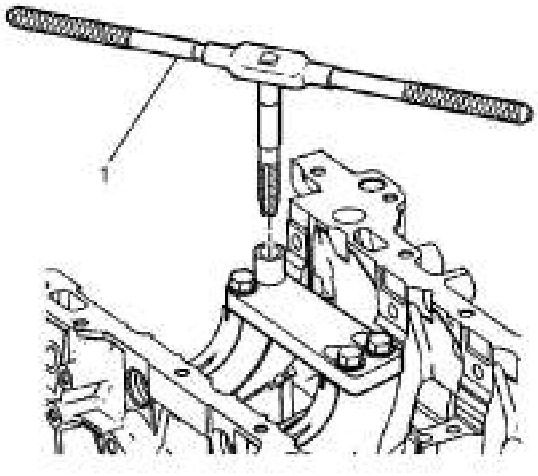
- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- Drill the crankshaft main bolt hole until the mark (1) on the drill aligns with the top of the drill bushing (2).

6. Drill out the threads of the damaged hole.



Important: All chips must be removed from the drilled hole prior to tapping.

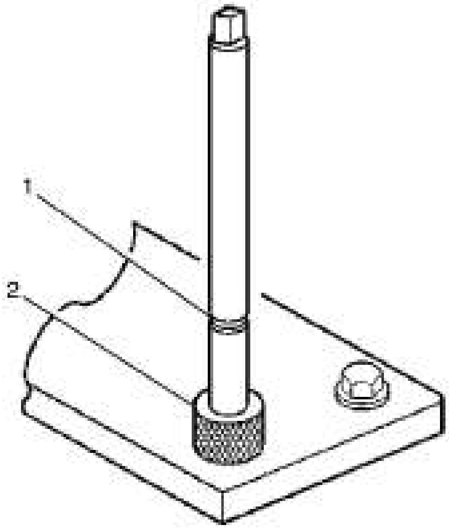
7. Using compressed air, clean out any chips.



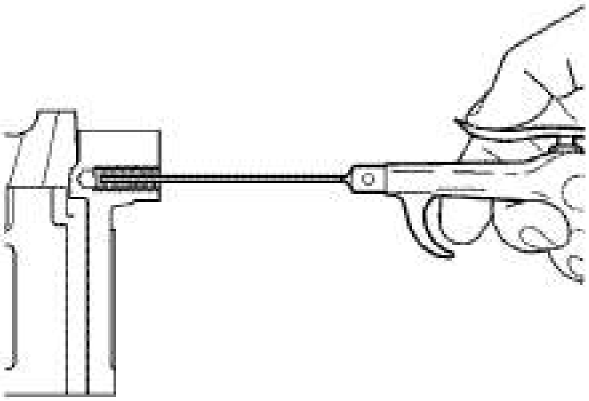
Important:

- DO NOT remove the fixture plate, ensure the fixture plate is installed during the machining and installation processes of the insert.
- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

8. Using a suitable tapping wrench (1), tap the threads of the drilled hole by hand only.

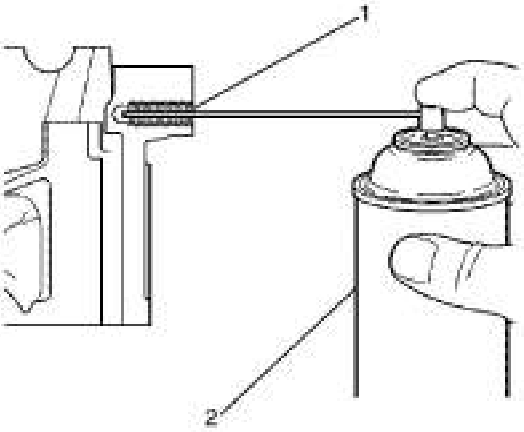


9. In order to tap the new threads for the insert to the correct depth, rotate the tap into the crankshaft main cap bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

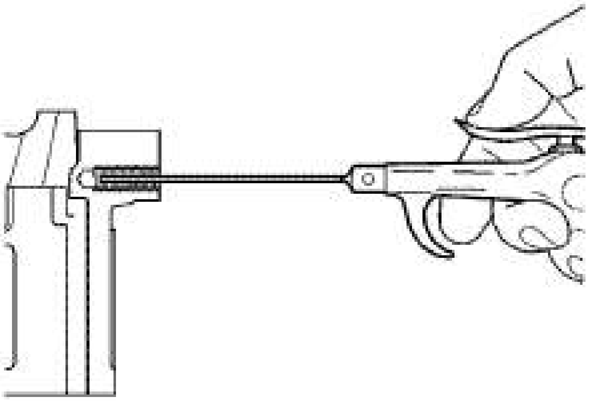


Important: All chips must be removed from the tapped hole prior to insert installation.

10. Using compressed air, clean out any chips.

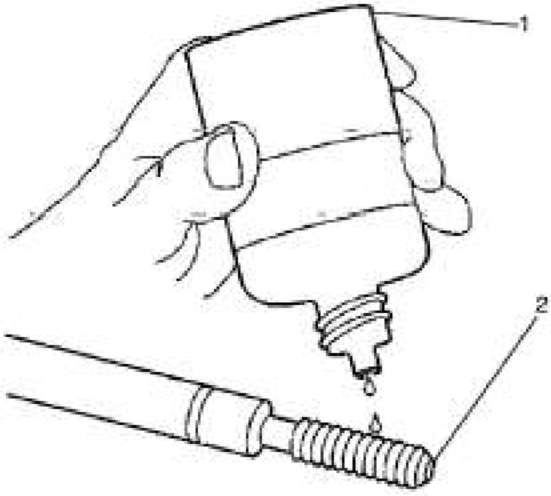


11. Spray a commercially available thread cleaner (2) into the tapped hole (1).



Important: All chips must be removed from the tapped hole prior to insert installation.

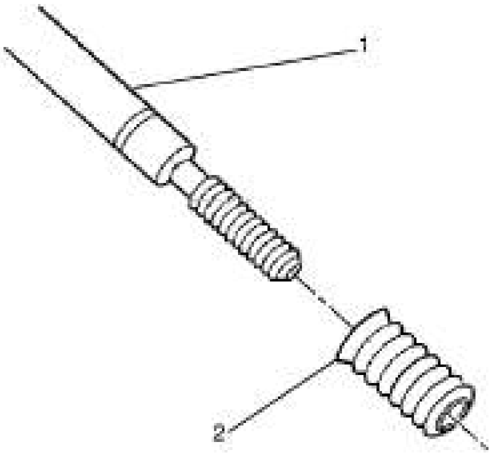
12. Using compressed air, clean out any chips.



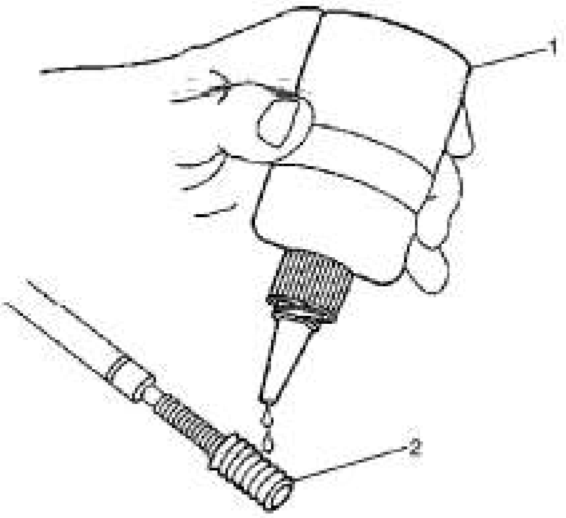
Important:

- DO NOT remove the fixture plate, make sure the fixture plate is installed during the installation process of the insert.
- DO NOT allow oil or other foreign material to contact the Outside Diameter (OD) of the insert.

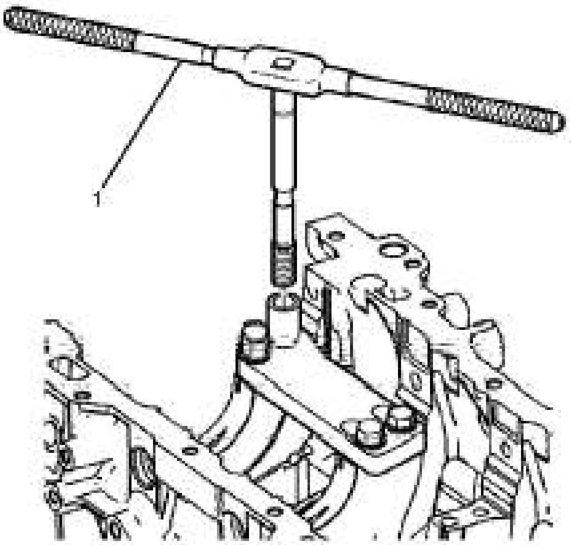
13. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



14. Install the insert (2) onto the driver installation tool (1).



15. Apply threadlock sealant such as LOCTITE 277®, or equivalent (1) to the insert OD threads (2).



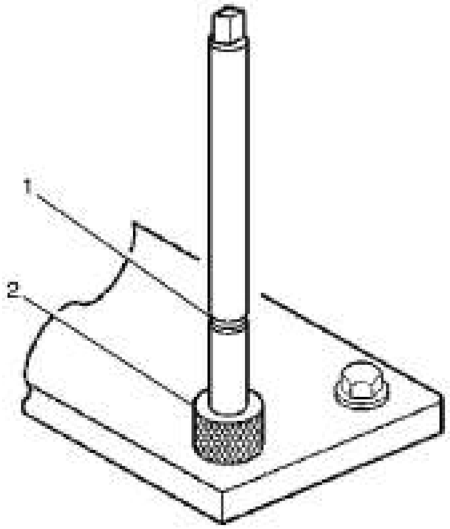
16. Install the insert and installation driver (1) into the tapped hole by hand only.
17. Start the insert into the threaded hole.

Important: If the insert will not thread down until the flange contacts the counterbored surface remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining chips and/or incorrect tapping.

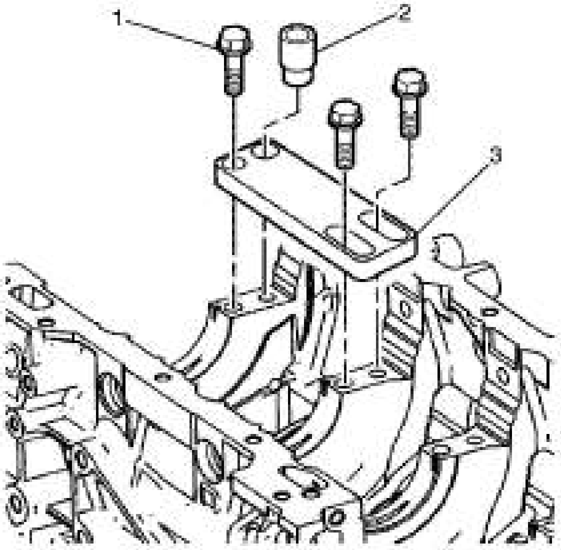
18. Install the insert until the flange of the insert contacts the counterbored surface.

Important: The driver installation tool (1) will tighten up before screwing completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

19. Continue to rotate the driver installation tool (1) through the insert.



20. Rotate the driver installation tool until the mark (1) on the driver installation tool aligns with the top of the drill bushing (2).
21. Inspect the insert for correct installation into the tapped hole.



22. Remove the fixture plate bolts (1).
23. Remove the fixture plate (3) and bushing (2).

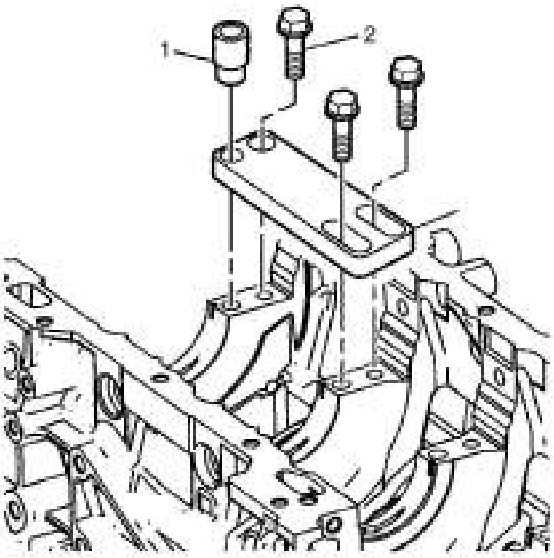
Inboard Bolt Holes

Caution: Refer to Safety Glasses Caution in the Preface section.

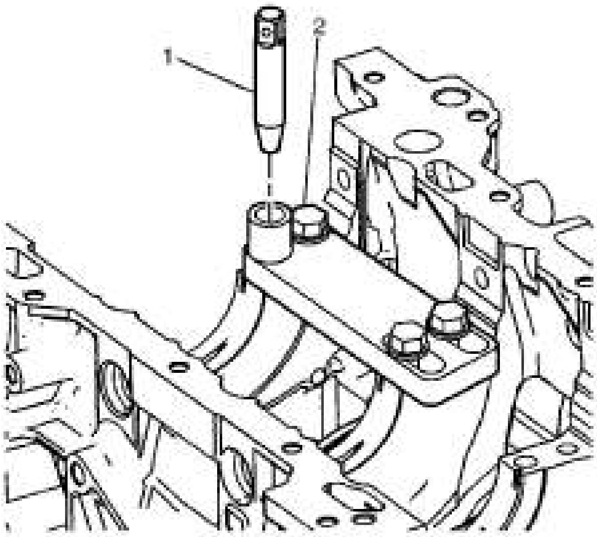
Important:

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counterboring and tapping procedures.

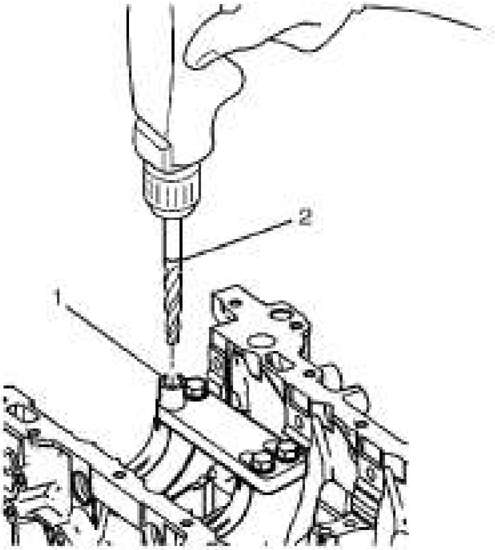
- When installed to the correct depth, the flange of the insert will be seated against the counterbore of the drilled/tapped hole.



1. Position the fixture plate (3) with the bushing (1) installed over the crankshaft main cap bolt hole to be repaired.
2. Loosely install the fixture plate bolts (2) into the remaining crankshaft main cap bolt holes.



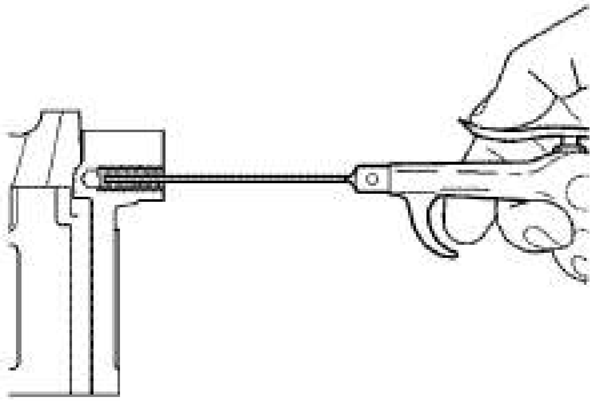
3. Position the alignment pin (1) through the bushing and into the crankshaft main cap bolt hole.
4. With the alignment pin in the desired crankshaft main cap bolt hole, tighten the fixture retaining bolts (2).
5. Remove the alignment pin (1) from the crankshaft main cap bolt hole.



Important:

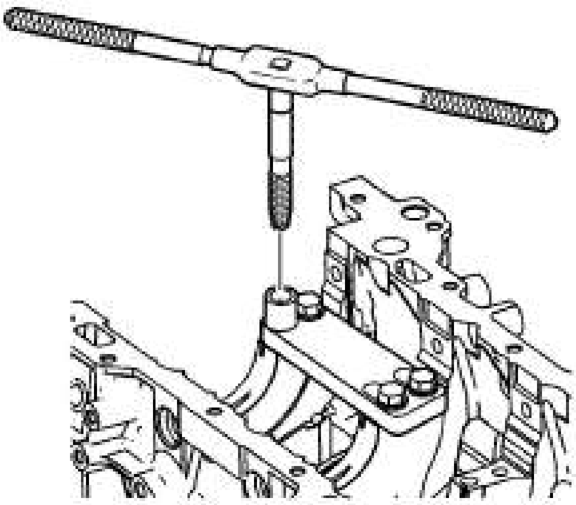
- During the drilling process, it is necessary to repeatedly remove the drill and clean chips from the hole and the flutes of the drill.
- Drill the crankshaft main bolt hole until the mark (1) on the drill aligns with the top of the drill bushing (2).

6. Drill out the threads of the damaged hole.



Important: All chips must be removed from the drilled hole prior to tapping.

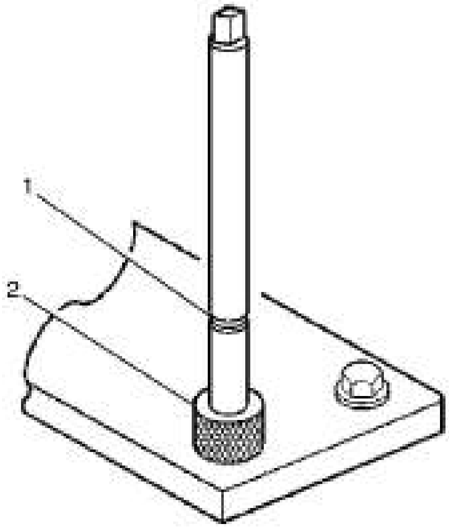
7. Using compressed air, clean out any chips.



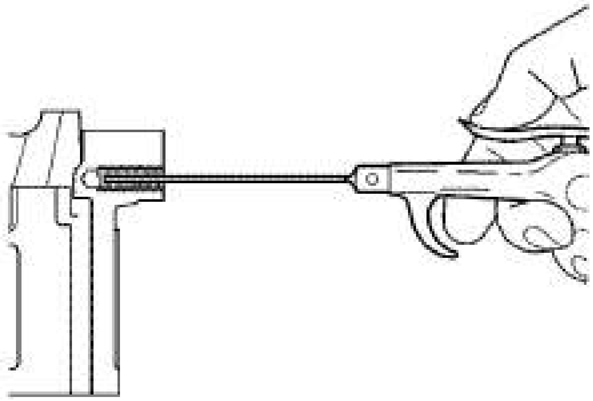
Important:

- DO NOT remove the fixture plate, ensure the fixture plate is installed during the machining and installation processes of the insert.
- During the tapping process, it is necessary to repeatedly remove the tap and clean chips from the hole and the flutes of the tap.
- Make sure the tap has created full threads at least to the depth equal to the insert length.

8. Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

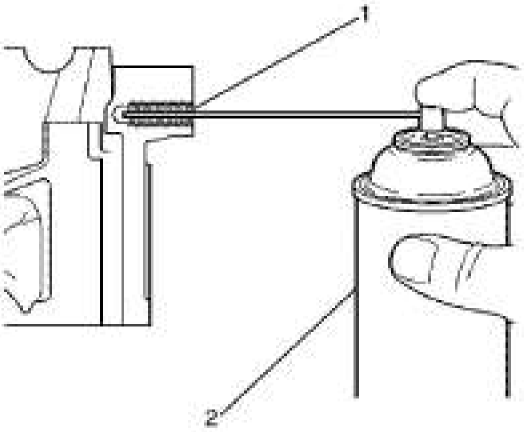


9. In order to tap the new threads for the insert to the correct depth, rotate the tap into the crankshaft main cap bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

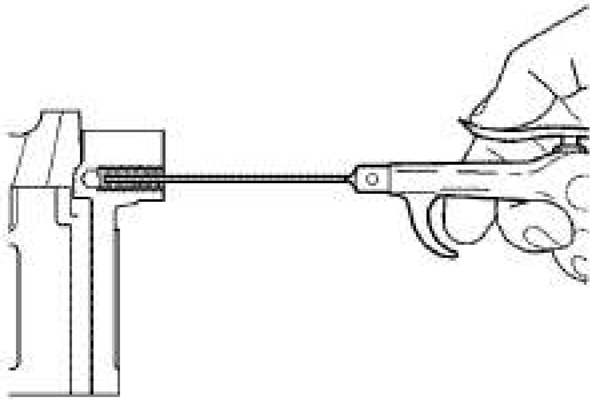


Important: All chips must be removed from the tapped hole prior to insert installation.

10. Using compressed air, clean out any chips.

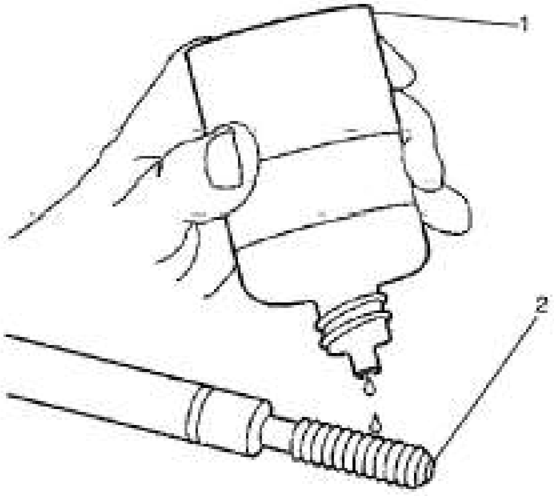


11. Spray a commercially available thread cleaner (2) into the tapped hole (1).



Important: All chips must be removed from the tapped hole prior to insert installation.

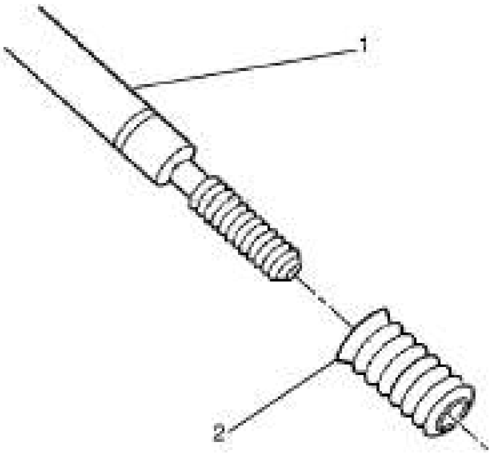
12. Using compressed air, clean out any chips.



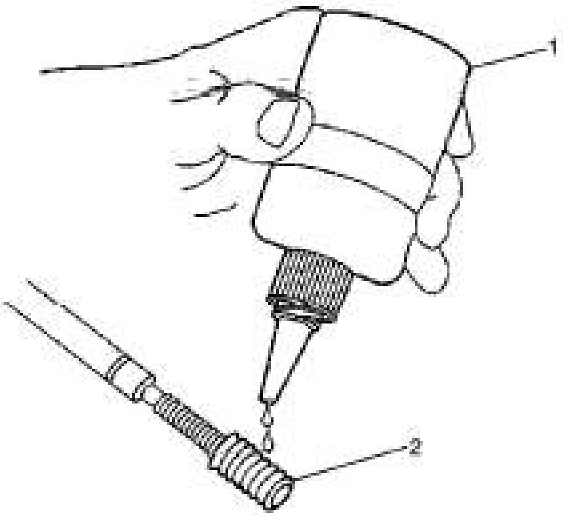
Important:

- DO NOTremove the fixture plate, make sure the fixture plate is installed during the installation process of the insert.
- DO NOT allow oil or other foreign material to contact the Outside Diameter (OD) of the insert.

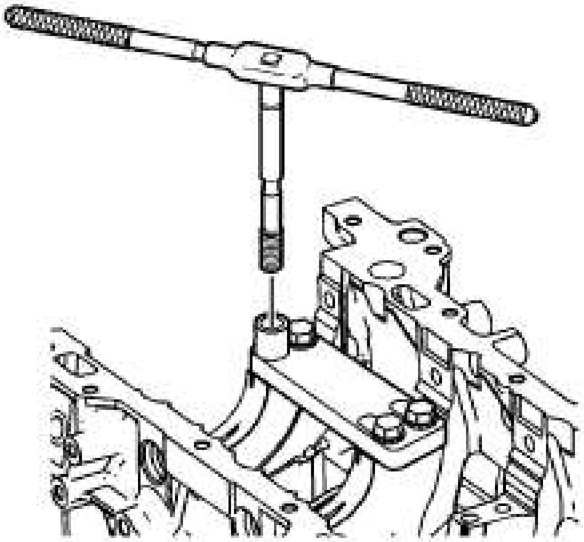
13. Lubricate the threads of the driver installation tool (2) with the driver oil (1).



14. Install the insert (2) onto the driver installation tool (1).



15. Apply threadlock sealant such as LOCTITE 277®, or equivalent (1) to the insert OD threads (2).



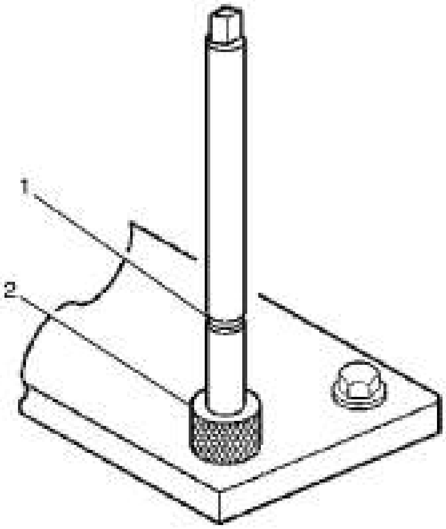
16. Install the insert and installation driver into the tapped hole by hand only.
17. Start the insert into the threaded hole.

Important: If the insert will not thread down until the flange contacts the counterbored surface remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining chips and/or incorrect tapping.

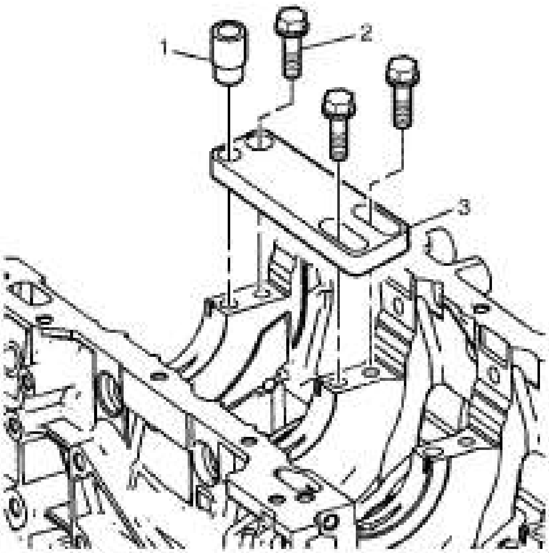
18. Install the insert until the flange of the insert contacts the counterbored surface.

Important: The driver installation tool will tighten up before screwing completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

19. Continue to rotate the driver installation tool through the insert.

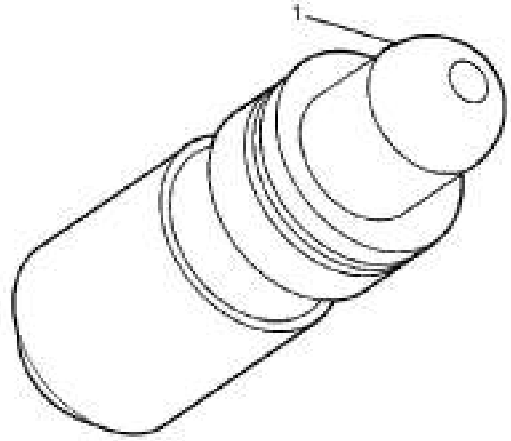


20. Rotate the driver installation tool until the mark (1) on the driver installation tool aligns with the top of the drill bushing (2).
21. Inspect the insert for correct installation into the tapped hole.



22. Remove the fixture plate bolts (2).
23. Remove the fixture plate (3) and bushing (1).

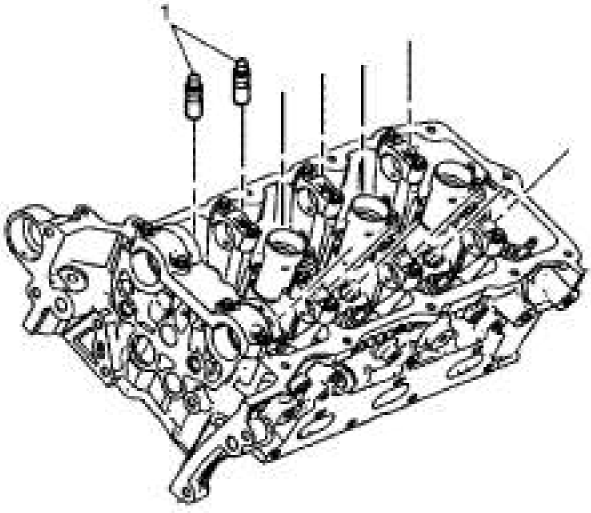
Valve Lifter Installation - Left Side



Important: DO NOT stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.

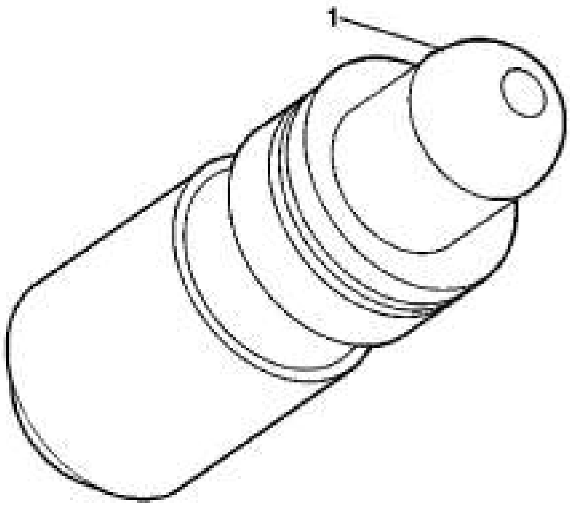
Important: DO NOT allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

1. Fill the Stationary Hydraulic Lash Adjuster (SHLA) with clean engine oil. Take precautions to prevent scratching the pivot sphere area (1) of the SHLA.
2. Lubricate the SHLA bores in the cylinder head with clean engine oil.



3. Install the SHLAs (1).
4. Apply a liberal amount of commercially available camshaft/lifter prelube to the SHLA (1) pivot spheres.

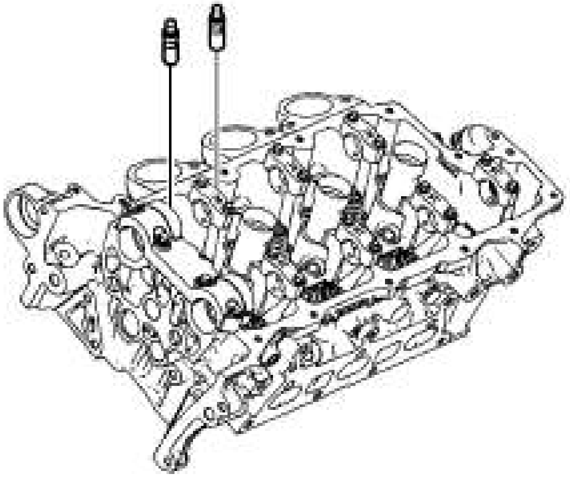
Valve Lifter Installation - Left Side (LLT)



Important: Do not stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.

Important: Do not allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

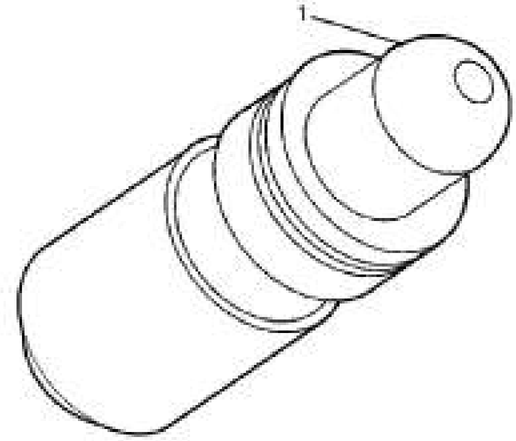
1. Fill the stationary hydraulic lash adjuster (SHLA) with clean engine oil GM P/N 12378006 or equivalent. Take precautions to prevent scratching the pivot sphere area (1) of the SHLA.
2. Lubricate the SHLA bores in the cylinder head with clean engine oil GM P/N 12378006 or equivalent.



3. Install the SHLAs in the cylinder head.
4. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the SHLA pivot spheres.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985125**

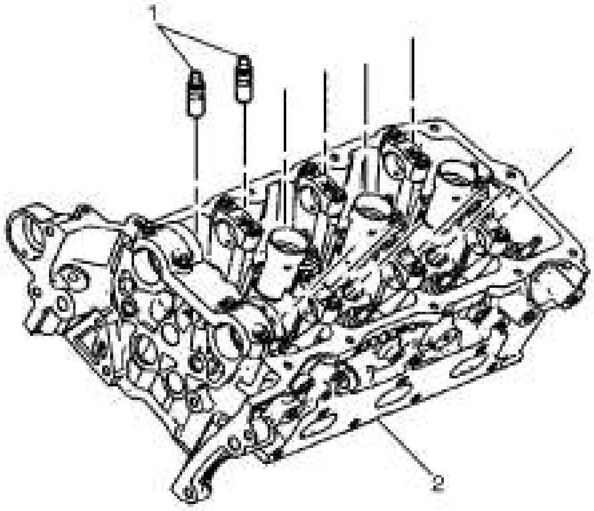
Valve Lifter Installation - Right Side



Important: DO NOT stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.

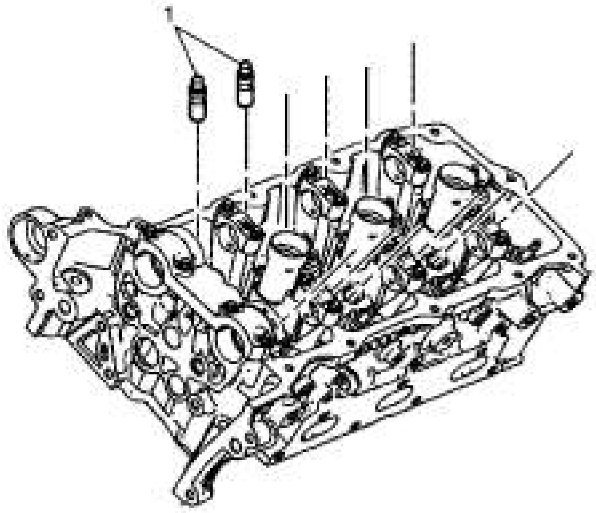
Important: DO NOT allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

1. Fill the Stationary Hydraulic Lash Adjuster (SHLA) with clean engine oil. Take precautions to prevent scratching the pivot sphere area (1) of the SHLA.
2. Lubricate the SHLA bores in the cylinder head with clean engine oil.



3. Install the SHLAs (1) in the cylinder head (2).
4. Apply a liberal amount of commercially available camshaft/lifter prelube to the SHLA pivot spheres.

Valve Lifter Removal - Left Side



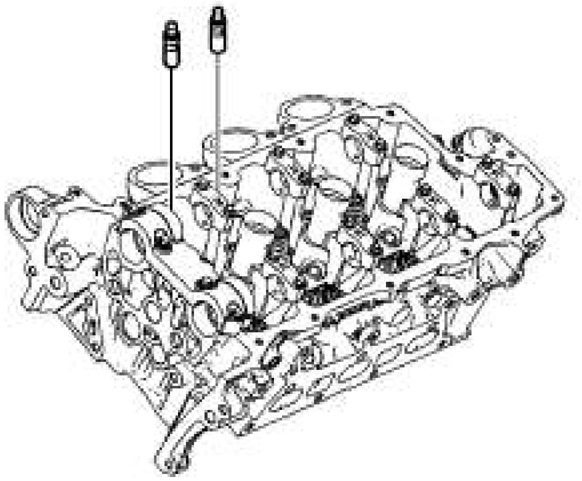
Important:

- DO NOT stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.
- DO NOT allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

1. Remove the Stationary Hydraulic Lash Adjuster, (SHLAs) (valve lifters) (1).

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1978409**

Valve Lifter Removal - Left Side (LLT)

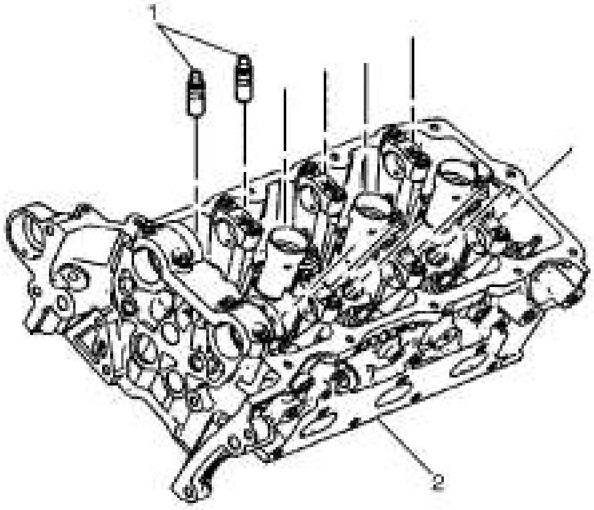


Important:

- Do not stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.
- Do not allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

Remove the valve lifters (SHLAs) from the cylinder head. If the lifters are to be reused, keep in order so they can be reinstalled in the same position.

Valve Lifter Removal - Right Side



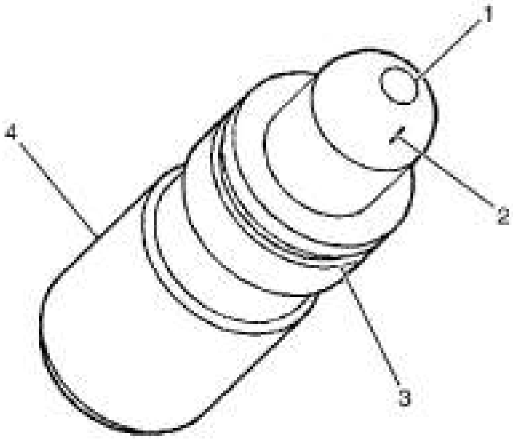
Important:

- DO NOT stroke/cycle the stationary hydraulic lash adjuster plunger without oil in the lower pressure chamber.
- DO NOT allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.

1. Remove the Stationary Hydraulic Lash Adjuster, (SHLAs) (valve lifters) (1) from the right bank cylinder head (2).

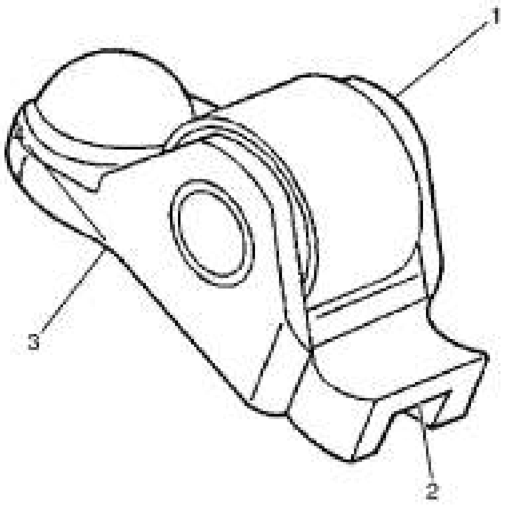
Valve Lifters Cleaning and Inspection

Notice: Refer to Valve Lifter Priming Notice in the Preface section.



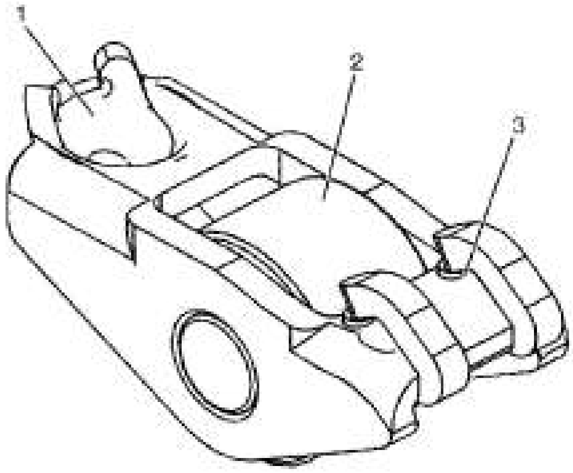
1. Inspect the stationary hydraulic lash adjuster (SHLA) in the following areas:
   - A plugged oil passage (1).
   - A scored or worn valve rocker arm pivot area (2).
   - A damaged or broken retainer (3).
   - A extremely scuffed or worn SHLA body (4).
2. Replace the SHLA or SHLAs as necessary.

Valve Rocker Arm Cleaning and Inspection

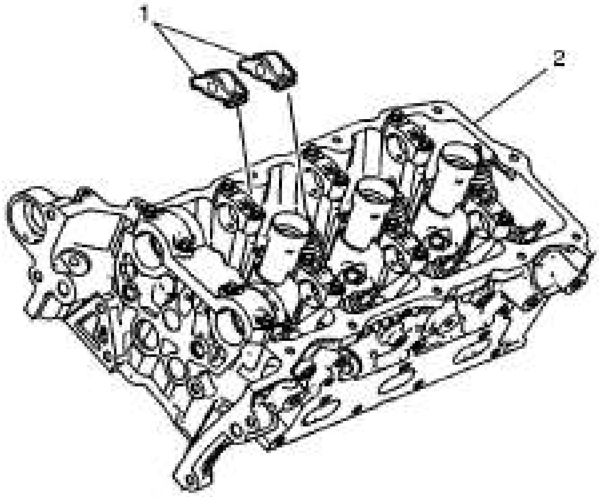


1. Inspect the valve rocker arm (1) for the following:
    - Flat spots.
    - Scoring and pitting above acceptable tolerances.
    - Ensure the roller spins freely.
2. Inspect the valve rocker arm valve tip area (2).
3. Inspect the valve rocker arm Stationary Hydraulic Lash Adjuster (SHLA) pivot area (3).
4. Replace the valve rocker arm or valve rocker arms as necessary.

Valve Rocker Arm Installation - Left Side



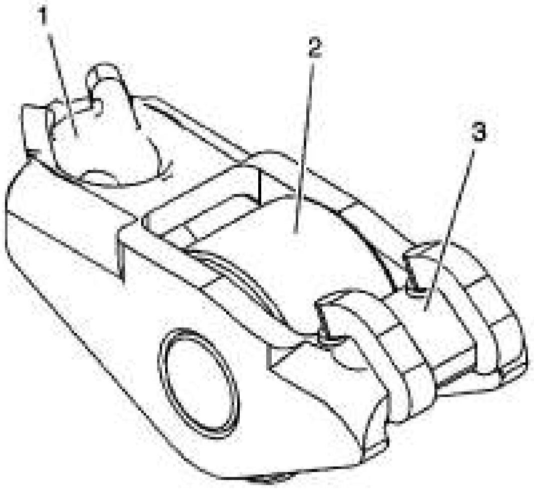
1. Apply a liberal amount of commercially available camshaft/lifter prelube to the pivot pocket (1), roller (2) and valve slot (3) areas of the valve rocker arms.



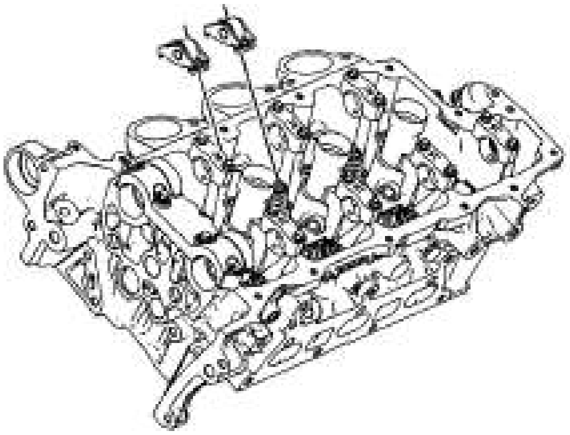
Important: The valve rocker arms (1) must be positioned squarely on the valve tip so that the full width of the roller will completely contact the camshaft lobe. If the valve rocker arms (1) are being reused you must put them back in their original location.

2. Place the valve rocker arms (1) in position on the valve tip and Stationary Hydraulic Lash Adjuster (SHLA).
3. The rounded head end of the valve rocker arms (1) go on the SHLA while the flat end goes on the valve tip.
4. Clean the camshaft journals and carriers with a clean, lint-free cloth.

Valve Rocker Arm Installation - Left Side (LLT)



1. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the pivot pocket (1), roller (2) and valve slot (3) areas of the camshaft followers.

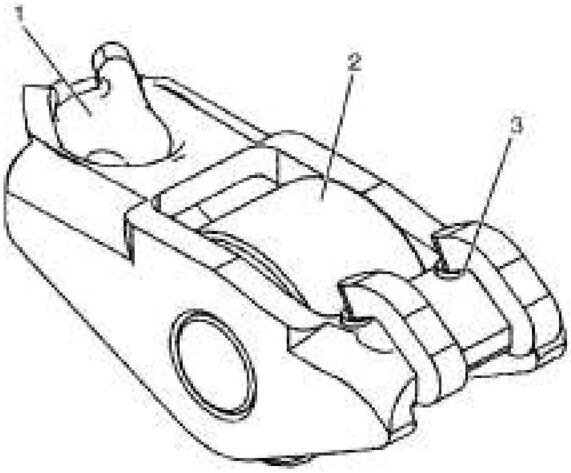


Important: The follower must be positioned squarely on the valve tip so that the full width of the roller will completely contact the camshaft lobe. If the followers are being reused you must put them back in their original location.

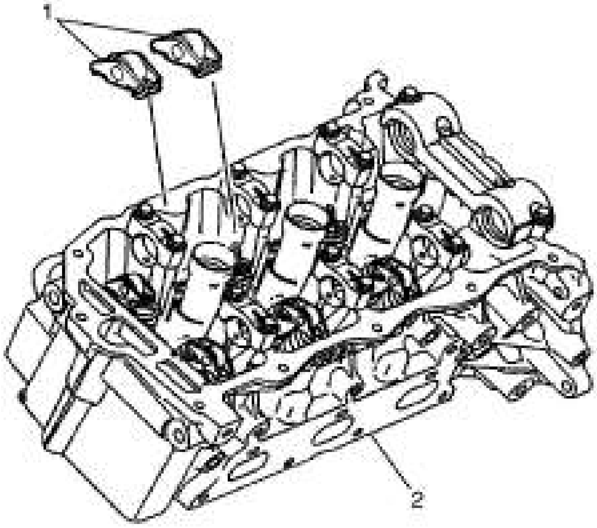
2. Place the camshaft followers in position on the valve tip and stationary hydraulic lash adjuster (SHLA).
3. The rounded head end of the follower goes on the SHLA while the flat end goes on the valve tip.
4. Clean the camshaft journals and carriers with a clean, lint-free cloth.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985127**

Valve Rocker Arm Installation - Right Side



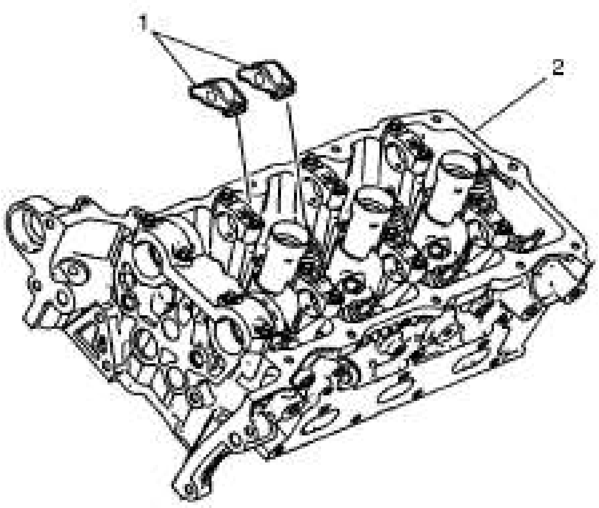
1. Apply a liberal amount of commercially available camshaft/lifter prelube to the pivot pocket (1), roller (2) and valve slot (3) areas of the valve rocker arms.



Important: The valve rocker arms (1) must be positioned squarely on the valve tip so that the full width of the roller will completely contact the camshaft lobe. If the valve rocker arms (1) are being reused you must put them back in their original location.

2. Place the valve rocker arms (1) in position on the valve tip and Stationary Hydraulic Lash Adjuster (SHLA).
3. The rounded head end of the valve rocker arms (1) go on the SHLA while the flat end goes on the valve tip.
4. Clean the camshaft journals and carriers with a clean, lint-free cloth.

Valve Rocker Arm Removal - Left Side

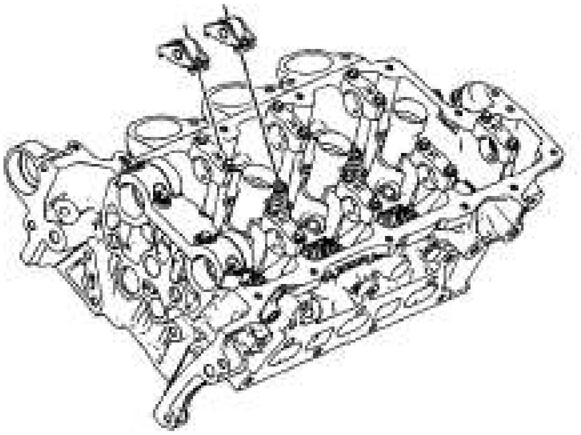


Important: The valve rocker arms (1) must be installed in their original locations.

1. Record the positions of the valve rocker arms (1).
2. Remove the valve rocker arms (1) from the cylinder head (2).

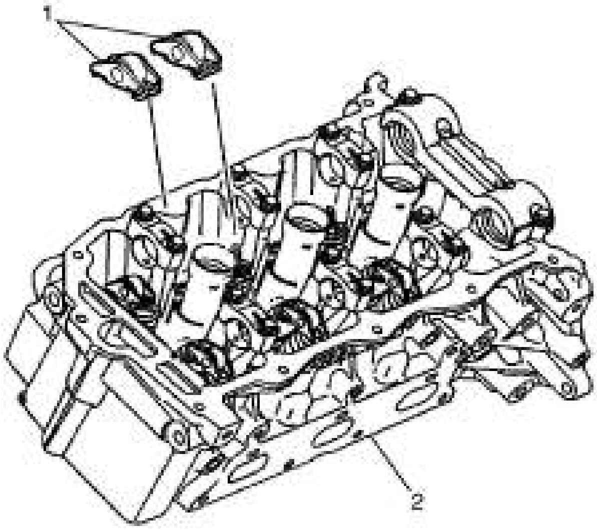
2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1978379**

Valve Rocker Arm Removal - Left Side (LLT)



Remove the valve rocker arms from the cylinder head. If the rocker arms are to be reused, keep in order so they can be reinstalled in the same position.

Valve Rocker Arm Removal - Right Side



Important: The valve rocker arms (1) must be installed in their original locations.

1. Record the positions of the valve rocker arms (1).
2. Remove the valve rocker arms (1) from the right bank cylinder head (2).

Valve Spring Inspection and Measurement

Tools Required

J 22738-B Valve Spring Tester

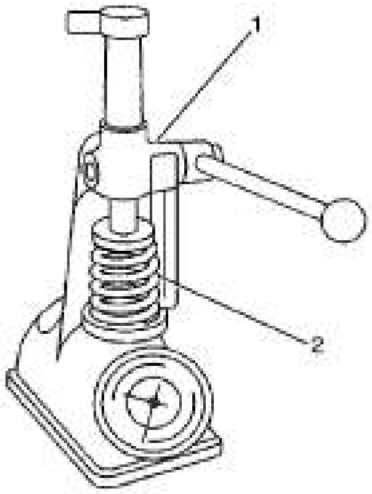
Inspection Procedure

1. Clean the valve springs in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

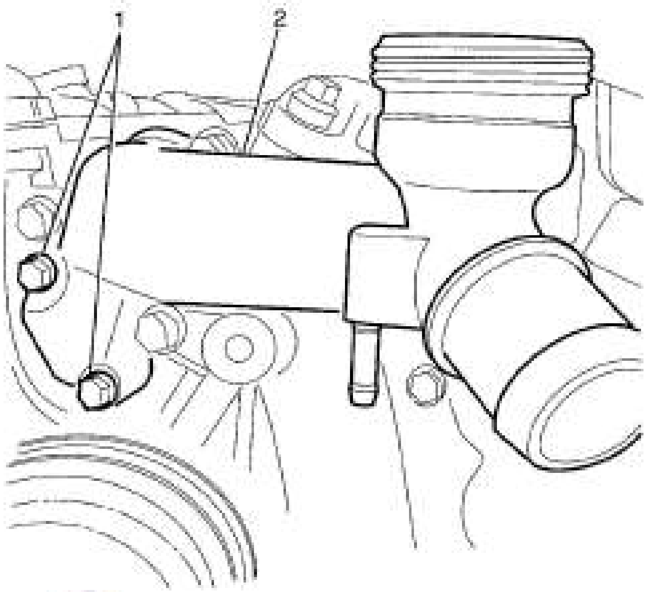
2. Dry the valve springs with compressed air.
3. Inspect the valve springs for broken coils or coil ends.

Measurement Procedure



1. Measure the valve spring tension using the J 22738-B . Refer to Engine Mechanical Specifications.
2. If low valve spring load is found, replace the valve springs. DO NOT use shims to increase spring load. The use of shims can cause the valve spring to bottom out before the camshaft lobe is at peak lift.

Water Outlet Installation



Important: Ensure a new rubber O-ring and seal is used when installing the water outlet housing.

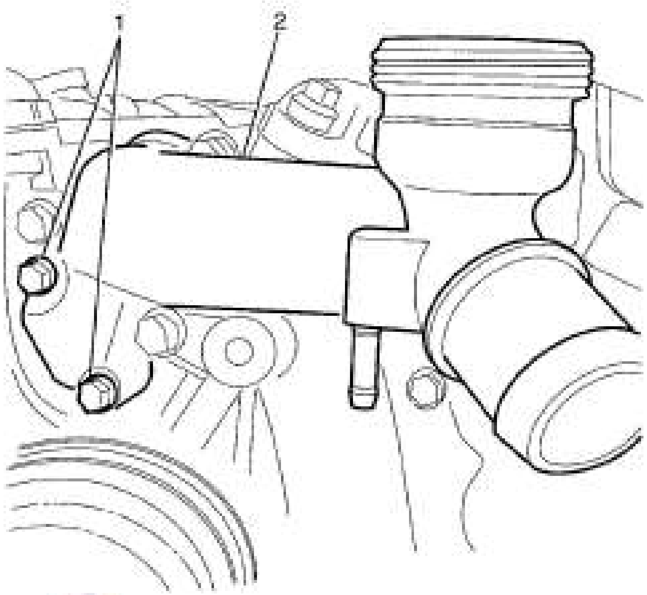
1. Install the coolant outlet housing (2) to the intake manifold.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the coolant outlet housing to intake manifold retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

Water Outlet Removal



1. Remove the coolant outlet housing to intake manifold retaining bolts (1).

   Important: Use of a soft hammer will aid in the removal of the coolant outlet housing.

2. Remove the coolant outlet housing (2).
3. Remove the rubber O-ring and seal.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995341

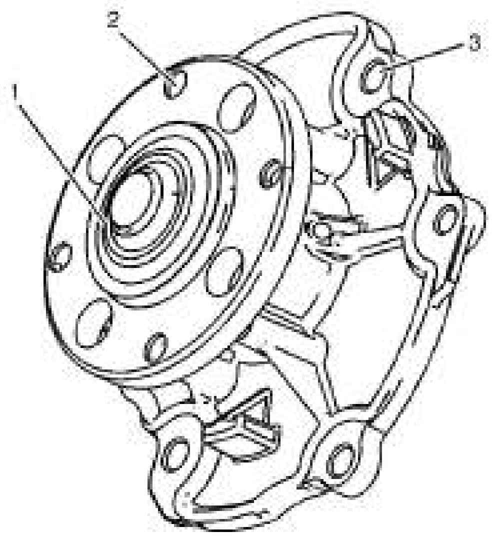
Water Pump Cleaning and Inspection

Cleaning Procedure

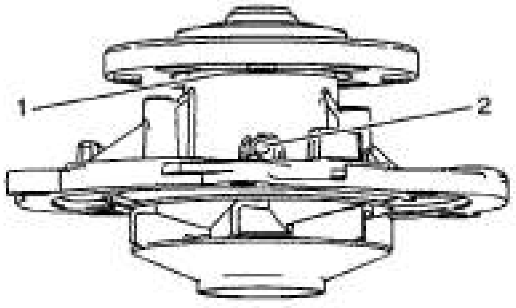
Notice: Refer to General Repair Instructions in the Preface section.

1. Remove the old gasket material from the water pump sealing surfaces.
2. Clean all excess dirt and debris from the water pump housing.

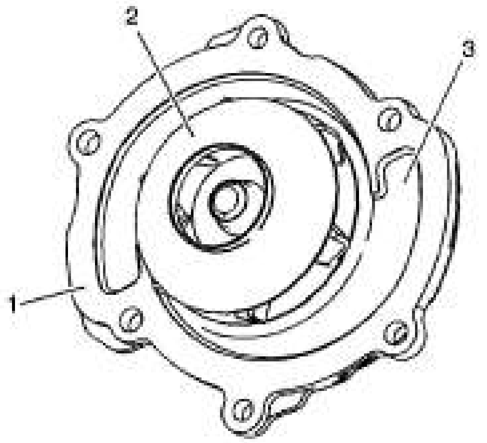
Inspection Procedure



1. Rotate the water pump hub (1). The water pump hub and impeller should turn straight and smoothly. If the hub wobbles, is noisy, or feels rough when rotated, replace the water pump.
2. Inspect the exterior of the water pump for the following:
   - Damage to the water pump hub bolt threads (2) for the water pump pulley
   - Damage to the water pump bolt holes (3)



3. Examine the water pump shaft (1) and the weep hole (2) in the water pump body for signs of leakage. If coolant leakage is evident, replace the water pump.



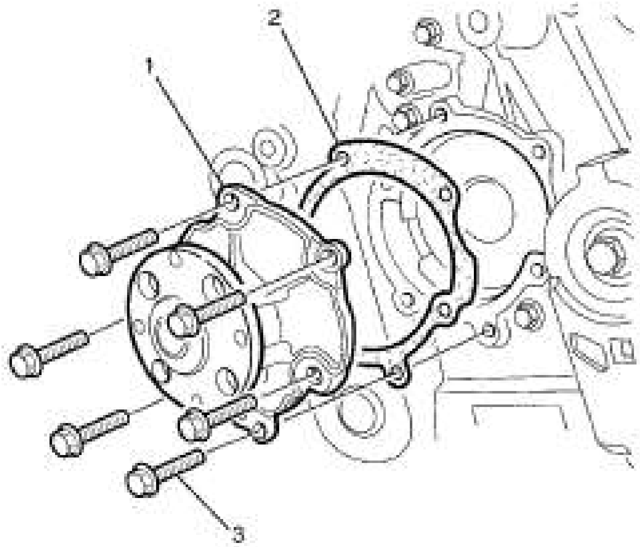
4. Inspect the interior of the water pump for the following:
   - Damage to the water pump gasket sealing surface (1)
   - Damage, corrosion or restrictions to the water pump impeller (2)
   - Damage, corrosion or restrictions to the coolant passages (3)
5. Repair or replace the water pump as necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985164**

Water Pump Installation

Important: Make sure all mating surfaces are clean and free of grease.

1. Using a water sealant install the water pump and gasket to front engine cover.
2. Make sure all retaining bolts are clean and free of debris.

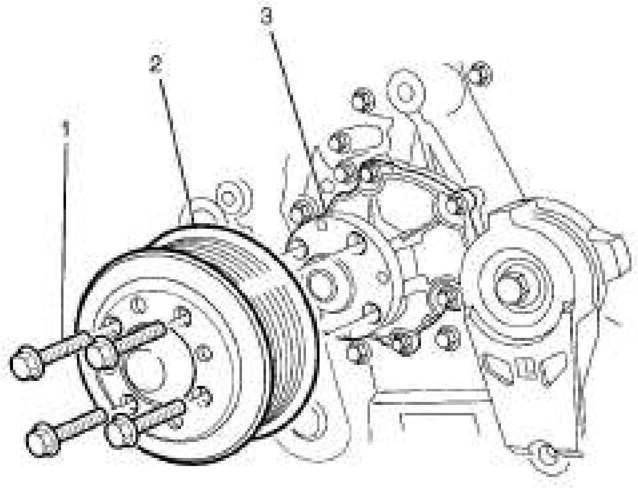


3. Install the water pump (1) and NEW gasket (2).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the water pump to engine front cover retaining bolts (3).

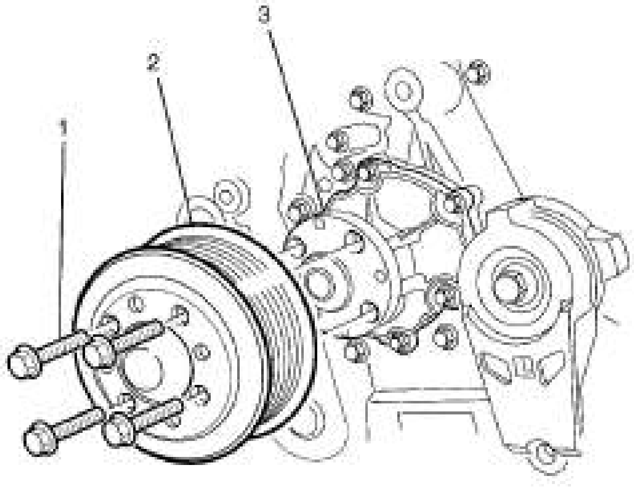
Tighten
Tighten the bolts to 10 N·m (89 lb in).



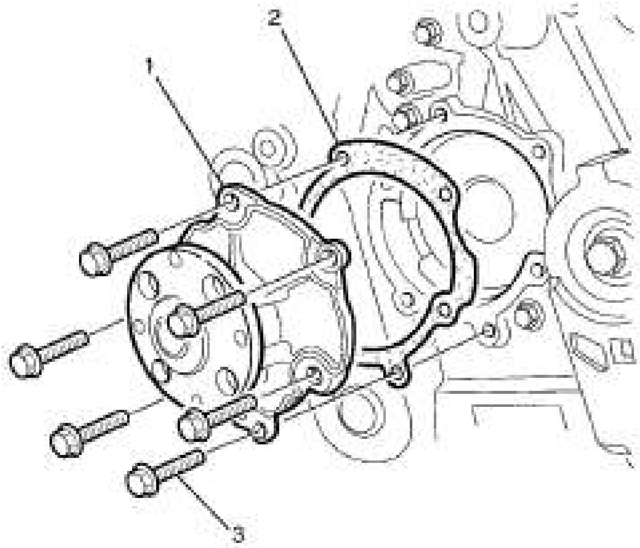
5. Install the water pump pulley (2) to the water pump (3)
6. Install the water pump pulley to water pump retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

Water Pump Removal



1. Remove the water pump pulley to water pump retaining bolts (1).
2. Remove the water pump pulley (2) from the water pump (3).



Important: Use a soft hammer to separate the water pump from the engine cover.

3. Remove the water pump to engine front cover retaining bolts (3).
4. Remove the water pump (1).

5. Remove the water pump gasket (2).

   Discard the gasket.

Cleanliness and Care

An automobile engine is a combination of many of the following surfaces:

- Machined
- Honed
- Polished
- Lapped

The tolerances of these surfaces are measured in the ten-thousandths of an inch. When you service any internal engine part, cleanliness and care are important. Apply a liberal coating of engine oil to the friction areas during assembly in order to protect and lubricate the surfaces on initial operation. Throughout this section, practice correct cleaning and protection procedures to the machined surfaces and to the friction areas.

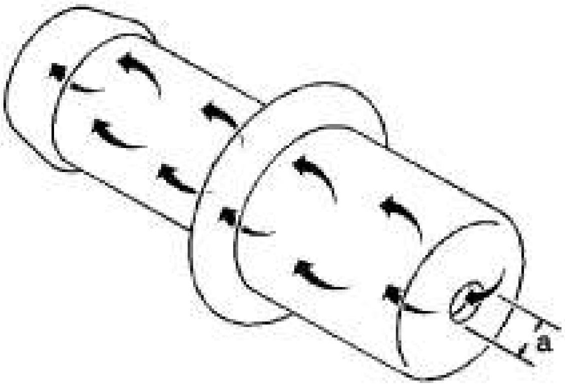
Notice: Engine damage may result if an abrasive paper, pad, or motorized wire brush is used to clean any engine gasket surfaces.

Whenever you remove the valve train components, keep the components in order. Follow this procedure in order to install the components in the same locations and with the same mating surfaces as when removed.

Caution: Refer to Battery Disconnect Caution in the Preface section.

Disconnect the negative battery cables before you perform any major work on the engine. For more information on the disconnection of the battery, refer to Engine Electrical.

Crankcase Ventilation System Description



A crankcase ventilation system is used to consume crankcase vapours created during the combustion process instead of venting them to the atmosphere.

Fresh air is supplied through a filter to the crankcase, the crankcase mixes the fresh air with the blow-by gases and then passed through a positive crankcase ventilation (PCV) orificed tube into the intake manifold.

The PCV orificed tube restricts the flow rate of the blow-by gases using a 3 mm (0.118 in) (a) orifice located at the end of the tube. If abnormal operating conditions arise, the system is designed to allow amounts of blow-by gases above acceptable tolerances to back flow through the crankcase vent tube into the throttle body in order to be consumed by normal combustion.

Drive Belt System Description

The drive belt system consists of the following components:

- The drive belt
- The drive belt tensioner
- The drive belt idler pulley
- The crankshaft balancer pulley
- The accessory drive component mounting brackets
- The accessory drive components
    - The power steering pump
    - The alternator
    - The A/C compressor
    - The water pump

The drive belt system uses 1 belt. The drive belt is thin so that it can bend backwards and has several ribs to match the grooves in the pulleys. The drive belts are made of different types of rubbers, chloroprene or EPDM, and have different layers or plies containing either fibre cloth or cords for reinforcement.

Both sides of the drive belt may be used to drive the different accessory drive components. When the back side of the drive belt is used to drive a pulley, the pulley is smooth.

The drive belt is pulled by the crankshaft balancer pulley across the accessory drive component pulleys. The spring loaded drive belt tensioner keeps constant tension on the drive belt to prevent the drive belt from slipping. The drive belt tensioner arm will move when loads are applied to the drive belt by the accessory drive components and the crankshaft.

The drive belt system may have an idler pulley, which is used to add wrap to the adjacent pulleys.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Description and Operation | **Document ID: 1974845**

Engine Component Description

The High Feature V6 RPO LY7 is a 3.6L engine incorporating two intake and two exhaust valves per cylinder. Individual intake and exhaust camshafts with camshaft position actuators are mounted on each cylinder head. The cylinder bore is 94 mm (3.7008 in) and the piston stroke is 85.6 mm (3.3701 in). The cylinders are arranged in two banks of three with a 60 degree included angle. The right bank of cylinders are number 1-3-5 and the left bank of cylinders are 2-4-6. The engine firing order is 1-2-3-4-5-6.

Crankcase

The cylinder block is constructed of aluminium alloy by precision sand-casting with cast in place iron cylinder liners. Each copper-infiltrated sintered steel main bearing cap incorporates six bolts bolting the cap into the cylinder block. Along with two outer and two inner bolts, two side bolts are used in the deep skirt block. To prevent aeration, oil return from the valvetrain and cylinder heads is channelled away from the rotating and reciprocating components through oil drain back passages incorporated into the cylinder heads and cylinder block. Pressure-actuated piston oil cooling jets are mounted between opposing cylinders. A knock sensor is located on the each side of the exterior of the cylinder block. The crankshaft position sensor is located on the left side of the exterior of the cylinder block.

Crankshaft

The crankshaft is a forged steel design with four main bearings. Crankshaft thrust is controlled by the number three main bearing. The crankshaft position reluctor wheel is pressed onto the rear of the crankshaft in front of the rear main journal. The crankshaft is internally balanced with an integral oil pump drive machined into the nose in front of the front main journal.

Connecting Rods and Pistons

The connecting rods are sinterforged steel and have full floating piston pins. The piston pins are a slip fit in the bronze bushed connecting rod. Round wire retainers are used to retain the piston pin into the piston. The cast aluminium pistons incorporate a polymer-coated skirt to reduce friction. The piston uses two low tension compression rings and one multi-piece oil control ring. The top compression ring is plasma sprayed. The second compression ring is cast iron napier. The oil control ring incorporates a steel expander and two chrome plated steel rails.

Camshaft Drive System

The camshaft drive system uses Inverted Tooth (IT) timing drive chains and consists of one primary timing drive chain driven by the crankshaft sprocket. The primary timing drive chain drives two intermediate drive shaft sprockets. Each oil pressure fed intermediate drive shaft sprocket drives separate secondary timing drive chains. Each secondary timing drive chain drives the respective cylinder head's intake and exhaust camshaft position actuators.

The primary timing drive chain uses two stationary timing drive chain guides and an oil pressure hydraulically actuated tensioner with built-in shoe. The tensioners minimize timing drive chain noise and provides accurate valve action by keeping slack out of the timing drive chains and continuously adjusting for timing drive chain wear. The tensioners incorporate a plunger that adjusts out with wear allowing only a minimal amount of backlash. The tensioners are equipped with oiling jets to spray oil onto the timing components during engine operation. The secondary timing drive chains use a stationary timing drive chain guide and movable timing drive chain shoe. The secondary timing drive chain shoe is under tension from an oil pressure hydraulically actuated tensioner. All tensioners are sealed to the head or block using a rubber coated steel gasket. The gasket traps an adequate oil reserve to ensure quiet start-up.

The primary timing drive system also uses an IT timing drive chain. The primary timing drive chain connects the crankshaft sprocket with the left and right side intermediate drive shaft sprockets.

Camshaft Position Actuator System

The engine incorporates a camshaft position actuator for each intake and exhaust camshaft. Camshaft phasing changes the inlet and exhaust valve timing within a range of 25 camshaft degrees as engine operating conditions vary. Dual camshaft phasing allows the further optimization of performance, fuel economy and emissions without compromising overall engine response and driveability. Variable valve timing also contributes to a reduction in exhaust emissions. It optimizes exhaust and inlet valve overlap and addresss the need for an Exhaust Gas Recirculation (EGR) system.

The camshaft position actuator is a hydraulic vane-type actuator that changes the camshaft lobe timing relative to the camshaft drive sprocket. Engine oil is directed by a camshaft position actuator oil control valve to the appropriate passages in the camshaft position actuator. Oil acting on the vane in the camshaft position actuator, rotates the camshaft relative to the sprocket. At idle, both camshafts are at the default or "home" position. At this position, the exhaust camshaft is fully advanced and the intake is fully retarded to minimize valve overlap for smooth idle. An internal lock pin locks the inner rotor to the outer camshaft position actuator housing at idle and maintains this position during start-up conditions. Under other engine operating conditions, the camshaft position actuator is controlled by the Engine Control Module (ECM) to deliver optimal intake and exhaust valve timing for performance, driveability and fuel economy. The camshaft position actuator incorporates an integral trigger wheel, which is sensed by the camshaft position sensor mounted in the front cover to accurately determine the position of each camshaft. Each camshaft position actuator has a specific timing drive mark for right or left bank application, as the camshaft position actuators are common bank to bank. The exhaust camshaft position actuator has a different internal configuration than the intake camshaft position actuator since the exhaust camshaft position actuator phases in the opposite direction relative to the inlet camshaft position actuator.

The camshaft position actuator oil control valve (OCV) directs oil from the oil feed in the head to the appropriate camshaft position actuator oil passages. There is one OCV for each camshaft position actuator. The OCV is sealed and mounted to the front cover. The ported end of the OCV is inserted into the cylinder head with a sliding fit. A filter screen protects each OCV oil port from any contamination in the oil supply.

The camshaft front journal has several drilled oil holes to allow camshaft position actuator control oil to transfer from the cylinder head to the camshaft position actuator. The center camshaft bolt hole is counterbored to allow oil to flow around the camshaft bolt and to the camshaft position actuator. Oil in this oil passage is used to move the camshaft position actuator to the default or home position. Radially outward from the center of the journal is a set of four drilled camshaft position actuator oil holes. Oil in this group of oil holes is used to move the camshaft from the default position to a specific set position as determined by the ECM. Seal rings are used at the front and rear of the front camshaft journal to prevent oil leakage from the camshaft position actuator hydraulic system. The seal is made from a plastic compound that resists wear and has a diagonal end gap to enhance sealing. The camshaft position actuator is mounted to the front end of the camshaft and the timing notch in the nose of the camshaft aligns with the dowel pin in the camshaft position actuator to ensure correct cam timing and camshaft position actuator oil hole alignment.

Cylinder Heads

The cylinder heads are semi permanent mould cast aluminium with powdered metal valve seat inserts and valve guides. Two 36.96 mm (1.4551 in) intake valves and two 30.60 mm (1.2047 in) exhaust valves are actuated by roller finger valve rocker arms pivoting on a Stationary Hydraulic Lash Adjuster (SHLA). Separate exhaust and intake camshafts are supported by four bearings machined into the cylinder head. The front camshaft bearing cap is used as a thrust control surface for each camshaft. Each spark plug is shielded by a tube that is pressed into the cylinder head. Each spark plug ignition coil is also mounted through the spark plug tube. The Engine Coolant Temperature (ECT) sensor is threaded into the left cylinder head.

Induction System

A dual-stage variable intake manifold is achieved through the use of a Intake Manifold Runner Control (IMRC) flap. The Engine Control Module (ECM) controlled valve changes the plenum volume available for resonance tuning of the inlet flow path. With the IMRC flap shut, the intake manifold is using dual plane flow with the cylinders feeding from two separate plenums. In this mode the system boosts cylinder charging in the low to mid speed range. At higher engine speeds the IMRC flap opens creating a single plane flow with the cylinders all feeding from a common large plenum. In this mode the system boosts charging in the high speed range. An electronically controlled throttle (ETC), through the ECM, coordinates the input from the driver with various control components.

Right and Left Bank Designation

Right side and left side designation through the engine mechanical section are viewed from the rear of the engine or from inside the vehicle.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Description and Operation | Document ID: 1990148

Engine Component Description (LLT)

The High Feature V6 (VIN Code Identifier "V") RPO LLT is a 3.6 Litre VVT (Variable Valve Timing) engine with direct injection. The direct injection system places the high pressure injectors in the cylinder heads. This engine incorporates 2 intake and 2 exhaust valves per cylinder. A dual overhead cam design with individual intake and exhaust camshafts. A camshaft position actuator is mounted on each camshaft. The cylinder bore is 94 mm (3.7008 in) and the piston stroke is 85.6 mm (3.3701 in). The cylinders are arranged in 2 banks of 3 with a 60 degree included angle. The right bank of cylinders are number 1-3-5 and the left bank of cylinders are 2-4-6. The engine firing order is 1-2-3-4-5-6.

Crankcase

The cylinder block is constructed of aluminum alloy by precision sand-casting with cast in place iron cylinder liners. Each copper-infiltrated sintered steel main bearing cap incorporates 6 bolts bolting the cap into the engine block. Along with 2 outer and 2 inner bolts, 2 side bolts are used in the deep skirt block. To prevent aeration, oil return from the valvetrain and cylinder heads is channeled away from the rotating and reciprocating components through oil drain back passages incorporated into the cylinder heads and engine block. Pressure-actuated piston oil cooling jets are mounted between opposing cylinders. A knock sensor is located on the each side of the exterior of the engine block. The crankshaft position sensor is located on the right side of the exterior of the engine block.

Crankshaft

The crankshaft is a forged steel design with 4 main bearings. Crankshaft thrust is controlled by the number 3 main bearing. The crankshaft position reluctor wheel is pressed onto the rear of the crankshaft in front of the rear main journal. The crankshaft is internally balanced with an integral oil pump drive machined into the nose in front of the front main journal.

Connecting Rods and Pistons

The connecting rods are sinterforged steel and have full floating piston pins. The piston pins are a slip fit in the bronze bushed connecting rod. Round wire retainers are used to retain the piston pin into the piston. The cast aluminum pistons incorporate a polymer-coated skirt to reduce friction. The piston uses 2 low tension compression rings and one multi-piece oil control ring. The top compression ring is plasma sprayed. The second compression ring is cast iron napier. The oil control ring incorporates a steel expander and 2 chrome plated steel rails. The top of the piston contains a dished portion for the direct injection system to aid in fuel-air charge mixture and even combustion.

Camshaft Drive System

The camshaft drive system consists of one primary timing drive chain driven by the crankshaft sprocket. The primary timing drive chain drives two intermediate drive shaft sprockets. Each oil pressure fed intermediate drive shaft sprocket drives separate secondary timing drive chains. Each secondary timing drive chain drives the respective cylinder head's intake and exhaust camshaft position actuators.

The primary timing drive chain uses two stationary timing drive chain guides and an oil pressure hydraulically actuated tensioner with built-in shoe. The tensioner minimizes timing drive chain noise and provides accurate valve action by keeping slack out of the timing drive chains and continuously adjusting for timing drive chain wear. The tensioner incorporates a plunger that adjusts out with wear allowing only a minimal amount of backlash. The tensioner is equipped with an oiling jet to spray oil onto the timing components during engine operation. The secondary timing drive chains use a stationary timing drive chain guide and movable timing drive chain shoe. The secondary timing drive chain shoe is under tension from an oil pressure hydraulically actuated tensioner. All tensioners are sealed to the head or block using a rubber coated steel gasket. The gasket traps an adequate oil reserve to ensure quiet start-up.

Camshaft Position Actuator System

The engine incorporates a camshaft position actuator for each intake and exhaust camshaft. Camshaft phasing changes the inlet and exhaust valve timing within a range of 25 camshaft degrees as engine operating conditions vary. Dual camshaft phasing allows the further optimization of performance, fuel economy and emissions without compromising overall engine response and driveability. Variable valve timing also contributes to a reduction in exhaust emissions. It optimizes exhaust and inlet valve overlap and eliminates the need for an exhaust gas recirculation (EGR) system.

The camshaft position actuator is a hydraulic vane-type actuator that changes the camshaft lobe timing relative to the camshaft drive sprocket. Engine oil is directed by a camshaft position actuator oil control valve to the appropriate passages in the camshaft position actuator. Oil acting on the vane in the camshaft position actuator, rotates the camshaft relative to the sprocket. At idle, both camshafts are at the default or "home" position. At this position, the exhaust camshaft is fully advanced and the intake is fully retarded to minimize valve overlap for smooth idle. An internal lock pin locks the inner rotor to the outer camshaft position actuator housing at idle and maintains this position during start-up conditions. Under other engine operating conditions, the camshaft position actuator is controlled by the engine control module (ECM) to deliver optimal intake and exhaust valve timing for performance, driveability and fuel economy. The camshaft position actuator incorporates an integral trigger wheel, which is sensed by the camshaft position sensor mounted in the front cover to accurately determine the position of each camshaft. Each camshaft position actuator has a specific timing drive mark for right or left bank application, as the camshaft position actuators are common bank to bank. The exhaust camshaft position actuator has a different internal configuration than the intake camshaft position actuator since the exhaust camshaft position actuator phases in the opposite direction relative to the inlet camshaft position actuator.

The camshaft position actuator oil control valve (OCV) directs oil from the oil feed in the head to the appropriate camshaft position actuator oil passages. There is one OCV for each camshaft position actuator. The OCV is sealed and mounted to the front cover. The ported end of the OCV is inserted into the cylinder head with a sliding fit. A filter screen protects each OCV oil port from any contamination in the oil supply.

The camshaft front journal has several drilled oil holes to allow camshaft position actuator control oil to transfer from the cylinder head to the camshaft position actuator. The center camshaft bolt hole is counterbored to allow oil to flow around the camshaft bolt and to the camshaft position actuator. Oil in this oil passage is used to move the camshaft position actuator to the default or home position. Radially outward from the center of the journal is a set of 4 drilled camshaft position actuator oil holes. Oil in this group of oil holes is used to move the camshaft from the default position to a specific set position as determined by the ECM. Seal rings are used at the front and rear of the front camshaft journal to prevent oil leakage from the camshaft position actuator hydraulic system. The seal is made from a plastic compound that resists wear and has a diagonal end gap to enhance sealing. The camshaft position actuator is mounted to the front end of the camshaft and the timing notch in the nose of the camshaft aligns with the dowel pin in the camshaft position actuator to ensure proper cam timing and camshaft position actuator oil hole alignment.

Cylinder Heads

The cylinder heads are semi permanent mold cast aluminum with powdered metal valve seat inserts and valve guides. Two 36.96 mm (1.4551 in) intake valves and two 30.60 mm (1.2047 in) exhaust valves are actuated by roller finger followers pivoting on a stationary hydraulic lash adjuster (SHLA). Separate exhaust and intake camshafts are supported by 4 bearings machined into the cylinder head. The front camshaft bearing cap is used as a thrust control surface for each camshaft. Each spark plug is shielded by a tube that is pressed into the cylinder head. Each spark plug ignition coil is also mounted through the spark plug tube. The engine coolant temperature (ECT) sensor is threaded into the left cylinder head. Longer intake ports are designed into the head for better airflow and eliminate the need for a separate lower intake manifold. With direct injection, the high pressure injectors are located in machined bores below the intake ports. A stainless steel, high pressure fuel rail is attached to the intake side of the head.

Induction System

A one piece, all-aluminum intake manifold is used to deliver a dry-air charge to the combustion chamber. Fuel is introduced directly to the cylinder during the intake stroke. As the piston approaches top-dead center, the air-fuel mixture is ignited by the spark plug. An electronically controlled throttle (ETC), through the ECM, coordinates the input from the driver with various control components.

Right and Left Bank Designation

Right hand (RH) and left hand (LH) designation through the engine mechanical section are viewed from the rear of the engine or from inside the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Description and Operation | **Document ID: 1974848**

Lubrication Description

A structural diecast aluminium oil pan incorporates an oil suction pipe, a baffle, a windage tray, and an oil level sensor. The oil suction pipe is bolted into the oil pan and seals to the bottom of the block with O-ring gasket. The baffle is mounted to the lower portion of the 6.5 litre (5.7 quart) capacity oil pan sump and ensures oil supply to the oil suction pickup. The windage tray is bolted to the upper portion of the oil pan and reduces friction losses at high speed. The oil level sensor is mounted through the bottom of the oil pan.

A crankshaft driven gerotor oil pump with internal pressure-relief valve is mounted to the front of the cylinder block and pulls oil from the oil suction pipe through the lower passage in the cylinder block. The oil pump then directs the flow of pressurized oil back through the upper passage in the block to the left side of the cylinder block where the oil filter adapter is mounted.

An oil filter adapter is mounted with a gasket to the left side of the cylinder block. The oil filter adapter incorporates a top-access, cartridge style oil filter. The filter is accessed through a screw on cap with an O-ring gasket. The oil filter adapter cap has a built-in oil bypass valve. The oil filter adapter housing incorporates a drain back control valve and a threaded oil pressure sending unit. Oil flows through the lower passage in the oil filter adapter up to and through the oil filter cartridge. Filtered oil travels back through the upper passage of the oil filter adapter and back into the cylinder block.

Oil is directed up and across the cylinder block front through several drilled passages. These front passages feed oil to each cylinder head, oil to the passage for the main bearings and piston oil jets, oil to the right and left secondary idler sprockets, and oil to the primary timing drive chain tensioner.

Each cylinder head passage directs oil into the cylinder head where it is directed to oiling circuits for the Stationary Hydraulic Lifter assemblies (SHLAs) and the camshaft bearing journals. Oil is also directed through 2 passages each with a spring-loaded check-ball valve to the 2 chambers where the camshaft position actuator oil control solenoid valves are mounted. Each chamber contains a camshaft position actuator oil control solenoid valve with built-in oil filter screen. One camshaft position actuator oil control solenoid valve is used to control the exhaust camshaft position actuator and 1 camshaft position actuator oil control solenoid valve is used to control the intake camshaft position actuator. The Engine Control Module (ECM) electrically controls each camshaft position actuator oil control solenoid valve. When energized by the ECM the camshaft position actuator oil control solenoid valve directs oil to pass up through the cylinder head front camshaft bearing cap. Oil passes through the camshaft bearing cap passage into oil holes drilled into the side of the front camshaft journal and onto the front of the camshaft mounting surface. Oil passes through to matching passages in the camshaft position actuator. Oil is directed by the camshaft position actuator oil control solenoid valve to the appropriate passage in the system to pressurize oil on the vanes on the inside of the of the camshaft position actuator. Oil acting on the vanes rotates the camshaft mounted to the inner camshaft position actuator rotor relative to the sprocket mounted to the outer camshaft position actuator housing. An internal lock pin locks the inner rotor to the outer camshaft position actuator housing at idle and maintains the camshaft position actuator in the home or default position during start-up conditions. Oil pressure directed by the camshaft position actuator oil control solenoid valve unlocks the pin and allows the camshaft position actuator to function. An additional passage in the cylinder head also directs oil to the secondary timing drive chain tensioner mounted to each cylinder head.

The oil passage that supplies oil to the main bearings also supplies oil to pressure-actuated piston-cooling oil jets. Each oil jet is mounted between opposing cylinder bores and directs oil to the

2 bores to provide extra cooling and control piston temperatures.

Oil is directed from the front passages to the front of the block where the right and left secondary idler sprockets and the primary timing drive chain tensioner are mounted. Each camshaft timing drive chain tensioner relies on a gasket in order to maintain an oil reserve after the engine is turned OFF. All camshaft timing drive chain tensioners incorporate a small oil jet to supply an oil spray onto the camshaft timing drive chain components.

Oil returns to the oil pan sump either through the camshaft timing drive chain area or through the cast oil drain back passages on the outboard walls of the cylinder heads and cylinder block.

Replacing Engine Gaskets

Gasket Reuse and Applying Sealant

- DO NOT reuse any gasket unless specified.
- Gaskets that can be reused will be identified in the service procedure.
- DO NOT apply sealant to any gasket or sealing surface unless specified in the service procedure.

Separating Components

- Use a rubber mallet in order to separate the components.
- Bump the part sideways in order to loosen the components.
- Bumping of the component should be done at bends or reinforced areas of the component to prevent distortion of the components.

Cleaning Gasket Surfaces

- Use care to avoid gouging or scraping the sealing surfaces.
- Use a plastic or wood scraper in order to remove all the sealant from the components.

  DO NOT use any other method or technique to remove the sealant or the gasket material from a part.
- DO NOT use abrasive pads, sand paper, or power tools to clean the gasket surfaces.
  - These methods of cleaning can cause damage to the component sealing surfaces.
  - Abrasive pads also produce a fine grit that the oil filter cannot remove from the engine oil.
  - This fine grit is an abrasive and can cause internal engine damage.

Assembling Components

- Assemble components using only the sealant (or equivalent) that is specified in the service procedure.
- Sealing surfaces must be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.
- Components requiring lubrication will be identified in the service procedure.
- Apply only the amount of sealant specified in the service procedure to a component.
- DO NOT allow the sealant to enter into any blind threaded holes, as the sealant may prevent the fastener from clamping correctly or cause component damage when tightened.

Important: DO NOT overtighten the fasteners.

- Tighten the fasteners to the correct specifications.

Separating Parts

In addition to the Room Temperature Vulcanizing (RTV) sealant's sealing capabilities, the RTV sealants may form an adhesive bond between the components. This may make the components difficult to remove or to separate. If possible, bump the components sideways rather than using prying tools in order to remove the components. This technique prevents damage when the bonding strength of the RTV sealant is stronger than the component itself. Perform bumping at the bends or at the reinforced areas in order to prevent part distortion.

Tools and Equipment

- Special tools are listed and illustrated throughout this section with a complete listing at the end of the section. These tools (or their equivalents) are specially designed to quickly and safely accomplish the operations for which they are intended. The use of these special tools will also minimize possible damage to engine components. Some precision measuring tools are required for inspection of certain critical components. Torque wrenches and a torque angle meter are necessary for the correct tightening of various fasteners.
- To correctly service the engine assembly, the following items should be readily available:
  - Approved eye protection and safety gloves
  - A clean, well-lit, work area
  - A suitable parts cleaning tank
  - A compressed air supply
  - Trays or storage containers to keep parts and fasteners organized
  - An adequate set of hand tools
  - Approved engine repair stand
  - An approved engine lifting device that will adequately support the weight of the components

Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant

Sealant Types

Important: The correct sealant and amount of sealant must be used in the correct location to prevent oil leaks, coolant leaks, or the loosening of the fasteners. DO NOT interchange the sealants. Use only the sealant, or equivalent, as specified in the service procedure.

The following 2 major types of sealant are commonly used in engines:

- Anaerobic sealant room temperature vulcanizing (RTV)
- Anaerobic sealant, which include the following:
  - Gasket eliminator
  - Pipe
  - Threadlock

Anaerobic Type Room Temperature Vulcanizing (RTV) Sealant

Anaerobic type room temperature vulcanizing (RTV) sealant cures in the absence of air. This type of sealant is used where 2 components, such as the intake manifold and the cylinder block, are assembled together.

Use the following information when using RTV sealant:

- DO NOT use RTV sealant in areas where extreme temperatures are expected. These areas include:
  - The exhaust manifold
  - The head gasket
  - Any other surfaces where a different type of sealant is specified in the service procedure
- Always follow all the safety recommendations and the directions that are on the RTV sealant container.
- Use a plastic or wood scraper in order to remove all the RTV sealant from the components.

Notice: Do not allow the RTV sealant to enter any blind threaded hole. RTV sealant that is allowed to enter a blind threaded hole can cause hydraulic lock of the fastener when the fastener is tightened. Hydraulic lock of a fastener can lead to damage to the fastener and/or the components. Hydraulic lock of a fastener can also prevent the proper clamping loads to be obtained when the fastener is tightened. Improper clamping loads can prevent proper sealing of the components allowing leakage to occur. Preventing proper fastener tightening can allow the components to loosen or separate leading to extensive engine damage.

- The surfaces to be sealed must be clean and dry.
- Use a RTV sealant bead size as specified in the service procedure.

- Apply the RTV sealant bead to the inside of any bolt holes areas.

  Important: DO NOT wait for the RTV sealant to skin over.

- Assemble the components while the RTV sealant is still wet to the touch, within 3 minutes.

  Important: DO NOT overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the correct torque specifications.

Anaerobic Type Gasket Eliminator Sealant

Anaerobic type gasket eliminator sealant cures in the absence of air. This type of sealant is used where 2 rigid parts, such as castings, are assembled together. When 2 rigid parts are disassembled and no sealant or gasket is readily noticeable, then the 2 parts were probably assembled using an anaerobic type gasket eliminator sealant.

Use the following information when using gasket eliminator sealant:

- Always follow all the safety recommendations and directions that are on the gasket eliminator sealant container.
- Apply a continuous bead of gasket eliminator sealant to one flange.

  The surfaces to be sealed must be clean and dry.

Notice: Refer to General Repair Instructions in the Preface section.

Important:

- Gasket eliminator sealed joint fasteners that are partially torqued and the gasket eliminator sealant allowed to cure more than 5 minutes, may result in incorrect shimming and sealing of the joint.
- DO NOT overtighten the fasteners.
  - Apply the gasket eliminator sealant evenly to get a uniform thickness of the gasket eliminator sealant on the sealing surface.
  - Tighten the fasteners in sequence, if specified, and to the correct torque specifications.
  - After correctly tightening the fasteners, remove the excess gasket eliminator sealant from the outside of the joint.

Anaerobic Type Threadlock Sealant

Anaerobic type threadlock sealant cures in the absence of air. This type of sealant is used for threadlocking and sealing of bolts, fittings, nuts, and studs. This type of sealant cures only when confined between 2 close fitting metal surfaces.

Use the following information when using threadlock sealant:

- Always follow all safety recommendations and directions that are on the threadlock sealant container.

- The threaded surfaces to be sealed must be clean and dry.
- Apply the threadlock sealant as specified on the threadlock sealant container.

Important:

- Fasteners that are partially torqued and then the threadlock sealant allowed to cure more than 5 minutes, may result in incorrect clamp load of assembled components.
- DO NOT overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the correct torque specifications.

Anaerobic Type Pipe Sealant

Anaerobic type pipe sealant cures in the absence of air and remains pliable when cured. This type of sealant is used where 2 parts are assembled together and require a leak proof joint.

Use the following information when using pipe sealant:

- DO NOT use pipe sealant in areas where extreme temperatures are expected. These areas include:
  - The exhaust manifold
  - The head gasket
  - Surfaces where a different sealant is specified
- Always follow all the safety recommendations and the directions that are on the pipe sealant container.
- The surfaces to be sealed must be clean and dry.
- Use a pipe sealant bead of the size or quantity as specified in the service procedure.

Notice: Refer to General Repair Instructions in the Preface section.

- Apply the pipe sealant bead to the inside of any bolt hole areas.
- Apply a continuous bead of pipe sealant to one sealing surface.

Important: DO NOT overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the correct torque specifications.

Rocker Arms - Valve Rocker Arm Ratio	1.70:1	
Valve Springs - Valve Spring Free Length	52.9 mm	2.08 in
Valve Springs - Valve Spring Installed Height	45.75 mm	1.8 in
Valve Springs - Valve Spring Load - Closed	340 N at 45.75 mm	76 lb at 1.8 in
Valve Springs - Valve Spring Load - Open	980 N at 33.55 mm	220 lb at 1.32 in

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Specifications | Document ID: 2093557

Engine Mechanical Specifications (LS3)

Application	Specification	
	Metric	English
General		
• Engine Type	V8	
• Displacement	6.2L	376 CID
• RPO	LS3	
• VIN	W	
• Bore	103.241-103.259 mm	4.0065-4.0065 in
• Stroke	92.0 mm	3.622 in
• Compression Ratio	10.7:1	
• Firing Order	1-8-7-2-6-5-4-3	
• Spark Plug Gap	1.02 mm	0.04 in
Block		
• Camshaft Bearing Bore 1 and 5 Diameter	59.58-59.63 mm	2.345-2.347 in
• Camshaft Bearing Bore 2 and 4 Diameter	59.08-59.13 mm	2.325-2.327 in
• Camshaft Bearing Bore 3 Diameter	58.58-58.63 mm	2.306-2.308 in
• Crankshaft Main Bearing Bore Diameter	69.871-69.889 mm	2.75-2.751 in
• Crankshaft Main Bearing Bore Out-of-Round	0.006 mm	0.0002 in
• Cylinder Bore Diameter	103.241-103.259 mm	4.0065-4.0065 in
• Cylinder Head Deck Height - Measuring from the Centerline of Crankshaft to the Deck Face	234.57-234.82 mm	9.235-9.245 in
• Cylinder Head Deck Surface Flatness - Measured within a 152.4 mm (6.0 in) Area	0.11 mm	0.004 in
• Cylinder Head Deck Surface Flatness - Measuring the Overall Length of the Block Deck	0.22 mm	0.008 in
• Valve Lifter Bore Diameter	21.417-21.443 mm	0.843-0.844 in
Camshaft		
• Camshaft End Play	0.025-0.305 mm	0.001-0.012 in
• Camshaft Journal Diameter	54.99-55.04 mm	2.164-2.166 in
• Camshaft Journal Out-of-Round	0.025 mm	0.001 in
• Camshaft Lobe Lift - Intake	8.24 mm	0.324 in
• Camshaft Lobe Lift - Exhaust	7.77 mm	0.306 in
• Camshaft Runout - Measured at the Intermediate Journals	0.05 mm	0.002 in
Connecting Rod		

Connecting Rod Bearing Clearance - Production	0.023-0.065 mm	0.0009-0.0025 in
Connecting Rod Bearing Clearance - Service	0.023-0.076 mm	0.0009-0.003 in
Connecting Rod Bore Diameter - Bearing End	56.505-56.525 mm	2.224-2.225 in
Connecting Rod Bore Out-of-Round - Bearing End - Production	0.004-0.008 mm	0.00015-0.0003 in
Connecting Rod Bore Out-of-Round - Bearing End - Service	0.004-0.008 mm	0.00015-0.0003 in
Connecting Rod Side Clearance	0.11-0.51 mm	0.00433-0.02 in
Crankshaft		
Connecting Rod Journal Diameter - Production	53.318-53.338 mm	2.0991-2.0999 in
Connecting Rod Journal Diameter - Service	53.308 mm	2.0987 in
Connecting Rod Journal Out-of-Round - Production	0.005 mm	0.0002 in
Connecting Rod Journal Out-of-Round - Service	0.01 mm	0.0004 in
Connecting Rod Journal Taper - Maximum for 1/2 of Journal Length - Production	0.005 mm	0.0002 in
Connecting Rod Journal Taper - Maximum for 1/2 of Journal Length - Service	0.02 mm	0.00078 in
Crankshaft End Play	0.04-0.2 mm	0.0015-0.0078 in
Crankshaft Main Bearing Clearance - Production	0.02-0.052 mm	0.0008-0.0021 in
Crankshaft Main Bearing Clearance - Service	0.02-0.065 mm	0.0008-0.0025 in
Crankshaft Main Journal Diameter - Production	64.992-65.008 mm	2.558-2.559 in
Crankshaft Main Journal Diameter - Service	64.992 mm	2.558 in
Crankshaft Main Journal Out-of-Round - Production	0.003 mm	0.000118 in
Crankshaft Main Journal Out-of-Round - Service	0.008 mm	0.0003 in
Crankshaft Main Journal Taper - Production	0.01 mm	0.0004 in
Crankshaft Main Journal Taper - Service	0.02 mm	0.00078 in
Crankshaft Rear Flange Runout	0.05 mm	0.002 in
Crankshaft Reluctor Ring Runout - Measured 1.0 mm (0.04 in) Below Tooth Diameter	0.7 mm	0.028 in
Crankshaft Thrust Surface - Production	26.14-26.22 mm	1.029-1.0315 in
Crankshaft Thrust Surface - Service	26.22 mm	1.0315 in
Crankshaft Thrust Surface Runout	0.025 mm	0.001 in
Cylinder Head		
Cylinder Head Height/Thickness - Measured from the Cylinder Head Deck to the Valve Rocker Arm Cover Seal Surface	120.2 mm	4.732 in
Surface Flatness - Block Deck - Measured within a	0.08 mm	0.003 in

152.4 mm (6.0 in) Area		
- Surface Flatness - Block Deck - Measuring the Overall Length of the Cylinder Head	0.1 mm	0.004 in
- Surface Flatness - Exhaust Manifold Deck	0.13 mm	0.005 in
- Surface Flatness - Intake Manifold Deck	0.08 mm	0.0031 in
- Valve Guide Installed Height - Measured from the Spring Seat Surface to the Top of the Guide	17.32 mm	0.682 in
Intake Manifold		
- Surface Flatness - Measured at Gasket Sealing Surfaces and Measured Within a 200 mm (7.87 in) Area that Includes 2 Runner Port Openings	0.3 mm	0.118 in
Lubrication System		
- Oil Capacity - with Filter	5.7 liters	6.0 quarts
- Oil Capacity - without Filter	5.4 liters	5.7 quarts
- Oil Capacity - with Filter - RPO KPS	5.7 liters	6.0 quarts
- Oil Pressure - Minimum - Hot	41 kPa at 1,000 engine RPM 124 kPa at 2,000 engine RPM 165 kPa at 4,000 engine RPM	6 psig at 1,000 engine RPM 18 psig at 2,000 engine RPM 24 psig at 4,000 engine RPM
Oil Pan		
- Front Cover Alignment - at Oil Pan Surface	0.0-0.5 mm	0.0-0.02 in
- Crankshaft Rear Oil Seal Housing Alignment - at Oil Pan Surface	0.0-0.5 mm	0.0-0.02 in
- Oil Pan Alignment - to Rear of Engine Block at Transmission Bell Housing Mounting Surface	0.0-0.1 mm	0.0-0.004 in
Piston Rings		
- Piston Ring End Gap - First Compression Ring - Measured in Cylinder Bore - Production	0.17-0.38 mm	0.0067-0.0150 in
- Piston Ring End Gap - First Compression Ring - Measured in Cylinder Bore - Service	0.17-0.44 mm	0.0067-0.0173 in
- Piston Ring End Gap - Second Compression Ring - Measured in Cylinder Bore - Production	0.32-0.63 mm	0.0126-0.0248 in
- Piston Ring End Gap - Second Compression Ring - Measured in Cylinder Bore - Service	0.32-0.69 mm	0.0126-0.0272 in
- Piston Ring End Gap - Oil Control Ring - Measured in Cylinder Bore - Production	0.22-0.79 mm	0.0086-0.0311 in
- Piston Ring End Gap - Oil Control Ring - Measured in Cylinder Bore - Service	0.22-0.85 mm	0.0086-0.0335 in
- Piston Ring to Groove Clearance - First Compression Ring - Production	0.030-0.083 mm	0.0012-0.0033 in
- Piston Ring to Groove Clearance - First Compression Ring - Service	0.030-0.083 mm	0.0012-0.0033 in

Piston Ring to Groove Clearance - Second Compression Ring - Production	0.040-0.083 mm	0.0016-0.0033 in
Piston Ring to Groove Clearance - Second Compression Ring - Service	0.040-0.083 mm	0.0016-0.0033 in
Piston Ring to Groove Clearance - Oil Control Ring - Production	0.013-0.201 mm	0.0005-0.0079 in
Piston Ring to Groove Clearance - Oil Control Ring - Service	0.013-0.201 mm	0.0005-0.0079 in
Pistons and Pins		
Pin - Piston Pin Clearance to Piston Pin Bore - Production	0.002-0.01 mm	0.00008-0.0004 in
Pin - Piston Pin Clearance to Piston Pin Bore - Service	0.002-0.015 mm	0.00008-0.0006 in
Pin - Piston Pin Diameter	23.952-23.955 mm	0.9430-0.9431 in
Pin - Piston Pin Fit in Connecting Rod Bore - Production	0.007-0.02 mm	0.00027-0.00078 in
Pin - Piston Pin Fit in Connecting Rod Bore - Service	0.007-0.022 mm	0.00027-0.00086 in
Piston - Piston Diameter - Measured Over Skirt Coating	103.258-103.289 mm	4.0653-4.0665 in
Piston - Piston to Bore Clearance - Production	-0.048 to +0.001 mm	-0.0019 to +0.000 in
Piston - Piston to Bore Clearance - Service Limit with Skirt Coating Worn Off	0.055 mm	0.0022 in
Valve System		
Valves - Valve Face Angle	45 degrees	
Valves - Valve Face Width	1.25 mm	0.05 in
Valves - Valve Lash	Net Lash - No Adjustment	
Valves - Valve Lift - Intake	13.97 mm	0.55 in
Valves - Valve Lift - Exhaust	13.22 mm	0.52 in
Valves - Valve Seat Angle	46 degrees	
Valves - Valve Seat Runout	0.05 mm	0.002 in
Valves - Valve Seat Width - Exhaust	1.78 mm	0.07 in
Valves - Seat Width - Intake	1.02 mm	0.04 in
Valves - Valve Stem Diameter - Production	7.955-7.976 mm	0.313-0.314 in
Valves - Valve Stem Diameter - Service	7.95 mm	0.313 in
Valves - Valve Stem-to-Guide Clearance - Production - Intake	0.025-0.066 mm	0.001-0.0026 in
Valves - Valve Stem-to-Guide Clearance - Service - Intake	0.093 mm	0.0037 in
Valves - Valve Stem-to-Guide Clearance - Production - Exhaust	0.025-0.066 mm	0.001-0.0026 in
Valves - Valve Stem-to-Guide Clearance - Service - Exhaust	0.093 mm	0.0037 in

- Rocker Arms - Valve Rocker Arm Ratio	1.70:1	
- Valve Springs - Valve Spring Free Length	52.9 mm	2.08 in
- Valve Springs - Valve Spring Installed Height	45.75 mm	1.8 in
- Valve Springs - Valve Spring Load - Closed	400 N at 45.75 mm	90 lb at 1.8 in
- Valve Springs - Valve Spring Load - Open	1175 N at 33.05 mm	264 lb at 1.30 in

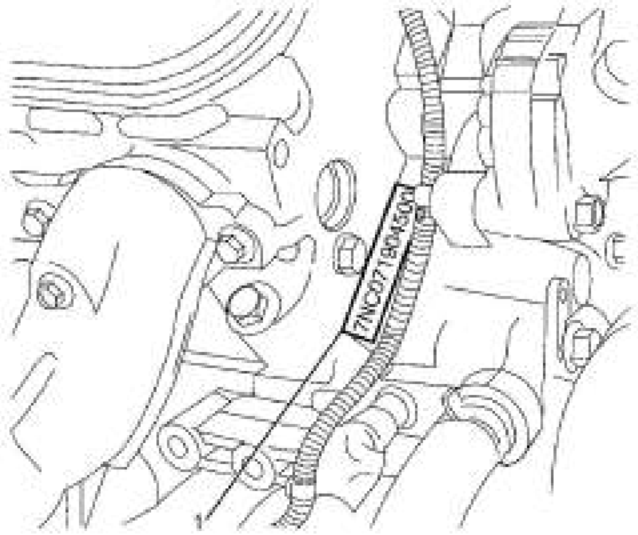
Engine Identification (L98, LS2)



The Engine Serial Number is located on the right-hand side at the front of the engine cylinder block (1) and is stamped or laser etched onto the block at the assembly plant. The number is prefixed by the engine model number. As an example 7NC is used. When reading the Engine Serial Number the following information can be obtained:

Engine Serial Number 7NC071904500 is used as an example:

- The first three digits, 7NC, identify the engine model.
- The next two digits, 07, identify the engine model year as 2007.
- The next three digits, 190, identify the Julian date the engine was manufactured as day 190.
- The next four digits, 4500, identify the assembly plant sequence number as 4500.

Document ID: 2037292

Base Engine Misfire with Abnormal Internal Lower Engine Noises

Cause	Correction
Abnormalities, such as extreme cracking, bumps or missing areas in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine RPM variations, noises similar to a faulty lower engine and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.	Replace the drive belt. Refer to Drive Belt Replacement - Accessory.
Worn, damaged, or mis-aligned accessory drive components or above acceptable pulley runout. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace, as required.
Loose or incorrectly installed engine flywheel or crankshaft balancer. A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer, as required. Refer to Engine Flywheel Replacement or Crankshaft Balancer Replacement.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform cylinder leak down and compression testing to identify the cause. Refer to Cylinder Leakage Test. • Repair or replace, as required.
Worn crankshaft thrust bearings. Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft and create a DTC without an actual misfire condition.	Replace the crankshaft and bearings, as required. Refer to Crankshaft and Bearing Removal.

Base Engine Misfire with Abnormal Valve Train Noise

Cause	Correction
Worn or loose rocker arms. The rocker arm bearing end caps and/or needle bearings should be intact within the rocker arm assembly.	Replace the valve rocker arms, as required. Refer to Base Engine Misfire with Abnormal Valve Train Noise.
Worn or bent pushrods.	Replace the pushrods, as required. Refer to Valve Rocker Arm and Push Rod Replacement.
Stuck valves. Carbon buildup on the valve stem can cause the valve not to close correctly.	Repair or replace, as required. Refer to Cylinder Head Disassemble.
A worn or mis-aligned timing chain above acceptable tolerances.	Replace the timing chain and sprockets, as required. Refer to Cylinder Head Disassemble.
Worn camshaft lobes	Replace the camshaft and valve lifters. Refer to Camshaft Replacement.
Sticking lifters	Replace the camshaft and valve lifters. Refer to Camshaft Replacement.

Base Engine Misfire with Coolant Consumption

Cause	Correction
Failed cylinder head gaskets and/or cracking or other damage to the cylinder heads and engine block cooling system passages. Coolant consumption may or may not cause the engine to overheat.	• Perform a cylinder leak down test. Refer to Cylinder Leakage Test. • Inspect the cylinder heads and engine block for damage to the coolant passages and/or a faulty head gasket. Refer to Coolant in Combustion Chamber. • Repair or replace, as required.

Base Engine Misfire with Excessive Oil Consumption

Cause	Correction
Worn valves, valve guides and/or valve stem oil seals.	1. Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. 2. Inspect the valves, valve guides and/or valve stem oil seals. Refer to Valve Stem Oil Seal and Valve Spring Replacement. 3. Repair or replace, as required.
Worn piston rings Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform a cylinder leak down test. Refer to Cylinder Leakage Test. • Repair or replace, as required.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2037291

Base Engine Misfire without Internal Engine Noises

Cause	Correction
Abnormalities, such as extreme cracking, bumps, or missing areas in the accessory drive belt Abnormalities in the accessory drive system and/or components may cause engine RPM variations and lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Replace the drive belt. Refer to Drive Belt Replacement - Accessory .
Worn, damaged, or mis-aligned accessory drive components or above acceptable pulley runout May lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace, as required.
Loose or incorrectly installed engine flywheel or crankshaft balancer. A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer, as required. Refer to Engine Flywheel Replacement or Crankshaft Balancer Replacement .
Restricted exhaust system. An extreme restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions include collapsed or dented pipes or plugged mufflers and/or catalytic converters.	Inspect the exhaust system for restrictions. Refer to Restricted Exhaust .
Incorrectly installed or damaged vacuum hoses.	Inspect the vacuum hose routing, Refer to Evaporative Emissions Hose Routing Diagram .
Incorrect sealing between the intake manifold and cylinder heads or throttle body.	Replace the intake manifold, gaskets, cylinder heads, and/or throttle body, as required. Refer to Intake Manifold Replacement .
Incorrectly installed or damaged MAP sensor. The sealing grommet of the MAP sensor should not be torn or damaged.	Repair or replace the MAP sensor, as required. Refer to Manifold Absolute Pressure Sensor Replacement
Worn or loose rocker arms. The rocker arm bearing end caps and/or needle bearings should be intact and the rocker arm in the correct position.	Replace the valve rocker arms, as required. Refer to Valve Rocker Arm and Push Rod Replacement .
Worn or bent pushrods.	Replace the valve rocker arms, as required. Refer to Valve Rocker Arm

	and Push Rod Replacement .
Stuck valves. Carbon buildup on the valve stem can cause the valve not to close correctly.	Repair or replace, as required. Refer to Cylinder Head Disassemble .
A worn or mis-aligned timing chain above acceptable tolerances.	Replace the timing chain and sprockets, as required. Refer to Camshaft Timing Chain and Sprocket Replacement .
Worn camshaft lobes.	Replace the camshaft and valve lifters. Refer to Camshaft Replacement .
Oil pressure above acceptable tolerances. A lubrication system with oil pressure above acceptable tolerances may lead to above acceptable valve lifter pump-up and loss of compression.	1. Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing . 2. Repair or replace the oil pump, as required. Refer to Oil Pump, Screen, and Crankshaft Oil Deflector Replacement .
Failed cylinder head gaskets and/or cracking or other damage to the cylinder heads and engine block cooling system passages. Coolant consumption may or may not cause the engine to overheat.	• Inspect for spark plugs saturated by coolant. Refer to Spark Plug Inspection . • Inspect the cylinder heads, engine block, and/or head gaskets. Refer to Coolant in Combustion Chamber . • Refer to Cylinder Head Replacement - Left Side . or Refer to Cylinder Head Replacement - Right Side . • Repair or replace, as required.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection . • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test . • Perform a cylinder leak down test. Refer to Cylinder Leakage Test . • Repair or replace, as required.
A damaged crankshaft reluctor wheel. A damaged crankshaft reluctor wheel can result in different symptoms depending on the severity and location of the damage. • Severe reluctor ring damage may exhibit	Replace the sensor and/or crankshaft, as required. Refer to Crankshaft and Bearing Removal . or Crankshaft Position Sensor

periodic loss of crankshaft position, stop delivering a signal, and then sync the crankshaft position. • Slight reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur. However, a P0300 DTC may be set.	Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2038196

Coolant in Combustion Chamber

<table>
<tr><th>Cause</th><th>Correction</th></tr>
<tr><td colspan="2">DEFINITION: White smoke and/or coolant type odour above acceptable tolerances coming from the exhaust pipe may indicate coolant in the combustion chamber. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an over-temperature condition which may cause engine component damage.
1. A slower than normal cranking speed may indicate coolant entering the combustion chamber. Refer to Engine Will Not Crank - Crankshaft Will Not Rotate .
2. Remove the spark plugs and inspect for spark plugs saturated by coolant or coolant in the cylinder bore. Refer to Spark Plug Inspection .
3. Inspect by performing a cylinder leak-down test. During this test, above acceptable air bubbles within the coolant may indicate a faulty gasket or damaged component. Refer to Cylinder Leakage Test .
4. Inspect by performing a cylinder compression test. 2 cylinders side-by-side on the engine block, with low compression, may indicate a failed cylinder head gasket. Refer to Engine Compression Test .</td></tr>
<tr><td>Failed cylinder head gasket.</td><td>Replace the head gasket and components, as required. Refer to Cylinder Head Cleaning and Inspection and Cylinder Head Replacement - Left Side and Cylinder Head Replacement - Right Side .</td></tr>
<tr><td>Warped cylinder head.</td><td>Machine the cylinder head to the correct flatness, if applicable and replace the cylinder head gasket. Refer to Cylinder Head Cleaning and Inspection .</td></tr>
<tr><td>Cracked cylinder head.</td><td>Replace the cylinder head and gasket. Refer to Cylinder Head Replacement - Left Side
or
Refer to Cylinder Head Replacement - Right Side .</td></tr>
<tr><td>Cracked cylinder liner or engine block.</td><td>Replace the components, as required.</td></tr>
<tr><td>Cylinder head or engine block porosity.</td><td>Replace the components, as required.</td></tr>
</table>

Coolant in Engine Oil (L98, LS2)

Cause	Correction
DEFINITION: Foamy or discoloured oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an over-temperature condition which may cause engine component damage. Contaminated engine oil and oil filter should be changed. 1. Inspect the oil for above acceptable foaming or an overfill condition. Oil diluted by coolant may not correctly lubricate the crankshaft bearings and may lead to component damage. Refer to Lower Engine Noise, Regardless of Engine Speed. 2. Inspect by performing a cylinder leak-down test. During this test, above acceptable air bubbles within the cooling system may indicate a faulty gasket or damaged component. Refer to Cylinder Leakage Test. 3. Inspect by performing a cylinder compression test. 2 cylinders side-by-side on the engine block with low compression may indicate a failed cylinder head gasket. Refer to Engine Compression Test.	
Failed cylinder head gasket	Replace the head gasket and components, as required. Refer to Cylinder Head Cleaning and Inspection and Cylinder Head Replacement - Left Side. Refer to Cylinder Head Replacement - Right Side.
Warped cylinder head.	Machine the cylinder head to the correct flatness, if applicable and replace the cylinder head gasket. Refer to Cylinder Head Cleaning and Inspection.
Cracked cylinder head.	Replace the cylinder head and gasket. Refer to Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side.
Cracked cylinder liner or engine block.	Replace the components, as required. Refer to Engine Block Disassemble in Engine Mechanical - 6.0L.
Cylinder head or engine block porosity.	Replace the components, as required. Refer to Engine Block Disassemble or Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side

Coolant in Engine Oil (LS3)

Cause	Correction
DEFINITION: Foamy or discolored oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an overtemperature condition which may cause engine component damage. Contaminated engine oil and oil filter should be changed. 1. Inspect the oil for excessive foaming or an overfill condition. Oil diluted by coolant may not properly lubricate the crankshaft bearings and may lead to component damage. Refer to Lower Engine Noise, Regardless of Engine Speed. 2. Inspect by performing a cylinder leak-down test. During this test, excessive air bubbles within the cooling system may indicate a faulty gasket or damaged component. 3. Inspect by performing a cylinder compression test. 2 cylinders side-by-side on the engine block with low compression may indicate a failed cylinder head gasket. Refer to Engine Compression Test.	
Faulty external engine oil cooler	Replace the components, as required.
Faulty cylinder head gasket	Replace the head gasket and components, as required. Refer to Cylinder Head Cleaning and Inspection and Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side.
Warped cylinder head	Machine the cylinder head to proper flatness, if applicable, and replace the cylinder head gasket. Refer to Cylinder Head Cleaning and Inspection.
Cracked cylinder head	Replace the cylinder head and gasket.
Cracked cylinder liner or engine block	Replace the components, as required.
Cylinder head, block, or manifold porosity	Replace the components, as required.

Crankcase Ventilation System Inspection / Diagnosis

Concern	Action
External oil leak.	Inspect for any of the following conditions: • Plugged positive crankcase ventilation (PCV). • Plugged or kinked PCV hose(s). • Damaged or incorrectly installed PCV or hose(s). • Above acceptable crankcase pressure.
Rough Idle.	Inspect for any of the following conditions: • Plugged PCV. • Plugged or kinked PCV hose(s). • Leaking (damaged) PCV or hose(s).
Stalling or slow idle speed.	Inspect for any of the following conditions: • Plugged PCV. • Plugged or kinked PCV hose(s). • Leaking (damaged) PCV or hose(s).
High idle speed.	Inspect for a leaking (damaged) PCV or hose(s).
Sludge in the engine.	Inspect for any of the following conditions: • Plugged PCV. • Plugged or kinked PCV hose(s).

Cylinder Leakage Test

Tools Required

J 35667-A Cylinder Head Leakdown Tester, or equivalent

Important: A leakage test may be performed in order to measure cylinder/combustion chamber leakage. High cylinder leakage may indicate one or more of the following conditions:

- Worn or burnt valves.
- Broken valve springs.
- Stuck valve lifters.
- Incorrect valve lash.
- Damaged piston.
- Worn piston rings.
- Worn or scored cylinder bore.
- Damaged cylinder head gasket.
- Cracked or damaged cylinder head.
- Cracked or damaged engine block.

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground negative cable.
2. Remove the spark plugs. Refer to Spark Plug Inspection.
3. Rotate the crankshaft to place the piston in the cylinder being tested at top dead centre (TDC) of the compression stroke.
4. Install the J 35667-A or equivalent.

   Important: It may be necessary to hold the crankshaft balancer bolt to prevent the crankshaft from rotating.

5. Apply compressed air pressure to the J 35667-A and adjust according to the manufacturers instructions.
6. Record the cylinder leakage value. Cylinder leakage that exceeds 25 percent is considered above acceptable and may require component service. In above acceptable leakage situations, inspect for the following conditions:
   - Air leakage noise at the throttle body or air inlet hose that may indicate a worn or burnt intake valve or a broken valve spring.
   - Air leakage noise at the exhaust system tail-pipe that may indicate a worn or burnt exhaust valve or a broken valve spring.
   - Air leakage noise from the crankcase, oil level indicator tube, or oil fill tube that may indicate worn piston rings, a damaged piston, a worn or scored cylinder bore, a damaged engine block or a damaged cylinder head.
   - Air bubbles in the cooling system may indicate a damaged cylinder head or a damaged cylinder head gasket.
7. Perform the leakage test on the remaining cylinders and record the values.

Diagnostic Starting Point - Engine Mechanical

Begin the system diagnosis by reviewing the Disassembled Views and Engine Component Descriptionand Lubrication Description and Drive Belt System Description. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Engine Mechanical, in order to identify the correct procedure for diagnosing the system and where the procedure is located.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2039706

Drive Belt Chirping, Squeal, and Whine Diagnosis

Drive Belt Chirping Diagnosis

Diagnostic Aids

The chirping noise may be intermittent due to moisture on the drive belts or the accessory drive pulleys. in order to duplicate the customer concern, It may be necessary to spray a small amount of water onto the drive belts. If spraying water on the drive belts duplicates the symptom, cleaning the accessory drive pulleys may be the most probable solution.

A loose or incorrect installation of a body or suspension component, or other items on the vehicle may cause the chirping noise.

Test Description

The numbers below refer to the steps in the diagnostic table.

2. The chirping noise may not be engine related. This step is to verify that the engine is making the noise. If the engine is not making the noise do not proceed further in this table.
3. The noise may be an internal engine noise. Remove the drive belts and operate the engine for a few seconds, this will verify if the chirping noise is related to the drive belts or not. With the drive belts removed the water pump will not operate and the engine may overheat. Also diagnostic trouble codes (DTCs) may set when the engine is operated with the drive belts removed.
4. Inspect the drive belts for signs of pilling. Pilling is the small balls, pills, or strings in the drive belt grooves caused by the accumulation of rubber dust.
6. Misalignment of the accessory drive pulleys may be caused from incorrect mounting or incorrect installation of an accessory drive component, or the pulley may be bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found refer to that accessory drive component for the correct removal and installation procedure for that pulley.
10. Inspection of the fasteners can address the possibility that a incorrect bolt, nut, spacer, or washer was installed.
12. Inspection the accessory drive pulleys should include inspecting for bends, dents or other damage to the pulleys that May prevent the drive belts from seating correctly in the pulley grooves or on the smooth surface of a pulley when the back side of the drive belt is used to drive the pulley.
14. Replacing the drive belts when it is not damaged or there is not above acceptable pilling will only be a temporary repair.

Step	Action	Yes	No

Notice: Refer to Belt Dressing Notice in the Preface section.

DEFINITION: The following items are indications of chirping:

- A high pitched noise that is heard once per revolution of the drive belts or an accessory drive pulley.
- Chirping may occur on cold damp start-up conditions and will subside once the vehicle reaches normal operating temperature.

1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical.
2	Verify that there is a chirping noise. Does the engine make the chirping noise?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belt. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. 2. Operate the engine for no longer than 30-40 seconds. Does the chirping noise still exist?	Go to Engine Noise on Start-Up, but Only Lasting a Few Seconds or Upper Engine Noise, Regardless of Engine Speed or Lower Engine Noise, Regardless of Engine Speed.	Go to Step 4
4	Inspect for extreme drive belt pilling exceeding 1/3 of the drive belt groove depth. Do the drive belt grooves have pilling?	Go to Step 5	Go to Step 6
5	Clean the accessory drive pulleys with a suitable wire brush. Were the accessory drive pulleys cleaned?	Go to Step 14	--
6	Inspect for a misaligned accessory drive pulleys. Is there a misaligned accessory drive pulleys?	Go to Step 7	Go to Step 8
7	Replace and/or repair the misaligned accessory drive pulleys. Refer to Power Steering Pump Pulley Replacement. Refer to Drive Belt Idler Pulley Replacement or Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning. Were the misaligned accessory drive pulleys replaced and/or repaired?	Go to Step 15	--
8	Inspect for a bent or cracked accessory drive brackets.		

	Did you find any bent or cracked accessory drive brackets?	Go to Step 9	Go to Step 10
9	Replace the bent and/or cracked accessory drive brackets. Refer to Compressor Mounting Bracket Replacement. Refer to Generator Bracket Replacement. Was the bent and/or cracked accessory drive brackets replaced?	Go to Step 15	--
10	Inspect for incorrect, loose, and/or missing fasteners. Were there any incorrect, loose, and/or missing fasteners found?	Go to Step 11	Go to Step 12
11	1. Replace any incorrect and/or missing fasteners. 2. Tighten any loose fasteners. Refer to Fastener Tightening Specifications. Were the fasteners replaced and/or tightened?	Go to Step 15	--
12	Inspect for a bent accessory drive pulleys. Refer to Power Steering Pump Pulley Replacement. Refer also to Drive Belt Idler Pulley Replacement or Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning. Was a bent accessory drive pulleys found?	Go to Step 13	Go to Step 14
13	Replace the bent accessory drive pulleys. Refer to Power Steering Pump Pulley Replacement. Refer also to Drive Belt Idler Pulley Replacement or Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning. Was the bent accessory drive pulleys replaced?	Go to Step 15	--
14	Replace the drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. Was the drive belts replaced?	Go to Step 15	--
15	1. Clear any codes. 2. Run the engine in order to verify the repair. Does the chirping noise still exist?	Go to Step 3	System OK

Drive Belt Squeal Diagnosis

Diagnostic Aids

A loose or incorrect installation of the body, suspension component, or other items on the vehicle may cause the squealing noise.

If the noise is intermittent, verify that the accessory drive components, by varying their loads, are operating to their maximum capacity. An overcharged air conditioning (A/C) system, power steering system restriction, incorrect fluid, or a failing alternator are suggested items to inspect.

Test Description

The numbers below refer to the step numbers in the diagnostic table.

2. The squeal may not be engine related. This step is to verify that the engine is making the noise. If the engine is not making the noise, do not proceed further in this table.
3. The noise may be an internal engine noise. Remove the drive belts and operate the engine for a few seconds; this will verify if the squealing noise is related to the drive belts or an accessory drive component. With the drive belts removed, the water pump will not operate and the engine may overheat. Also diagnostic trouble codes (DTCs) may set when the engine is operated with the drive belts removed.
4. This test is to verify that an accessory drive component does not have a seized bearing. With the belts removed, test the bearings in the accessory drive components for smooth operation. Also, test the accessory drive components with the engine operating by varying the load on the accessory drive components to verify that the components are operating correctly.
5. This test is to verify that the drive belt tensioners are operating correctly. If the drive belt tensioners are not operating correctly, correct belt tension may not be achieved to keep the drive belt from slipping, which may cause a belt squeal noise.
6. This test is to verify that the drive belt is not too long, which May prevent the drive belt tensioners from operating correctly. Also, if an incorrect length drive belt was installed, it may not be routed correctly and may be turning an accessory drive component in the incorrect direction.
7. Misalignment of the accessory drive pulleys may be caused from incorrect mounting or incorrect installation of an accessory drive component, or the pulley may be bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves, across 2 or 3 pulleys. If a misaligned pulley is found, refer to that accessory drive component for the correct removal and installation procedure for that pulley.
8. Inspect the accessory drive pulleys to verify that they are the correct diameter or width. Using a known good vehicle, compare the pulley sizes.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: The following items are indications of drive belt squeal:			

- A loud screeching noise that is caused by slipping drive belts; this is unusual for a drive belt with multiple ribs.
- The noise occurs when a heavy load is applied to the drive belts, such as an air conditioning (A/C) compressor engagement, snapping the throttle, or slipping on a seized pulley, or a faulty accessory drive component.

1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical.
2	Verify that there is a squealing noise. Does the engine make the squealing noise?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belt. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. 2. Operate the engine for no longer than 30 - 40 seconds. Does the squealing noise still exist?	Go to Engine Noise on Start-Up, but Only Lasting a Few Seconds or Upper Engine Noise, Regardless of Engine Speed or Lower Engine Noise, Regardless of Engine Speed.	Go to Step 4
4	Inspect for a seized accessory drive component bearing or a faulty accessory drive component. Did you find and correct the condition?	Go to Step 9	Go to Step 5
5	Inspect the drive belt tensioner for correct operation. Refer to Drive Belt Tensioner Diagnosis. Did you find and correct the condition?	Go to Step 9	Go to Step 6
6	Check the drive belt is the correct length . Did you find and correct the condition?	Go to Step 9	Go to Step 7
7	Inspect for a misaligned pulleys. Did you find and correct the condition?	Go to Step 9	Go to Step 8
8	Inspect for an incorrect size pulley. Did you find and correct the condition?	Go to Step 9	--
	1. Install the drive belts. Refer		

9	to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. 2. Clear any codes. 3. Run the engine in order to verify the repair. Does the squealing noise still exist?	--	System OK

Drive Belt Whine Diagnosis

Diagnostic Aids

The drive belts will not cause the whine. If the whine is intermittent, verify that it is not the accessory drive components by varying their loads, making sure they are operating to their maximum capacity. An overcharged air conditioning (A/C) system, a power steering system restriction, or the incorrect fluid, or a failing alternator are suggested items to inspect.

Test Description

The numbers below refer to the steps in the diagnostic table.

3. This test is to verify that the whine is being caused by the accessory drive components. Remove the drive belts and operate the engine for a few seconds, this will verify if the whining noise is related to the accessory drive component. With the drive belts removed the water pump will not operate and the engine may overheat. Also diagnostic trouble codes (DTCs) may set when the engine is operated with the drive belts removed.

4. The inspection should include checking the drive belt tensioner and the drive belt idler pulley bearings. The drive belts may have to be installed and the accessory drive components operated separately by varying their loads. Refer to the suspected accessory drive component for the correct removal and installation procedure.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: A high pitched continuous noise that may be caused by an accessory drive component failed bearing.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical.
2	Verify that there is a whining noise. Does the engine make the whining noise?	Go to Step 3	Go to Diagnostic Aids
	1. Remove the drive belts.		

3	Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. 2. Operate the engine for no longer than 30 - 40 seconds. Does the whining noise still exist?	Go to Engine Noise on Start-Up, but Only Lasting a Few Seconds or Upper Engine Noise, Regardless of Engine Speed or Lower Engine Noise, Regardless of Engine Speed.	Go to Step 4
4	1. Inspect for a failed accessory drive component bearing. 2. Install the drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. Did you find and correct the condition?	Go to Step 5	--
5	1. Clear any codes. 2. Run the engine in order to verify the repair. Does the whining still exist?	--	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |
Document ID: 2039711

Drive Belt Falls Off and Excessive Wear Diagnosis

Drive Belt Falls Off Diagnosis

Diagnostic Aids

If the drive belts repeatedly fall off the accessory drive pulleys, this may be caused by pulley misalignment.

If the drive belts repeatedly fall off the accessory drive pulleys, this may be caused by pulley misalignment.

If the drive belts are the incorrect length, the drive belt tensioners may not maintain the correct tension on the drive belts.

Test Description

The numbers below refer to the steps in the diagnostic table.

2. This inspection is to verify the condition of the drive belts. Damage may have occurred to the drive belts when the drive belts fell off the pulley. Inspect the drive belts for cuts, tears, sections of ribs missing, or damaged belt plies.
4. Misalignment of the accessory drive pulleys may be caused from incorrect mounting or incorrect installation of an accessory drive component, or the pulley may be bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found, refer to that accessory drive component for the correct removal and installation procedure of that pulley.
5. Inspection of the accessory drive pulleys should include inspecting for bends, dents or other damage that May prevent the drive belt from seating correctly in the pulley grooves or on the smooth surface of a pulley when the back side of the drive belts are used to drive the pulley.
6. Accessory drive component brackets that are bent or cracked will also cause the drive belts to fall off.
7. Inspection of the fasteners can address the possibility that an incorrect bolt, nut, spacer, or washer was installed. Missing, loose, or incorrect fasteners may cause pulley misalignment from the accessory drive brackets moving under load. Over tightening the fasteners may cause misalignment of the accessory component brackets.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: The drive belts fall off the pulleys or may not ride correctly on the pulleys.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary	Go to	Go to Symptoms - Engine

	inspections?	Step 2	Mechanical .
2	Inspect the drive belts for wear, damage, debris build-up and missing drive belt ribs. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . Was a damaged drive belt found?	Go to Step 3	Go to Step 4
3	Install new drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . Do the drive belts continue to fall off?	Go to Step 4	System OK
4	Inspect for misaligned drive pulleys. Did you find and correct the condition?	Go to Step 12	Go to Step 5
5	Inspect for a bent or dented accessory drive pulley. Did you find and correct the condition?	Go to Step 12	Go to Step 6
6	Inspect for a bent or a cracked accessory drive bracket. Did you find and correct the condition?	Go to Step 12	Go to Step 7
7	Inspect for incorrect, loose or missing fasteners. Were there any incorrect, loose and/or missing fasteners?	Go to Step 8	Go to Step 9
8	1. Replace any incorrect and/or missing fasteners. 2. Tighten any loose fasteners. Refer to Fastener Tightening Specifications. Does the drive belt continue to fall off?	Go to Step 9	System OK
9	Inspect the drive belt tensioner for correct operation. Refer to Drive Belt Tensioner Diagnosis . Does the drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner. Refer to Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning . Does the drive belt continue to fall off?	Go to Step 11	System OK
11	Inspect for a failed drive belt idler and drive belt tensioner pulley bearing. Refer to Drive Belt Tensioner Diagnosis . Did you find and repair the condition?	Go to Step 12	--
12	Run the engine in order to verify the repair. Does the drive belt still fall off?	--	System OK

Drive Belt Excessive Wear Diagnosis

Diagnostic Aids

Above acceptable wear on a drive belt is usually caused by incorrect installation or the wrong drive belts for the application.

Minor misalignment of the drive belt pulleys will not cause above acceptable wear, but will probably cause the drive belts to make a noise or to fall off the pulleys.

Major misalignment of the drive belt pulleys will cause above acceptable wear and may also make the drive belts fall off the pulleys.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. The inspection is to verify that the drive belts are correctly installed over all of the drive belt pulleys. Wear on the drive belts may be caused by misalignment the drive belts by one groove on a pulley.
3. The installation of a drive belt that is to wide or to narrow will cause wear on the drive belts. The drive belt ribs should match all of the grooves on the pulleys.
4. This inspection is to verify the drive belts is not contacting any parts of the engine or body while the engine is operating. There should be sufficient clearance when the drive belt accessory drive components load varies. The drive belts should not come in contact with an engine or a body component when snapping the throttle.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: Wear at the outside ribs of the drive belts due to an incorrectly installed drive belts			
1	Did you review the Symptoms - Engine Mechanical diagnostic information and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical .
2	Inspect the drive belts for the correct installation. Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . Did you find this condition?	Go to Step 5	Go to Step 3
3	Inspect for the correct drive belt. Did you find this condition?	Go to Step 5	Go to Step 4
4	Inspect for the drive belt rubbing against a bracket, hose, or wiring harness. Did you find and repair the condition?	Go to Step 6	Go to Diagnostic Aids
5	Replace the drive belt. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement .		

	Did you complete the replacement?	Go to Step 6	--
6	Run the engine in order to verify the repair. Is there still above acceptable drive belt wear?	--	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |
Document ID: 2039710

Drive Belt Rumbling and Vibration Diagnosis

Drive Belt Rumbling Diagnosis

Diagnostic Aids

Vibration from the engine operating may cause a body component or another part of the vehicle to produce a rumbling noise.

The drive belts may have a condition that can not be seen or felt. Sometimes replacing the drive belts may be the only repair for the symptom.

If after replacing the drive belts and completing the diagnostic table, the noise is only heard with the drive belts installed, there might be an accessory drive component inoperative. Varying the load on the accessory drive components may aid in identifying which accessory drive component is causing the rumbling noise.

Test Description

The numbers below refer to the steps in the diagnostic table.

2. This test is to verify that the symptom is present during diagnosing. Other vehicle components may cause a similar symptom.

3. This test is to verify that the drive belts are causing the rumbling. Rumbling may be confused with an internal engine noise due to the similarity in the description. Remove only one drive belt at a time if the vehicle has multiple drive belts. Operate the engine for a few seconds, this will verify if the rumbling noise is related to the drive belts or not. With the drive belts removed the water pump will not operate and the engine may overheat. Also diagnostic trouble codes (DTCs) may set when the engine is operated with the drive belts removed.

4. Inspect the drive belts to ensure that the drive belts are not the cause of the noise. Small cracks across the ribs of the drive belts will not cause the noise. Belt separation is identified by the plies of the belt separating, this may be seen at the edge of the belt or felt as a lump in the belt.

5. Small amounts of pilling is a normal condition and acceptable. When the pilling is extreme the drive belts does not have a smooth surface for correct operation.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: • A low pitch tapping, knocking, or thumping noise heard at or just above idle. • Heard once per revolution of the drive belts or pulleys.			

- Rumbling may be caused from:
  - Pilling, the accumulation of rubber dust that forms small balls (pills) or strings in the drive belts pulley groove.
  - The separation of the drive belts.
  - A damaged drive belt.

1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical.
2	Verify that there is a rumbling noise. Does the engine make the rumbling noise?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. 2. Operate the engine for no longer than 30 - 40 seconds. Does the rumbling noise still exist?	Go to Engine Noise on Start-Up, but Only Lasting a Few Seconds or Upper Engine Noise, Regardless of Engine Speed or Lower Engine Noise, Regardless of Engine Speed.	Go to Step 4
4	Inspect the drive belts for damage, separation, or sections of missing ribs. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. Were any of these conditions found?	Go to Step 7	Go to Step 5
5	Inspect for extreme pilling of more than 1/3 of the drive belt groove depth. Do the drive belt grooves have pilling?	Go to Step 6	Go to Step 7
6	1. Clean the drive belt pulleys using a suitable wire brush. 2. Install the drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. Did you complete the repair?	Go to Step 8	Go to Step 7
7	Install a new drive belt. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement. Did you complete the replacement?	Go to Step 8	--
8	1. Clear any codes. 2. Run the engine in order to verify the repair.		

	Does the rumbling noise still exist?	--	System OK

Drive Belt Vibration Diagnosis

Diagnostic Aids

The accessory drive components may have an affect on engine vibration. An overcharged air conditioning (A/C) system, a power steering system restriction, or the incorrect fluid, or an extra load placed on the alternator are suggested items to inspect. To help identify an intermittent or an incorrect condition, vary the loads on the accessory drive components.

Test Description

The numbers below refer to the steps in the diagnostic table.

2. This test is to verify that the vibration is present during diagnosing. Other vehicle components may cause a similar symptom such as the exhaust system or the drivetrain.
3. This test is to verify that the drive belts or accessory drive components may be causing the vibration. Remove the drive belts and operate the engine for a few seconds, this will verify if the vibration is related to the drive belts or not. With the drive belts removed the water pump will not operate and the engine may overheat. Also diagnostic trouble codes (DTCs) may set when the engine is operated with the drive belts removed.
4. The drive belts may cause a vibration. While the drive belts are removed this is the best time to inspect the condition of the drive belts.
6. Inspection of the fasteners can address the possibility that a incorrect bolt, nut, spacer, or washer was installed.
9. Inspect the water pump drive shaft for being bent. Also inspect the water pump bearings for smooth operation and above acceptable play. Compare the water pump with a known, good water pump.
10. Accessory drive component brackets that are bent, cracked, or loose may put an extra strain on that accessory component causing it to vibrate.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: The following items are indications of drive belt vibration: • The vibration is engine-speed related. • The vibration may be sensitive to accessory load.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical .
2	Verify that the vibration is engine related.		

	Does the engine make the vibration?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . 2. Operate the engine for no longer than 30 - 40 seconds. Does the engine still make the vibration?	Go to Drive Belt Rumbling and Vibration Diagnosis .	Go to Step 4
4	Inspect the drive belts for wear, damage, debris build-up and missing drive belt ribs. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . Were any of these conditions found?	Go to Step 5	Go to Step 6
5	Install new drive belts. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement . Did you complete the replacement?	Go to Step 11	--
6	Inspect for incorrect, loose or missing fasteners. Were any of these conditions found?	Go to Step 7	Go to Step 8
7	1. Replace the incorrect or missing fasteners. 2. Tighten any loose fasteners. Refer to Fastener Tightening Specifications . Were the fasteners replaced and/or tightened?	Go to Step 11	--
8	Inspect for a bent water pump drive shaft. Refer to Water Pump Cleaning and Inspection . Did you find and correct the condition?	Go to Step 11	Go to Step 9
9	Inspect for a bent or cracked accessory drive brackets. Did you find and correct the condition?	Go to Step 10	--
10	Replace the bent and/or cracked accessory drive brackets. Refer to Compressor Mounting Bracket Replacement . Refer to Generator Bracket Replacement . Was the bent and/or cracked accessory drive brackets replaced?	Go to Step 11	--
11	1. Clear any codes. 2. Run the engine in order to verify the repair. Does the vibration still exist?	--	System OK

Drive Belt Tensioner Diagnosis

Notice: Allowing the drive belt tensioner to snap into the free position may result in damage to the tensioner.

Important: When the engine is operating, the belt tensioner arm will move. Do not replace the belt tensioner because of movement in the belt tensioner arm.

1. Remove the drive belt. Refer to Drive Belt Replacement - Accessory or Air Conditioning Compressor Belt Replacement.
2. Position a hex-head socket on the belt tensioner pulley bolt.
3. Move the belt tensioner through its full travel.
   - The movement should feel smooth.
   - There should be no binding.
   - The belt tensioner should return freely.
4. If any binding is observed, replace the drive belt tensioner. Refer to Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning.
5. Install the drive belt. Refer to Drive Belt Tensioner Replacement - Accessory or Drive Belt Tensioner Replacement - Air Conditioning.

Engine Balancing

During the powertrain build process, balance weights may be added to the crankshaft balancer and/or manual transmission flywheel, as required.

In order to maintain engine/clutch assembly balance, it may be necessary to install or remove balance weights as detailed below:

Crankshaft Balancer

- Existing RPO-LS3/LS7 balancer onto existing engine: The balancer position must be marked prior to removal and installed to the original position. Refer to Crankshaft Balancer Removal.
- Existing RPO-LS9 balancer onto existing engine: It is not necessary to mark the balancer prior to removal. The balancer is positioned by a key located in the front of crankshaft.
- New balancer onto an existing engine: Install the same size balance weights into the new balancer in the same location as the old balancer. Refer to Crankshaft Balancer Cleaning and Inspection.

Note:

Engine Flywheel

- The RPO-LS3/LS7 flywheel, clutch disc, and pressure plate are each individually balanced components and are available separately. The pressure plate mounts, or locates, onto the flywheel dowel pins in the flywheel. If the pressure plate is not aligned properly onto the dowel pins and tightened down, the pins may bend and the plate may be incorrectly positioned, which will affect component balance. Refer to Engine Flywheel Removal.
- The RPO-LS9 clutch discs and pressure plate are a balanced assembly and not available separately. The pressure plate mounts, or locates, onto the six flywheel dowel pins. If the pressure plate is not aligned properly onto the dowel pins and tightened down, the pins may bend and the plate may be incorrectly positioned, which will affect component balance.
- Existing flywheel, clutch, and pressure plate onto the existing engine: Pressure plate position to flywheel must be marked prior to removal and installed to the original position. Flywheel position to crankshaft must be marked prior to removal and installed to the original position. Refer to Engine Flywheel Removal.
- Existing flywheel, clutch, and pressure plate onto a new engine: Pressure plate position to flywheel must be marked prior to removal and installed to the original position. Flywheel position to crankshaft must be marked prior to removal and installed to the similar position on the new engine. Do not remove balance weights from flywheel, if applicable.
- New flywheel onto an existing engine: Install the same size balance weights into the new flywheel in the same location as the old flywheel. Install the new flywheel to a similar position on the new engine.
- New flywheel, clutch, and pressure plate onto a new engine: Do not install balance weights.

Engine Compression Test

1. Charge the battery if the battery is not fully charged.
2. Disable the ignition system.
3. Disable the fuel injection system.
4. Remove all spark plugs.
5. Turn the ignition to the ON position.
6. Depress the accelerator pedal to position the throttle plate wide open.
7. Start with the compression gauge at zero and while observing the gauge, crank the engine through 4 compression strokes. Record the reading and repeat for the remaining cylinders.

   Important: The minimum compression in any 1 cylinder should not be less than 70 percent of the highest cylinder. No cylinder should read less than 690 kPa (100 psi). For example, if the highest pressure in any 1 cylinder is 1035 kPa (150 psi), the lowest allowable pressure for any other cylinder is 725 kPa (105 psi). (1035 x 70% = 725) (150 x 70% = 105).

8. If a cylinder has low compression, inject approximately 15 ml (1 tablespoon) of engine oil into the combustion chamber through the spark plug hole. Measure the compression again and record the reading.
   - Normal - Compression builds up quickly and evenly to the specified compression for each cylinder.
   - Piston Rings Leaking - Compression is low on the first stroke. Compression builds up with the following strokes, but does not reach normal. Compression improves considerably when you add oil.
   - Valves Leaking - Compression is low on the first stroke. Compression usually does not build up on the following strokes. Compression does not improve much when you add oil.
   - If 2 adjacent cylinders have lower than normal compression, and injecting oil into the cylinders does not increase the compression, the cause may be a head gasket leaking between the cylinders.

Engine Noise on Start-Up, but Only Lasting a Few Seconds (L98, LS2)

Cause	Correction
Incorrect oil filter without anti-drainback feature.	Install the correct oil filter. Refer to Engine Oil and Oil Filter Replacement.
Incorrect oil viscosity.	Install the correct viscosity oil. Refer to Engine Oil and Oil Filter Replacement.
High valve lifter leak down rate.	Replace the lifters, as required. Refer to Cylinder Head Replacement - Right Side.
Worn crankshaft thrust bearing.	1. Check the crankshaft end play. Refer to Engine Mechanical Specifications. 2. Inspect the thrust bearing and crankshaft. Refer to Crankshaft and Bearing Cleaning and Inspection. 3. Repair or replace, as required. Refer to Crankshaft and Bearing Removal. or Refer to Crankshaft and Bearing Installation.

Engine Noise on Start-Up, but Only Lasting a Few Seconds (LS3)

Cause	Correction
Incorrect oil filter without anti-drainback feature	Install the correct oil filter.
Incorrect oil viscosity	1. Drain the oil. 2. Install the correct viscosity oil.
High valve lifter leak down rate	Replace the lifters as required.
Worn crankshaft thrust bearing	1. Check the crankshaft end play. 2. Inspect the thrust bearing and crankshaft. 3. Repair or replace as required.
Faulty oil filter bypass valve. The valve is now internal to the oil filter.	Replace the oil filter as required.

Engine Noise Under Load (L98, LS2)

Cause	Correction
Low oil pressure.	Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing.
Detonation or spark knock.	Verify the correct operation of the ignition controls system. Refer to Diagnostic Starting Point - Engine Controls.
Loose torque converter bolts.	1. Inspect the torque converter bolts and flex plate. Refer to Flex Plate/Torque Converter Vibration Test for 5L40-E/5L50-E. or Refer to Flex Plate/Torque Converter Vibration Test for 6L50/6L80/6L90. 2. Repair or replace, as required. Refer to Torque Converter Replacement for 5L40-E/5L50-E. or Refer to Torque Converter Replacement for 6L50/6L80/6L90. or Refer to Engine Flywheel Replacement.
Cracked flywheel - automatic transmission.	Repair or replace the flywheel. Refer to Engine Flywheel Replacement.
Above acceptable connecting rod bearing clearance.	Inspect the following components and repair, as required: • The connecting rod bearings • The connecting rods • The crankshaft Refer to Piston, Connecting Rod, and Bearing Removal.
Above acceptable crankshaft bearing clearance.	Inspect the following components and repair, as required: • The crankshaft bearings • The crankshaft journals • The cylinder block crankshaft bearing bore Refer to Piston, Connecting Rod, and Bearing Removal.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |
Document ID: 2039700

Engine Will Not Crank - Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component.	1. Remove the accessory drive belts. Refer to Drive Belt Replacement - Accessory . 2. Confirm that the engine will rotate. Rotate the crankshaft by hand at the crankshaft balancer or flywheel location. 3. Repair or replace the components, as required.
Seized automatic transmission torque converter.	1. Remove the torque converter-to-flywheel bolts. 2. Confirm that the engine will rotate. Rotate the crankshaft by hand at the crankshaft balancer or flywheel location. 3. Repair or replace the components, as required.
Broken timing chain.	1. Inspect the timing chain and gears. Refer to Camshaft Timing Chain and Sprocket Cleaning and Inspection . 2. Repair or replace the components, as required. Refer to Camshaft Timing Chain and Sprocket Replacement .
Seized timing chain or timing gears.	1. Inspect the timing chain and gears for foreign material or a seized chain. Refer to Camshaft Timing Chain and Sprocket Cleaning and Inspection . 2. Repair or replace the components, as required. Refer to Camshaft Timing Chain and Sprocket Replacement .
Seized or broken camshaft.	1. Inspect the camshaft and the camshaft bearings. Refer to Camshaft and Bearings Cleaning and Inspection . 2. Repair or replace the components, as required. Refer to Camshaft Replacement .
Bent valve in the cylinder head.	1. Inspect the valves and the cylinder heads. Refer to Cylinder Head Disassemble . 2. Repair or replace the components, as required. Refer to Cylinder Head Disassemble .
Seized oil pump.	1. Inspect the oil pump assembly. Refer to Oil Pump Cleaning and Inspection . 2. Repair or replace, as required. Refer to Oil Pump, Screen, and Crankshaft Oil Deflector Replacement .
Hydraulically locked cylinder. • Coolant/antifreeze in the cylinder. • Oil in the cylinder. • Fuel in the cylinder.	1. Inspect for spark plugs saturated by coolant. Refer to Spark Plug Inspection . 2. Remove spark plugs and check for fluid in the cylinder. When rotating the engine with the spark plugs removed, the piston, on compression stroke, will push fluid from the combustion chamber. Refer to Coolant in Combustion Chamber . 3. Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection . 4. Inspect for failed head gaskets. Perform a cylinder leak down test. Refer to Cylinder Leakage Test 5. Inspect for a cracked engine block or cylinder head. Refer to Engine Compression Test . 6. Inspect for a sticking fuel injector. Refer to Fuel Injector Replacement .

	7. Repair or replace the components, as required.
Material in the cylinder. • Broken valve. • Broken piston rings. • Piston material. • Foreign material.	1. Inspect the cylinder for damaged components and/or foreign materials. 2. Repair or replace the components, as required.
Seized crankshaft or connecting rod bearings.	1. Inspect crankshaft and connecting rod bearings. 2. Repair or replace the components, as required.
Bent or broken connecting rod.	1. Inspect the connecting rods. 2. Replace the piston and pin as an assembly, as required.
Broken crankshaft.	1. Inspect the crankshaft. 2. Repair or replace the components, as required.

Document ID: 2078270

Lower Engine Noise, Regardless of Engine Speed (L98, LS2)

Cause	Correction
Worn valves, valve guides and/or valve stem oil seals.	1. Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. 2. Inspect the valves, valve guides and/or valve stem oil seals. Refer to Valve Stem Oil Seal and Valve Spring Replacement. 3. Repair or replace, as required.
Worn piston rings Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform a cylinder leak down test. Refer to Cylinder Leakage Test. • Repair or replace, as required.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2037314

Oil Consumption Diagnosis

Checks	Causes
Above acceptable oil consumption, not due to leaks, is the use of 1 L (1 qt) or more of engine oil within 3200 kilometers (2,000 miles).	
Preliminary	The causes of above acceptable oil consumption may include the following conditions: • External oil leaks Refer to Oil Leak Diagnosis. • Incorrect oil level or incorrect reading of the oil level indicator. With the vehicle on a level surface, run the engine for a few minutes, allow adequate drain down time, 2 - 3 minutes, and check for the correct engine oil level. • Incorrect oil viscosity. Refer to the vehicle owners manual and use the recommended SAE grade and viscosity for the prevailing temperatures. • Continuous high speed driving and/or extreme usage. • Crankcase ventilation system restrictions or malfunctioning components. • Worn valve guides and/or valve stems. • Worn or incorrectly installed valve stem oil seals. • Piston rings broken, worn, or not seated correctly Allow adequate time for the rings to seat. Replace worn piston rings as necessary. • Piston and rings incorrectly installed or not fitted to the cylinder bore.

Oil Leak Diagnosis

Step	Action	Yes	No
Important: You can repair most fluid leaks by first visually locating the leak, repairing or replacing the component, or by resealing the gasket surface. Once the leak is identified, determine the cause of the leak. Repair the cause of the leak as well as the leak itself.			
1	1. Operate the vehicle until it reaches normal operating temperature. 2. Park the vehicle on a level surface, over a large sheet of paper or other clean surface. 3. Wait 15 minutes. 4. Inspect for drippings. Are drippings present?	Go to Step 2	System OK
2	Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 3
3	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces. • Fittings. • Cracked or damaged components. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 4
4	1. Completely clean the entire engine and surrounding components. 2. Operate the vehicle for several kilometres (miles) at normal operating temperature and at varying speeds. 3. Park the vehicle on a level surface, over a large sheet of paper or other clean surface. 4. Wait 15 minutes. 5. Identify the type of fluid, and the approximate location of the leak. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 5
5	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces. • Fittings. • Cracked or damaged components. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 6

6	1. Completely clean the entire engine and surrounding components. 2. Apply an aerosol-type powder, baby powder, foot powder, etc. to the suspected area. 3. Operate the vehicle for several kilometres (miles) at normal operating temperature and at varying speeds. 4. Identify the type of fluid, and the approximate location of the leak, from the discolorations in the powder surface. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 7
7	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces. • Fittings. • Cracked or damaged components. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 8
8	Use the J 28428-E high-intensity black light kit in order to identify the type of fluid, and the approximate location of the leak. Refer to the manufacturer's instructions when using the tool. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 9
9	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces. • Fittings. • Cracked or damaged components. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	System OK
10	1. Inspect the engine for mechanical damage. Special attention should be shown to the following areas: • Higher than recommended fluid levels. • Higher than recommended fluid pressures. • Plugged or malfunctioning fluid filters or pressure bypass valves. • Plugged or malfunctioning engine ventilation system. • Incorrectly tightened or damaged fasteners. • Cracked or porous components. • Incorrect sealants or gaskets, where required. • Incorrect sealant or gasket installation. • Damaged or worn gaskets or seals.		

	- Damaged or worn sealing surfaces. 2. Inspect the engine for customer modifications. Is there mechanical damage, or customer changes to the engine?	Go to Step 11	System OK
11	Repair or replace all damaged components. Does the engine still leak oil?	Go to Step 1	System OK

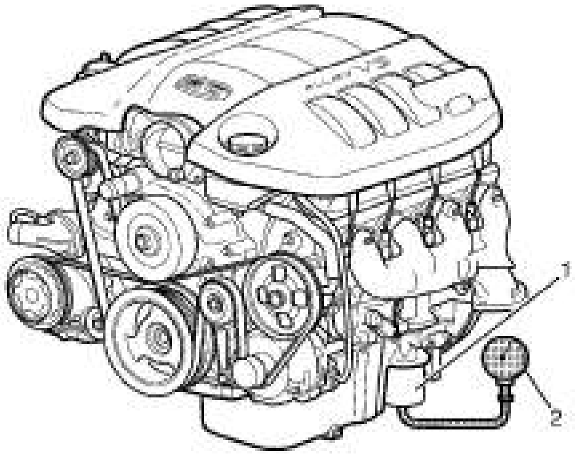
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |
Document ID: 2086106

Oil Pressure Diagnosis and Testing (L98, LS2)

Tools Required

- J 21867 Pressure Gage
- EN-47971 Oil Pressure Gage Adapter

1. With the vehicle on a level surface, run the vehicle for a few minutes, allow adequate drain down time, 2 - 3 minutes, and measure the oil level.
2. If required, add the recommended grade engine oil and fill the crankcase until the oil level measures full on the oil level indicator.
3. Run the engine briefly, 10 - 15 seconds, and verify low or no oil pressure on the vehicle gauge or light.
4. Listen for a noisy valve train or a knocking noise.
5. Inspect for the following conditions:
    - Oil diluted by water or glycol anti freeze
    - Foamy oil



6. Remove the oil filter and install the EN-47971 (1).
7. Install J 21867 (2), or equivalent, to the EN-47971 (1).
8. Run the engine and measure the engine oil pressure.
9. Compare the readings to Engine Mechanical Specifications.
10. If the engine oil pressure is below specifications, inspect the engine for one or more of the following conditions:
    - Oil pump worn or dirty.
    - Refer to Oil Pump Cleaning and Inspection .
    - Oil pump-to-engine block bolts loose.

- Refer to Oil Pump, Screen and Crankshaft Oil Deflector Installation.
- Oil pump screen loose, plugged, or damaged. Refer to Oil Pump Cleaning and Inspection .
- Oil pump screen O-ring seal missing or damaged. Refer to Oil Pump Cleaning and Inspection .
- Oil filter loose or a leaking or damaged gasket. Refer to Oil Filter, Adapter, and Pan Cover Installation.
- Malfunctioning oil pump pressure relief valve. Refer to Oil Filter, Adapter, and Pan Cover Installation .
- Above acceptable bearing clearance. Refer to Engine Block Disassemble in Engine Mechanical - 6.0L
- Cracked, porous, or restricted oil galleries. Refer to Engine Block Disassemble in Engine Mechanical - 6.0L.
- Oil gallery plugs missing or incorrectly installed.
- Refer to Engine Block Assemble.
- Broken valve lifters. Refer to Valve Lifter Replacement.
- Repair as necessary.

11. If the oil pressure reading on the J 21867 (2), or equivalent, is within specifications, inspect for the following conditions:
    - Plugged or incorrect oil filter and/or malfunctioning oil filter bypass valve. Refer to Engine Oil and Oil Filter Replacement.
    - Malfunctioning engine oil pressure sensor or switch. Refer to Engine Oil Pressure Sensor and/or Switch Replacement.

Symptoms - Engine Mechanical

Strategy Based Diagnostics

1. Perform the Diagnostic System Check - Vehicle , before using the symptom tables, if applicable.
2. Review the system operations in order to familiarize yourself with the system functions. Refer to Disassembled Views and Engine Component Description and Lubrication Description and Drive Belt System Description.

All diagnosis on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow may always be used in order to resolve a system condition. The diagnostic flow is the place to start when repairs are necessary. For a detailed explanation, refer to Strategy Based Diagnosis.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the Engine. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Check for the correct oil level, correct oil viscosity, and correct oil filter.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, ambient temperature, engine temperature, amount of engine warm-up time, and other specifics.
- Compare the engine sounds, if applicable, to a known good engine and make sure you are not trying to correct a normal condition.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating correctly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Base Engine Misfire without Internal Engine Noises.
- Base Engine Misfire with Abnormal Internal Lower Engine Noises.
- Base Engine Misfire with Abnormal Valve Train Noise.
- Base Engine Misfire with Coolant Consumption.
- Base Engine Misfire with Excessive Oil Consumption.
- Engine Noise on Start-Up, but Only Lasting a Few Seconds.
- Upper Engine Noise, Regardless of Engine Speed.

- Lower Engine Noise, Regardless of Engine Speed.
- Engine Noise Under Load.
- Engine Will Not Crank - Crankshaft Will Not Rotate.
- Coolant in Combustion Chamber.
- Coolant in Engine Oil.
- Engine Compression Test.
- Cylinder Leakage Test.
- Oil Consumption Diagnosis.
- Oil Pressure Diagnosis and Testing.
- Oil Leak Diagnosis.
- Drive Belt Chirping, Squeal, and Whine Diagnosis.
- Drive Belt Chirping, Squeal, and Whine Diagnosis.
- Drive Belt Chirping, Squeal, and Whine Diagnosis.
- Drive Belt Rumbling and Vibration Diagnosis.
- Drive Belt Rumbling and Vibration Diagnosis.
- Drive Belt Falls Off and Excessive Wear Diagnosis.
- Drive Belt Falls Off and Excessive Wear Diagnosis.
- Drive Belt Tensioner Diagnosis.

Upper Engine Noise, Regardless of Engine Speed (L98, LS2)

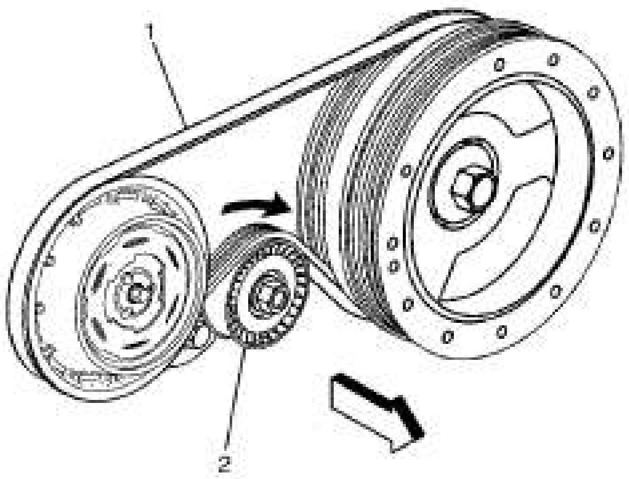
Cause	Correction
Low oil pressure.	Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing.
Loose and/or worn valve rocker arm attachments.	1. Inspect the valve rocker arm, bolt, and pedestal. 2. Replace the valve rocker arms, as required. Refer to Valve Rocker Arm and Push Rod Replacement.
Worn or damaged valve rocker arm.	1. Inspect the rocker arm for wear or missing needle bearings 2. Replace the valve rocker arms, as required. Refer to Valve Rocker Arm and Push Rod Replacement.
Bent or damaged push rod.	Inspect the following components and replace, as required: - The valve rocker arm. Replace the valve rocker arms, as required. Refer to Valve Rocker Arm and Push Rod Replacement. - The valve push rod. Replace the valve push rods, as required. Refer to Valve Rocker Arm and Push Rod Replacement. - The valve lifter. Replace the camshaft and valve lifters. Refer to Camshaft Replacement. - The valve lifter guide. Replace the valve lifter guides. Refer to Valve Lifter Replacement. - Inspect the top of the pistons for valve contact. If the top of the piston shows valve contact, replace the piston and pin assembly. Replace the piston and pin assembly. Refer to Piston, Connecting Rod, and Bearing Removal.
Incorrect lubrication to the valve rocker arms.	Inspect the following components and repair or replace, as required: - The valve rocker arm. Replace the valve rocker arms, as required. Refer to Valve Rocker Arm and Push Rod Replacement. - The valve push rod. Replace the valve push rods, as required. Refer to Valve Rocker Arm and Push Rod Replacement. - The valve lifter.

	Replace the camshaft and valve lifters. Refer to Camshaft Replacement. - The oil filter bypass valve. Replace the oil filter. Refer to Engine Oil and Oil Filter Replacement. - The oil pump and pump screen. Replace the oil pump and pump screen. Refer to Oil Pump, Screen, and Crankshaft Oil Deflector Replacement. - The engine block oil galleries. Refer to Engine Block Cleaning and Inspection.
Broken valve spring.	Replace the valve spring and spring shim. Refer to Valve Stem Oil Seal and Valve Spring Replacement.
Worn or dirty valve lifters.	Replace the valve lifters. Refer to Valve Lifter Replacement.
Stretched or broken timing chain and/or damaged sprocket teeth.	Replace the timing chain and sprockets. Refer to Camshaft Timing Chain and Sprocket Replacement.
Worn engine camshaft lobes.	1. Inspect the engine camshaft lobes. 2. Replace the camshaft and valve lifters, as required. Refer to Camshaft Replacement.
Worn valve guides or valve stems.	Inspect the following components and repair, as required: - The valves. Refer to Cylinder Head Disassemble. - The valve guides. Refer to Cylinder Head Disassemble.
Stuck valves. Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect the following components and repair, as required: - The valves. Refer to Cylinder Head Disassemble. - The valve guides. Refer to Cylinder Head Disassemble.

Air Conditioning Compressor Belt Replacement

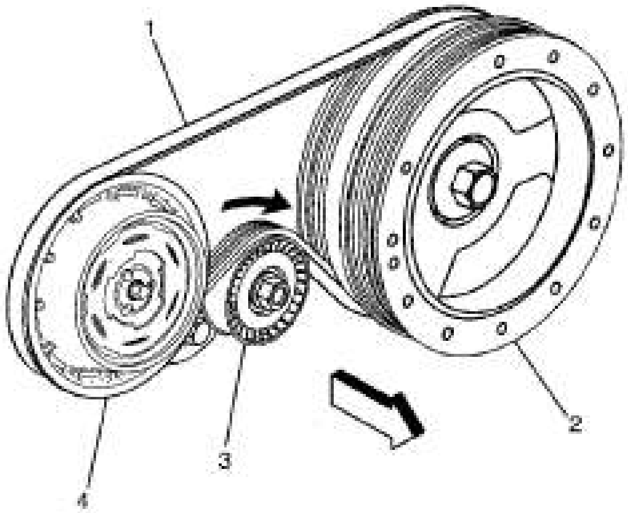
Removal Procedure

1. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
2. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the Front Air Deflector. Refer to Front Air Deflector Replacement.



4. Using a suitable tool, rotate the air conditioner (A/C) belt tensioner (2) clockwise.
5. Remove the A/C belt (1).
6. Slowly release the A/C belt tensioner (2).
7. Clean and inspect the belt surfaces of all the pulleys.

Installation Procedure



1. Install the A/C belt (1) around the crankshaft balancer (2).
2. Using a suitable tool, rotate the A/C belt tensioner (3) clockwise.
3. Install the A/C belt (1) over the A/C belt tensioner (3) idler pulley.
4. Install the A/C belt (1) around the A/C compressor pulley (4).
5. Slowly release the tension on the A/C belt tensioner (3).
6. Inspect the A/C belt (1) for correct installation and alignment.
7. Install the Front Air Deflector. Refer to Front Air Deflector Replacement.
8. Lower the vehicle.
9. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.

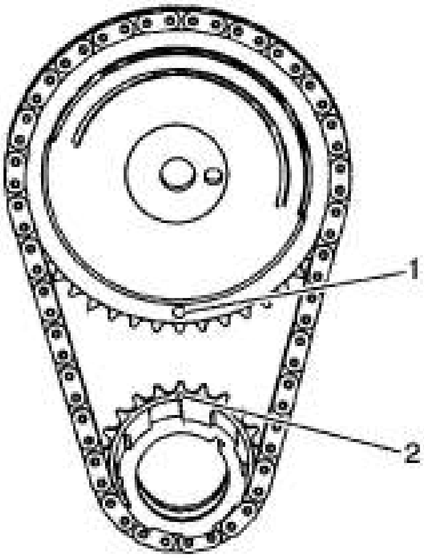
Camshaft Replacement

Tools Required

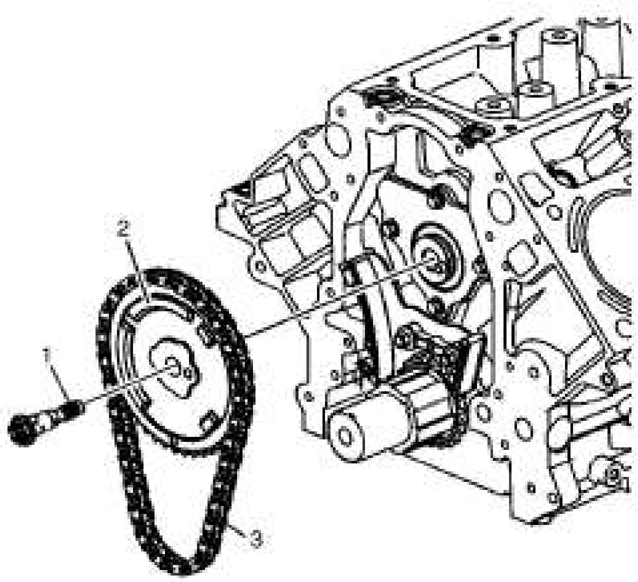
J 41476 J 41476 Front and Rear Cover Alignment Tool

Removal Procedure

1. Remove the engine assembly. Refer to Engine Replacement.
2. Remove the oil level indicator tube. Refer to Oil Level Indicator and Tube Removal.
3. Remove the left and right exhaust manifolds. Refer to Exhaust Manifold Replacement - Left Side and Exhaust Manifold Replacement - Right Side.
4. Remove the intake manifold. Refer to Intake Manifold Removal.
5. Remove the coolant air bleed pipe. Refer to Coolant Air Bleed Pipe Assembly Replacement.
6. Remove the left and right valve rocker arm covers. Refer to Valve Rocker Arm and Push Rod Replacement and Valve Stem Oil Seal and Valve Spring Replacement.
7. Remove the valve rocker arms and push rods. Refer to Oil Level Indicator and Tube Replacement.
8. Remove the left and right cylinder heads. Refer to Cylinder Head Replacement - Left Side and Cylinder Head Replacement - Right Side.
9. Remove the valve lifters. Refer to Valve Lifter Replacement.
10. Remove the water pump. Refer to Water Pump Removal.
11. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.
12. Remove the engine front cover. Refer to Engine Front Cover Replacement.



13. Inspect the sprockets for correct alignment. The mark on the camshaft sprocket (1) should be located in the 6 o'clock position and the mark on the crankshaft sprocket (2) should be located in the 12 o'clock position.



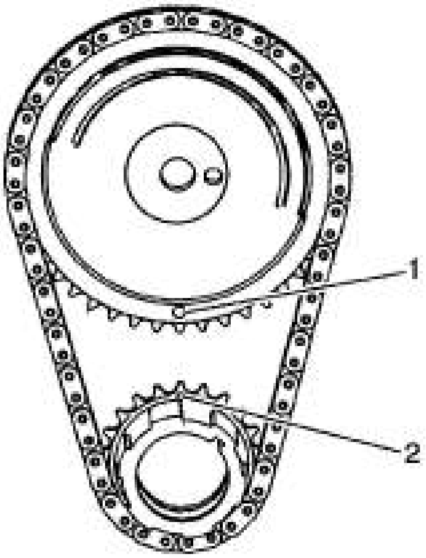
Notice: Do not turn the crankshaft assembly after the timing chain has been removed in order to prevent damage to the piston assemblies or the valves.

14. Remove the camshaft sprocket bolt (1).
15. Remove the camshaft sprocket (2) and timing chain (3).
16. Remove the camshaft. Refer to Camshaft Removal.

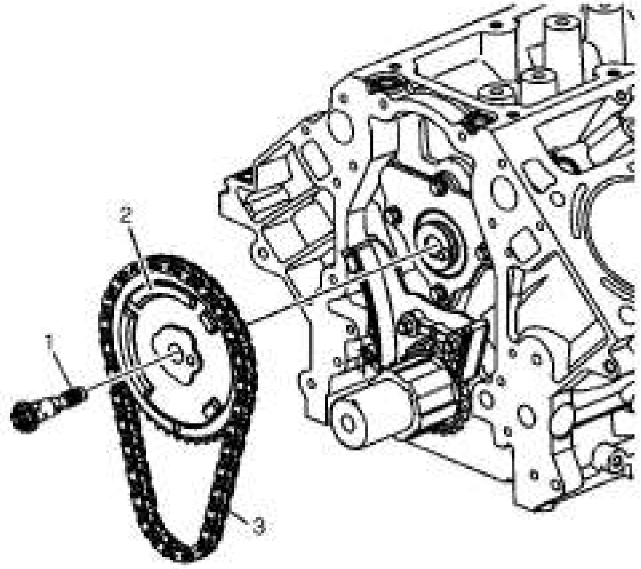
Installation Procedure

Important: If camshaft replacement is required, the valve lifters must also be replaced.

1. Install the camshaft. Refer to Camshaft Installation.



2. Align the camshaft sprocket alignment mark (1, 2), in the 6 o'clock position.



3. Install the camshaft sprocket (1) and timing chain (2).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the camshaft sprocket to camshaft retaining bolt (1).

   Tighten
   Tighten the bolt to 25 N·m(18 lb ft).

5. Install the engine front cover. Refer to Engine Front Cover Replacement.
6. Install a NEW crankshaft front oil seal. Refer to Crankshaft Front Oil Seal Installation.
7. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
8. Install the valve lifters. Refer to Valve Lifter Replacement.
9. Install the right side and left side cylinder heads. Refer to Cylinder Head Installation - Left Side and Cylinder Head Installation - Right Side.
10. Install the valve rocker arms and push rods. Refer to Valve Rocker Arm and Push Rod Replacement.
11. Install the right and left valve rocker arm covers. Refer to Valve Rocker Arm Cover Replacement - Left Side and Valve Rocker Arm Cover Replacement - Right Side.
12. Install the coolant air bleed pipe. Refer to Coolant Air Bleed Pipe Assembly Replacement.
13. Install the intake manifold. Refer to Intake Manifold Installation.
14. Install the water pump. Refer to Water Pump Installation.
15. Install the left and right exhaust manifolds. Refer to Exhaust Manifold Replacement - Left Side and Exhaust Manifold Replacement - Right Side.
16. Install the oil level indicator tube. Refer to Oil Level Indicator and Tube Installation.
17. Install the engine assembly. Refer to Engine Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 2037124

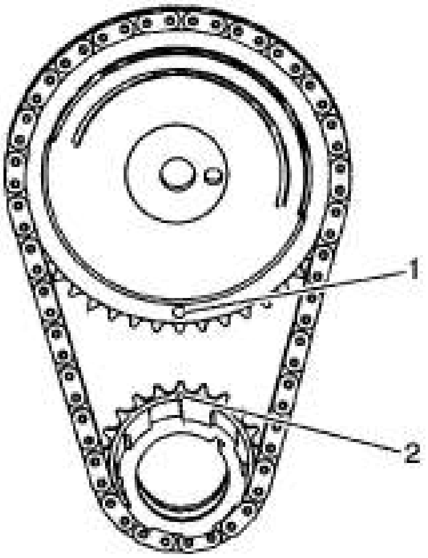
Camshaft Timing Chain and Sprocket Replacement

Tools Required

- EN 46330 EN 46330 Timing Chain Tensioner Retaining Pin
- J 8433-1 Puller Bar
- J 41478 Crankshaft Front Oil Seal Installer
- J 41558 Crankshaft Sprocket Remover
- J 41665 Crankshaft Balancer and Sprocket Installer
- J 41816-2 Crankshaft End Protector
- J 45059 Angle Meter

Removal Procedure

1. Remove the crankshaft balancer. Refer to Crankshaft Balancer Replacement.
2. Remove the engine front cover. Refer to Engine Front Cover Replacement.
3. Remove the oil pump. Refer to Oil Pump, Screen, and Crankshaft Oil Deflector Replacement.



Notice: Do not turn the crankshaft assembly after the timing chain has been removed in order to prevent damage to the piston assemblies or the valves.

4. Inspect the sprockets for correct alignment. The mark on the camshaft sprocket (1) should be located in the 6 o'clock position and the mark on the crankshaft sprocket (2) should be located in the 12 o'clock position.
5. Remove the timing chain and sprockets. Refer to Timing Chain and Sprocket Removal.

Installation Procedure

1. Install the timing chain and sprockets. Refer to Timing Chain and Sprocket Installation.
2. Install the oil pump. Refer to Oil Pump, Screen, and Crankshaft Oil Deflector Replacement.
3. Install the engine front cover. Refer to Engine Front Cover Replacement.
4. Install the crankshaft balancer. Refer to Crankshaft Balancer Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037359**

Crankshaft Balancer Replacement

Tools Required

- J 41816-A Crankshaft Balancer Remover
- J 41816-2 Crankshaft End Protector
- J 42386-A Flywheel Holding Tool
- J 41665 Crankshaft Balancer and Sprocket Installer

Removal Procedure

1. Disconnect the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the radiator. Refer to Radiator Replacement.
3. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
4. Remove the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.
5. Remove the starter motor. Refer to Starter Motor Replacement.
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.

Installation Procedure

1. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
2. Install the starter motor. Refer to Starter Motor Replacement.
3. Install the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.
4. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
5. Install the radiator. Refer to Radiator Replacement.
6. Connect the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037360**

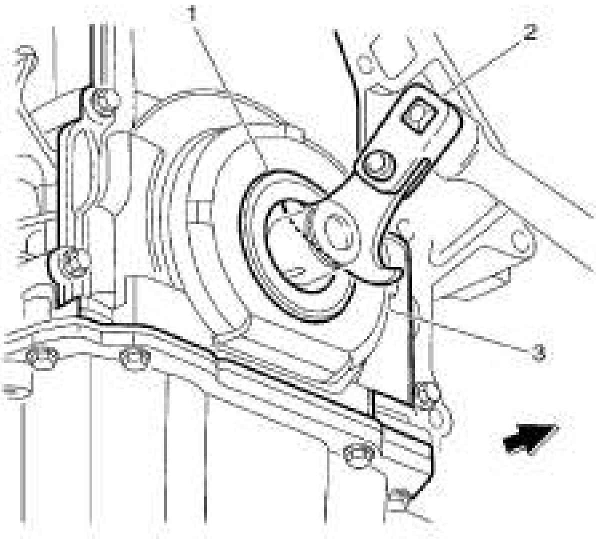
Crankshaft Front Oil Seal Replacement

Tools Required

- J 41478 Crankshaft Front Oil Seal Installer
- E-308 Crankshaft Front Oil Seal Remover.

Removal Procedure

1. Disconnect the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the radiator. Refer to Radiator Replacement.
3. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
4. Remove the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.
5. Remove the starter motor. Refer to Starter Motor Replacement.
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.



7. Using tool E-308 (2) gently pry the crankshaft oil seal (1) from the front engine cover (3).

Installation Procedure

1. Install the crankshaft front oil seal installation. Refer to Crankshaft Front Oil Seal Installation.
2. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
3. Install the starter motor. Refer to Starter Motor Replacement.
4. Install the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.
5. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
6. Install the radiator. Refer to Radiator Replacement.
7. Connect the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 1997693

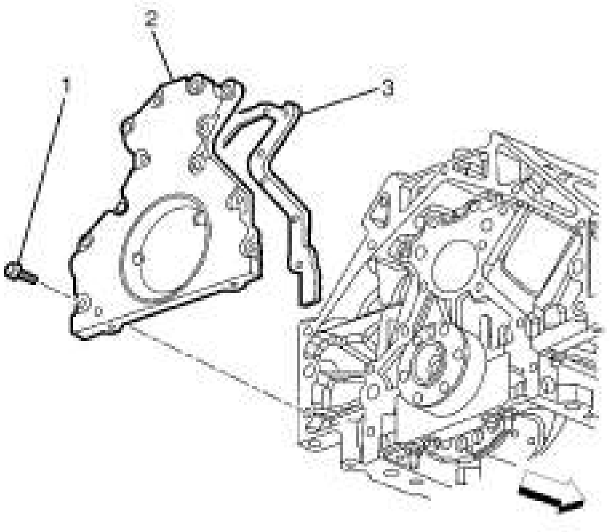
Crankshaft Rear Oil Seal Housing Replacement

Tools Required

- J 41476 Front and Rear Cover Alignment
- J 41479 Crankshaft Rear Oil Seal Installer

Removal Procedure

1. Remove the engine assembly. Refer to Engine Replacement .
2. Remove the oil pan. Refer to Oil Pan Replacement .
3. Remove the engine flywheel. Refer to Engine Flywheel Replacement .



4. Remove the engine rear cover to cylinder block retaining bolts (1).
5. Remove the engine rear cover (2) and engine rear cover gasket (3).
6. Discard the engine rear cover gasket (3).
7. Clean and inspect the engine rear cover (2). Refer to Engine Rear Cover Cleaning and Inspection .

Installation Procedure

1. Install the engine rear cover. Refer to Engine Rear Cover Installation .
2. Install the crankshaft rear seal. Refer to Crankshaft Rear Oil Seal Replacement .
3. Install the engine flywheel. Refer to Engine Flywheel Replacement .
4. Install the oil pan. Refer to Oil Pan Replacement .
5. Install the engine assembly. Refer to Engine Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037362**

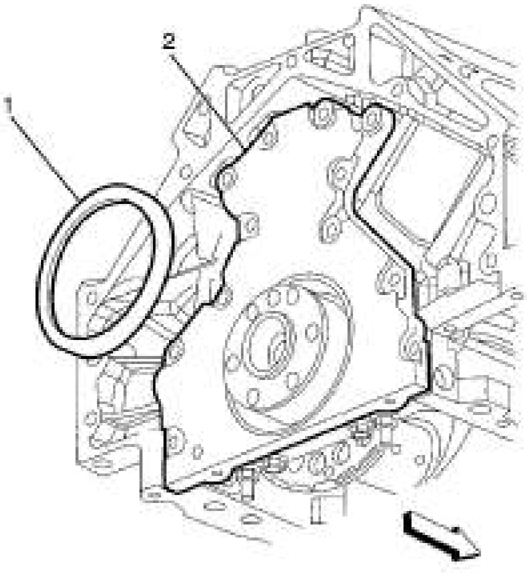
Crankshaft Rear Oil Seal Replacement

Tools Required

J 41479 Crankshaft Rear Oil Seal Installer

Removal Procedure

1. Remove the engine flywheel. Refer to Engine Flywheel Replacement.



2. Gently pry the crankshaft rear oil seal (1) from the rear cover (2).

Installation Procedure

1. Install the crankshaft rear seal. Refer to Crankshaft Rear Oil Seal Installation.
2. Install the engine flywheel. Refer to Engine Flywheel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038131**

Cylinder Head Replacement - Left Side

Tools Required

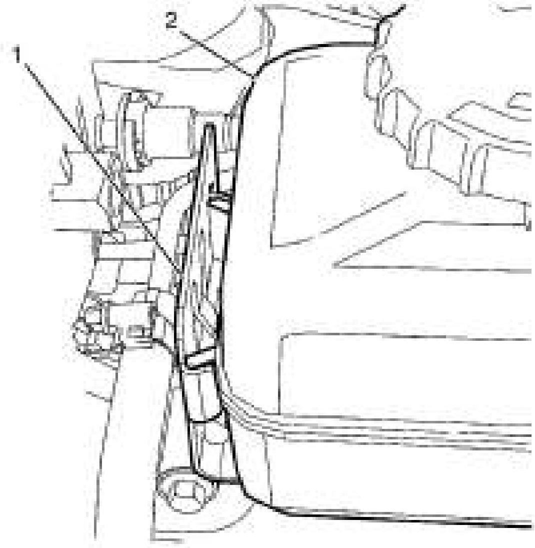
- J 45059 Angle Meter
- J 42385-100 Head/Main Bolt Thread Repair Kit

Removal Procedure

1. Remove the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
2. Remove the engine cover. Refer to Engine Cover Replacement .
3. Depressurize the fuel system. Refer to Fuel Pressure Relief.

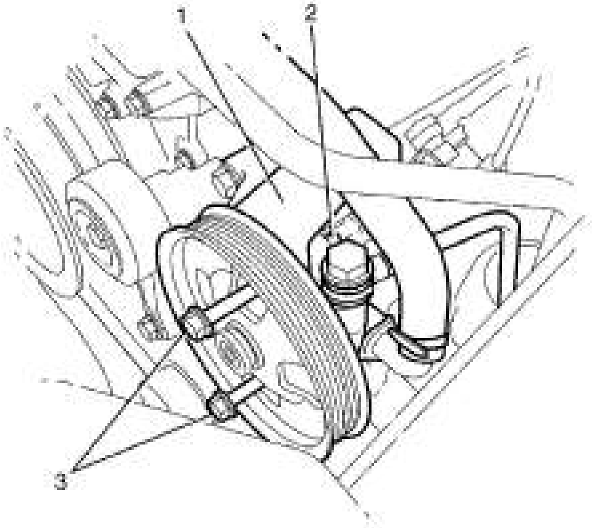
Caution: Refer to Battery Disconnect Caution in the Preface section.

4. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
5. Drain the cooling system. Refer to Cooling System Draining and Filling.
6. Remove the intake manifold assembly. Refer to Intake Manifold Replacement.
7. Remove the engine coolant air bleed pipe and cover. Refer to Engine Coolant Air Bleed Hose Replacement.
8. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
9. Remove the left side ignition coils. Refer to Ignition Coil Replacement .
10. Remove the spark plugs. Refer to Spark Plug Replacement.
11. Remove the left side exhaust manifold. Refer to Exhaust Manifold Replacement - Left Side.

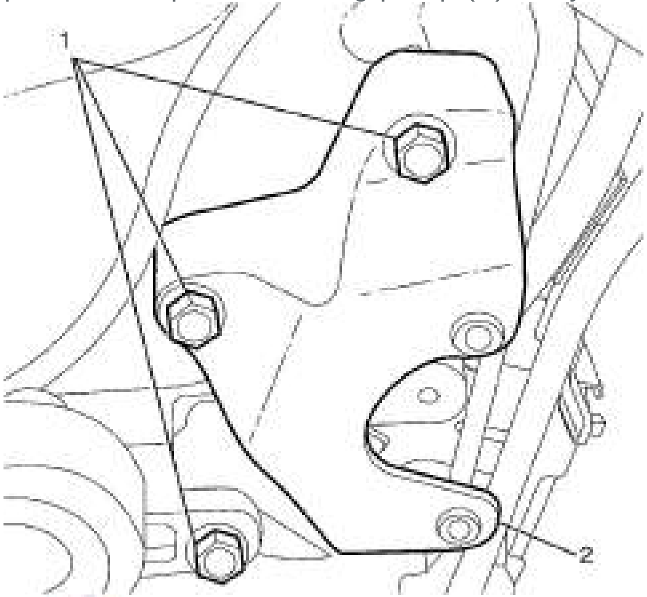


Important: The locking tang on the power steering reservoir bracket (1) must be released before removing the power steering reservoir (2).

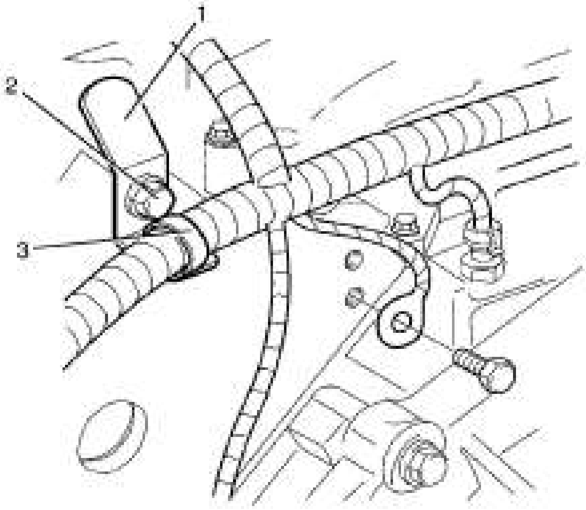
12. Remove the power steering reservoir (2) from the power steering pump power steering reservoir bracket (1) and position the power steering reservoir (2) aside.



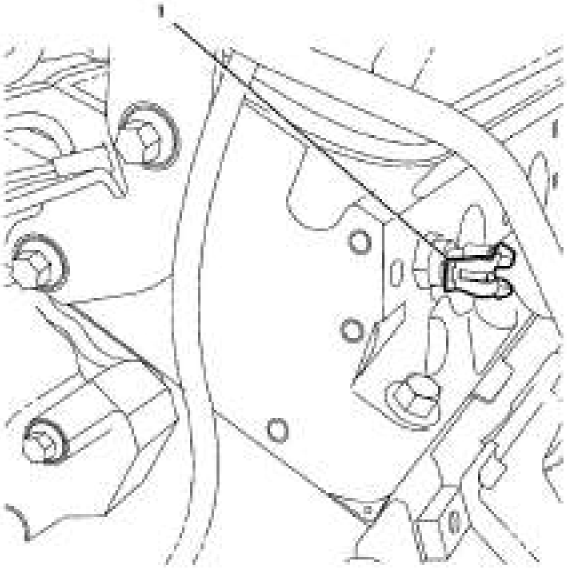
13. Remove the power steering pump (2) to power steering pump bracket retaining bolts (3) and position the power steering pump (2) away from the power steering pump bracket (1).



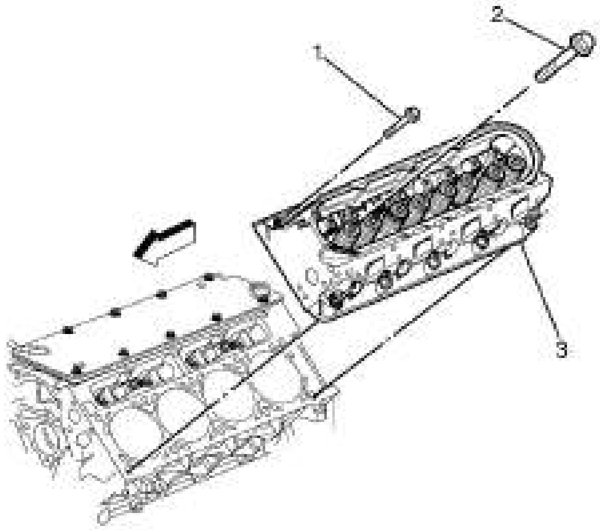
14. Remove the power steering pump bracket to engine retaining bolts (1).
15. Remove the power steering pump bracket (2).



16. Detach the powertrain wiring harness strap (3) from the rear cylinder head bracket (1).
17. Remove the powertrain wiring harness ground cable to cylinder head retaining bolt (2).



18. Disconnect the coolant temperature sensor electrical connector (1).
19. Remove the left side valve rocker arm cover. Refer to Valve Rocker Arm Cover Replacement - Left Side.
20. Remove the left side valve rocker arms and pushrods. Refer to Valve Rocker Arm and Push Rod Replacement.



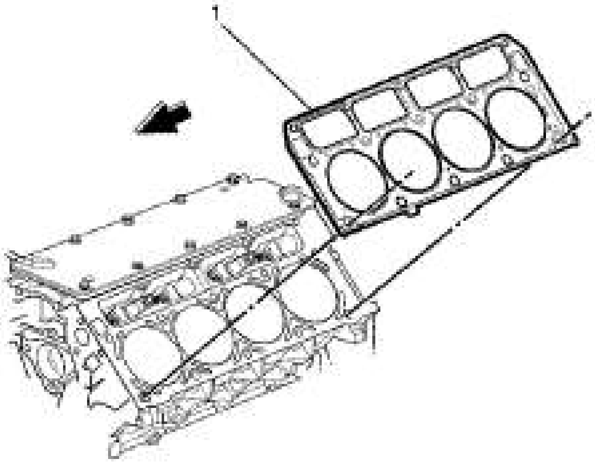
Important: The cylinder head bolts are torque to yield bolts and are single use only fasteners.

21. Remove and discard the cylinder head bolts (1) 10 places, (2) 5 places.

Discard the bolts.

Notice: After removal, place the cylinder head on 2 wood blocks in order to prevent damage to the sealing surfaces.

22. Remove the cylinder head (3).



Important: Cylinder head gaskets must be discarded whenever the cylinder head has been removed from the cylinder block.

23. Remove the cylinder head gasket (1).

    Discard the gasket.

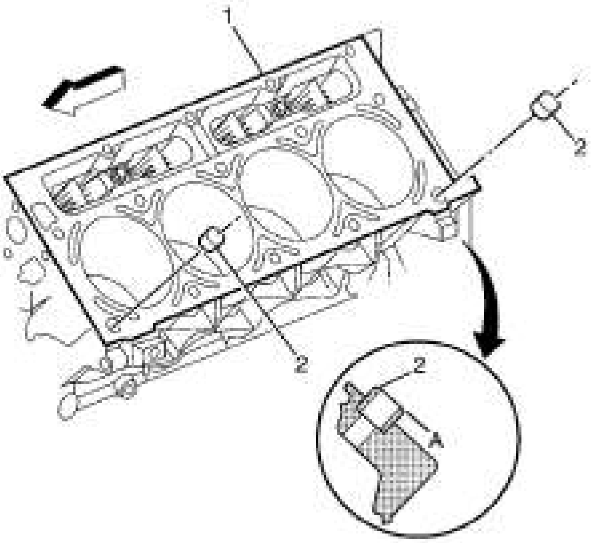
24. Clean and inspect the cylinder head and the cylinder block sealing surfaces. Refer to Cylinder Head Cleaning and Inspection and Engine Block Cleaning and Inspection.
25. If necessary, perform the following steps:

    Disassemble the cylinder head. Refer to Cylinder Head Disassemble.

Installation Procedure

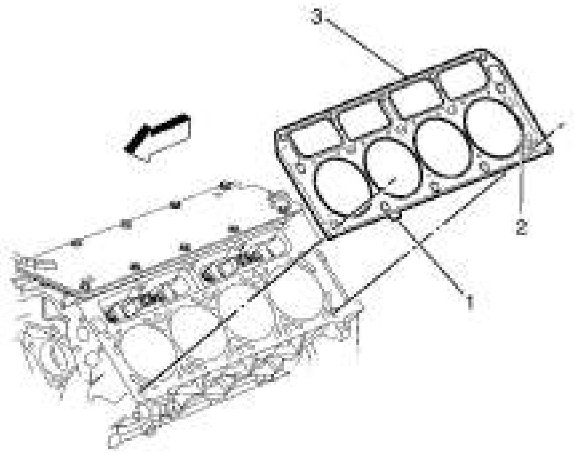
1. If necessary, perform the following steps:

   Assemble the cylinder head. Refer to Cylinder Head Assemble.



Important: Make sure the locating sleeves (2) are correctly installed to the maximum height (A) of 8.3 mm (0.33 in).

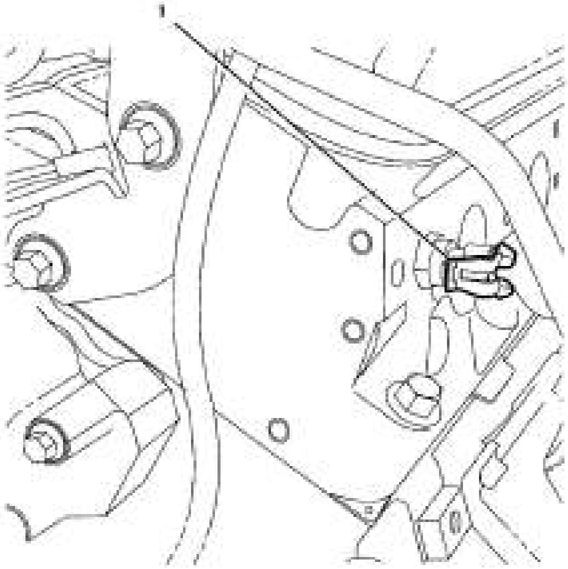
2. Install the locating sleeves (2) into the cylinder block (1).



Important: The cylinder head gasket (3) will fit on either side of the engine. Make sure the tab on the cylinder head gasket (1) is located towards the front half point and the stamping FRONT on the cylinder head gasket (2) is facing the front of the engine.

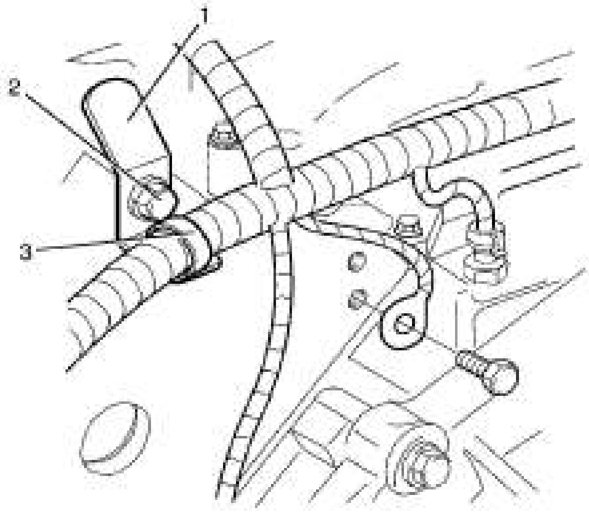
Important: Do not use any type of sealant on the cylinder head gasket (3), unless specified.

3. Install the NEW cylinder head gasket (3) correctly over the locating sleeves.
4. Install the cylinder head with the exhaust manifold to the engine. Refer to Cylinder Head Installation - Left Side.
5. Install the left side valve rocker arms and pushrods. Refer to Valve Rocker Arm and Push Rod Replacement.
6. Install the left side valve rocker arm cover. Refer to Valve Rocker Arm Cover Replacement - Left Side.



7. Connect the coolant temperature sensor electrical connector (1).

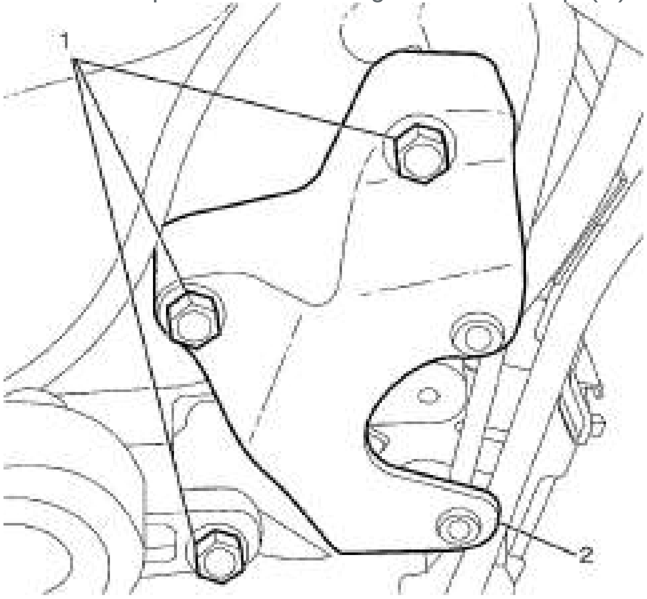
   Notice: Refer to Fastener Notice in the Preface section.



8. Install the engine wiring harness ground connector to cylinder head retaining bolt (2).

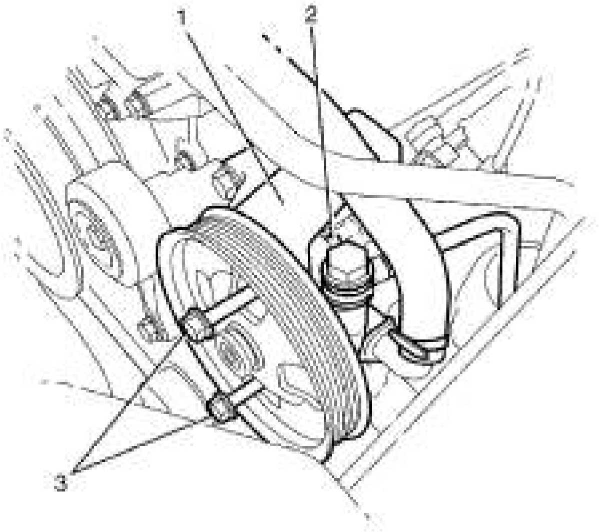
   Tighten
   Tighten the bolt to 10 N·m (89 lb in).

9. Attach the powertrain wiring harness strap (3) to the rear cylinder head bracket (1).



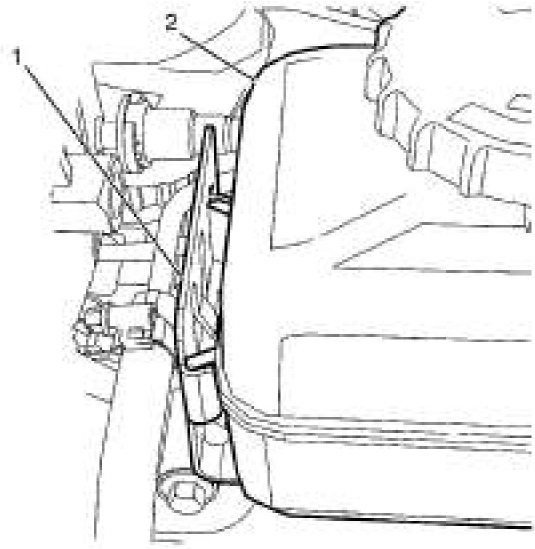
10. Install the power steering pump bracket (2).
11. Install the power steering pump bracket to engine retaining bolts (1).

Tighten
Tighten the bolts to 58 N·m (43 lb ft).



12. Position the power steering pump (2) on the power steering pump bracket (1).
13. Install the power steering pump to power steering pump bracket retaining bolts (3).

Tighten
Tighten the bolts to 30 N·m (22 lb ft).



Important: Make sure the power steering reservoir (2) and the locking tang on the power steering reservoir bracket (1) are engaged to avoid an induced rattle condition.

14. Install the power steering reservoir (2) to the power steering pump power steering reservoir bracket (1).
15. Install the left side exhaust manifold. Refer to Exhaust Manifold Replacement - Left Side.
16. Install the spark plugs. Refer to Spark Plug Replacement.
17. Install the left side ignition coils. Refer to Ignition Coil Replacement .
18. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
19. Install the engine coolant air bleed pipe and cover. Refer to Engine Coolant Air Bleed Hose Replacement.
20. Install the intake manifold assembly. Refer to Intake Manifold Replacement.
21. Refill the cooling system. Refer to Cooling System Draining and Filling.
22. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
23. Install the engine cover. Refer to Engine Cover Replacement .
24. Install the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038132**

Cylinder Head Replacement - Right Side

Tools Required

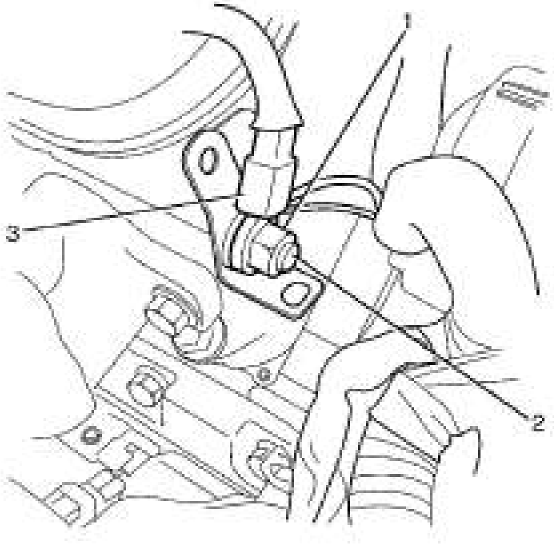
- J 45059 Angle Meter
- J 42385-100 Head/Main Bolt Thread Repair Kit

Removal Procedure

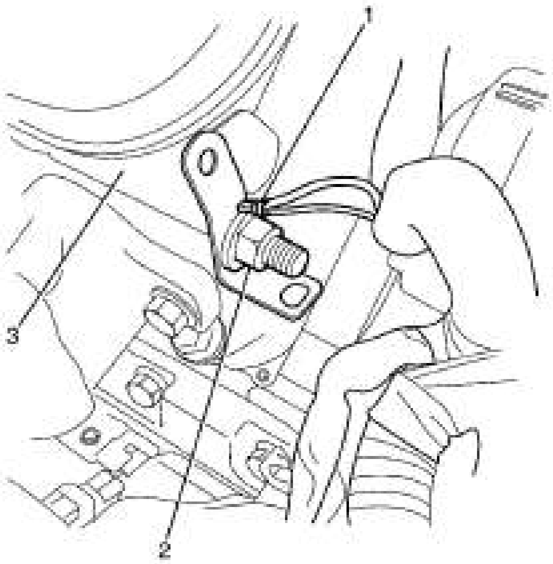
1. Remove the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
2. Remove the engine cover. Refer to Engine Cover Replacement .
3. Depressurize the fuel system. Refer to Fuel Pressure Relief.

Caution: Refer to Battery Disconnect Caution in the Preface section.

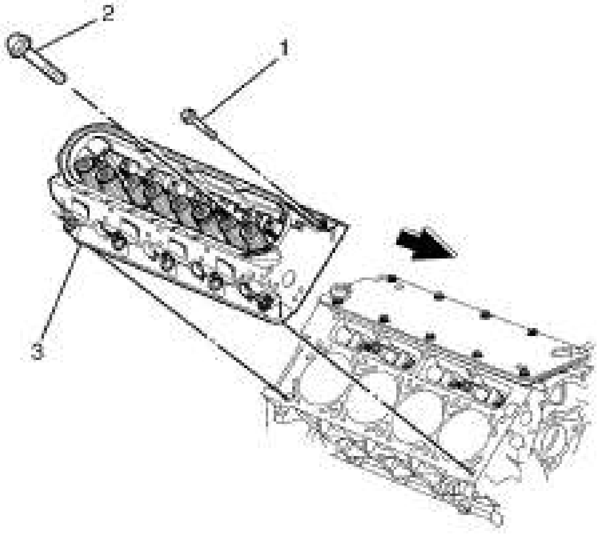
4. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
5. Drain the cooling system. Refer to Cooling System Draining and Filling.
6. Remove the intake manifold assembly. Refer to Intake Manifold Replacement.
7. Remove the engine coolant air bleed pipe and cover. Refer to Engine Coolant Air Bleed Hose Replacement.
8. Remove the right side ignition coils. Refer to Ignition Coil Replacement .
9. Remove the spark plugs. Refer to Spark Plug Replacement.
10. Remove the oil level indicator and tube. Refer to Oil Level Indicator and Tube Replacement.



11. Remove the vehicle body ground cable to cylinder head retaining nut (1).
12. Remove the vehicle body ground cable (3) from the cylinder head stud (2).



13. Remove the cylinder head stud (3) from the cylinder head (2) and secure the wiring harness ground (1) away from the cylinder head (2).
14. Remove the right side exhaust manifold. Refer to Exhaust Manifold Replacement - Right Side.
15. Remove the right side valve rocker arm cover. Refer to Valve Rocker Arm Cover Replacement - Right Side.
16. Remove the right side valve rocker arms and pushrods. Refer to Valve Rocker Arm and Push Rod Replacement.



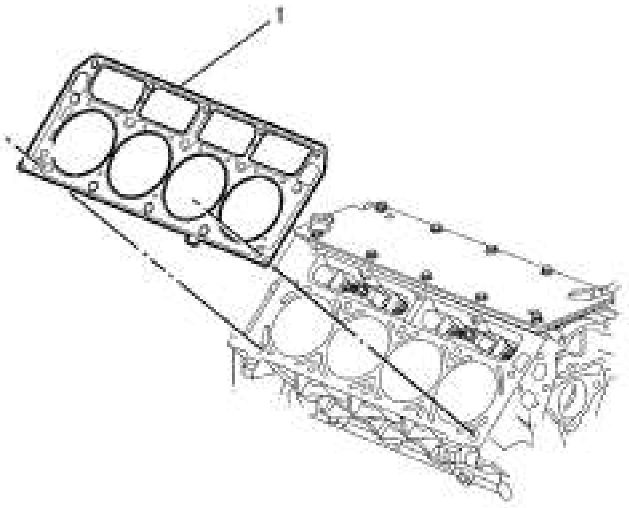
Important: The cylinder head bolts are torque to yield bolts and are single use only fasteners.

17. Remove and discard the cylinder head bolts (1) 10 places, (2) 5 places.

Discard the bolts.

Notice: After removal, place the cylinder head on 2 wood blocks in order to prevent damage to the sealing surfaces.

18. Remove the cylinder head (3).



Important: Cylinder head gaskets must be discarded whenever the cylinder head has been removed from the cylinder block.

19. Remove the cylinder head gasket (1).

    Discard the gasket.

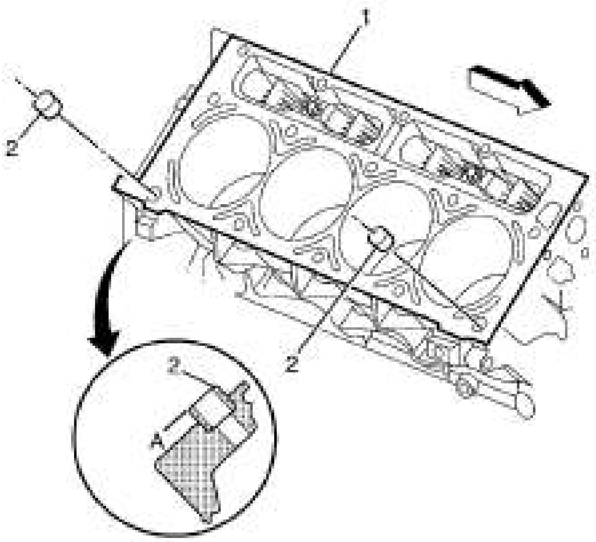
20. Clean and inspect the cylinder head and the cylinder block sealing surfaces. Refer to Cylinder Head Cleaning and Inspection and Engine Block Cleaning and Inspection.
21. If necessary, perform the following steps:

    Disassemble the cylinder head. Refer to Cylinder Head Disassemble.

Installation Procedure

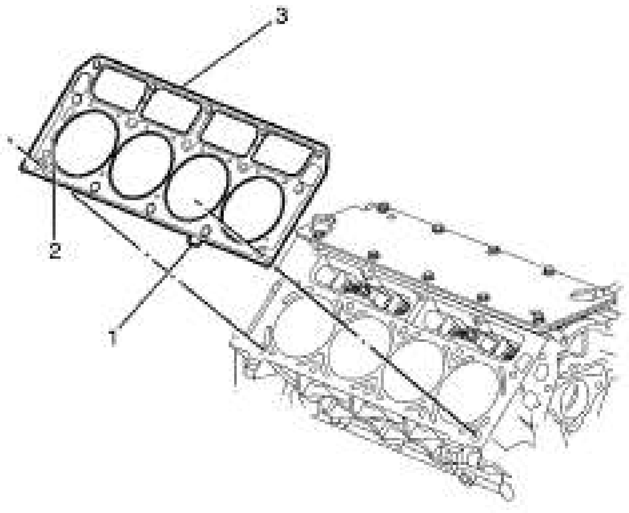
1. If necessary, perform the following steps:

   Assemble the cylinder head. Refer to Cylinder Head Assemble.



Important: Make sure the locating sleeves (2) are correctly installed to the maximum height (A) of 8.3 mm (0.33 in).

2. Install the locating sleeves (2) into the cylinder block (1).

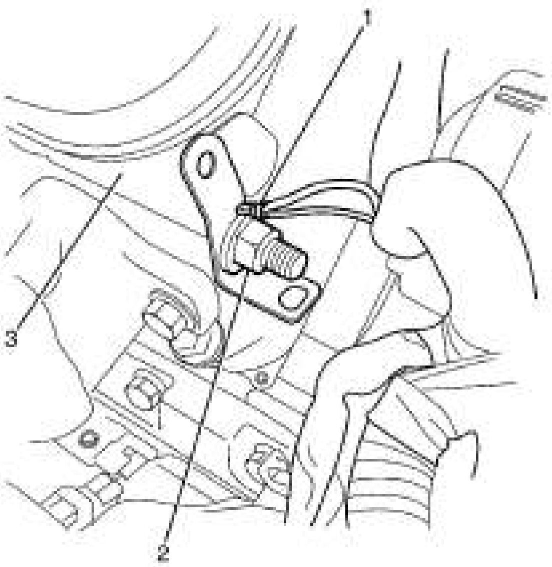


Important: The cylinder head gasket (3) will fit on either side of the engine. Make sure the tab on the cylinder head gasket (1) is located towards the front half point and the stamping FRONT on the cylinder head gasket (2) is facing the front of the engine.

Important: Do not use any type of sealant on the cylinder head gasket (1), unless specified.

3. Install the NEW cylinder head gasket (3) correctly over the locating sleeves.

4. Install the cylinder head with the exhaust manifold to the engine. Refer to Cylinder Head Installation - Right Side.
5. Install the right side valve rocker arms and pushrods. Refer to Valve Rocker Arm and Push Rod Replacement.
6. Install the right side valve rocker arm cover. Refer to Valve Rocker Arm Cover Replacement - Right Side.
7. Remove the right side exhaust manifold. Refer to Exhaust Manifold Replacement - Right Side.

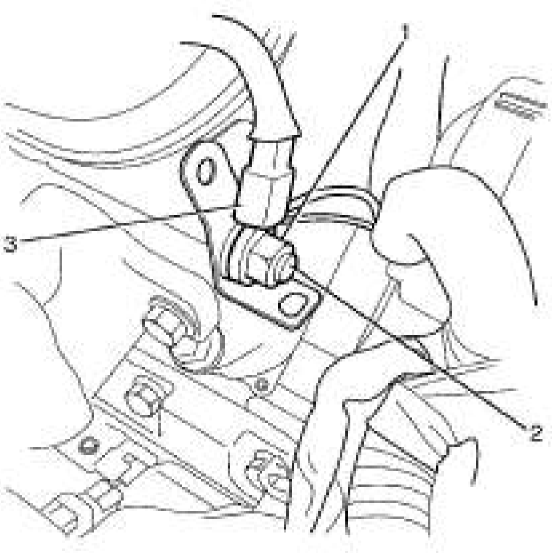


8. Position the wiring harness ground (1) on the cylinder head (2).

Notice: Refer to Fastener Notice in the Preface section.

9. Install the cylinder head stud (3) to the cylinder head (2).

Tighten
Tighten the stud to 30 N·m(22 lb ft).



10. Position the vehicle body ground cable (3) on the cylinder head stud (2).
11. Install the vehicle body ground cable to cylinder head retaining nut (1).

    Tighten
    Tighten the nut to 12 N·m(106 lb ft).

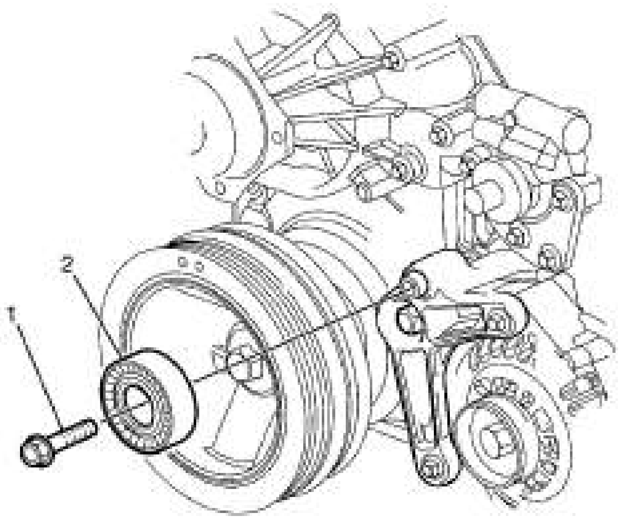
12. Install the oil level indicator and tube. Refer to Oil Level Indicator and Tube Replacement.
13. Install the spark plugs. Refer to Spark Plug Replacement.
14. Install the right side ignition coils. Refer to Ignition Coil Replacement .
15. Install the engine coolant air bleed pipe and cover. Refer to Engine Coolant Air Bleed Hose Replacement.
16. Install the intake manifold assembly. Refer to Intake Manifold Replacement.
17. Refill the cooling system. Refer to Cooling System Draining and Filling.
18. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
19. Install the engine cover. Refer to Engine Cover Replacement .
20. Install the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 2037321

Drive Belt Idler Pulley Replacement

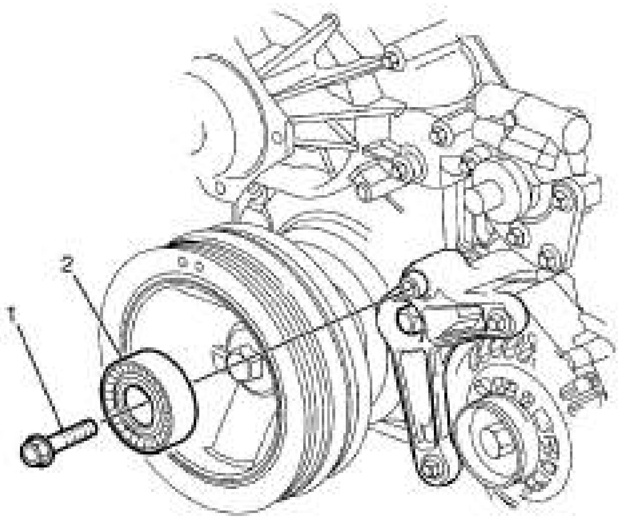
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Assembly Replacement.
2. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.



3. Remove the drive belt idler pulley to alternator bracket retaining bolt (1).
4. Remove the drive belt idler pulley (2).

Installation Procedure



1. Install the drive belt idler pulley (2).
2. Hand tighten the drive belt idler pulley to alternator bracket retaining bolt (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Tighten the drive belt idler pulley bolt.

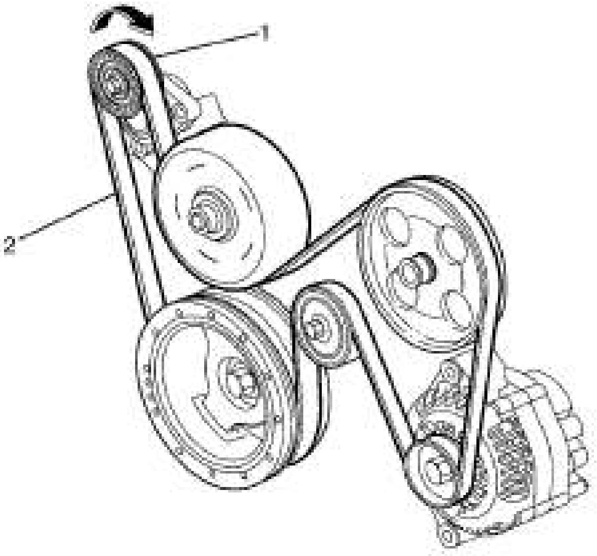
   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).

4. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
5. Install the air intake duct. Refer to Air Cleaner Assembly Replacement.

Drive Belt Replacement - Accessory

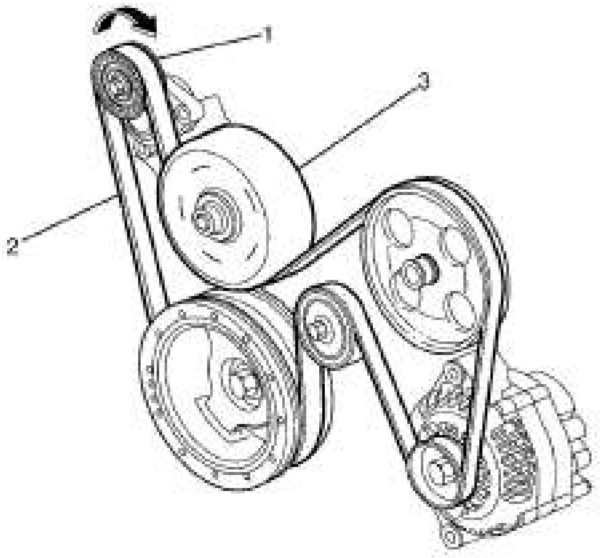
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Assembly Replacement.



2. Using a suitable tool, rotate the drive belt tensioner (1) clockwise to relieve the tension on the accessory drive belt (2).
3. Remove the accessory drive belt (2).
4. Slowly release tension on the drive belt tensioner (1).
5. Clean and inspect the drive belt surfaces of all the pulleys.

Installation Procedure

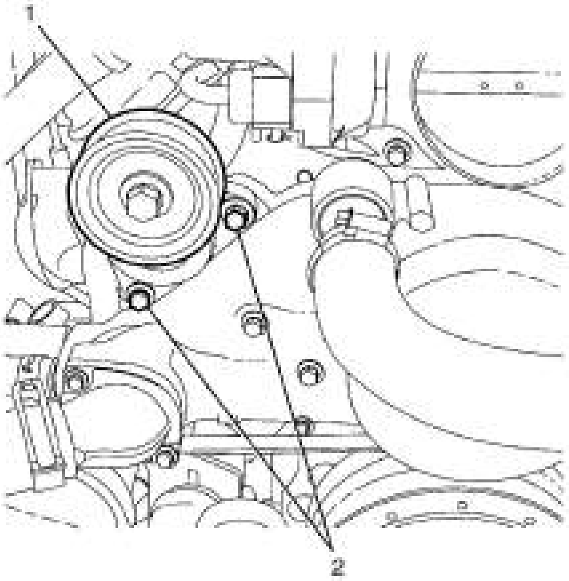


1. Route the accessory drive belt (2) around all the pulleys except the water pump pulley (3).
2. Using a suitable tool, rotate the drive belt tensioner (1) clockwise.
3. Install the accessory drive belt under the water pump pulley (3).
4. Slowly release the drive belt tensioner (1).
5. Install the air intake duct. Refer to Air Cleaner Assembly Replacement.
6. Inspect the accessory drive belt (2) for correct alignment.

Drive Belt Tensioner Replacement - Accessory

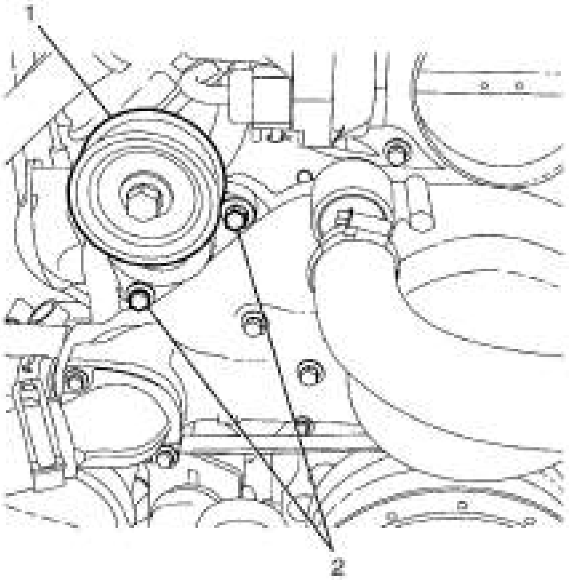
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Assembly Replacement.
2. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.



3. Remove the accessory drive belt tensioner to cylinder head retaining bolts (2).
4. Remove the accessory drive belt tensioner (1).

Installation Procedure



1. Install the accessory drive belt tensioner (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the accessory drive belt tensioner to cylinder head retaining bolts (2).

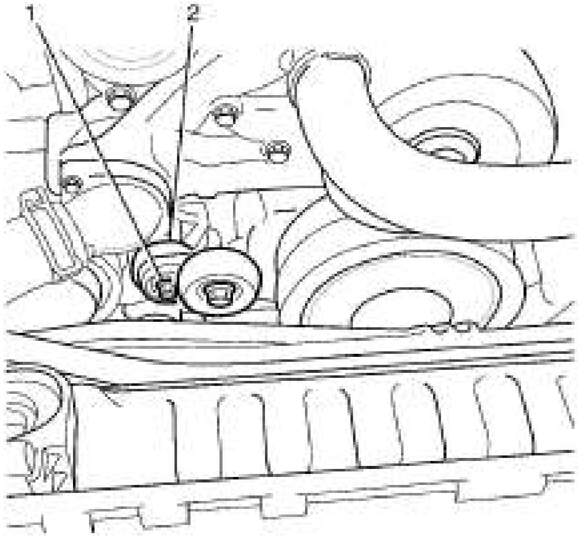
   Tighten
   Tighten the bolts to 58 N·m (43 lb ft).

3. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
4. Install the air intake duct. Refer to Air Cleaner Assembly Replacement.

Drive Belt Tensioner Replacement - Air Conditioning

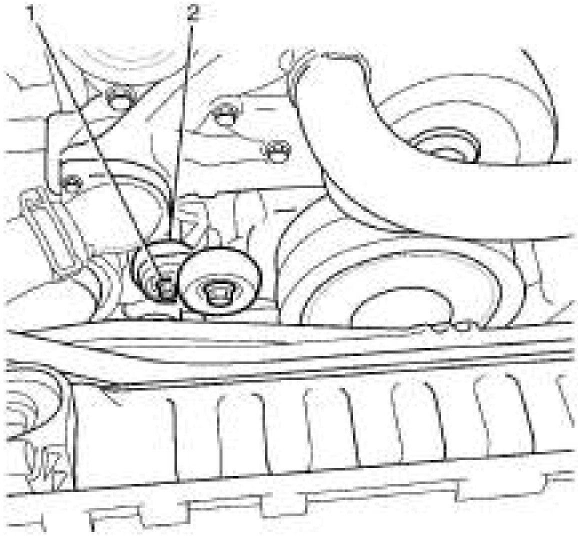
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Assembly Replacement.
2. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
3. Remove the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.



4. Remove the A/C drive belt tensioner to A/C compressor bracket retaining bolt (1).
5. Remove the A/C drive belt tensioner (2).

Installation Procedure



1. Install the A/C drive belt tensioner (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Tighten the A/C drive belt tensioner to A/C compressor bracket retaining bolt (1).

   Tighten
   Tighten the bolt to 22 N·m (16 lb ft).

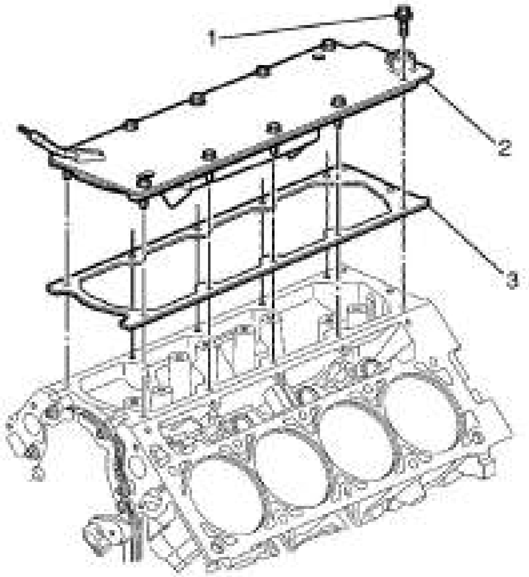
3. Install the air conditioning (A/C) drive belt. Refer to Air Conditioning Compressor Belt Replacement.
4. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
5. Install the air intake duct. Refer to Air Cleaner Assembly Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037331**

Engine Block Valley Cover Replacement

Removal Procedure

1. Remove the intake manifold. Refer to Intake Manifold Replacement.
2. Remove the oil pressure sensor. Refer to Engine Oil Pressure Sensor and/or Switch Replacement.



3. Remove the valley cover to cylinder block retaining bolts (1).
4. Remove the valley cover (2).

Important: The valley cover gasket (3) is a single use only component and must be replaced whenever the valley cover gasket (3) is removed from the engine.

5. Remove the valley cover gasket (3).

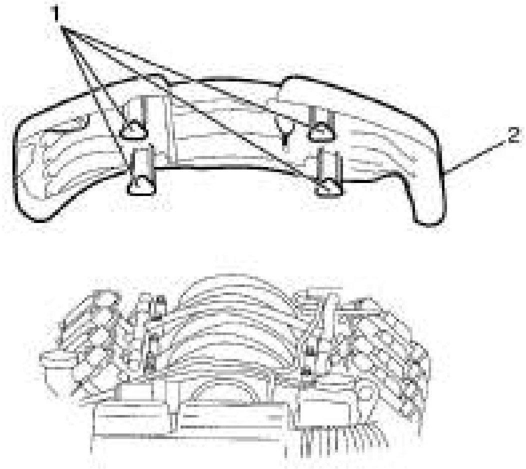
   Discard the valley cover gasket (3).

Installation Procedure

1. Install the valley cover. Refer to Engine Block Valley Cover Installation.
2. Install the oil pressure sensor. Refer to Engine Oil Pressure Sensor and/or Switch Replacement.
3. Install the intake manifold. Refer to Intake Manifold Replacement.

Engine Cover Replacement

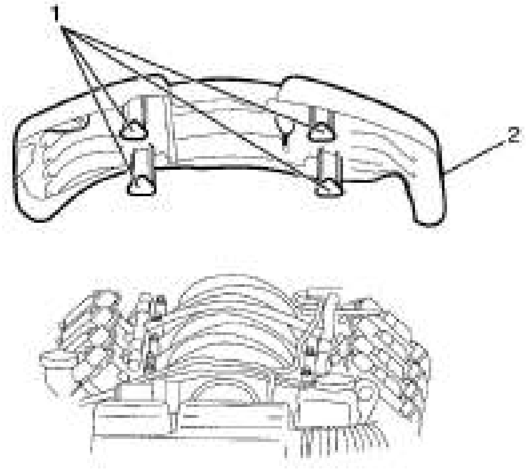
Removal Procedure



Important: Detach the engine cover to fuel rail retaining clips (1) by pulling upward on the engine cover.

1. Detach the engine cover from the fuel rail retaining clips (1).
2. Remove the engine cover (2).

Installation Procedure



1. Align the engine cover to fuel rail retaining clips (1).

   Important: Make sure the engine cover retaining clips (1) are fully engaged to prevent causing an induced rattle condition.

2. Install the engine cover (2).

Engine Flywheel Replacement

Removal Procedure

1. Remove the automatic transmission. Refer to Transmission Replacement .
2. Remove the engine flywheel. Refer to Engine Flywheel Removal .

Installation Procedure

1. Install the engine flywheel. Refer to Engine Flywheel Installation .
2. Install the automatic transmission. Refer to Transmission Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037361**

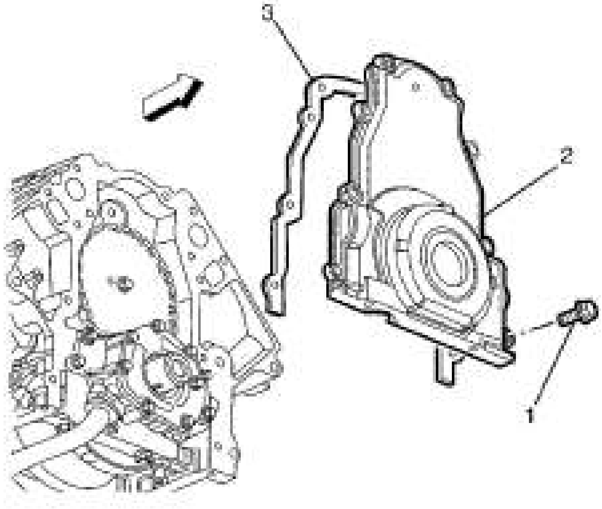
Engine Front Cover Replacement

Tools Required

- J 41480 Front and Rear Cover Alignment
- J 41476 Front and Rear Cover Alignment Tool

Removal Procedure

1. Remove the oil pan. Refer to Oil Pan Replacement.
2. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.



3. Remove the engine front cover to cylinder block retaining bolts (1).

   Important: The engine front cover gasket (3) is a single use only component and must be replaced whenever the engine front cover (2) is removed.

4. Remove the engine front cover (2) and gasket (3).
5. Remove the engine front cover gasket (3).

   Discard the engine front cover gasket (3).

6. Clean and inspect the engine front cover. Refer to Engine Front Cover Cleaning and Inspection.

Installation Procedure

1. Install the engine front cover. Refer to Engine Front Cover Installation.
2. Install the crankshaft balancer. Refer to Crankshaft Balancer Removal.

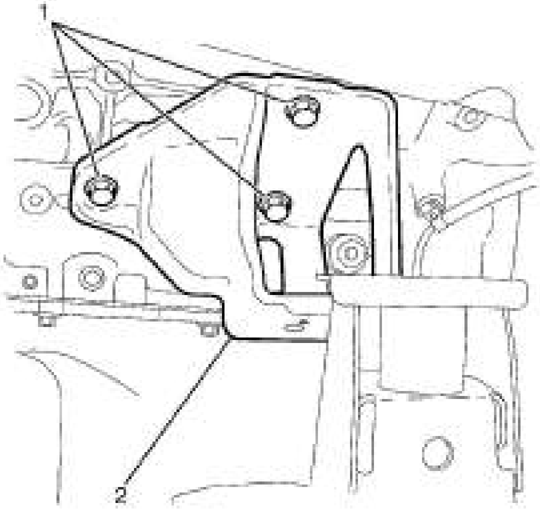
3. Install the oil pan. Refer to Oil Pan Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037329**

Engine Mount Bracket Replacement - Left Side

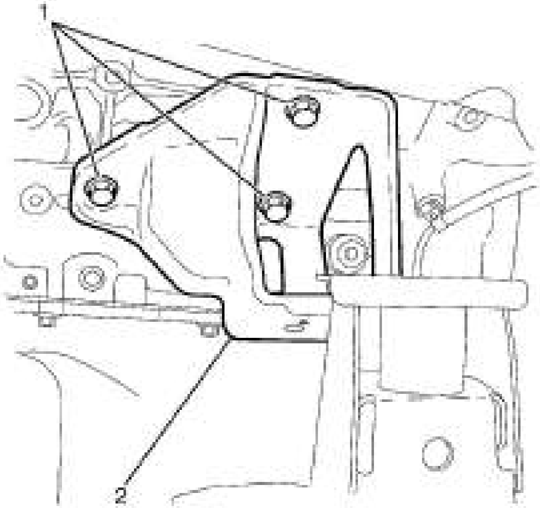
Removal Procedure

1. Remove the left side engine mount. Refer to Engine Mount Replacement - Left Side.



2. Remove the left side engine mount bracket to cylinder block retaining bolts (1).
3. Remove the left side engine mount bracket (2).

Installation Procedure



1. Install the left side engine mount bracket (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the left side engine mount bracket to cylinder block retaining bolts (1).

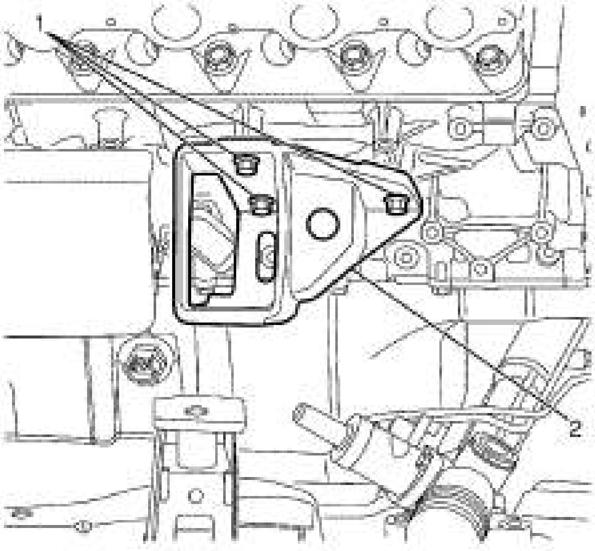
   Tighten
   Tighten the bolt to 50 N·m (37 lb ft).

3. Install the left side engine mount. Refer to Engine Mount Replacement - Left Side.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037330**

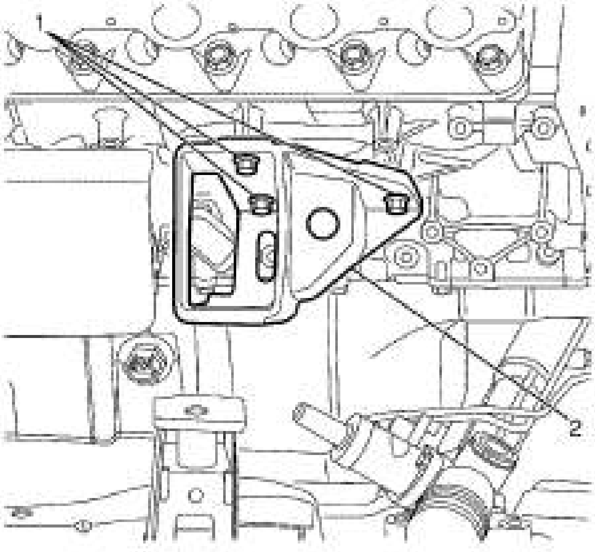
Engine Mount Bracket Replacement - Right Side

Removal Procedure



1. Remove the right side engine mount. Refer to Engine Mount Replacement - Right Side .
2. Remove the right side engine mount bracket to cylinder block retaining bolts (1).
3. Remove the right side engine mount bracket (2).

Installation Procedure



1. Install the right side engine mount bracket (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the right side engine mount bracket to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolts to 50 N·m (37 lb ft).

3. Install the right side engine mount. Refer to Engine Mount Replacement - Right Side .

Engine Mount Inspection

Notice: Broken or deteriorated mounts can cause misalignment and destruction of certain drive train components. When a single mount breaks, the remaining mounts are subjected to abnormally high stresses.

Important: Raising the engine, will remove the weight from the engine mount and create a slight tension in the rubber mount.

1. Use a suitable engine lifting tool to raise the engine until the weight of the engine is removed from the engine mounts.

   Important: Before replacing any engine mount due to suspected fluid loss, verify that the source of the fluid is actually the engine mount, not the engine or other accessories.

2. Observe the engine mount while raising the engine. Replace the engine mount if the mount exhibits any of the following conditions:
   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the engine mount.
   - The rubber is split through the centre of the engine mount.
   - The GLYCOL™ fluid is leaking from the engine mount.
3. If there is movement between the metal plate of the engine mount and its attaching points, lower the engine on the engine mount. Tighten the bolts or nuts attaching the engine mount to the frame or engine mount bracket. Refer to Engine Mount Replacement - Left Side or Engine Mount Replacement - Right Side.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038122**

Engine Mount Replacement - Left Side

Tools Required

- J 28467-B Universal Engine Support Fixture
- J 41803 Engine Support Fixture
- J 41798 Engine Lift Bracket

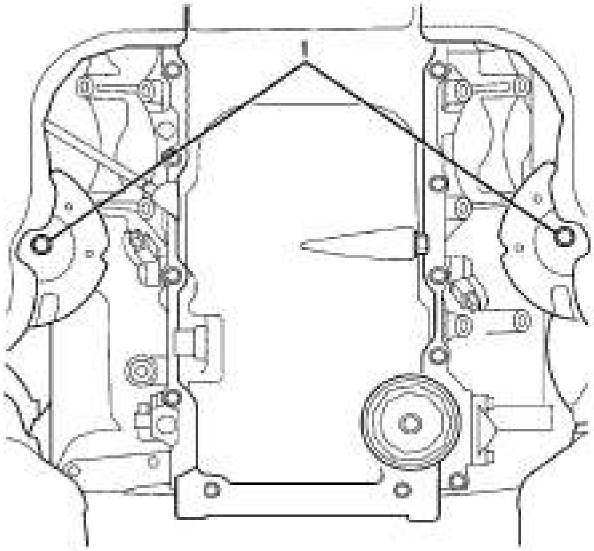
Removal Procedure

1. Remove the engine cover. Refer to Engine Cover Replacement .

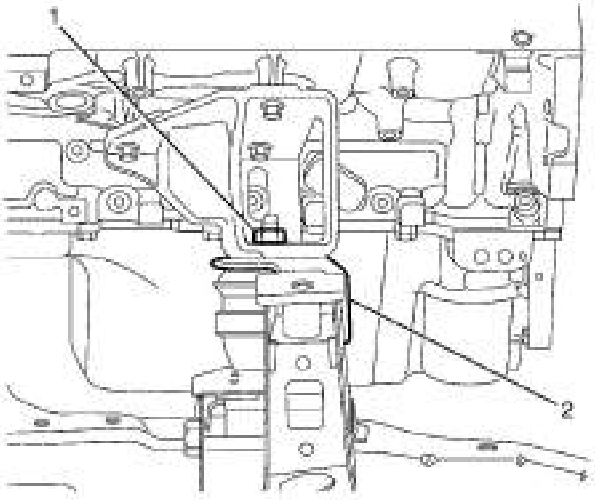
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

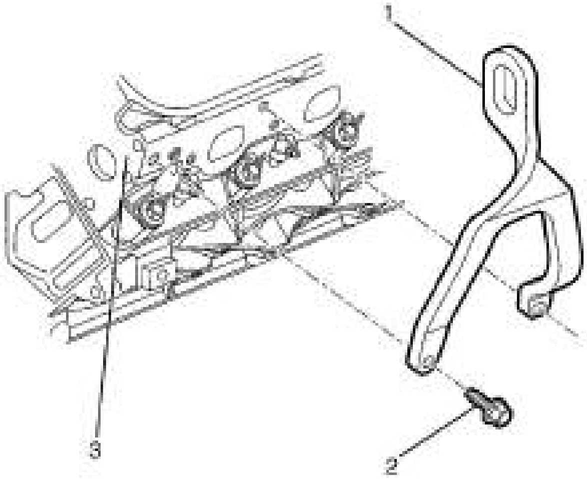
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the engine splash shield. Refer to Engine Splash Shield Replacement .



4. Remove the lower engine mount to front subframe retaining nut (1) from both engine mounts.
5. Lower the vehicle.



6. Remove the upper left side engine mount to engine mount bracket retaining nut (1).

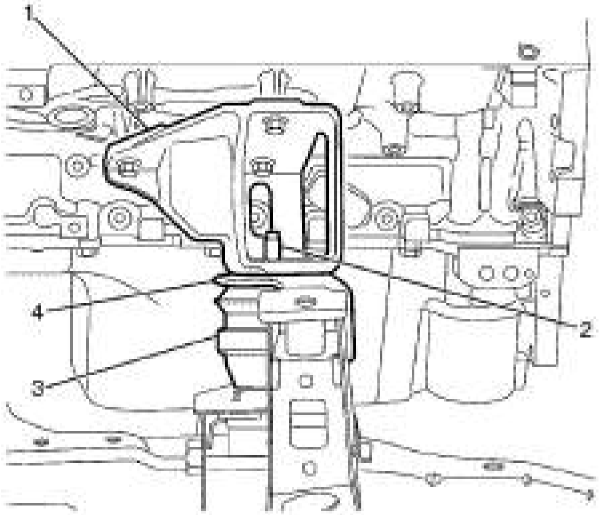


7. Position the J 41798 (1) on the cylinder head (3).

   Notice: Refer to Fastener Notice in the Preface section.

8. Install the J 41798 to cylinder head retaining bolts (2).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).



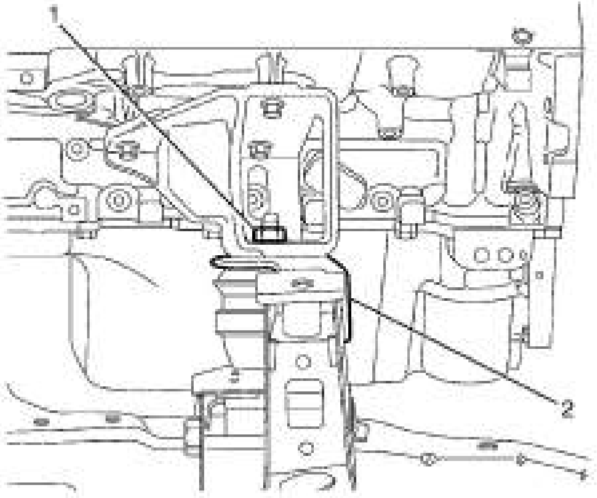
Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

9. Install J 41803 and J 28467-B and raise the engine assembly until the left side engine mount bracket (1) is clear of the left side engine mount retaining stud (2).

Important: DO NOT bend or distort the right side engine mount heat shield (4).

10. Remove the left side engine mount assembly (3).

Installation Procedure



Important: DO NOT bend or distort the right side engine mount heat shield (4).

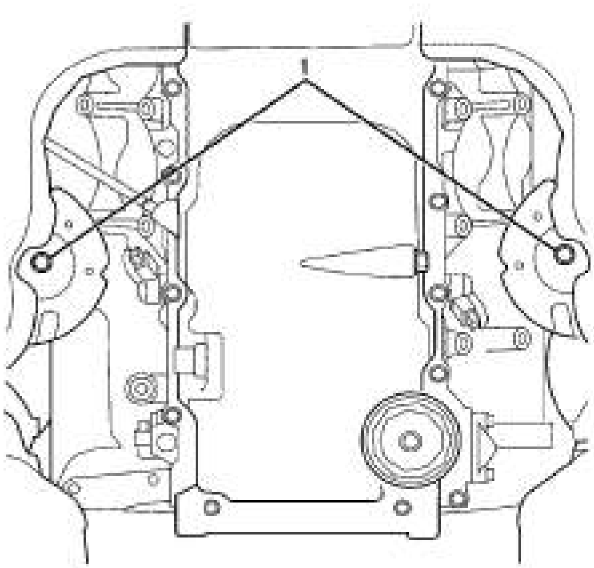
1. Position the left side engine mount assembly (3).
2. Lower the engine and remove J 41803 , J 28467-B and J 41798 from the engine.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the upper engine mount to engine mount bracket retaining nut (1).

Tighten
Tighten the nut to 80 N·m (59 lb ft).

Caution: Refer to Vehicle Lifting Caution in the Preface section.



4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Notice: Refer to Fastener Notice in the Preface section.

5. Install the lower engine mount to front subframe retaining nut (1) on both engine mounts.

Tighten
Tighten the nut to 80 N·m (59 lb ft).

6. Install the engine splash shield. Refer to Engine Splash Shield Replacement .
7. Lower the vehicle.
8. Install the engine splash shield. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 2038134

Engine Mount Replacement - Right Side

Tools Required

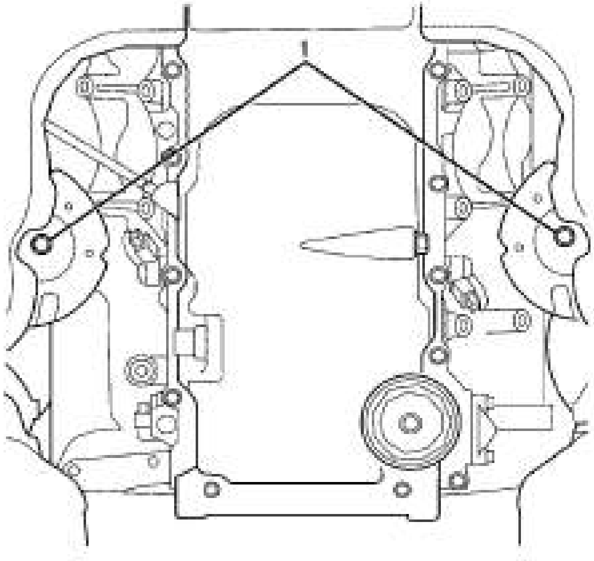
- J 28467-B Universal Engine Support Fixture
- J 41803 Engine Support Fixture
- J 41798 Engine Lift Bracket

Removal Procedure

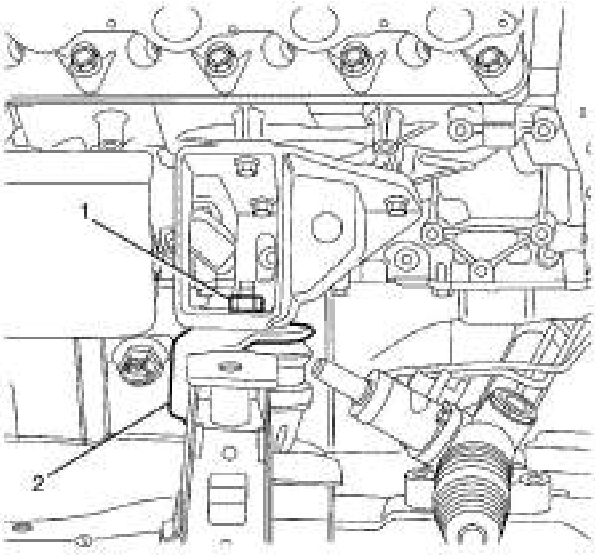
1. Remove the engine cover. Refer to Engine Cover Replacement .
2. Remove the Oil Level Indicator and Tube. Refer to Oil Level Indicator and Tube Replacement .

Caution: Refer to Vehicle Lifting Caution in the Preface section.

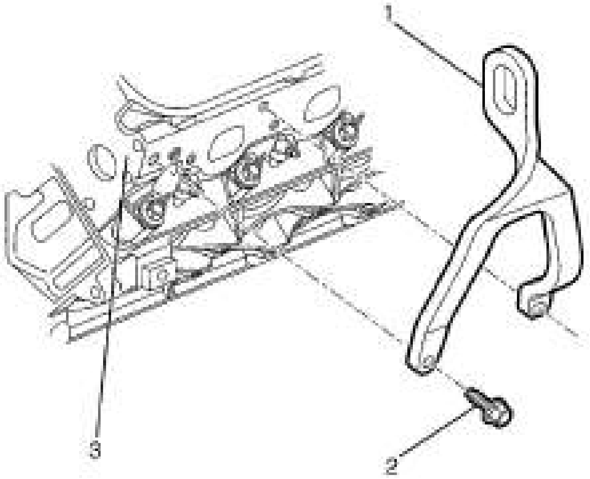
3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the engine splash shield. Refer to Engine Splash Shield Replacement .



5. Remove the lower engine mount to front subframe retaining nut (1) from both engine mounts.
6. Lower the vehicle.



7. Remove the upper right side engine mount to engine mount bracket retaining nut 1).

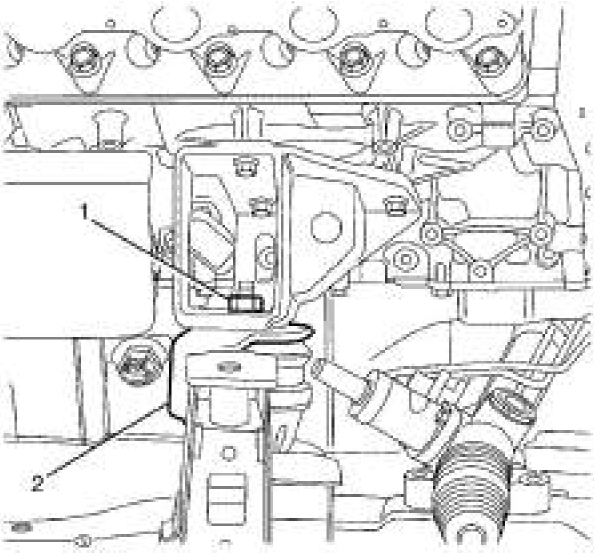


8. Position the J 41798 (1) on the cylinder head (3).

   Notice: Refer to Fastener Notice in the Preface section.

9. Install the J 41798 to cylinder head retaining bolts (2).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).



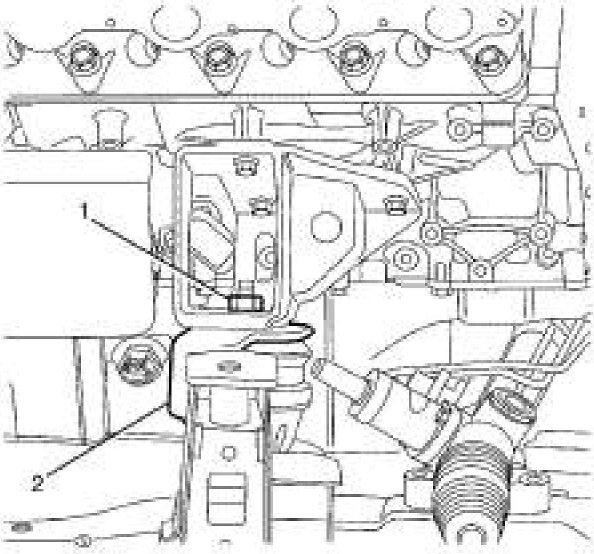
Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

10. Install J 41803 and J 28467-B and raise the engine assembly until the right side engine mount bracket (1) is clear of the right side engine mount retaining stud (2).

Important: DO NOT bend or distort the right side engine mount heat shield (4).

11. Remove the right side engine mount assembly (3).

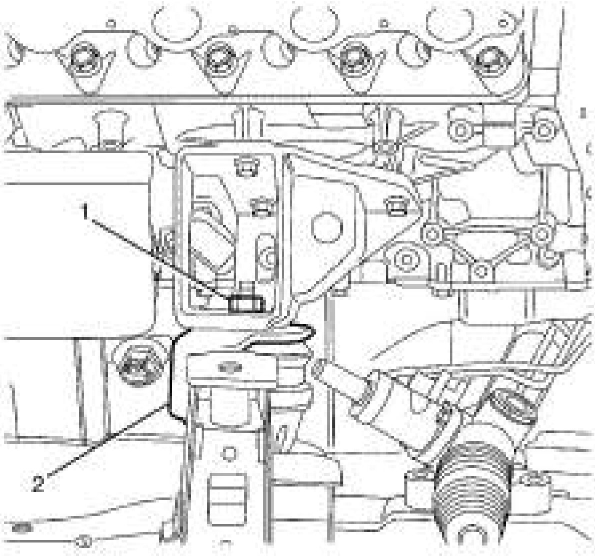
Installation Procedure



Important: DO NOT bend or distort the right side engine mount heat shield (4).

1. Install the right side engine mount assembly (3).
2. Lower the engine assembly until the right side engine mount retaining stud (2) is installed through the right side engine mount bracket (1).
3. Remove J 41803 , J 28467-B and J 41798 from the engine.

Notice: Refer to Fastener Notice in the Preface section.



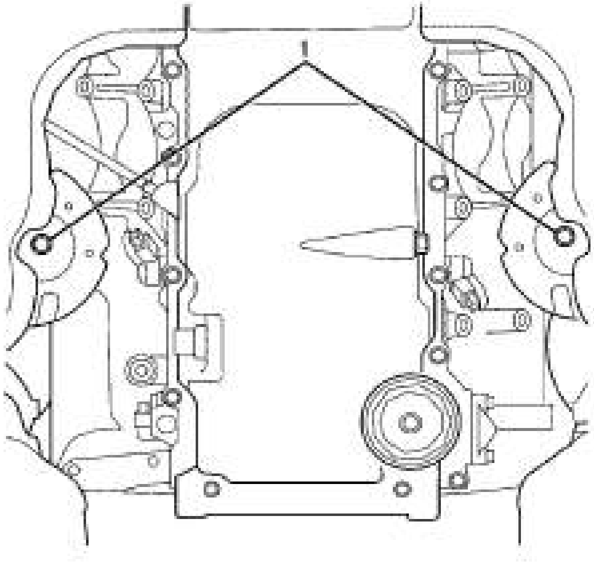
4. Install the upper right side engine mount to engine mount bracket retaining nut (1).

Tighten
Tighten the nut to 80 N·m (59 lb ft).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

5. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Notice: Refer to Fastener Notice in the Preface section.



6. Install the lower engine mount to front subframe retaining nut (1) on both engine mounts.

   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

7. Install the engine splash shield. Refer to Engine Splash Shield Replacement .
8. Lower the vehicle.
9. Install the Oil Level Indicator and Tube. Refer to Oil Level Indicator and Tube Replacement .
10. Install the engine cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2086105**

Engine Oil and Oil Filter Replacement (L98, LS2)

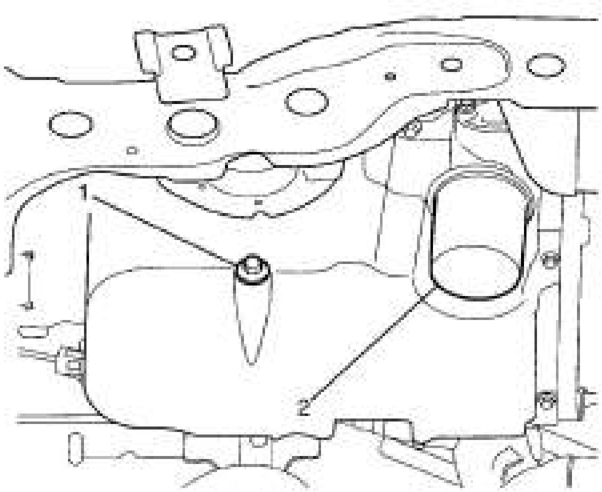
Removal Procedure

1. Remove the oil fill cap.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

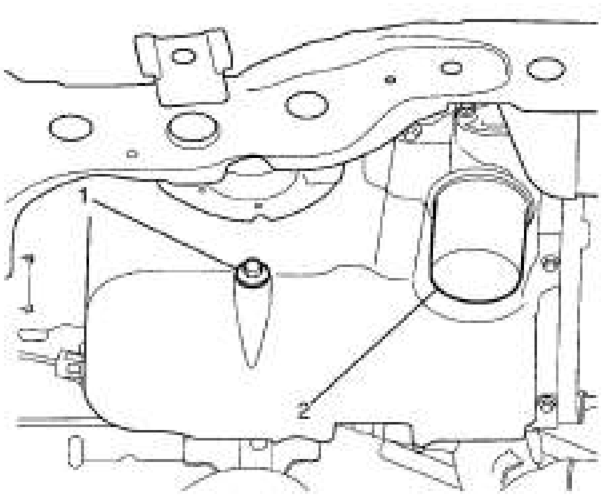
2. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.



3. Remove the oil pan drain plug (1).
4. Drain the engine oil into an appropriate container.
5. Remove the engine oil filter (2).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



Important: Before installing the new oil filter, ensure that the old oil filter gasket has been removed. If not, remove the old gasket.

1. Install the oil filter (2).

   Tighten
   Tighten the filter to 30 N·m (22 lb ft).

2. Install the oil pan drain plug (1).

   Tighten
   Tighten the plug to 25 N·m (18 lb ft).

3. Lower the vehicle.
4. Fill the engine with a suitable amount and type of engine oil. Refer to Approximate Fluid Capacities and Fluid and Lubricant Recommendations.
5. Check the oil level.
6. Install the oil fill cap.
7. Reset the service reminder display. Refer to Service Display Reminders.

Engine Oil Level Sensor and/or Switch Replacement

Removal Procedure

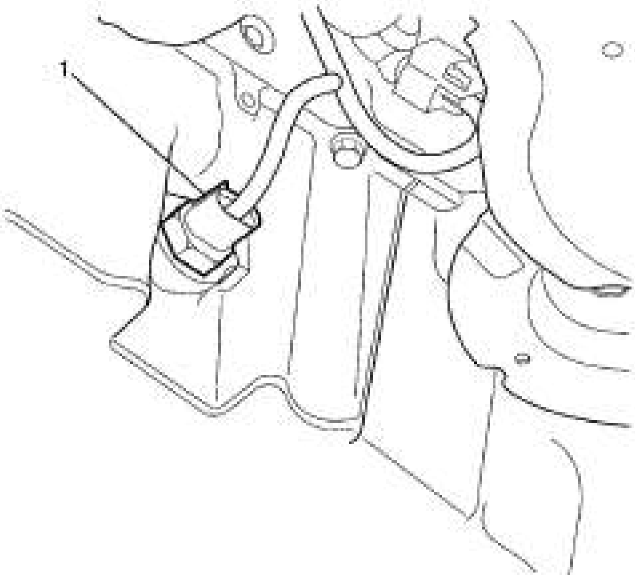
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

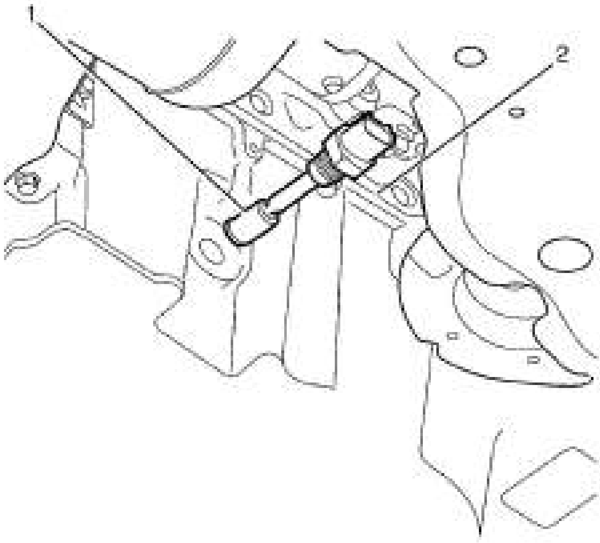
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Drain the engine oil. Refer to Engine Oil and Oil Filter Replacement.



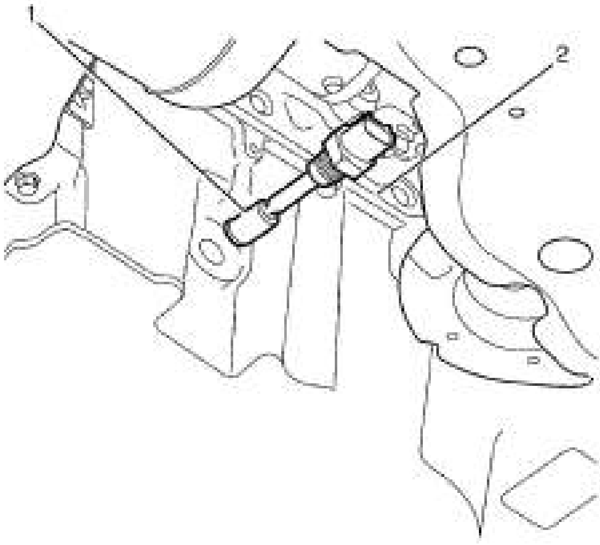
4. Disconnect the oil level/temperature sensor electrical connector (1).



5. Remove the engine oil lever sensor (1) from the oil pan (2).

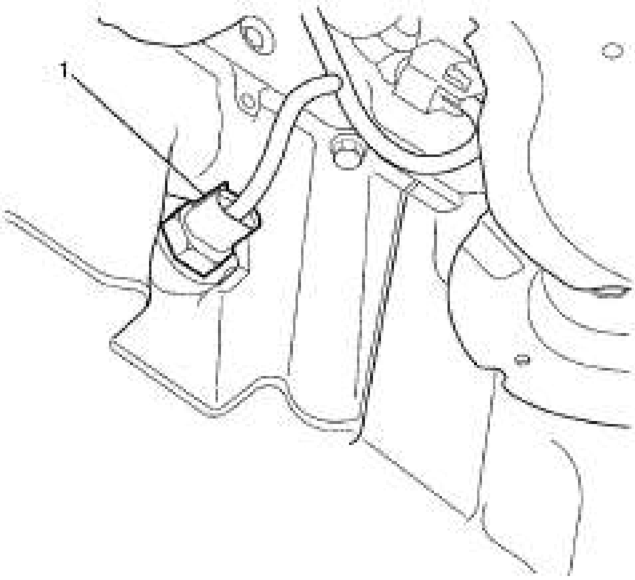
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the engine oil level sensor (1) to the oil pan (2).

Tighten
Tighten the sensor to 20 N·m (15 lb ft).



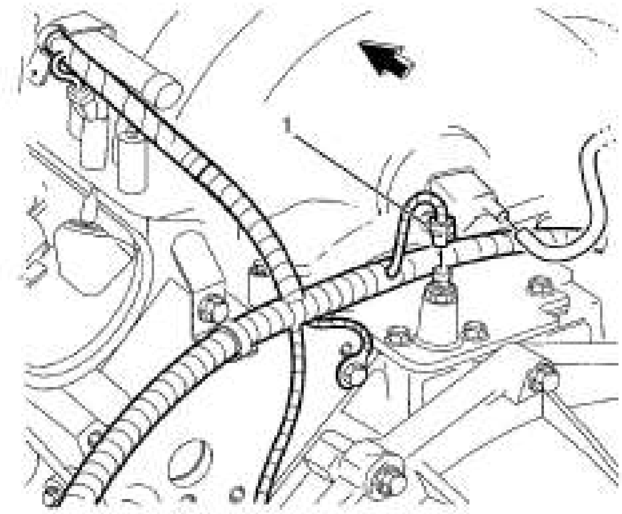
2. Connect the oil level/temperature sensor electrical connector (1).
3. Lower the vehicle.
4. Replace the engine oil and oil filter. Refer to Engine Oil and Oil Filter Replacement.

Engine Oil Pressure Sensor and / or Switch Replacement

Tools Required

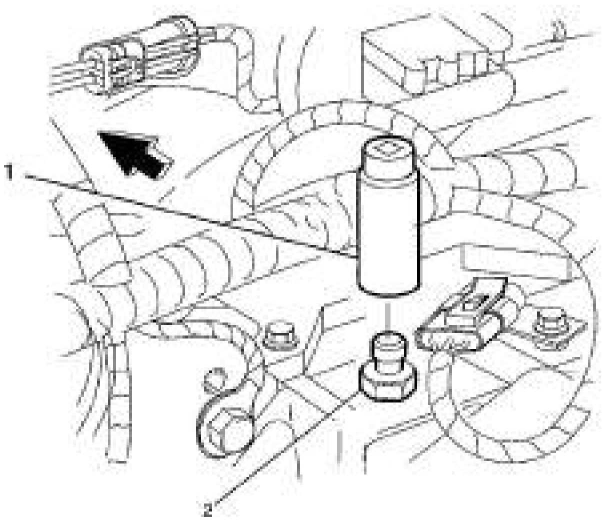
J 41712 Oil Pressure Switch Socket

Removal Procedure



1. Disconnect the oil pressure sensor wiring harness connector (1).

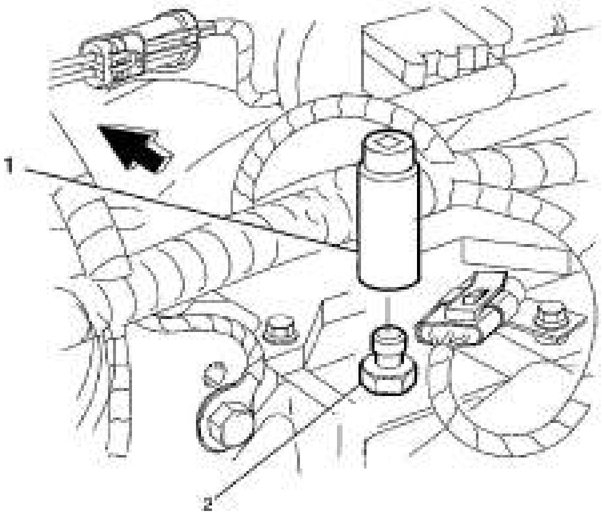
   Important: Clean the area around the sensor before removal. This prevents debris from entering the engine.



2. Use the J 41712 (1) to remove the oil pressure sensor (2).

Installation Procedure

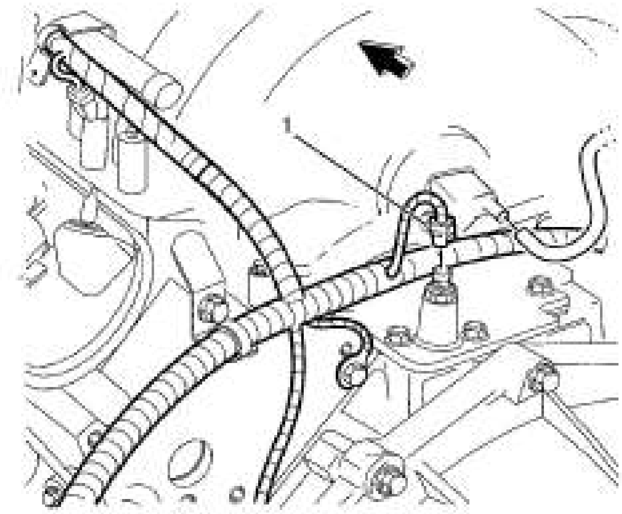
Notice: Refer to Fastener Notice in the Preface section.



Important: If installing the old oil pressure sensor (2), apply LOCTITE 565 ™ or equivalent to the cleaned oil pressure sensor (2) thread.

1. Install the oil pressure sensor (2) using the J 41712 J 41712.

Tighten
Tighten the sensor to 35 N·m (26 lb ft).



2. Connect the oil pressure sensor electrical connector (1).

Engine Replacement (RHD)

Tools Required

J 41798 Engine Lifting Brackets

Removal Procedure

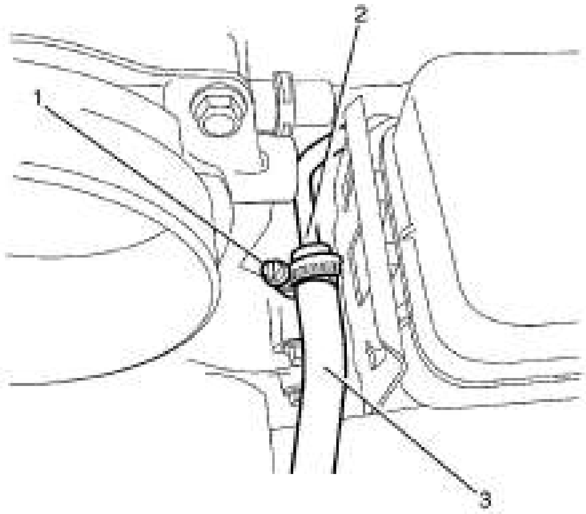
Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

Important: The front wheels of the vehicle must be maintained in the straight ahead position and the steering column must be in the LOCK position before disconnecting the steering column or intermediate shaft. If these procedures are not followed incorrect alignment of some components during installation will result and damage to the SIR coil assembly will occur.

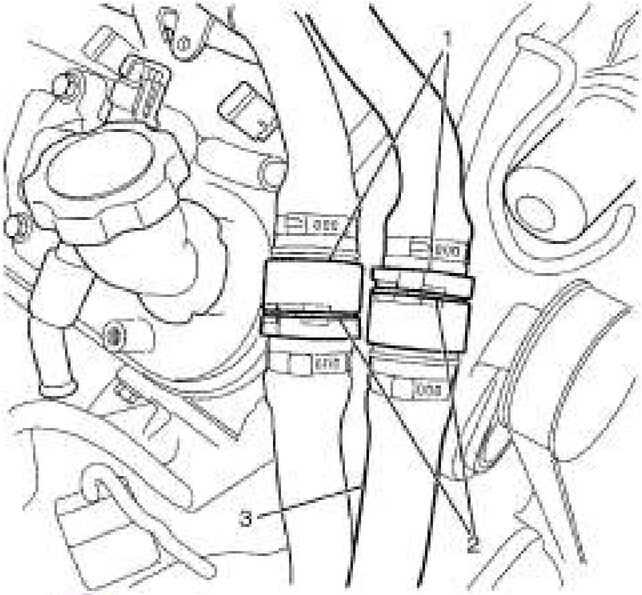
1. Turn the ignition key to the LOCK position.

Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
5. Recover the air conditioning (A/C) refrigerant. Refer to Refrigerant Recovery and Recharging.
6. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
7. Depressurize the fuel system. Refer to Fuel Pressure Relief.
8. Drain the cooling system. Refer to Cooling System Draining and Filling.
9. Remove the radiator outlet hose. Refer to Radiator Outlet Hose Replacement.



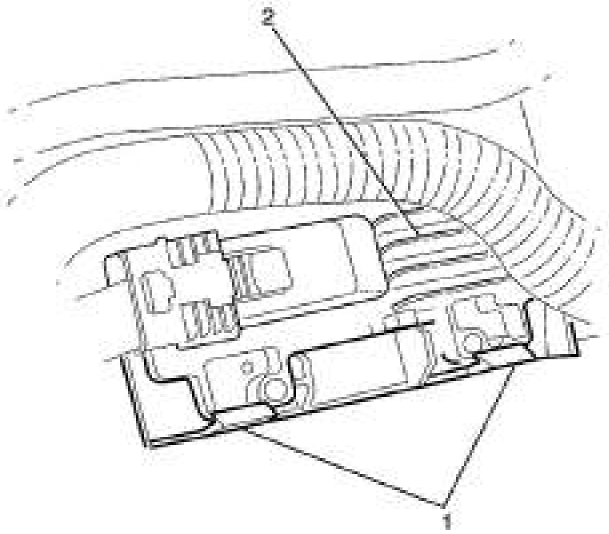
10. Loosen the coolant bleed hose retaining clamp (1) at the cylinder head end and slide 50 mm (2 in) along the coolant bleed hose (3).
11. Disconnect the coolant air bleed hose (3) from the coolant bleed pipe (2).



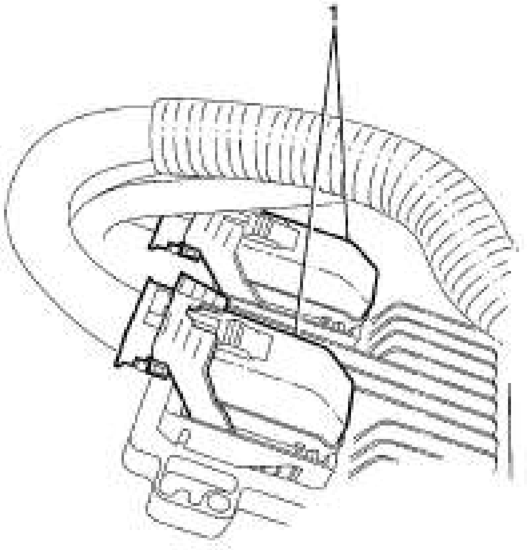
Important: Disconnect the heater hose assembly quick connect fittings (1) by releasing the retaining clips (2) using a suitable tool.

12. Disconnect the inlet and outlet heater hoses (3) from the heater hose assembly quick connect fittings (1).

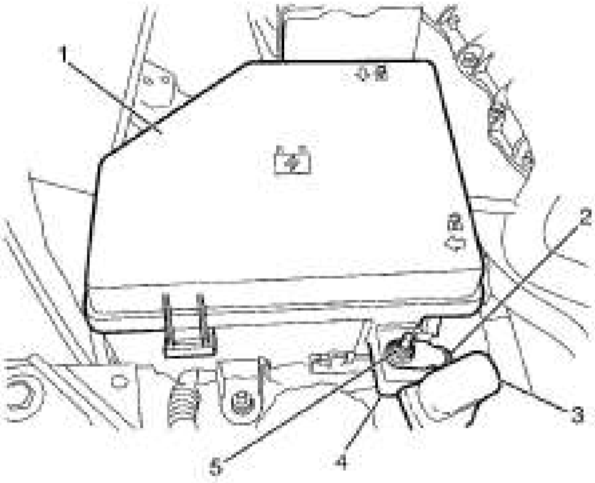
Notice: Do not touch the connector pins or soldered components on the circuit board in order to prevent possible electrostatic discharge (ESD) damage to the PCM.



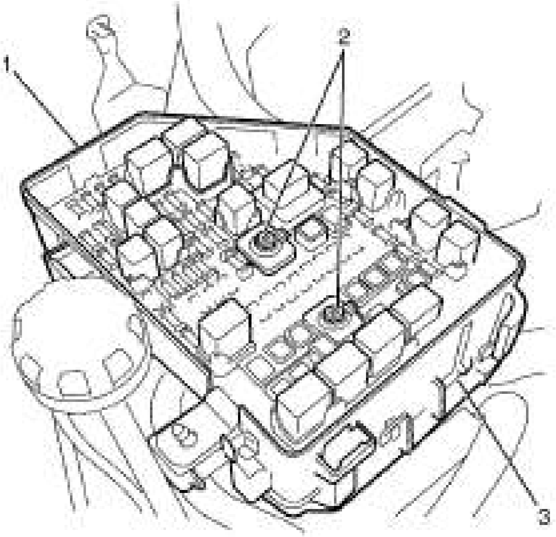
13. Release the ECM retaining clips (1) and detach the ECM (2).



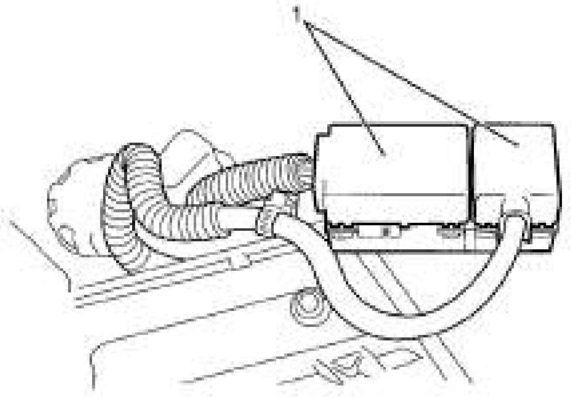
14. Move the connector lock levers to the unlock position and disconnect the ECM electrical connectors (1).



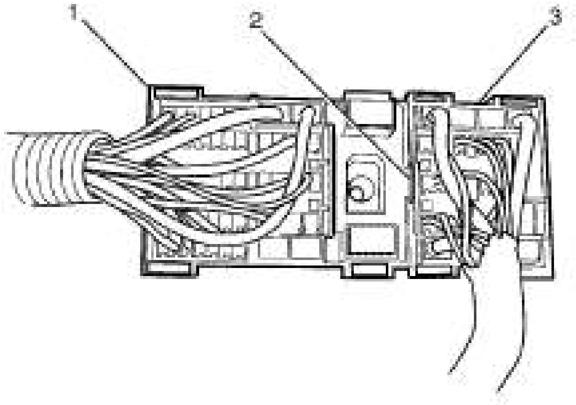
15. Remove the under hood body electrical centre (BEC) cover (1).
16. Remove the positive cable protective cover (3).
17. Remove the positive cable to under hood BEC plate retaining bolt (5).
18. Disconnect the positive cable (2) from the upper under hood BEC plate (4).



19. Remove the under hood BEC upper plate to lower plate retaining bolts (2).
20. Raise the upper under hood BEC plate (1) from the lower under hood BEC plate (3).

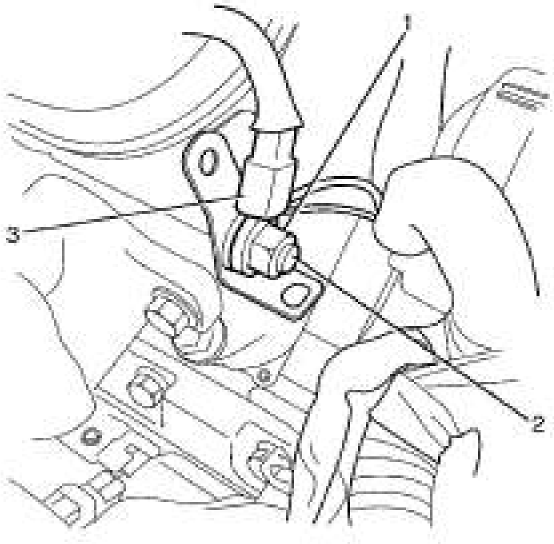


21. Detach the protector (1) from the base of the under hood BEC connector (2).

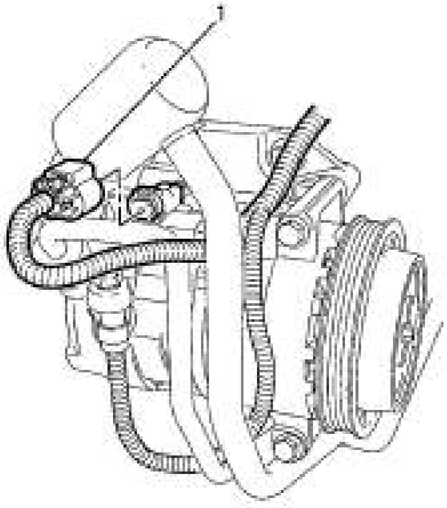


Important: Use a suitable tool to depress the connector locking tang (2), then pull the body harness connector (1) upward and the engine connector (3) downward to separate the body harness connector (1) from the engine connector (3).

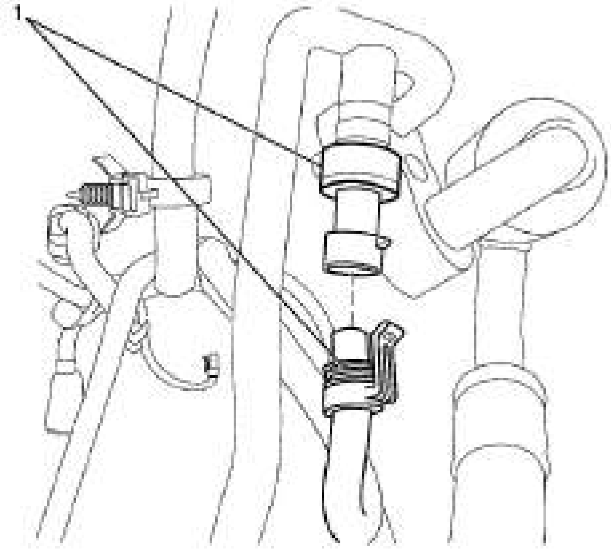
22. Separate the body harness connector (1) from the engine connector (3).
23. Reposition and secure the engine wiring harness and connector (3) on the engine.



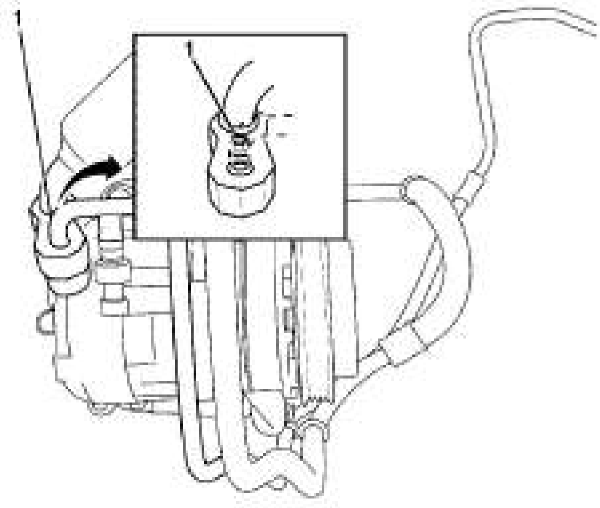
24. Remove the vehicle body ground cable to cylinder head retaining nut (1).
25. Remove the vehicle body ground cable (3) from the cylinder head stud (2).



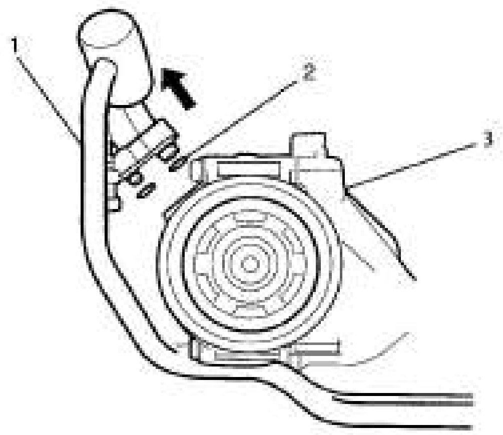
26. Disconnect the A/C electrical connector (1) from the A/C compressor.



27. Disconnect the electrical connector from the A/C Refrigerant Pressure Sensor (1).



28. Remove the suction/discharge pipes pad (1) to compressor retaining bolt (2).



29. Disconnect the suction/discharge pipes (1) from the compressor (3).

    Important: Sealing washers are single use and must be discarded after use.

    Important: Seal pipes immediately to prevent absorption of moisture from the atmosphere.

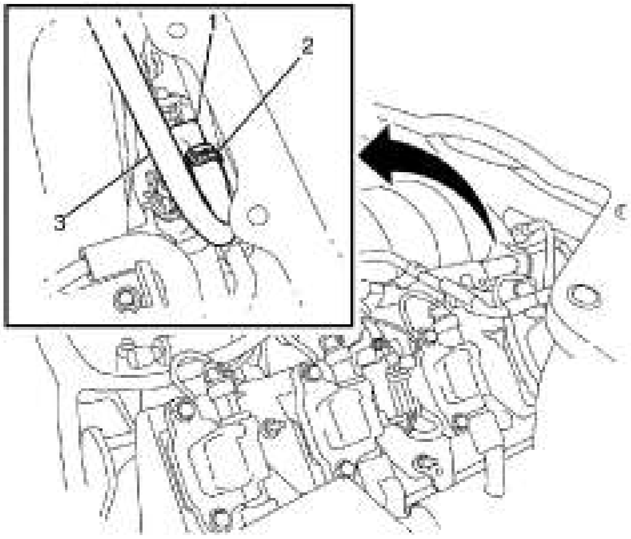
    Important: The plugs for A/C compressor ports must be sufficient to stop oil escaping when tilting A/C compressor for removal.

30. Remove and discard the port sealing washers (2).

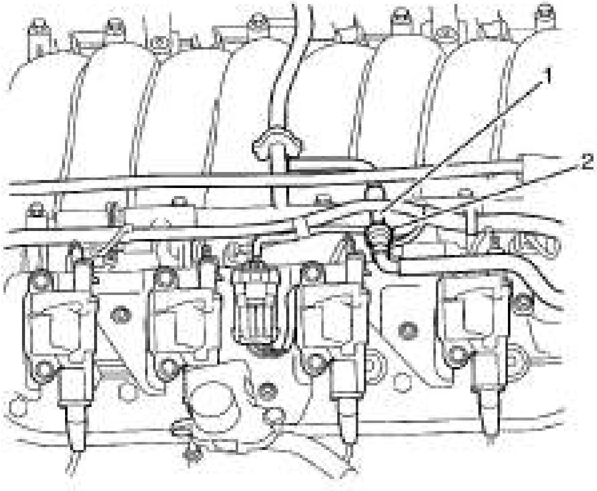
    Discard the port sealing washers (2).

    Important: Cap or plug the ports immediately to prevent absorption of moisture from the atmosphere.

31. Cap or plug the A/C compressor (3) ports.
32. Cap or plug the A/C hoses (1).

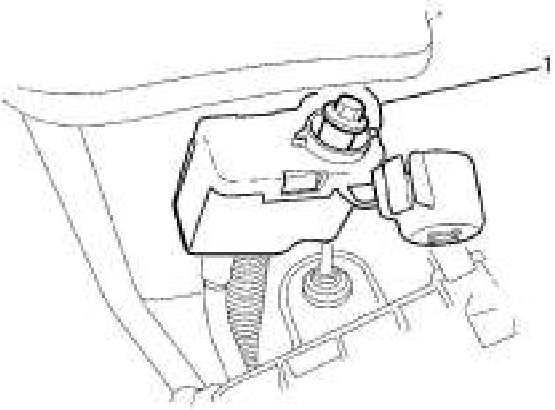


33. Compress the vacuum brake booster hose retaining clamp (2) at the intake manifold vacuum port (1) and slide 50 mm (2 in) back along the vacuum brake booster hose (3).
34. Disconnect the vacuum brake booster hose (3) from the intake manifold vacuum port (1).

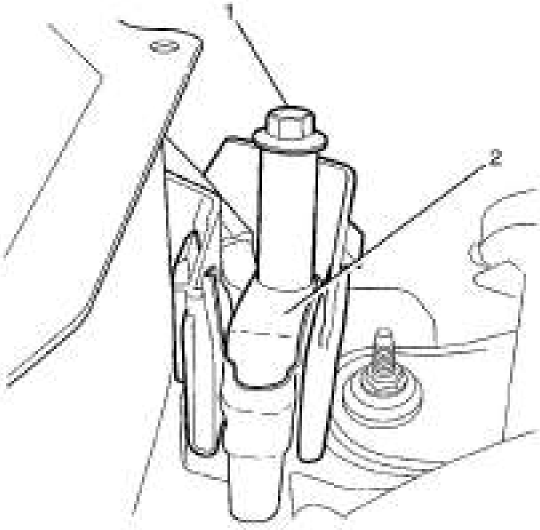


Important: Plug or cap the fuel feed pipe (2) and fuel rail tube (1) ends to prevent fuel leaks and/or contamination.

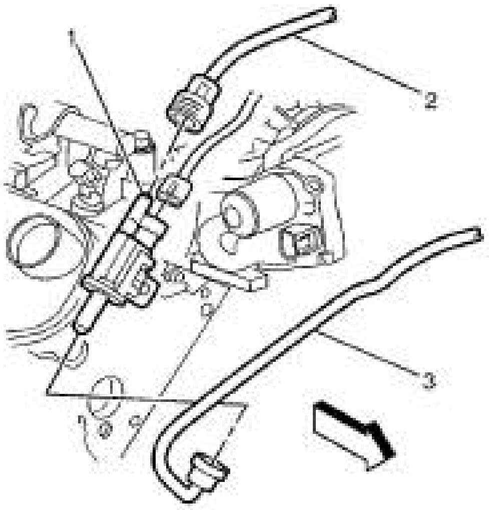
35. Disconnect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



36. Remove the remote positive battery post cover (1) from the remote positive battery post.



37. Remove the remote positive battery post to wiring harness retaining bolt (1).
38. Remove the wiring harness (2) from the remote positive battery post.

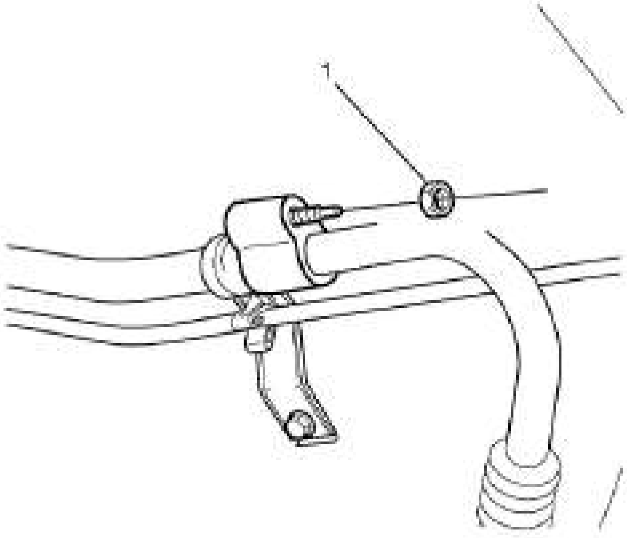


Important: Plug or cap the throttle body to EVAP purge valve hose (3) and EVAP purge valve (1) ends to prevent fuel leaks and/or contamination.

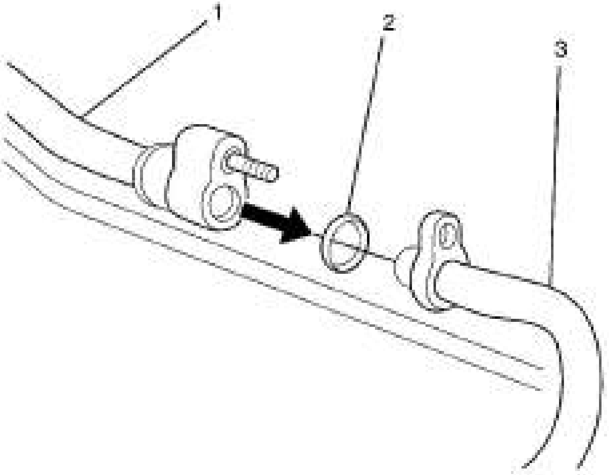
39. Disconnect the throttle body to EVAP purge valve hose (3) from the EVAP purge valve (1).

    Important: Plug or cap the EVAP purge valve to fuel tank hose (2) and EVAP purge valve (1) ends to prevent fuel leaks and/or contamination.

40. Disconnect the EVAP purge valve to fuel tank hose (2) from the EVAP purge valve (1).



41. Remove the A/C suction pipe pad to lower A/C suction pipe retaining nut (1).



42. Disconnect the upper A/C suction pipe (1) from the lower A/C suction pipe (3).

    Important: Plug or cap the A/C suction pipe ends (1 and 3) immediately to prevent contamination and absorption of moisture from the atmosphere.

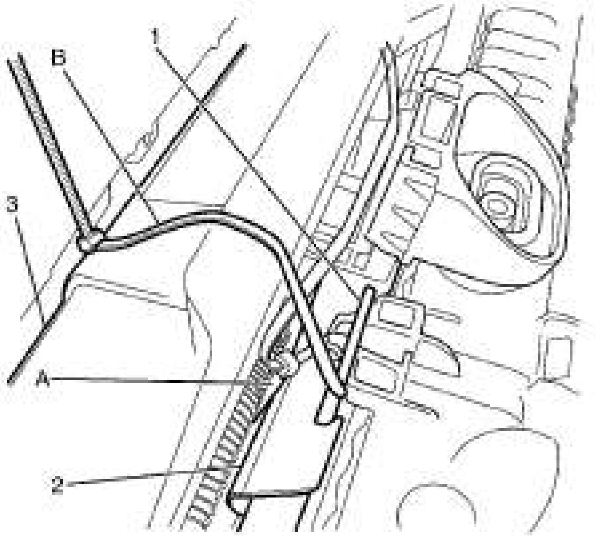
43. Plug or cap the A/C suction pipe ends.

    Important: The A/C suction pipe sealing O-ring (2) is a single use component and will not reseal. Install a NEW A/C suction pipe sealing O-ring (2) whenever the upper A/C suction pipe (1) is removed from the lower A/C suction pipe (3).

44. Remove and discard the A/C suction pipe sealing O-ring (2).

    Discard the A/C suction pipe sealing O-ring (2).

45. Reposition and retain the A/C suction/discharge pipes away from the engine.



Important: It is necessary to secure the radiator and condenser assembly (2) to the front end assembly (3) as the radiator and condenser assembly is supported to the subframe.

Important: Thread zip tie A around the front end assembly and zip tie B through the radiator and condenser mount (1). Insert zip tie A into the retainer of zip tie B and insert zip tie B into the retainer of zip tie A.

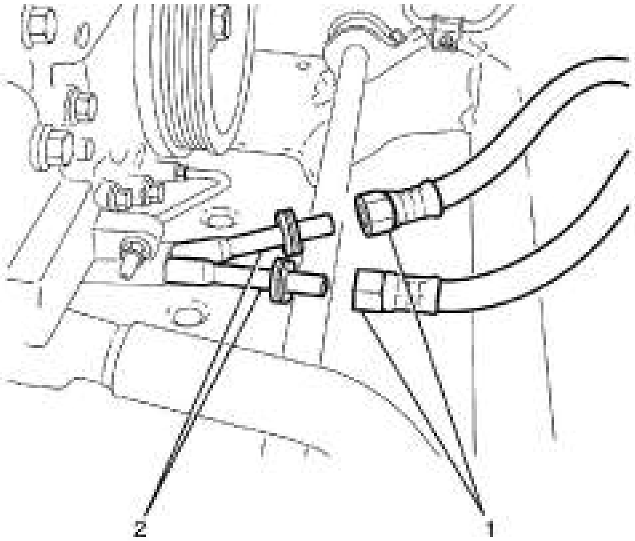
46. Secure radiator and condenser assembly (2) to the front end assembly (3) with large zip ties or equivalent.

Important: Ignore steps 47 - 49 for vehicles equipped with a manual transmission.

Important: The flexible hoses are not serviced separately. Therefore if the hose's require replacement, then the hose and radiator to hose cooler hose assembly must be fitted.

Important: When removal is complete plug hose openings with a clean lint free cloth to prevent foreign matter entry.

47. Place a suitable container beneath the radiator and engine.

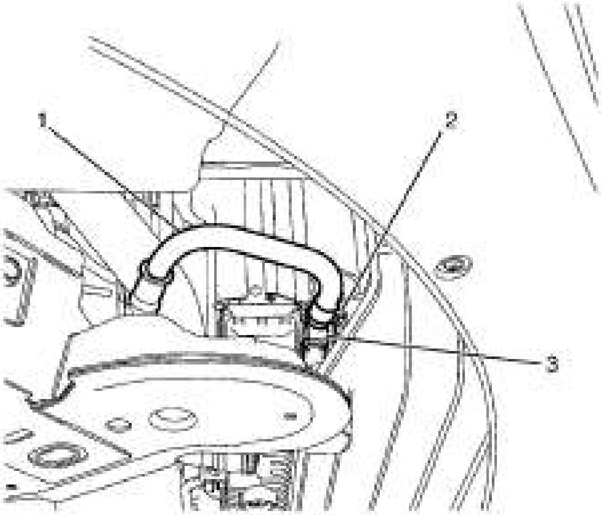


48. Disconnect the automatic transmission cooler pipe (2) from the flexible hose (1) at the quick connect fitting using tool. AU525.
    - Open release tool AU525 then close and clip around the hose to be disconnected.
    - While holding the flexible hose (1) push the hose inwards with one hand, then pull back to separate from the steel hose piping (2).
    - Repeat for the second fitting if required.
49. Reposition and secure the flexible hoses (1) away from the engine and subframe.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

50. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
51. Remove the front air deflector. Refer to Front Air Deflector Replacement.
52. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.

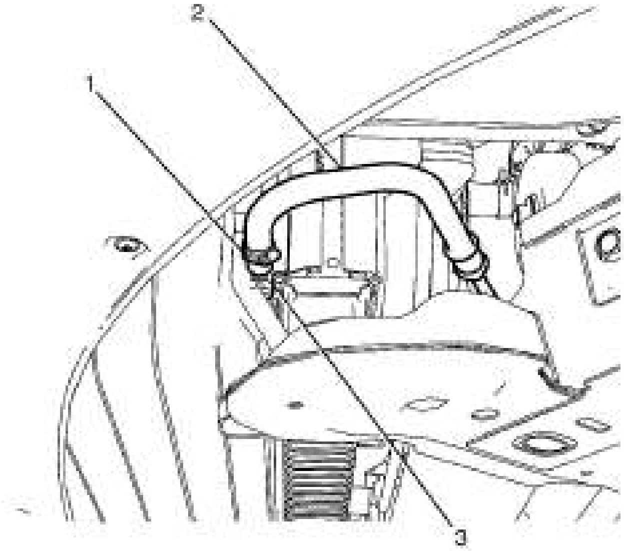


53. Place a suitable container under the power steering cooler.

Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

54. Release the power steering gear outlet hose spring clamp (2) and disconnect the power steering gear outlet hose (1) from the power steering cooler (3).

    Plug the power steering cooler (3) and power steering gear outlet hose (1).

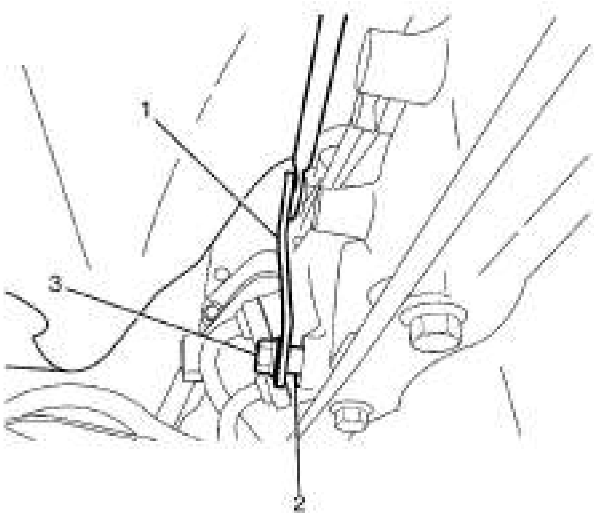


Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

55. Release the power steering reservoir inlet pipe/hose spring clamp (1) and disconnect the power steering reservoir inlet hose (2) from the power steering cooler (3).

    Plug the power steering cooler (3) and power steering reservoir inlet hose (2).

56. Remove the exhaust system. Refer to Exhaust System Replacement.
57. Remove the centre heat shield. Refer to Exhaust Heat Shield Replacement - Center.
58. Remove the propeller shaft. Refer to Propeller Shaft Replacement.
59. Remove the starter. Refer to Starter Motor Replacement.

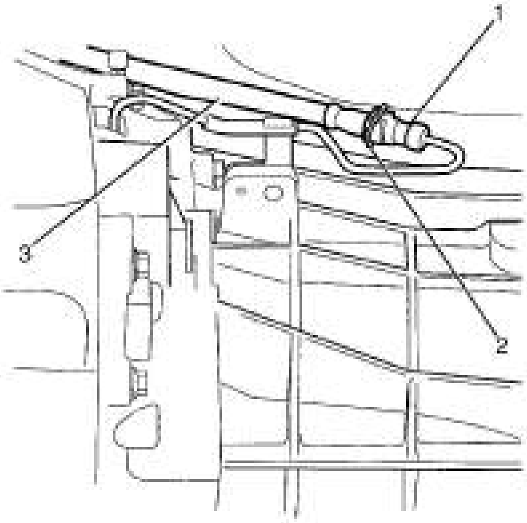


Important: Ignore steps 60 to 62 for vehicles fitted with an manual transmission.

60. Remove the shift selector linkage rod to shift selector shaft retaining nut (3).
61. Remove the shift selector linkage rod (1) from the shift selector shaft (2).

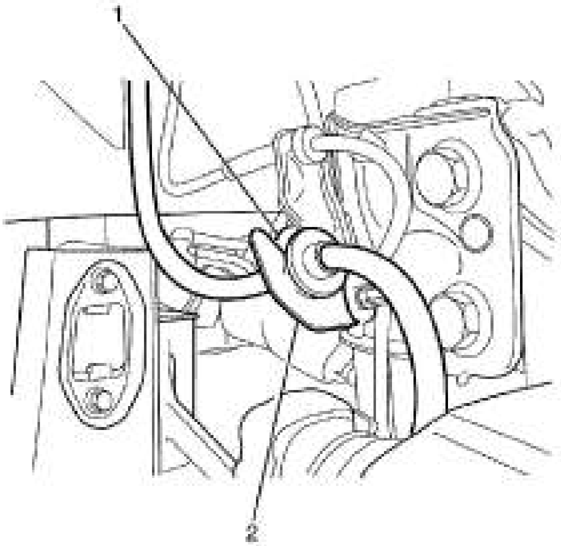
Important: Ignore steps 63 to 65 for vehicles fitted with an automatic transmission.

62. Remove the shift control assembly. Refer to Shift Control Assembly Replacement.

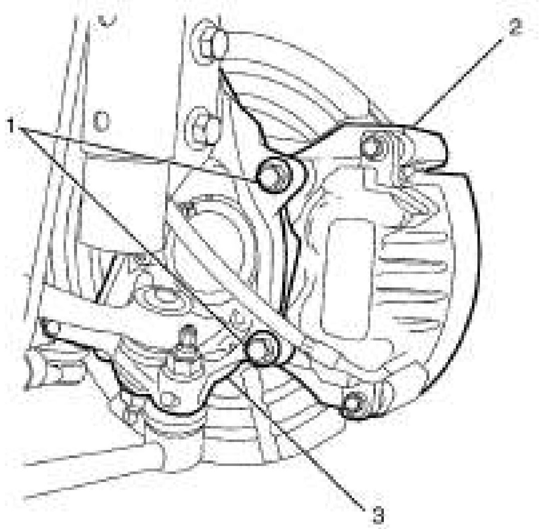


Important: Use a suitable tool to remove the flexible hose securing clip (2), take care not to lose the flexible hose securing clip (2) on removal.

63. Remove the flexible hose securing clip (2).
64. Disconnect the to concentric actuator cylinder feed hose (3) from the concentric actuator cylinder feed pipe (1).
65. Remove the front wheels. Refer to Tire and Wheel Removal and Installation.



66. Detach the front brake hose (1) from the front strut mounted brake hose retaining bracket (2). Repeat for opposite side.



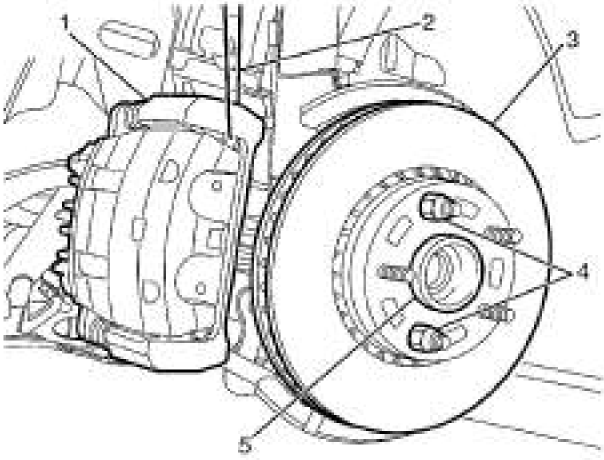
Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

67. Remove the front brake caliper anchor plate to knuckle retaining bolts (1). Repeat for opposite side.

    Discard the bolts.

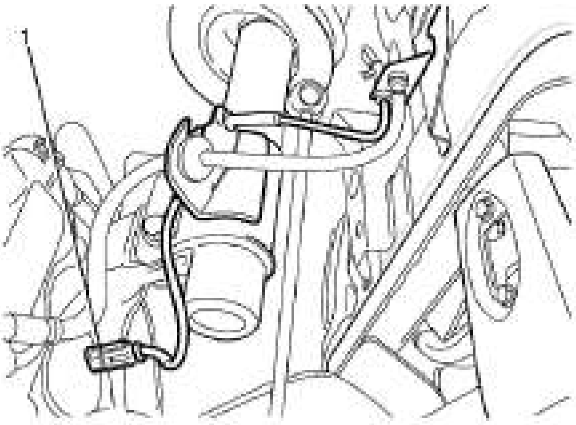
Important: DO NOT disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

68. Remove the front brake caliper (2) from the front steering knuckle (3). Repeat for opposite side.

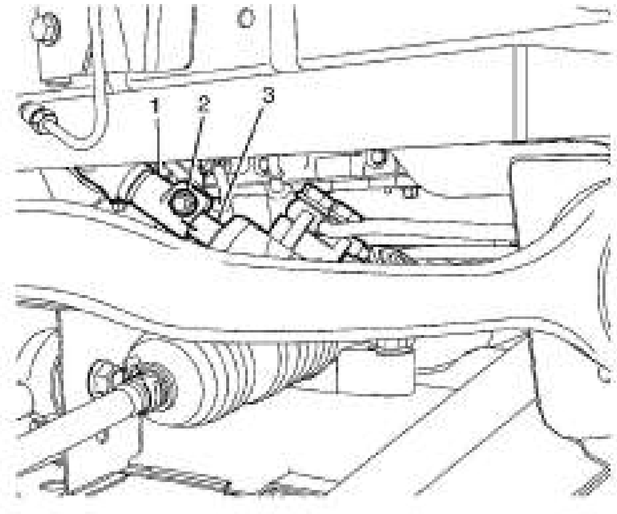


Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

69. Support the brake caliper (1) with heavy mechanic's wire, or equivalent (2).
70. Remove the two wheel nuts (4) retaining the front brake disc (3) to the hub (5). Repeat for opposite side.



71. Disconnect the front wheel speed sensor jumper harness electrical connector (1) and secure away from the front subframe and suspension components. Repeat for opposite side.



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

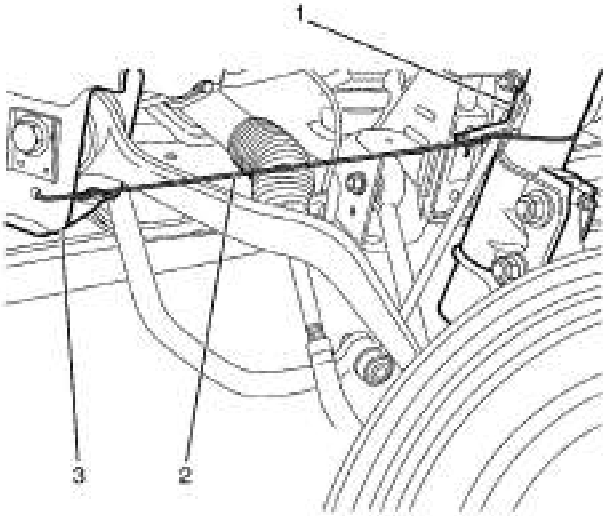
72. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).
73. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

74. Disconnect the intermediate shaft (2) from the pinion shaft (3).

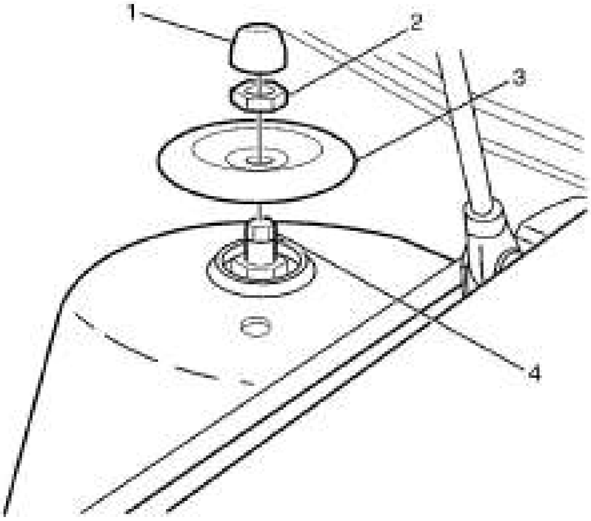
Discard the bolt.

75. Lower the vehicle.



Important: The strut assembly (1) must be secured to the subframe (3) to prevent damage to the front wheelhouse liner, fenders and suspension components.

76. Retain the front strut assembly (1) to the front subframe (3) using heavy mechanics wire or equivalent (2). Repeat for opposite side.



77. Remove the stud dust cover (1) from the strut assembly to front wheelhouse retaining nut (2). Repeat for opposite side.

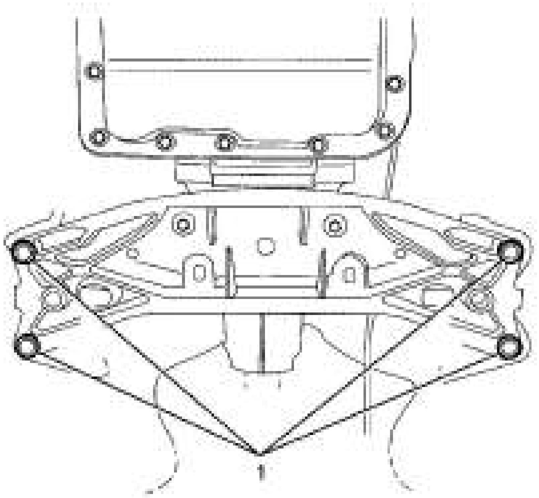
Important: The strut assembly (4) must be supported from underneath before the strut assembly to body retaining nut (2) is removed.

78. Remove the strut assembly to front wheelhouse retaining nut (2) while holding the strut

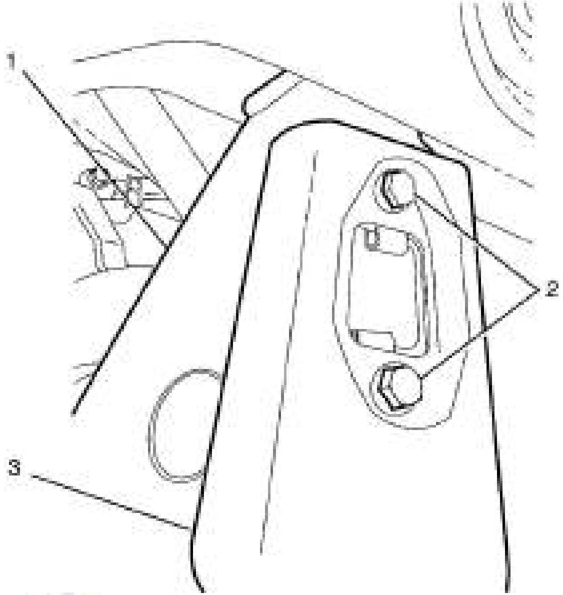
piston shaft (4). Repeat for opposite side.

Discard the nut.

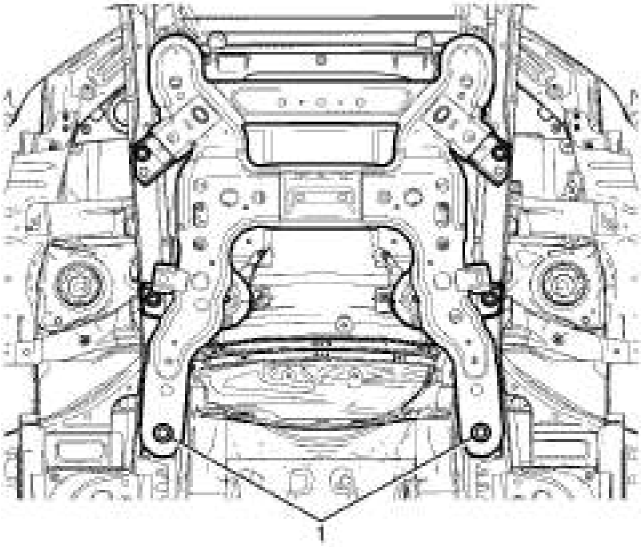
79. Remove the strut assembly to front wheelhouse retaining plate (3). Repeat for opposite side.
80. Position a suitable powertrain and/or engine lift table below the frame, engine and transmission.
81. Raise the lift table and/or lower the vehicle to support the frame, engine and transmission.



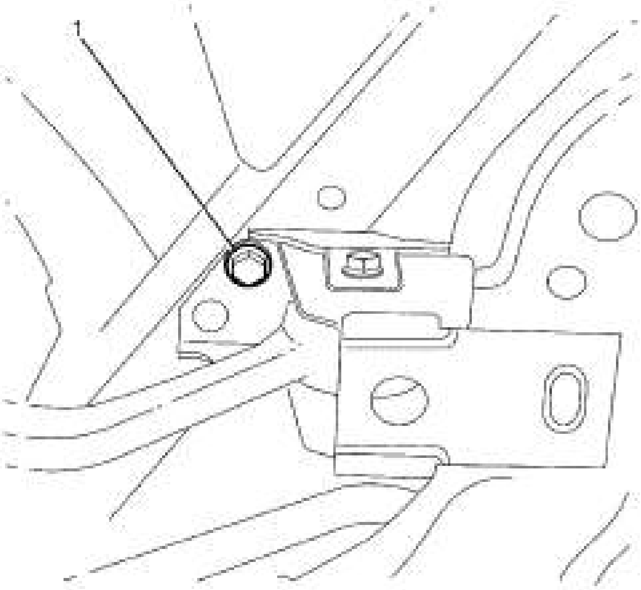
82. Remove the transmission support to body retaining bolts (1).



83. Remove the front subframe reinforcement plate to front subframe retaining bolts (2).
84. Remove the front subframe reinforcement plate (3) from the front subframe (1).

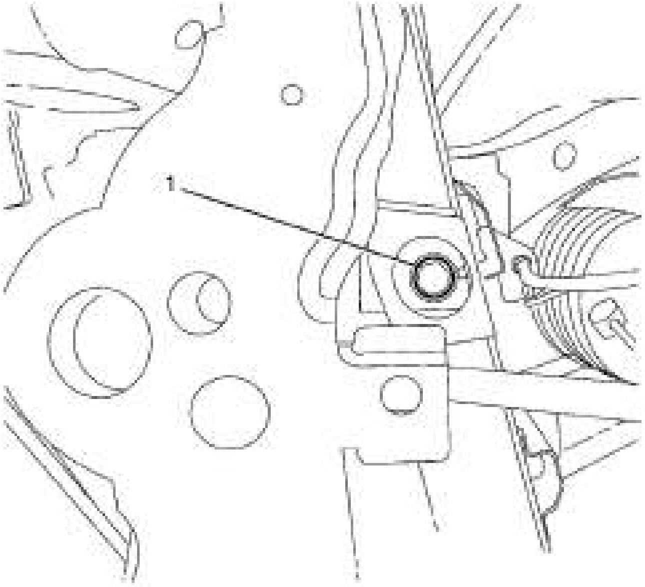


85. Remove the front subframe to body rear retaining bolts (1).



Important: Only right side depicted in graphic, left side similar.

86. Remove the front subframe to body front retaining bolt (1). Repeat for opposite side.

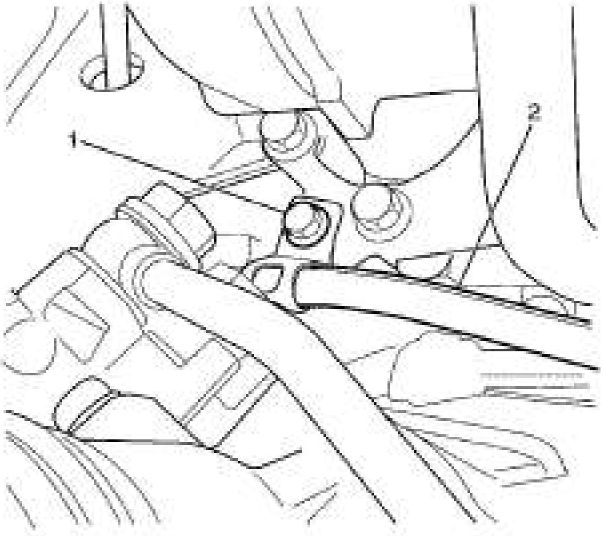


Important: Only right side depicted in graphic, left side similar.

87. Remove the front subframe to body retaining bolt (1). Repeat for opposite side.

    Important: Make sure that all the hoses, wires, pipes and front struts clear the vehicle during the removal process.

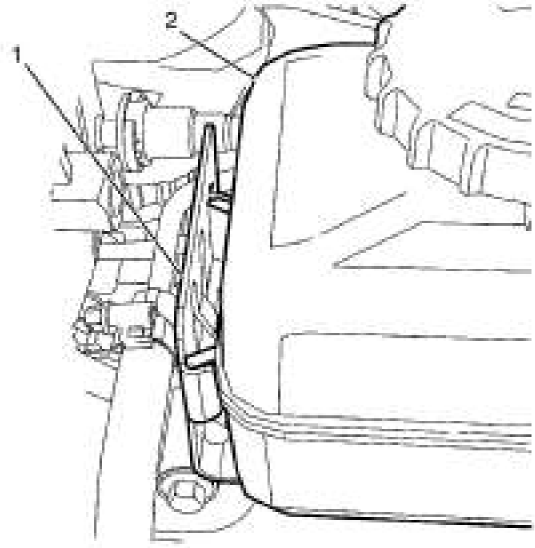
88. With the aid of an assistant, lower the table and/or raise the vehicle to remove the engine, transmission, front suspension and subframe assembly from the vehicle.
89. Remove the engine and transmission wiring harness and related components. Refer to Engine Wiring Harness Assembly Removal.



90. Remove the automatic transmission cooler pipe clamp to A/C bracket bolt (1) and position

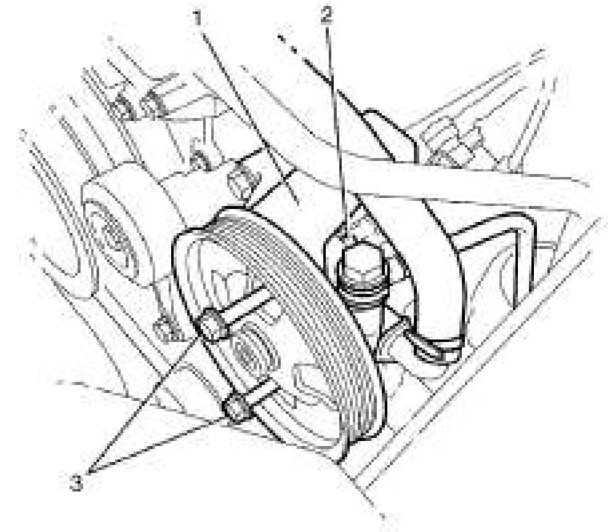
the automatic transmission cooler pipes (2) aside.

91. Connect a suitable lifting crane to the engine lift brackets and raise the suitable lifting crane to support the engine.
92. Position a second powertrain lift table below the transmission.
93. Remove the transmission. Refer to one of the following procedures:
    - Transmission Replacement in Manual Transmission -- Tremec 6-speed.
    - Transmission Replacement in Automatic Transmission -- 4L60-E/4L65-E/4L70-E.
    - Transmission Replacement in Automatic Transmission -- 5L40-E/5L50-E
    - Transmission Replacement in Automatic Transmission -- 6L50/6L80/6L90.
94. Remove the engine flywheel. Refer to Engine Flywheel Removal.
95. Remove the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
96. Remove the A/C drive belt. Refer to Air Conditioning Compressor Belt Replacement.

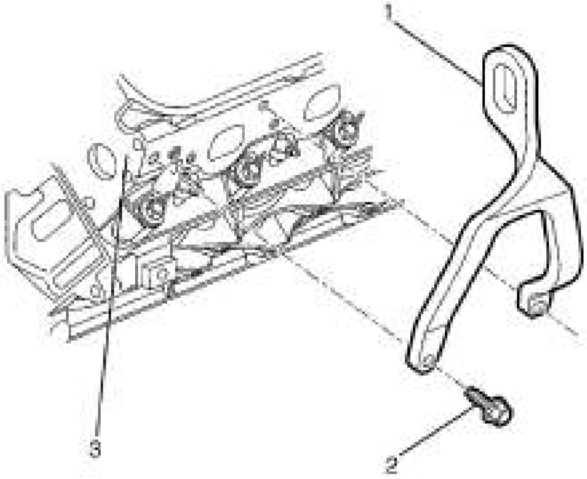


Important: The locking tang on the power steering reservoir bracket (1) must be released before removing the power steering reservoir (2).

97. Remove the power steering reservoir (2) from the power steering pump power steering reservoir bracket (1) and position the power steering reservoir (2) aside.



98. Remove the power steering pump (2) to power steering pump bracket retaining bolts (3) and position the power steering pump (2) away from the power steering pump bracket (1).



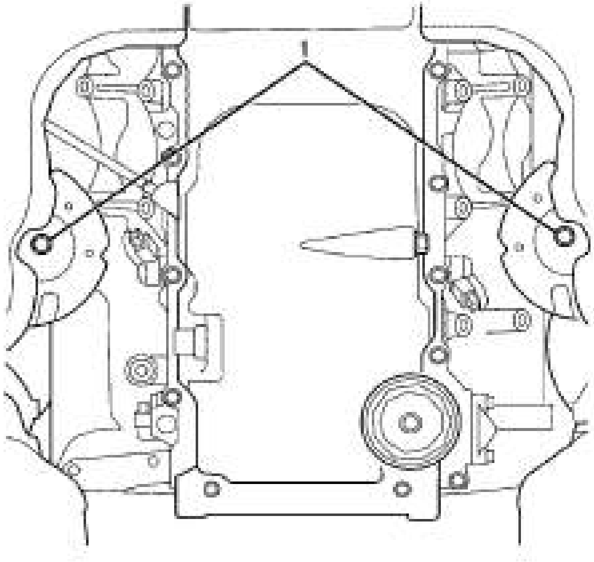
99. Position the J 41798 J 41798 (1) on the cylinder head (3).

Notice: Refer to Fastener Notice in the Preface section.

100. Install the J 41798 J 41798 to cylinder head retaining bolts (2).

Tighten
Tighten the bolts to 50 N·m (36 lb ft).

101. Attach a suitable lifting chain and hooks to the engine lifting brackets (1).



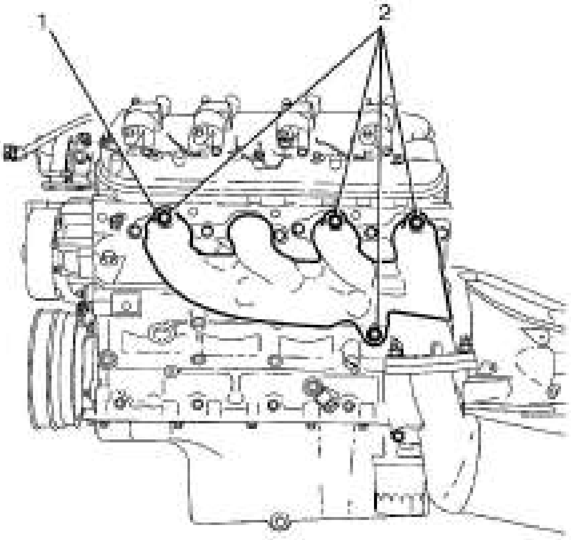
102. Remove the lower engine mount to front subframe retaining nut (1) from both engine mounts.
103. Using a suitable lifting crane, raise the engine to clear the engine mount stud.
104. Remove the engine from the subframe

If required mount the engine on a suitable engine stand.

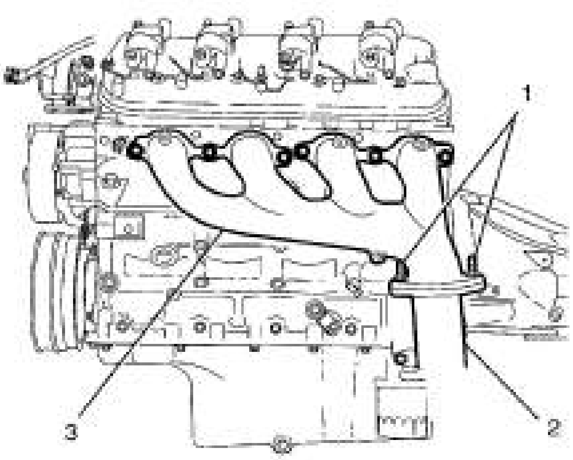
105. Remove the left side spark plug leads. Refer to Spark Plug Wire Replacement.
106. Remove the left side spark plugs from the cylinder head. Refer to Spark Plug Replacement.

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



107. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (2).
108. Remove the left side exhaust manifold heat shield (1).



Important: The left side catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

109. Remove the left side catalytic converter to exhaust manifold retaining nuts (1).

     Discard the nuts.

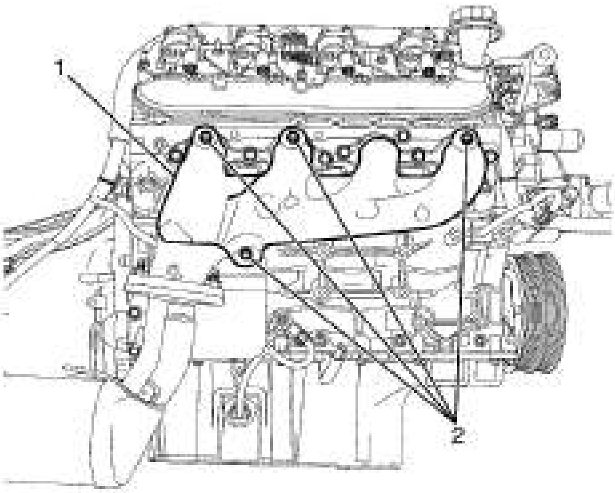
110. Disconnect the left side catalytic converter (2) from the exhaust manifold (3).

     Discard the gasket.

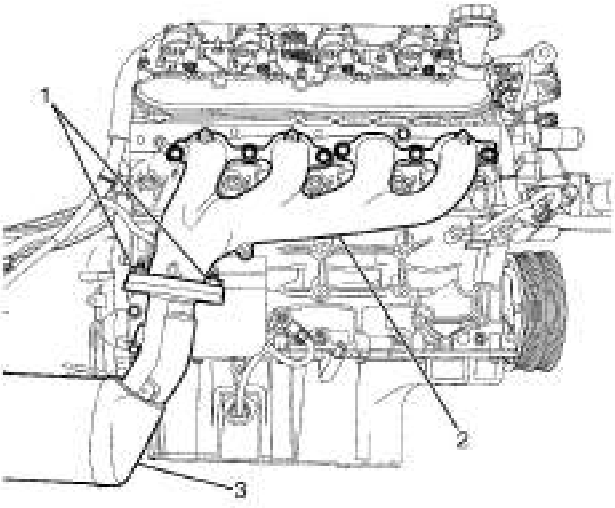
111. Remove the right side spark plug leads. Refer to Spark Plug Wire Replacement.
112. Remove the right side spark plugs from the cylinder head. Refer to Spark Plug Replacement.

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



113. Remove the right side exhaust manifold heat shield to right side exhaust manifold retaining bolts (2).
114. Remove the right side exhaust manifold heat shield (1).



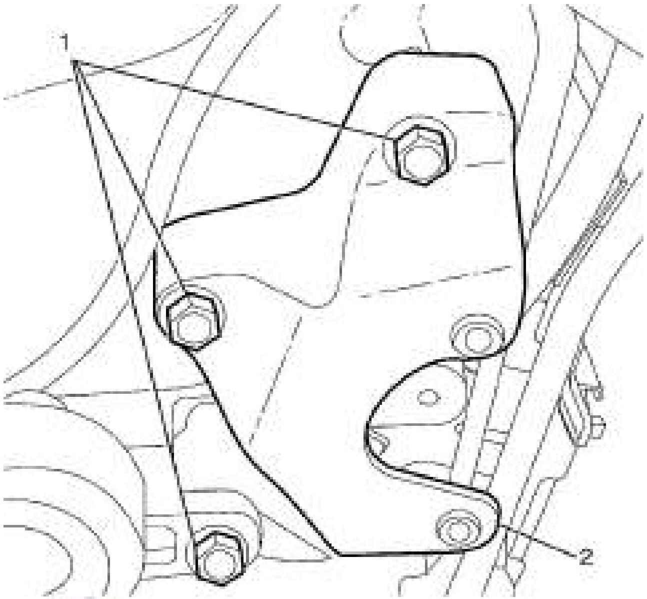
Important: The right side catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

115. Remove the right side catalytic converter to exhaust manifold retaining nuts (1).

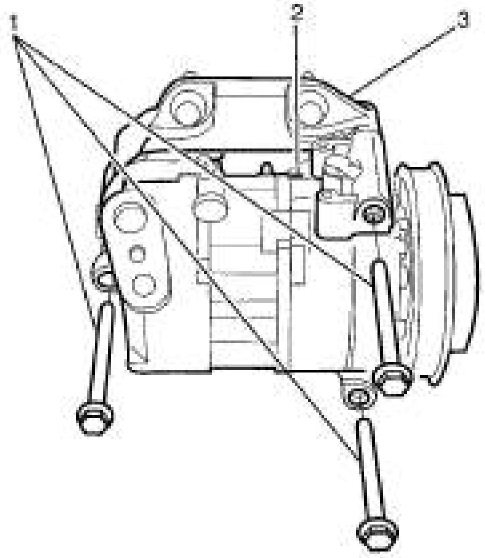
     Discard the nuts.

116. Disconnect the right side catalytic converter (3) from the exhaust manifold (2).

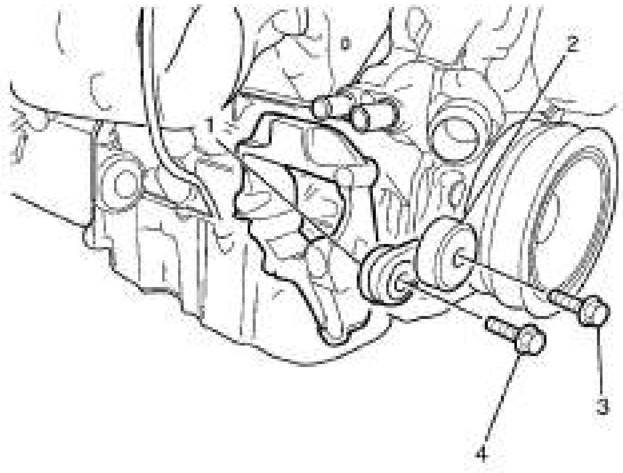
Discard the gasket.



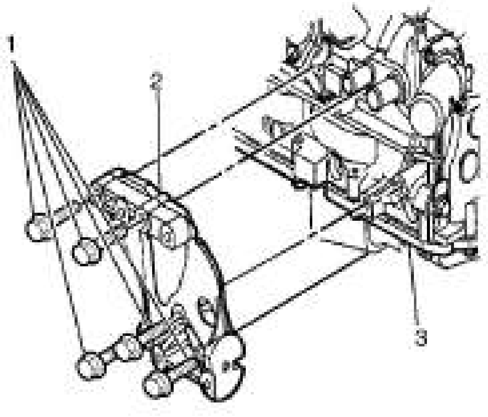
117. Remove the power steering pump bracket to engine retaining bolts (1).
118. Remove the power steering pump bracket (2).



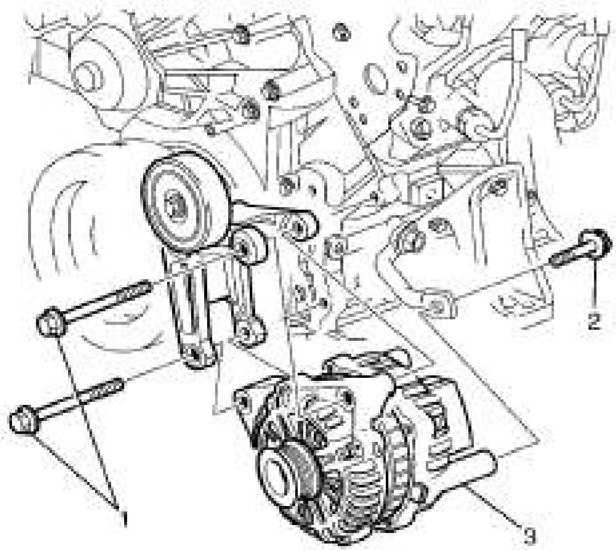
119. Remove the compressor to A/C compressor bracket retaining bolts (1).
120. Remove the compressor (2) to the A/C compressor bracket (3).



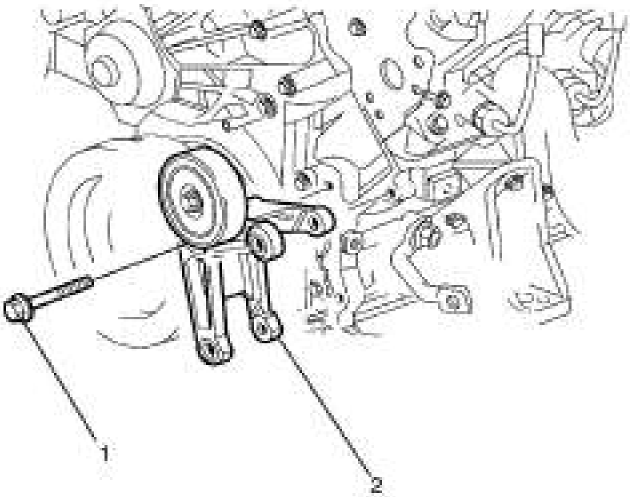
121. Remove the A/C tensioner pulley to A/C tensioner retaining bolt (3).
122. Remove the A/C tensioner pulley (2).
123. Remove the A/C drive belt tensioner to A/C compressor bracket retaining bolt (4).
124. Remove the A/C drive belt tensioner (1).



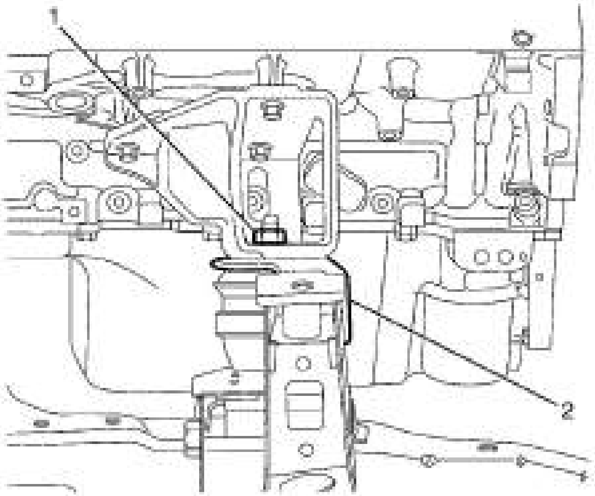
125. Remove the A/C compressor bracket to cylinder head retaining bolts (1).
126. Remove the A/C compressor bracket (2).



127. Remove alternator to alternator bracket retaining bolts (1 and 2).
128. Remove the alternator (3) from the alternator bracket.

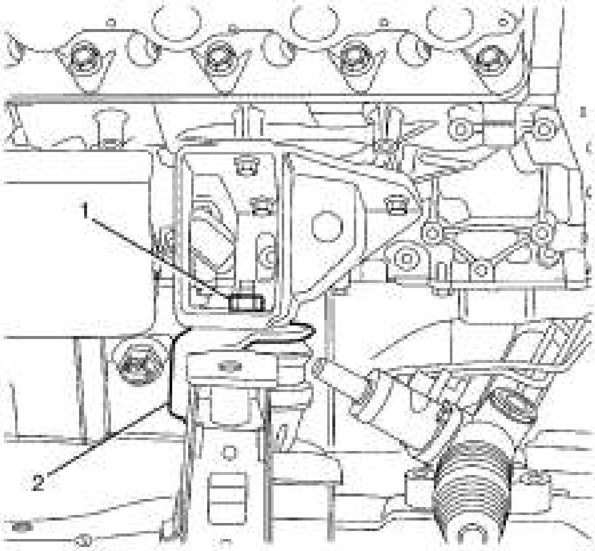


129. Remove the alternator bracket to engine block mounting bolt (1).
130. Remove the alternator bracket (2) from the engine.



Important: DO NOT bend or distort the left side engine mount heat shield (2).

131. Remove the left side engine mount to engine mount bracket retaining nut (1).



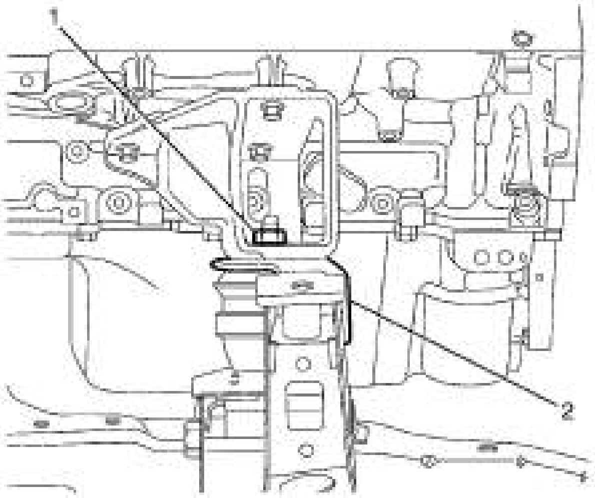
Important: DO NOT bend or distort the right side engine mount heat shield (2).

132. Remove the right side engine mount to engine mount bracket retaining nut (1).
133. Attach a suitable lifting chain and hooks to the 2 J 41798 J 41798, engine lifting brackets.
134. Using a suitable lifting crane, remove the engine from the subframe.

If required, mount engine to a suitable engine stand.

135. Remove the lifting equipment as required.

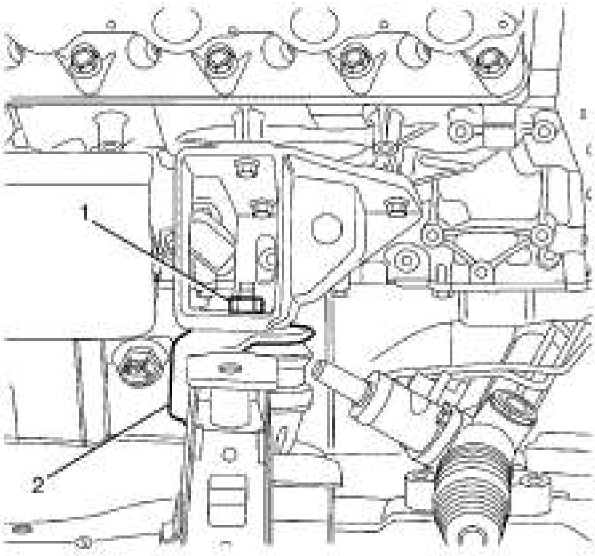
Installation Procedure



Important: DO NOT bend or distort the left side engine mount heat shield (4).

1. Install the left side engine mount to engine mount bracket retaining nut (1)

   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

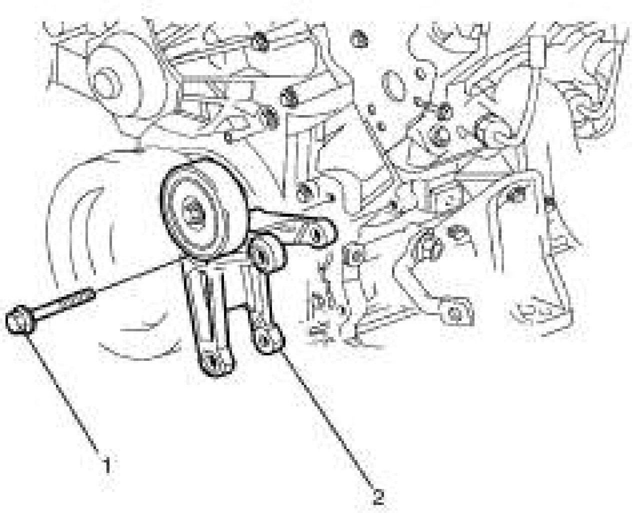


Important: DO NOT bend or distort the right side engine mount heat shield (4).

2. Install the right side engine mount to engine mount bracket retaining nut (1).

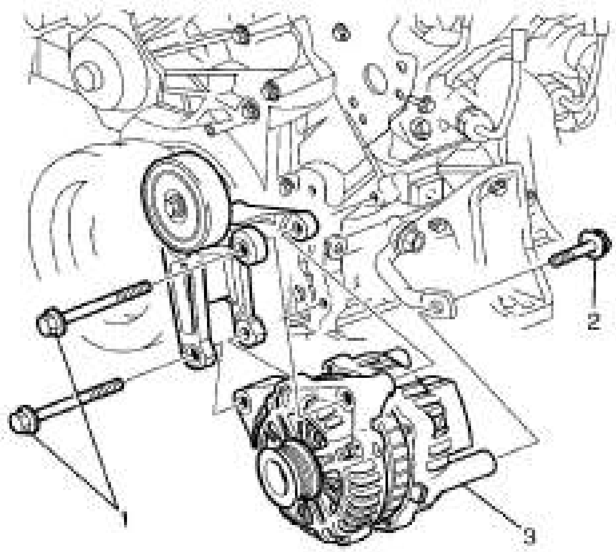
   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

3. Remove the lifting equipment as required and the J 41798 J 41798 from the cylinder heads.



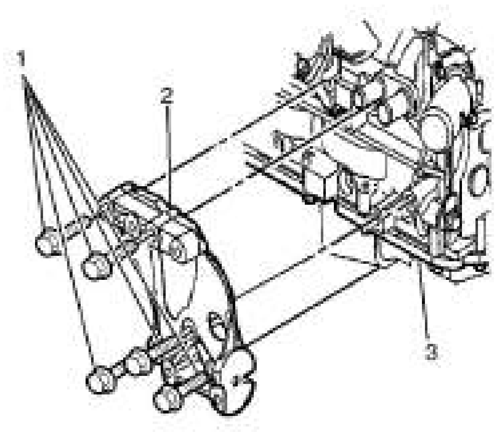
4. Install the alternator bracket (2) to the engine.
5. Install the alternator bracket to engine block mounting bolt (1).

   Tighten
   Tighten the bolt to 50 N·m (37 lb ft).



6. Install the alternator (3) to the alternator bracket.
7. Install alternator to alternator bracket retaining bolts (1 and 2).

   Tighten
   Tighten the bolts to 34 N·m (25 lb in).

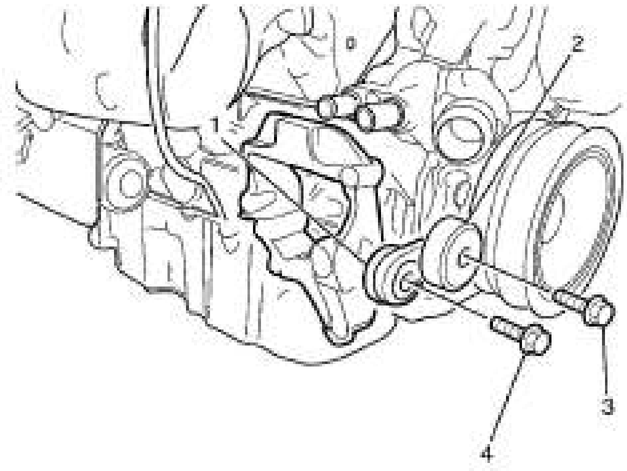


8. Install the A/C compressor bracket (2) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

9. Install the A/C compressor bracket to the cylinder block retaining bolts (1).

Tighten
Tighten the bolts to 58 N·m(43 lb ft).



10. Install the A/C drive belt tensioner (1) to the engine.

    Notice: Refer to Fastener Notice in the Preface section.

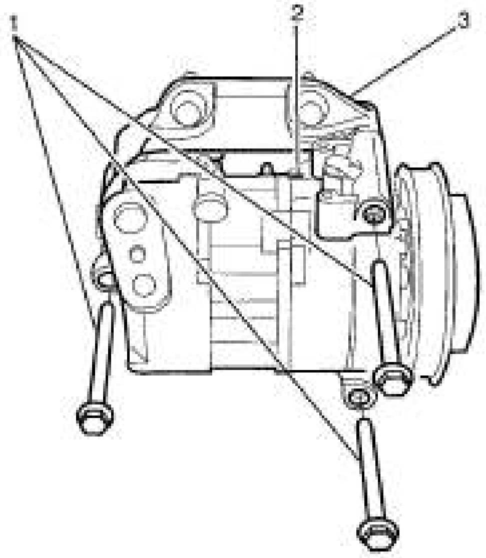
11. Tighten the A/C drive belt tensioner to A/C compressor bracket retaining bolt (4).

    Tighten
    Tighten the bolt to 22 N·m (16 lb ft).

12. Install the A/C tensioner pulley (2) to the A/C tensioner.
13. Install the A/C tensioner pulley to A/C tensioner retaining bolt (3).

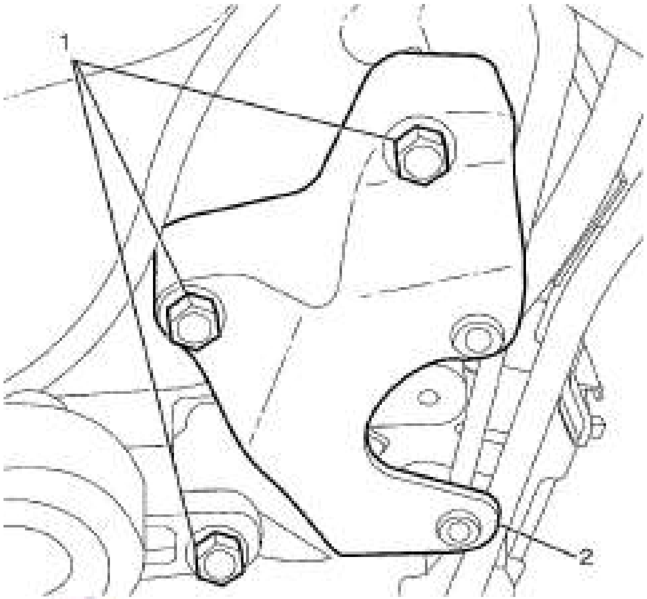
    Tighten
    Tighten the bolt to 50 N·m (37 lb ft).

14. If you are replacing the compressor, balance the compressor oil. Refer to Air Conditioning Compressor Oil Balancing.



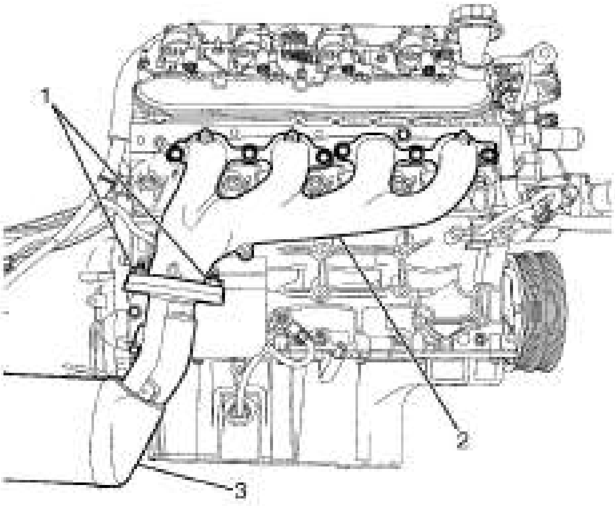
15. Install the compressor (2) to the compressor mounting bracket (3).
16. Install the compressor to compressor mounting bracket retaining bolts (1).

    Tighten
    Tighten the bolts to 22 N·m (16 lb ft).



17. Install the power steering pump bracket (2).
18. Install the power steering pump bracket to engine retaining bolts (1).

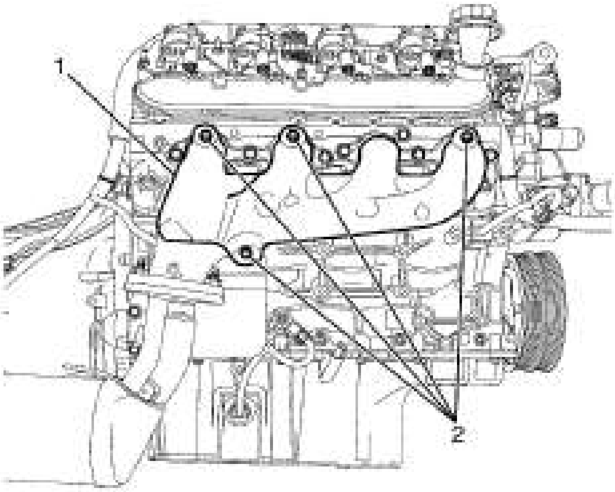
    Tighten
    Tighten the bolts to 58 N·m (43 lb ft).



Important: Make sure that a new sealing ring is fitted prior to installation. If not the exhaust system may perform poorly.

19. Install a NEW sealing ring to the right side catalytic converter.
20. Connect the right side catalytic converter (3) to the right side exhaust manifold (2).
21. Install the right side catalytic converter to right side exhaust manifold retaining nuts (1).

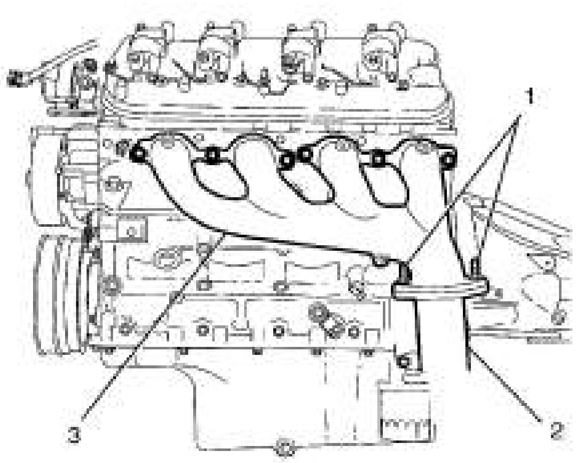
Tighten
Tighten the nuts to 45 N·m (33 lb ft).



22. Install the right side exhaust manifold heat shield (1) to the right side exhaust manifold.
23. Install the right side exhaust manifold heat shield to right side exhaust manifold retaining bolts (2).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

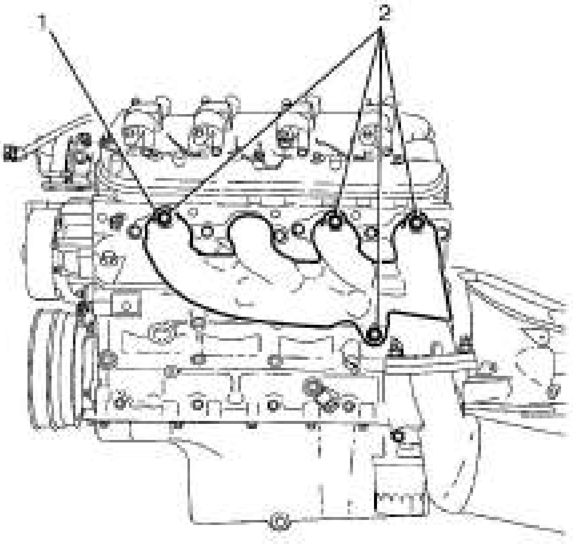
24. Install the right side spark plugs to the cylinder head. Refer to Spark Plug Replacement.
25. Install the right side spark plug leads. Refer to Spark Plug Wire Replacement



Important: Make sure that a new sealing ring is fitted prior to installation. If not the exhaust system may perform poorly.

26. Install a NEW sealing ring to the left side catalytic converter.
27. Connect the left side catalytic converter (2) to the left side exhaust manifold (3).
28. Install the left side catalytic converter to left side exhaust manifold retaining nuts (1).

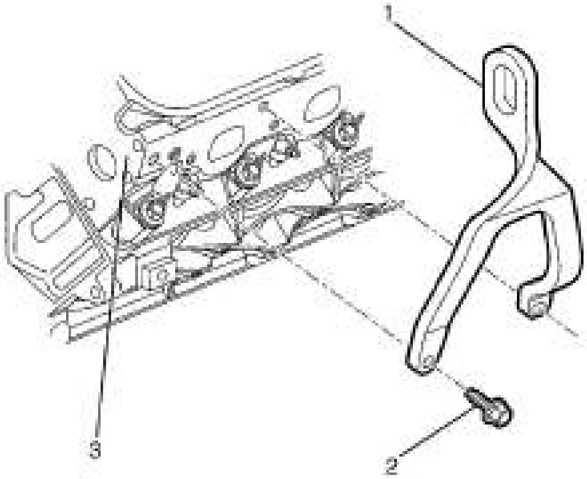
    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



29. Install the left side exhaust manifold heat shield (1) to the left side exhaust manifold.
30. Install the left side exhaust manifold heat shield to left side exhaust manifold retaining bolts (2).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

31. Install the left side spark plugs to the cylinder head. Refer to Spark Plug Replacement.
32. Install the left side spark plug leads. Refer to Spark Plug Wire Replacement



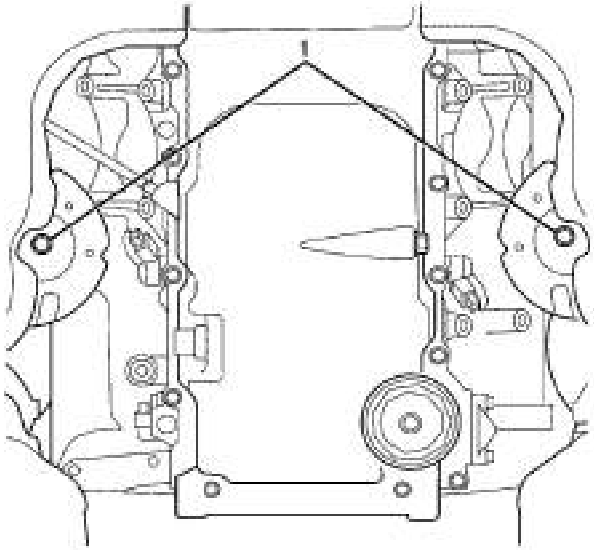
33. Position the J 41798 J 41798 (1) on the cylinder heads (3).

    Notice: Refer to Fastener Notice in the Preface section.

34. Install the J 41798 J 41798 to cylinder head retaining bolts (2).

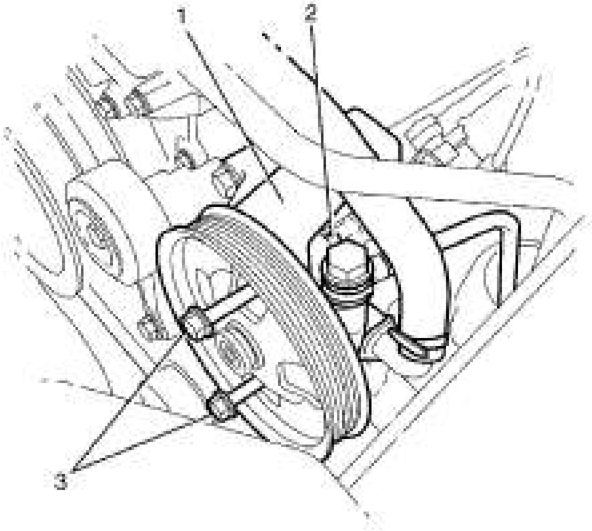
    Tighten
    Tighten the bolts to 50 N·m (36 lb ft).

35. Using a suitable lifting crane and the J 41798 J 41798 raise the engine slightly.
36. Remove the engine from the engine stand.
37. Lower the engine onto the front subframe.
38. Position the engine mounts to the front subframe.



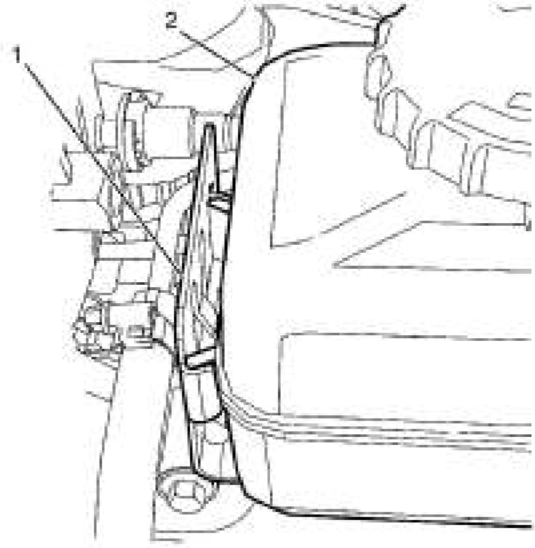
39. Install the lower engine mount to front subframe retaining nuts (1) on both engine mounts.

    Tighten
    Tighten the nuts to 80 N·m (59 lb ft).



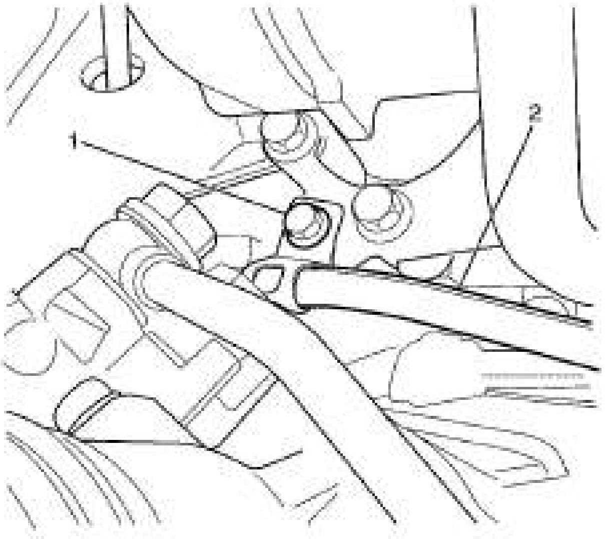
40. Position the power steering pump (2) to the power steering pump bracket (1).
41. Install NEW power steering pump to power steering pump bracket retaining bolts (3).

Tighten
Tighten the bolts to 30 N·m (23 lb ft).



Important: Make sure the power steering reservoir (2) and the power steering reservoir bracket locking tang (1) are engaged to avoid an induced rattle condition.

42. Install the power steering reservoir (2) to the power steering pump power steering reservoir bracket (1).
43. Install the A/C drive belt. Refer to Air Conditioning Compressor Belt Replacement.
44. Install the accessory drive belt. Refer to Drive Belt Replacement - Accessory.
45. Install the engine flywheel. Refer to Engine Flywheel Installation.
46. Connect a suitable lifting crane to the engine lift brackets and raise the suitable lifting crane to support the engine.
47. Install the transmission. Refer to one of the following procedures:
    - Transmission Replacement in Manual Transmission -- Tremec 6-speed.
    - Transmission Replacement in Automatic Transmission -- 4L60-E/4L65-E/4L70-E.
    - Transmission Replacement in Automatic Transmission -- 5L40-E/5L50-E
    - Transmission Replacement in Automatic Transmission -- 6L50/6L80/6L90.



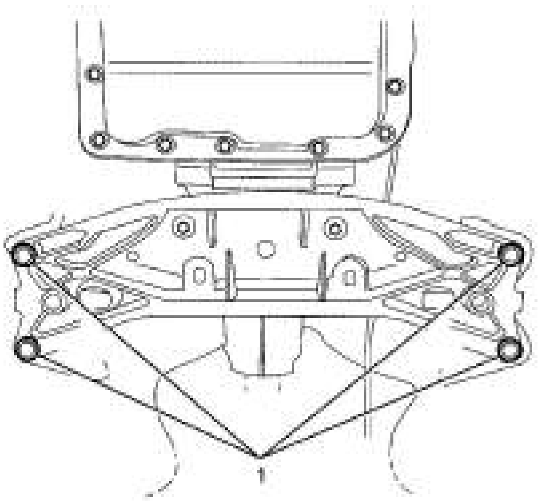
48. Position the automatic transmission cooler pipes (2) to the engine.
49. Install the automatic transmission cooler pipe clamp to A/C bracket bolt (1).

Tighten
Tighten the bolt to 22 N·m (16 lb ft).

50. Install the engine and transmission wiring harness and related components. Refer to Engine Wiring Harness Assembly Removal.

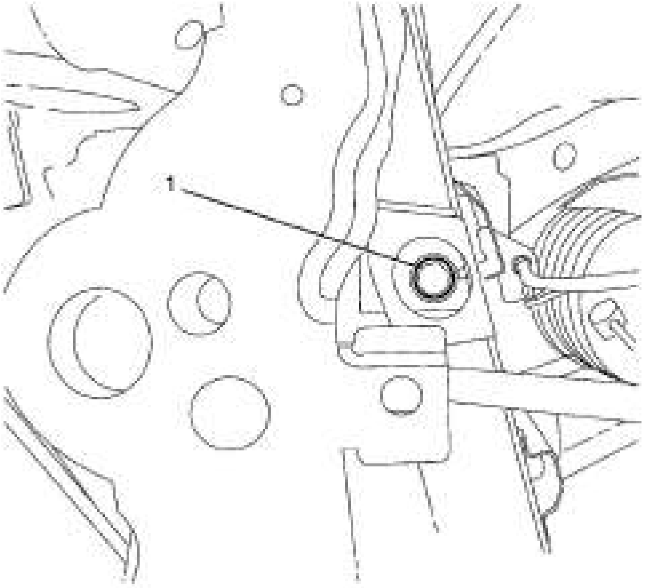
Important: Make sure that all the hoses, wires, pipes and shock modules clear the vehicle during the installation process.

51. With the aid of an assistant, raise the table and/or lower the vehicle to install the engine, transmission, front suspension and subframe assembly to the vehicle.



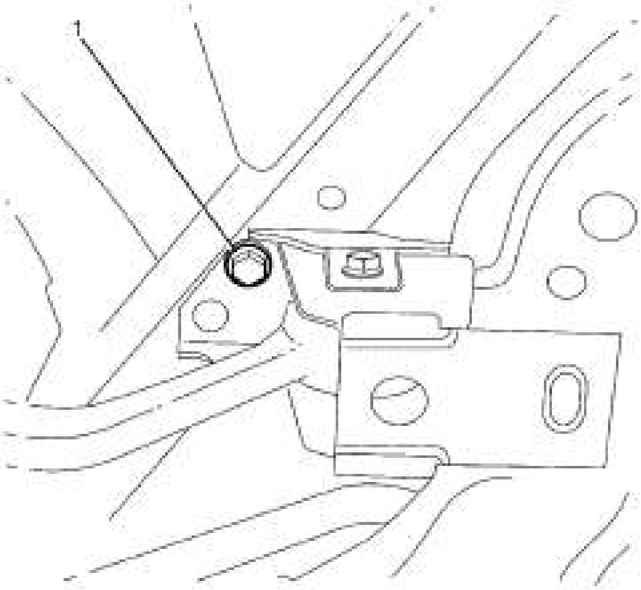
52. Install the transmission support to body retaining bolts (1).

Tighten
Tighten the bolts to 58 N·m (42 lb ft).



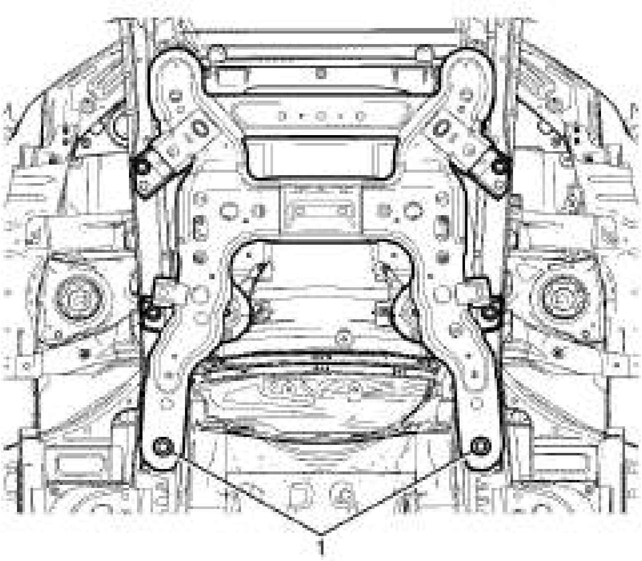
53. Install the front subframe to body centre retaining bolt (1). Repeat for opposite side.

Tighten
Tighten the bolts to 160 N·m (118 lb ft).



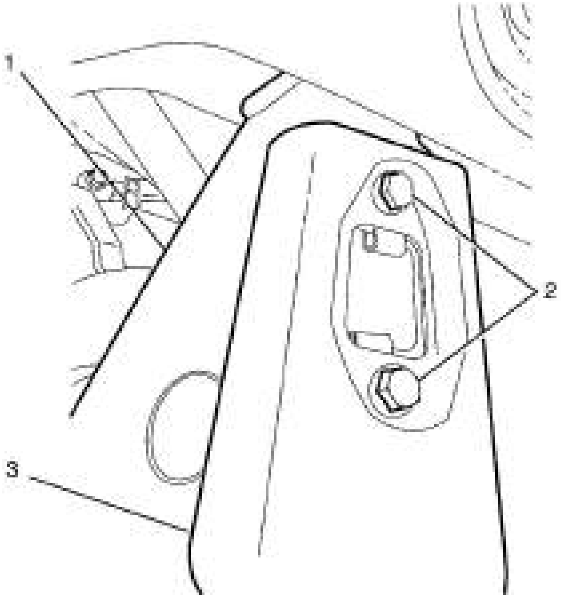
54. Install the front subframe to body front retaining bolt (1). Repeat for opposite side.

    Tighten
    Tighten the bolts to 160 N·m (118 lb ft).



55. Install the subframe to body rear retaining bolts (1).

    Tighten
    Tighten the bolts to 240 N·m (177 lb ft).

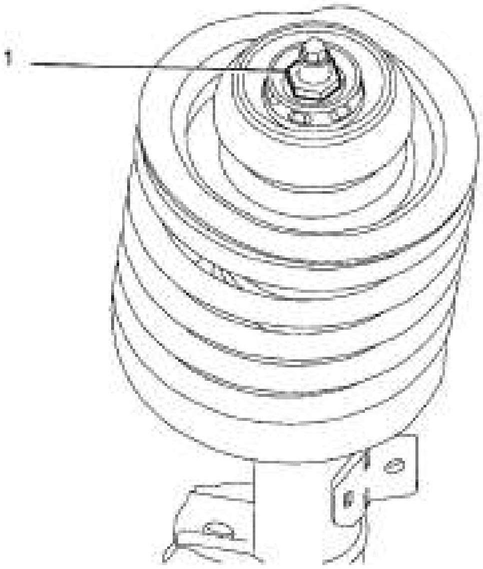


56. Install the front subframe reinforcement plate (3) to the subframe (1).
57. Install the front subframe reinforcement plate to front subframe retaining bolts (2).

Tighten
Tighten the bolts to 17 N·m (11 lb ft).

58. Lower the lift table and/or raise the vehicle to remove the support from the frame, engine and transmission.
59. Remove the powertrain and/or engine lift table from the frame, engine and transmission.
60. Lower the vehicle.

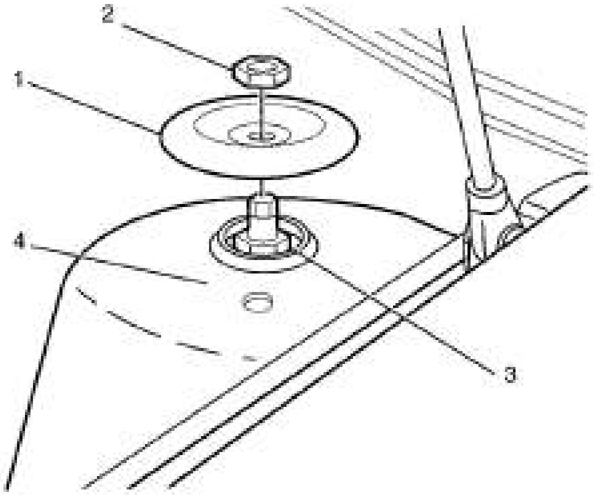
Notice: Refer to Fastener Notice in the Preface section.



Important: The strut assembly retaining nut (1) must be checked for correct torque before installing the strut assembly into the vehicle. The strut assembly retaining nut torque must be 75 N·m (55 lb ft).

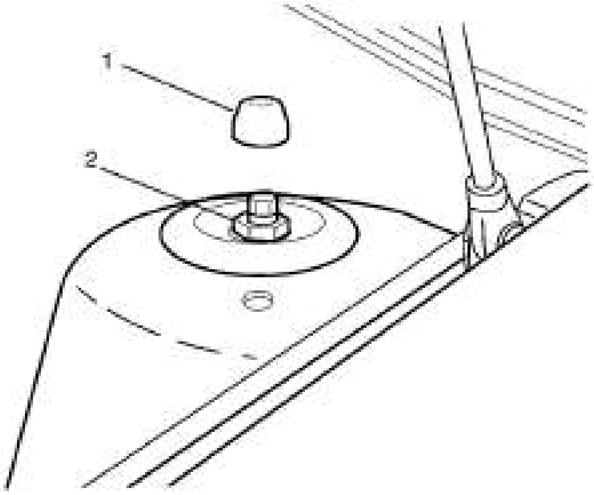
61. Check the torque of the strut assembly retaining nut (1), correct if necessary. Repeat for opposite side.

Tighten
Tighten the nut to 75 N·m (55 lb ft).

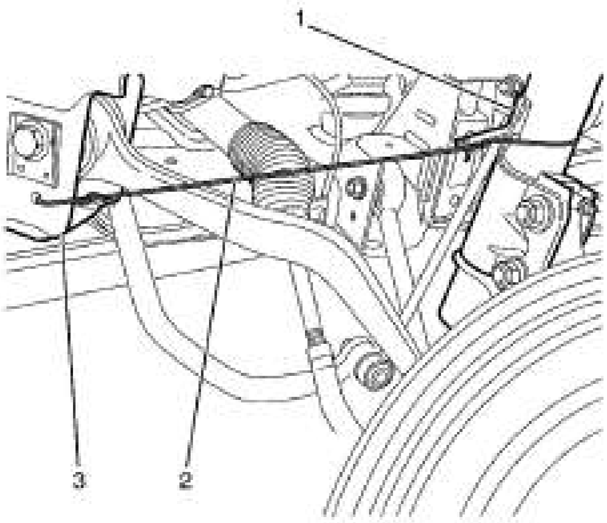


62. Install the front strut assembly (3) to the front wheelhouse (4). Repeat for opposite side.
63. Install front strut assembly to front wheelhouse retaining plate (1). Repeat for opposite side.
64. Tighten the NEW front strut assembly to front wheelhouse retaining nut (2). Repeat for opposite side.

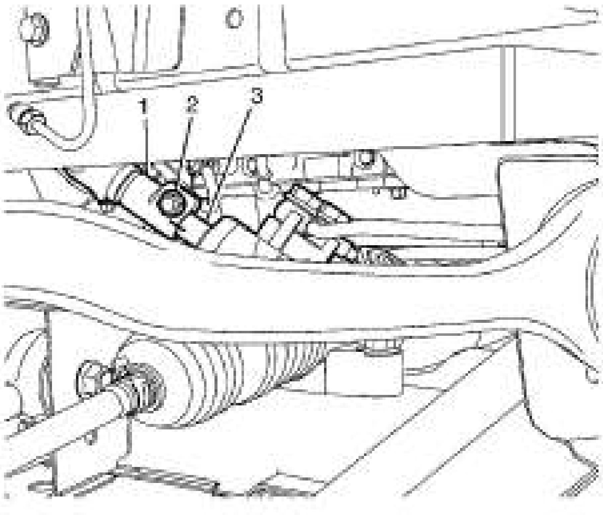
Tighten
Tighten the nut to 55 N·m (40 lb ft).



65. Install the dust cover (1) to the front strut assembly to front wheelhouse retaining nut (2).
66. Raise the vehicle.



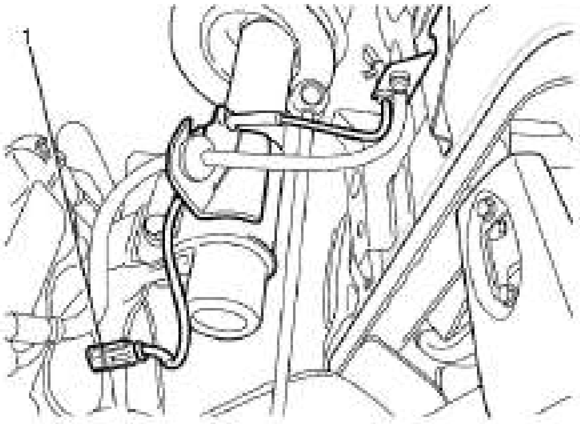
67. Remove the heavy mechanics wire or equivalent (2) retaining the front strut assembly (1) to the front subframe (3).



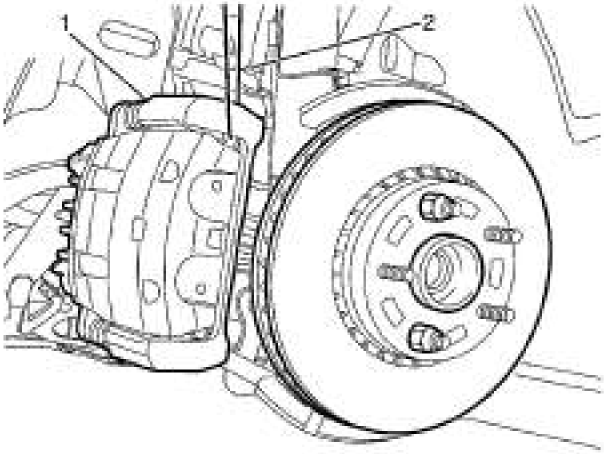
Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

68. Connect the intermediate steering shaft (1) to the pinion shaft (3).
69. Install NEW the intermediate steering shaft to pinion shaft retaining bolt (2).

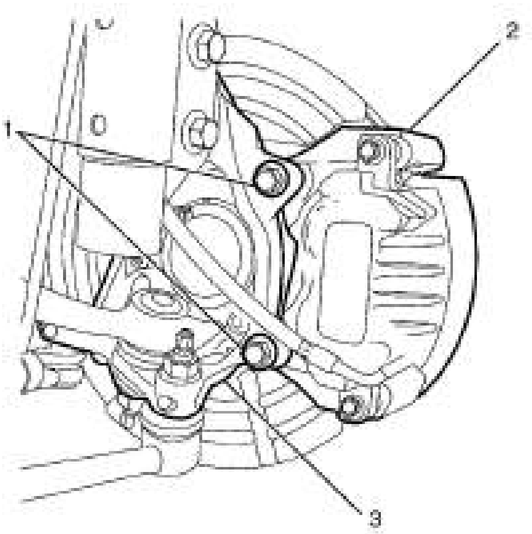
Tighten
Tighten the bolt to 25 N·m (18 lb ft).



70. Connect the front wheel speed sensor jumper harness electrical connector (1) to the front wheel speed sensor. Repeat for opposite side.



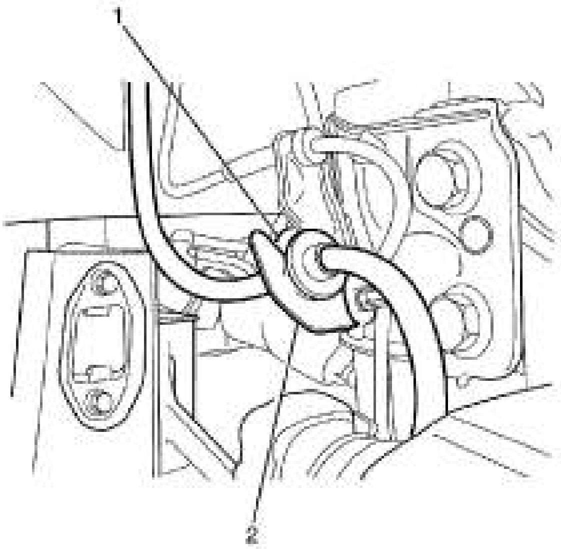
71. Remove the heavy mechanic's wire, or equivalent support (2) from the brake caliper (1). Repeat for opposite side.



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

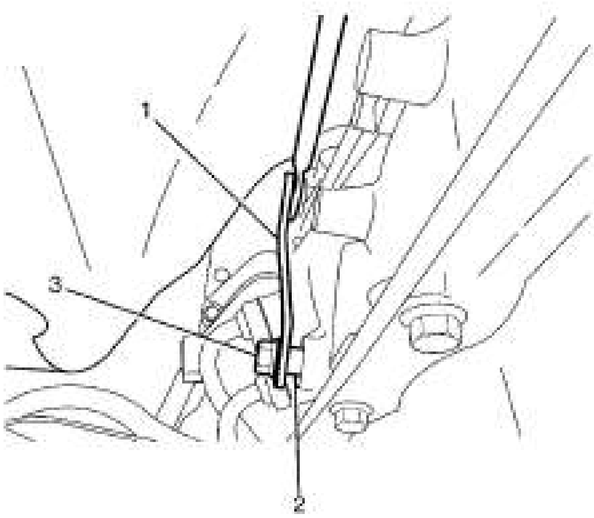
72. Install the front brake caliper assembly (2) to the front steering knuckle (3). Repeat for opposite side.
73. Install the NEW brake caliper anchor plate to knuckle retaining bolts (1).

Tighten
Tighten the bolts to 60 N·m +120° (44 lb in +120°).



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

74. Attach the front brake hose (1) to the strut mounted brake hose retaining bracket (2). Repeat for opposite side.
75. Install the front wheels. Refer to Tire and Wheel Removal and Installation.



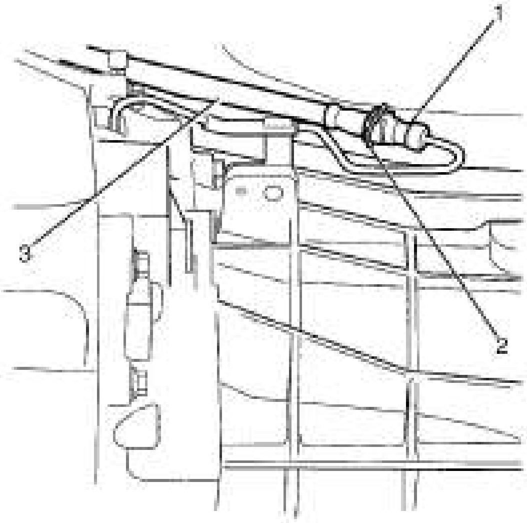
Important: Ignore steps 73 and 74 for vehicles fitted with an manual transmission.

76. Install the shift selector linkage rod (1) to the shift selector shaft (2).
77. Install the shift selector linkage rod to shift selector shaft retaining nut (3).

Tighten
Tighten the nut to 25 N·m (18 lb ft).

Important: Ignore steps 75 through to 77 for vehicles fitted with an automatic transmission.

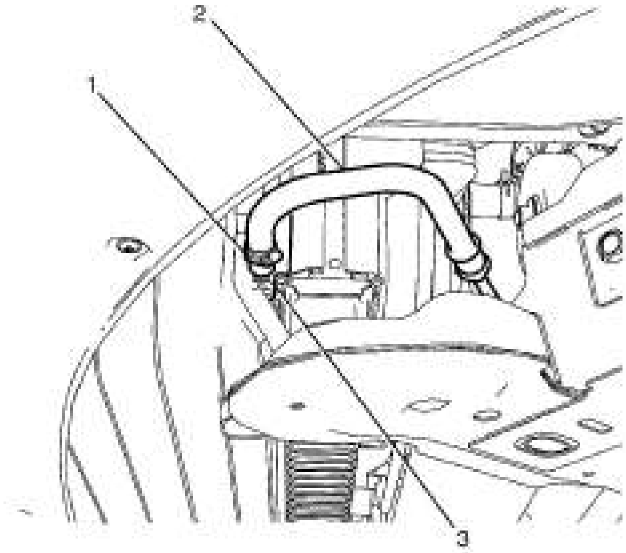
78. Install the shift control assembly. Refer to Shift Control Assembly Replacement.



79. Connect the to concentric actuator cylinder feed hose (3) to the concentric actuator cylinder feed pipe (1).

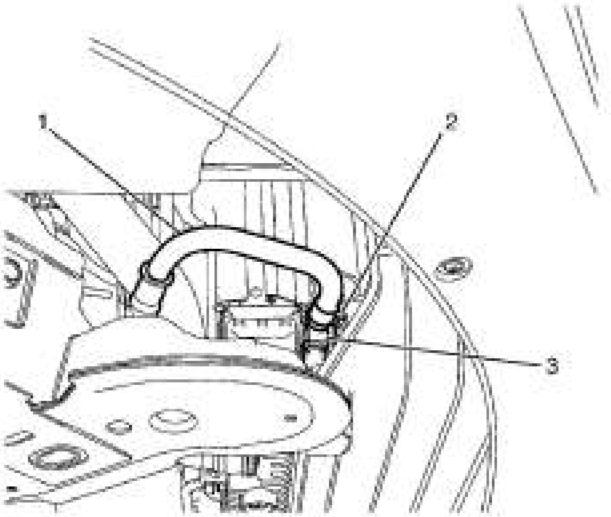
    Important: Listen for an audible click to confirm fitting.

80. Install the flexible hose securing clip (2).
81. Install the starter motor. Refer to Starter Motor Replacement.
82. Install the propeller shaft. Refer to Propeller Shaft Replacement.
83. Install the centre exhaust heat shield. Refer to Exhaust Heat Shield Replacement - Center.
84. Install the Exhaust system. Refer to Exhaust System Replacement.



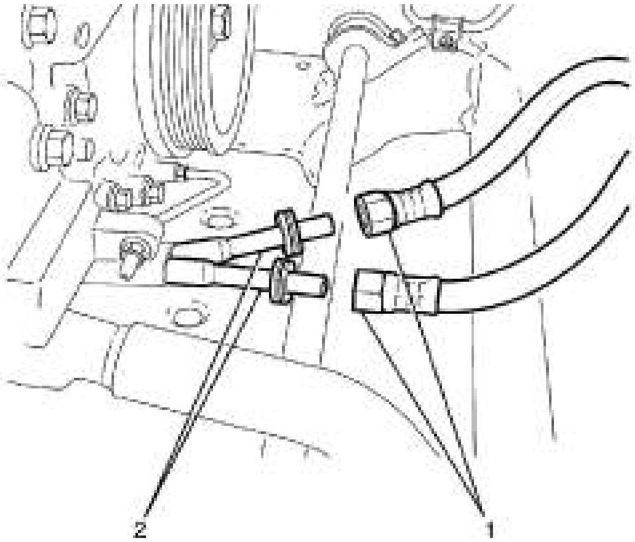
85. Remove the plug from the power steering cooler (3) and power steering reservoir inlet hose (2).
86. Connect the power steering reservoir inlet hose (2) to the power steering cooler (3).

87. Install the power steering reservoir inlet hose spring clamp (1) to its original location



88. Remove the plug from the power steering cooler (3) and power steering reservoir inlet hose (1).
89. Connect the power steering reservoir inlet hose (1) to the power steering cooler (3).
90. Install the power steering reservoir inlet hose spring clamp (2) to its original location
91. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
92. Install the front air deflector. Refer to Front Air Deflector Replacement.
93. Lower the vehicle.

Important: Ignore steps 91 through to 94 for vehicles equipped with a manual transmission.



94. Remove the clean lint free cloth at the automatic transmission cooler pipes (2) and the

flexible hoses (1).

Important: The flexible hoses are not serviced separately. Therefore if the hose's require replacement, then the hose and radiator to hose cooler hose assembly must be fitted.

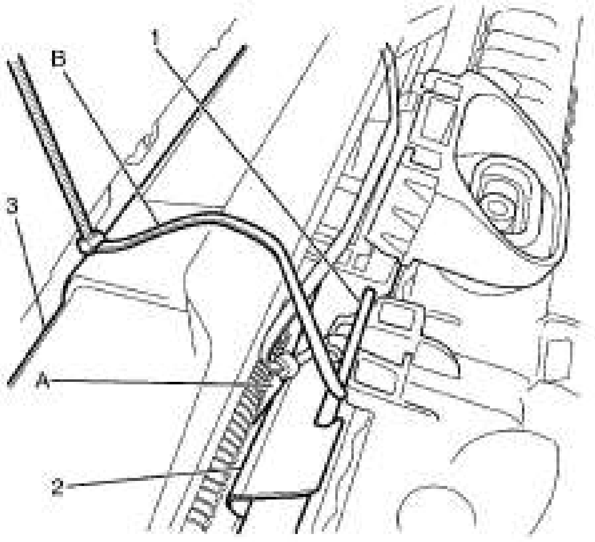
95. Align both flexible hose's with both steel cooler lines.

Important: Listen for an audible click to confirm fitting.

96. Hold the cooler line (2) and connect the flexible hose (1) by pushing together. Repeat procedure for other hose.

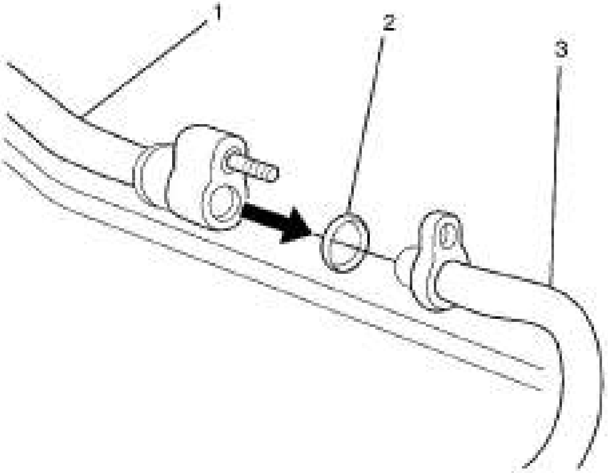
Important: When adding or changing transmission fluid use only recommend automatic transmission fluid.

97. Check and top up transmission fluid level if required. Refer to Transmission Fluid Level Inspection. Refer to Transmission Fluid Level Inspection.



Important: Cut zip tie A and zip tie B and remove from around the front end assembly (3) and the radiator and condenser mount (1).

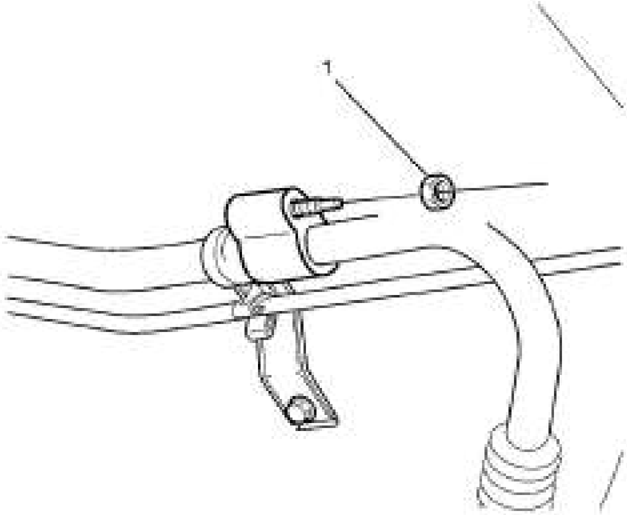
98. Remove the large zip ties or equivalent securing the radiator and condenser assembly (2) to the front end assembly (3).



99. Remove the plug or cap at the A/C suction pipe ends (1 and 3)

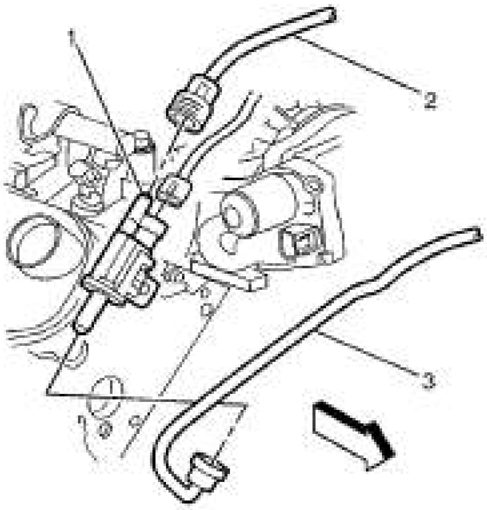
Important: The A/C sealing O-rings must be fitted dry. DO NOT lubricate the A/C sealing O-rings.

100. Fit the NEW A/C suction pipe sealing O-ring (2) to the suction tube.
101. Install the upper A/C suction pipe (1) to the lower A/C suction pipe (3).

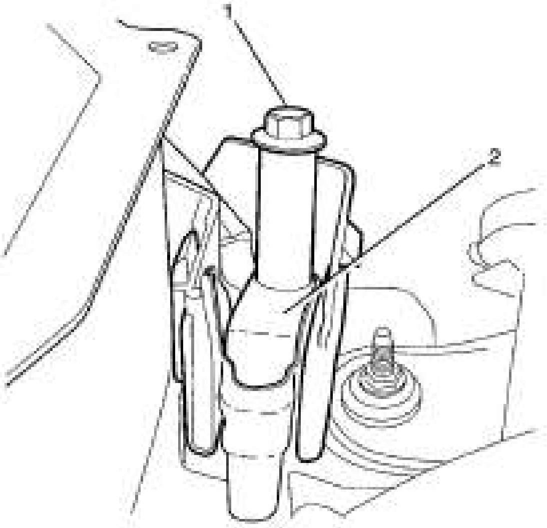


102. Install the A/C suction pipe pad to A/C suction pipe retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



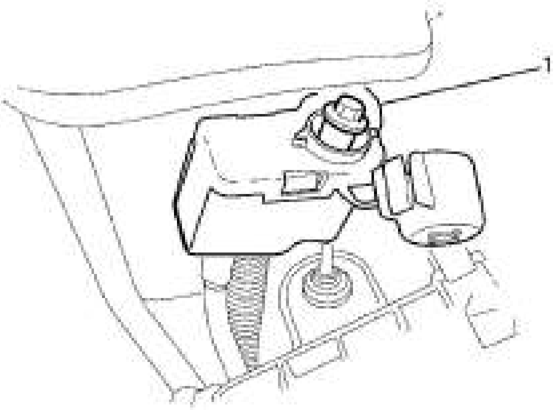
103. Remove the plug from the throttle body to EVAP purge valve tube (3) and EVAP purge valve (1) ends.
104. Connect the throttle body to EVAP purge valve tube (3) to the EVAP purge valve (1).
105. Remove the plug from the EVAP purge valve to fuel tank tube (2) and EVAP purge valve (1) ends.
106. Connect the EVAP purge valve to fuel tank tube (2) to the EVAP purge valve (1).



107. Install the wiring harness (2) to the remote positive battery post.
108. Install the remote positive battery post to wiring harness retaining bolt (1).

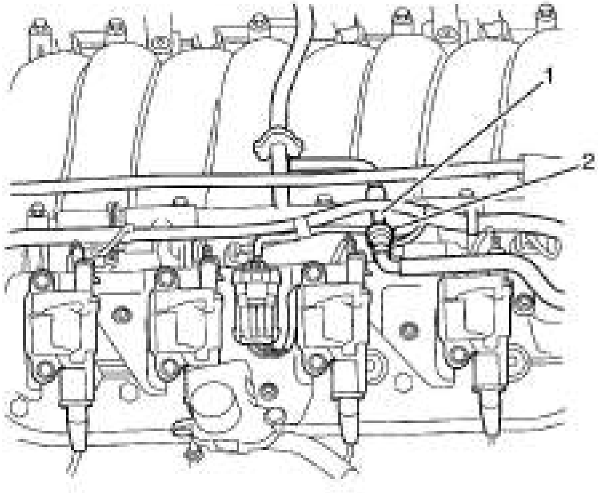
Tighten

Tighten the bolt to 15 N·m (11 lb ft).

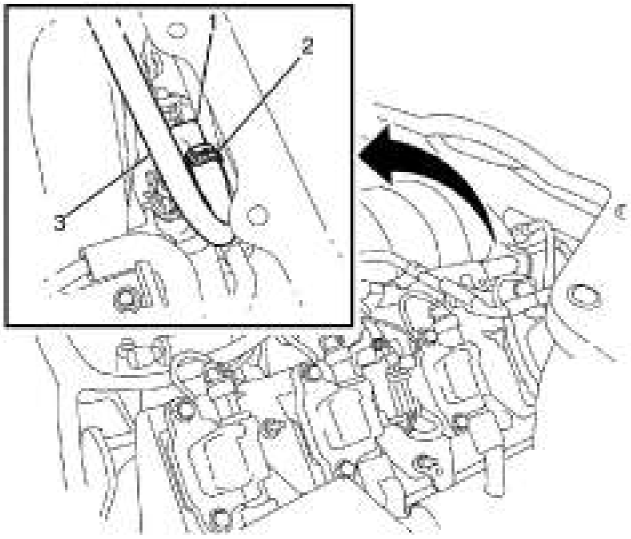


Important: Make sure the clips on the remote positive battery post cover (1) are engaged to avoid an induced rattle condition.

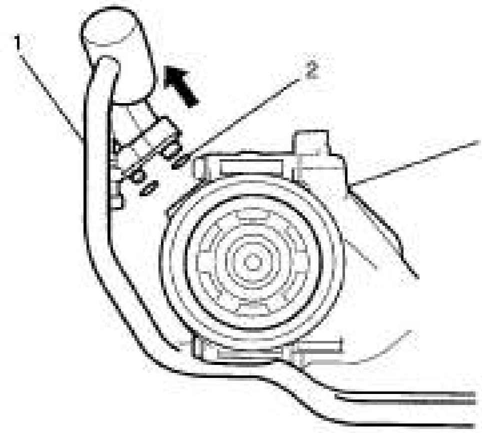
109. Install the remote positive battery post cover (1).



110. Remove the plug from the fuel feed pipe (2) and fuel rail pipe (1) ends.
111. Connect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



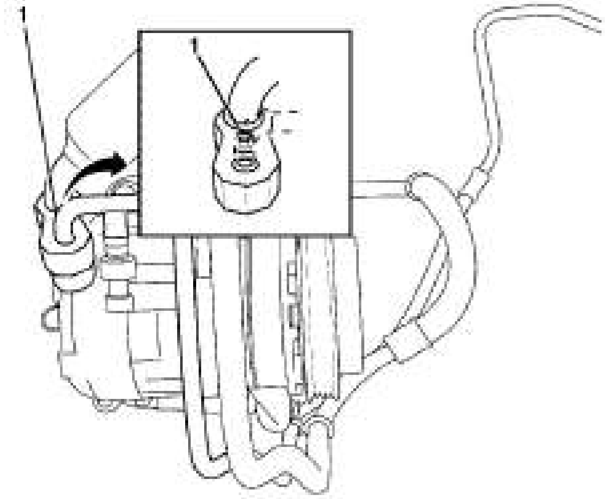
112. Connect the vacuum brake booster hose (3) from the intake manifold vacuum port (1).
113. Compress the vacuum brake booster hose retaining clamp (2) and return to its original position on the vacuum brake booster hose (3).



114. Remove the plug from the compressor (3) ports.
115. Remove the plug from the pipes (1).

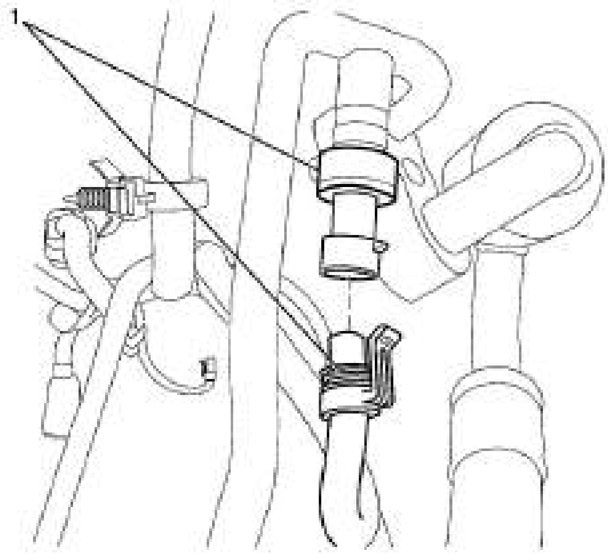
Important: The A/C sealing O-rings must be fitted dry. DO NOT lubricate the A/C sealing O-rings.

116. Fit the NEW A/C suction/discharge pipe O-rings (2) to the suction/discharge pipes (1).
117. Connect the A/C suction/discharge line pad (1) to the A/C compressor (3).

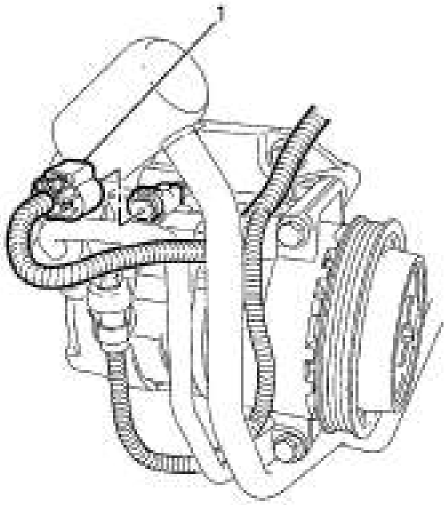


118. Install the suction/discharge line pad (1) to compressor and tighten the retaining bolt (1) to the correct torque specification.

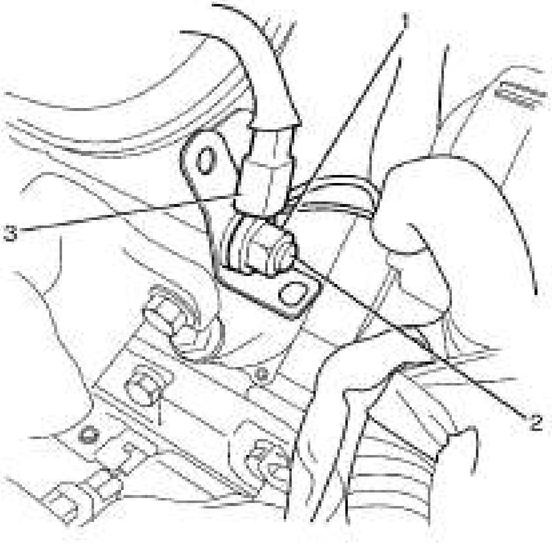
     Tighten
     Tighten the bolt to 22 N·m (16 lb ft).



119. Connect the electrical connector to the A/C Refrigerant Pressure Sensor (1).

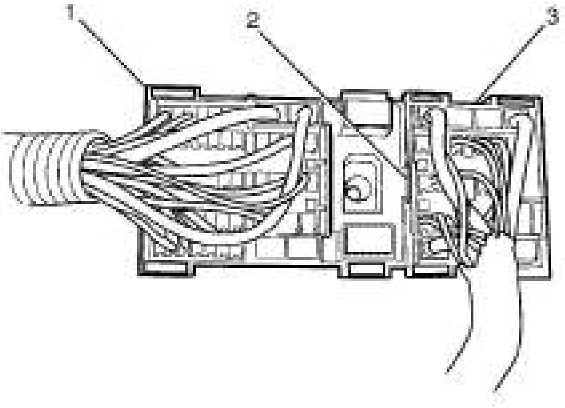


120. Connect the A/C electrical connector (1) to the A/C compressor.



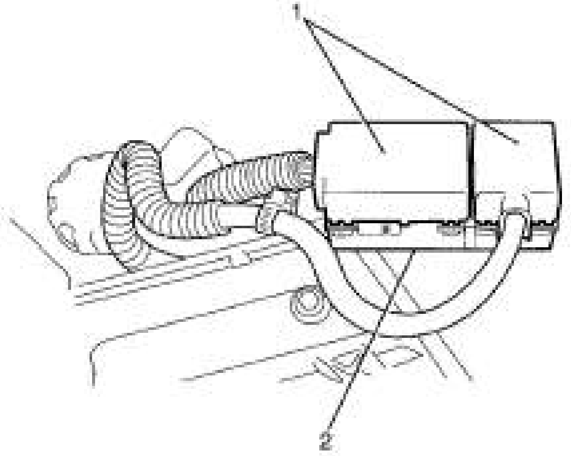
121. Install the vehicle body ground cable (3) to the cylinder head stud (2).
122. Install the vehicle body ground cable to cylinder head retaining nut (1).

Tighten
Tighten the nut to 10 N·m (89 lb ft).

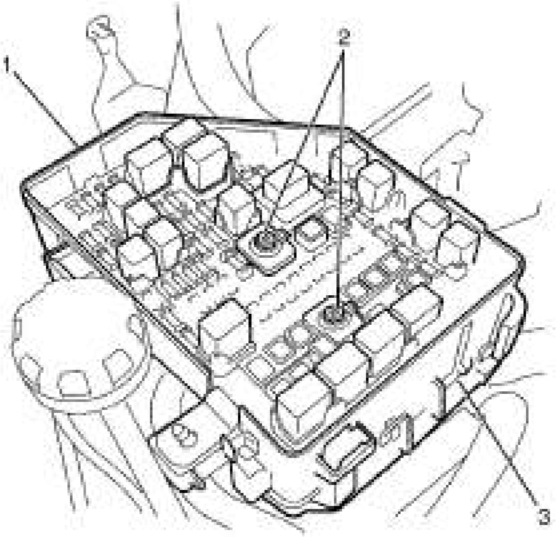


Important: Listen for a audible click from the locking tang (2) to confirm fitting.

123. Slide the engine connector (3) into the body harness connector (1) to join.



124. Attach the protector (1) to the base of the under hood BEC connector (2).

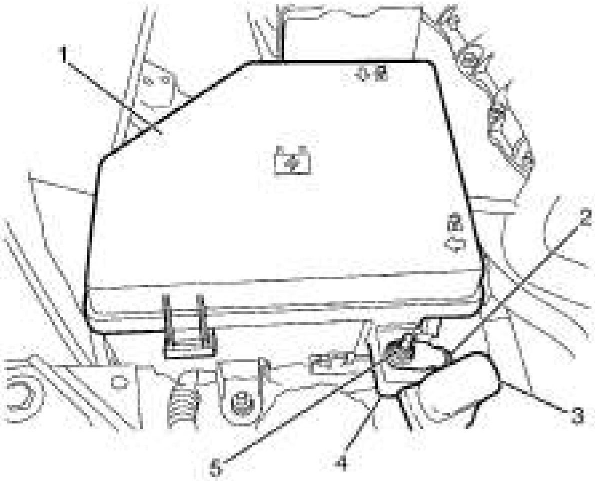


125. Install the upper under hood BEC plate (1) to the lower under hood BEC plate (3).

Important: The under hood BEC upper plate to lower plate retaining bolts (2) DO NOT have a torque specification. Listen for an audible clicking sound whilst tightening the under hood BEC upper plate to lower plate retaining bolts (2) to confirm correct fitting.

126. Install the under hood BEC upper plate to lower plate retaining bolts (2).

Listen for an audible click for correct tension.

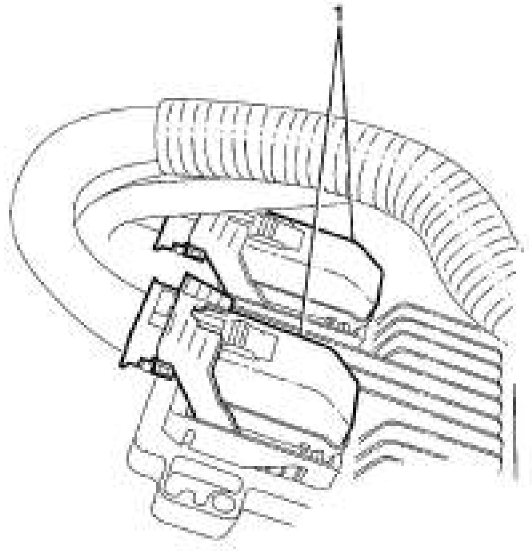


127. Connect the positive cable (2) to the upper under hood BEC plate (4).
128. Install the positive cable to under hood BEC plate retaining bolt (5).

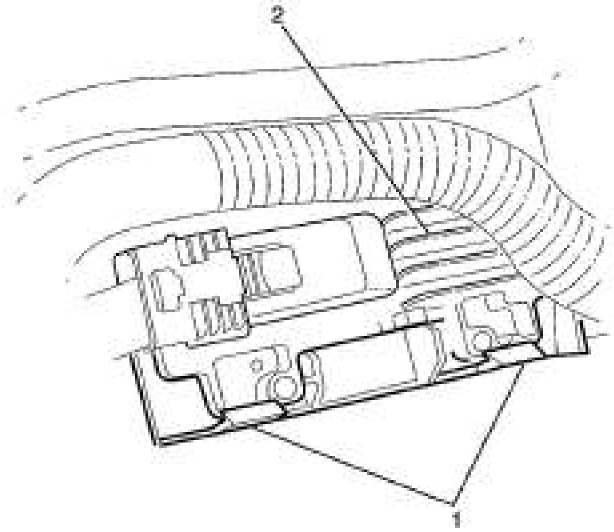
Tighten
Tighten the bolt to 10 N·m (89 lb ft).

129. Install the positive cable protective cover (3).
130. Install the under hood body electrical centre (BEC) cover (1).

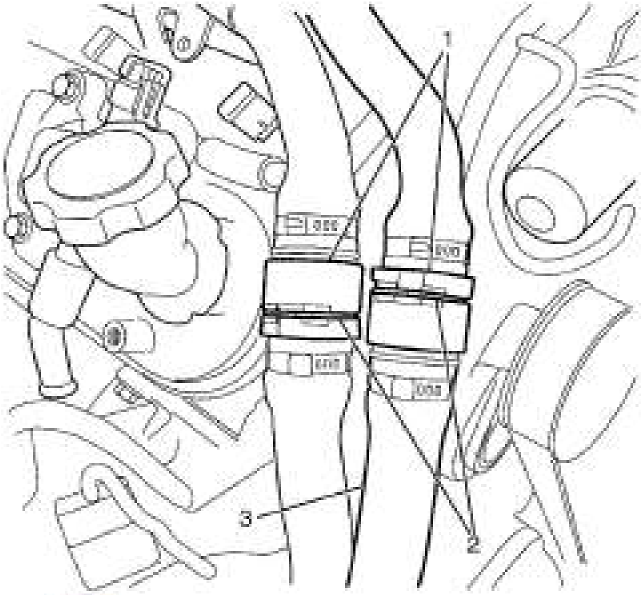
Notice: Do not touch the connector pins or soldered components on the circuit board in order to prevent possible electrostatic discharge (ESD) damage to the PCM.



131. Connect the ECM electrical connectors (1) to the ECM.

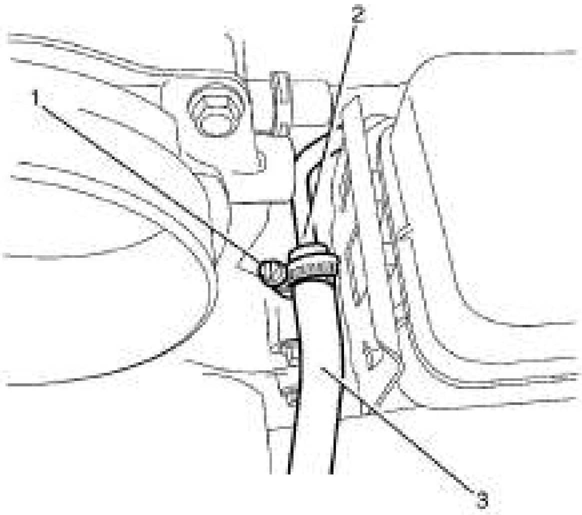


132. Engage the ECM retaining clips (1) to secure the ECM (2).



Important: Listen for a audible click to confirm fitting.

133. Connect the inlet and outlet heater hoses (3) at the heater hose assembly quick connect fittings (1).



134. Connect the coolant air bleed hose (3) to the coolant bleed pipe (2).
135. Reposition the coolant bleed hose retaining clamp (1) to its original position on the coolant bleed hose (3).
136. Tighten the coolant bleed hose retaining clamp (1).
137. Install the radiator outlet hose. Refer to Radiator Outlet Hose Replacement.
138. Fill the cooling system. Refer to Cooling System Draining and Filling.
139. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
140. Recharge the air conditioning (A/C) system. Refer to Refrigerant Recovery and Recharging.

141. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
142. Install the engine cover. Refer to Engine Cover Replacement.
143. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
144. Bleed The clutch. Refer to Hydraulic Clutch Bleeding.
145. Disable the ignition system.
146. Crank the engine several times. Listen for any unusual noises or evidence that parts are binding.
147. Enable the ignition system.
148. Start the engine and listen for unusual noises.
149. Check the vehicle oil pressure gauge and confirm that the engine has acceptable oil pressure.

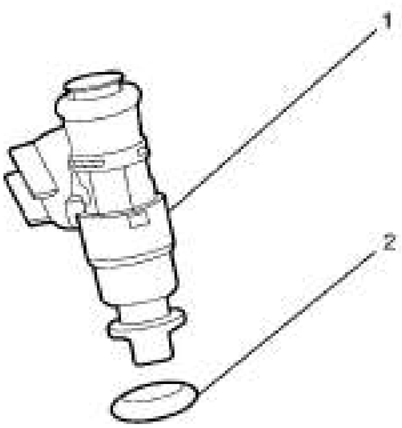
     If necessary, install an oil pressure gauge and measure the engine oil pressure.

150. Run the engine speed at about 1,000 RPM until the engine has reached normal operating temperature.
151. Listen for sticking lifters and other unusual noises.
152. Inspect for fuel, oil, and/or other coolant leaks while the engine is running.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2079343**

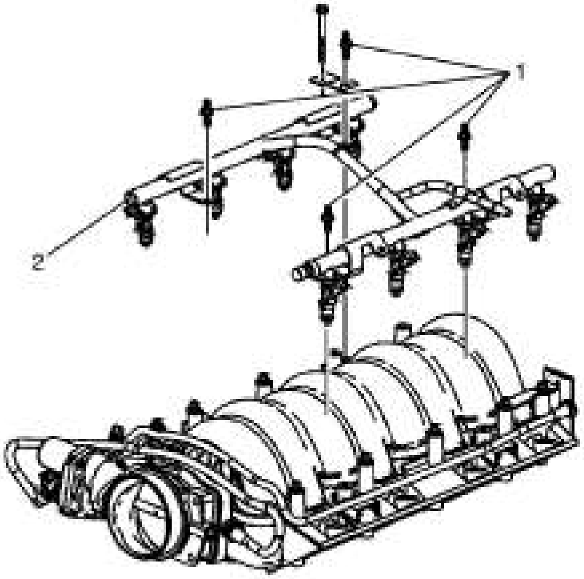
Fuel Rail and Injectors Installation (L98, LS2)

Caution: Refer to Fuel Rail Stop Bracket Installation Caution in the Preface section.



Important: DO NOT use the fuel injector O-ring seals again. Install NEW fuel injector O-ring seals during assembly.

1. Lubricate the NEW fuel injector O-ring seals with clean engine oil.
2. Install the O-ring seals to the fuel injectors.

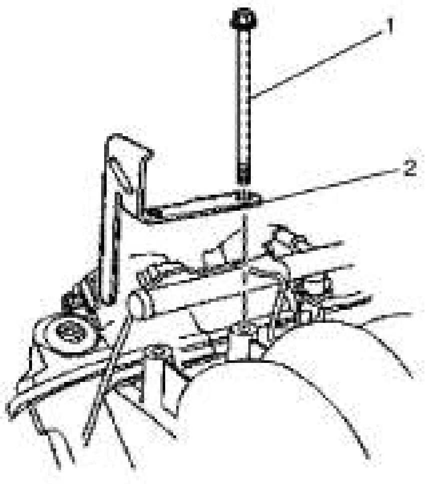


3. Install the fuel rail (3) to the manifold. Push firmly on both sides of the rail until all injectors have entered their bores.
4. Apply a 5 mm (0.2 in) band of threadlock to the threads of the fuel rail bolts (2). Refer to Adhesives, Fluids, Lubricants, and Sealers.

Notice: Refer to Fastener Notice in the Preface section.

5. Install the fuel rail bolts (2) and fuel rail ground strap (1).

Tighten
Tighten the bolts to 10 N·m (89 lb in).



Important: The fuel rail stop bracket (2) must be installed. The fuel rail stop bracket (2) serves as a protective shield in the event of a vehicle frontal collision.

6. Install the fuel rail stop bracket (2).
7. Install the fuel rail stop bracket to intake manifold retaining bolt (1).

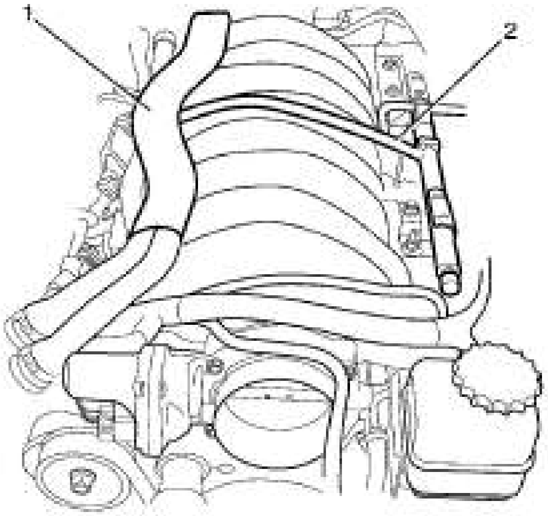
Tighten
Tighten the bolts to 10 N·m (89 lb in).

Intake Manifold Replacement

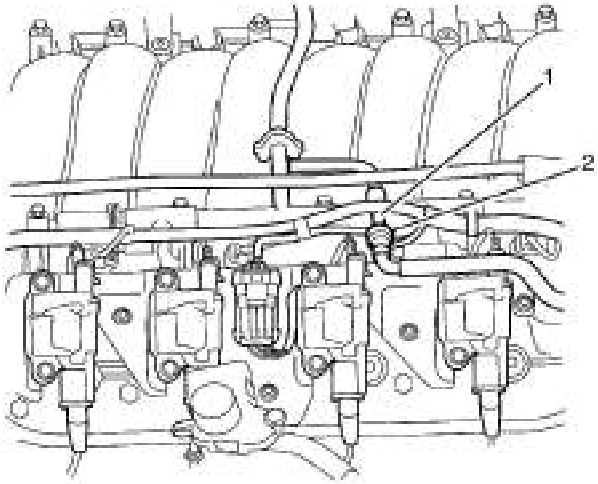
Removal Procedure

Important: The intake manifold, throttle body, fuel injection rail, and injectors may be removed as an assembly. If not servicing the individual components, remove the manifold as a complete assembly.

1. Remove the engine cover. Refer to Engine Cover Replacement.
2. Depressurize the fuel system. Refer to Fuel Pressure Relief.
3. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
4. Drain the cooling system. Refer to Cooling System Draining and Filling.
5. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

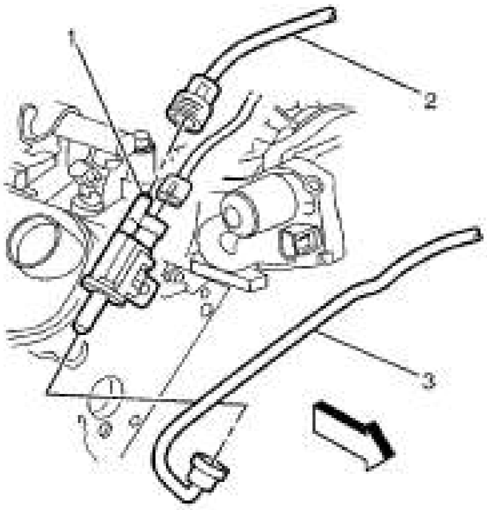


6. Reposition and secure the heater hoses (1) away from the intake manifold (2).



Important: Plug or cap the fuel feed pipe (2) and fuel rail tube (1) ends to prevent fuel leaks and/or contamination.

7. Disconnect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.

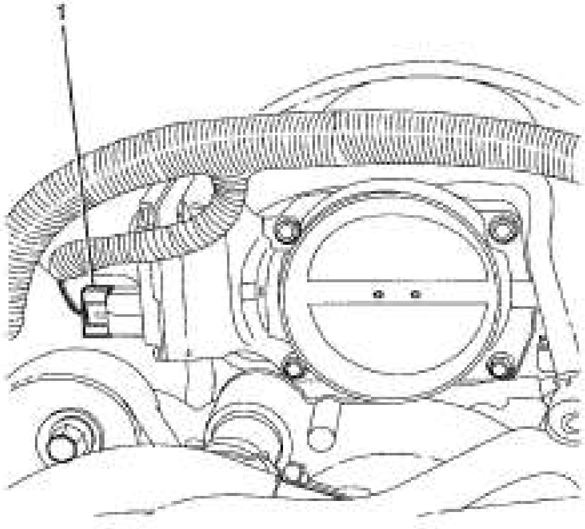


Important: Plug or cap the throttle body to EVAP purge valve hose (3) and EVAP purge valve (1) ends to prevent fuel leaks and/or contamination.

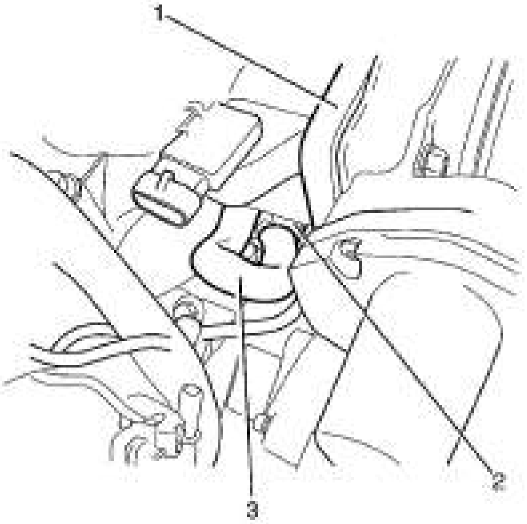
8. Disconnect the throttle body to EVAP purge valve hose (3) from the EVAP purge valve (1).

Important: Plug or cap the EVAP purge valve to fuel tank hose (2) and EVAP purge valve (1) ends to prevent fuel leaks and/or contamination.

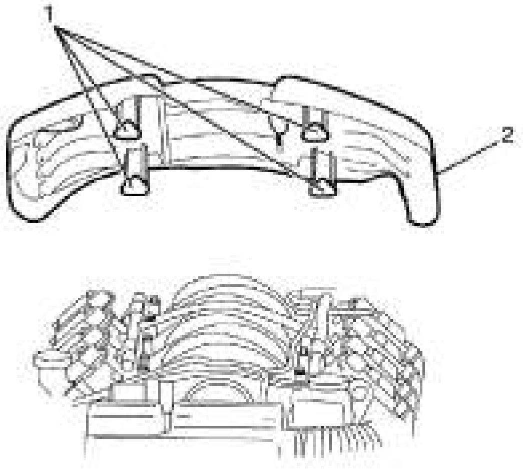
9. Disconnect the EVAP purge valve to fuel tank hose (2) from the EVAP purge valve (1).



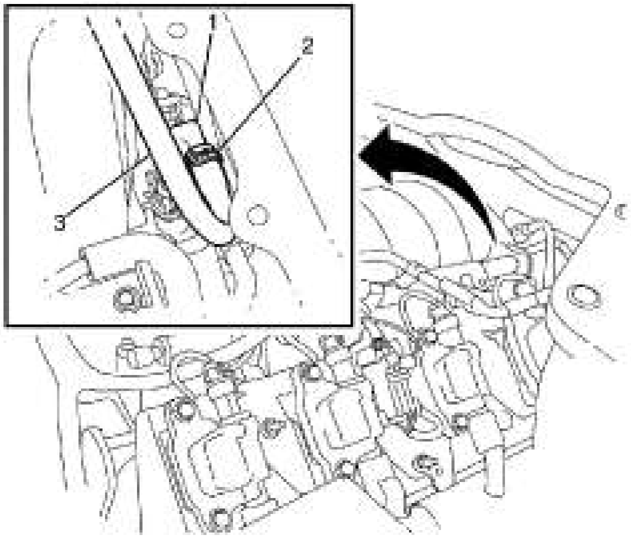
10. Disconnect the electronic throttle body wiring harness connector (1).



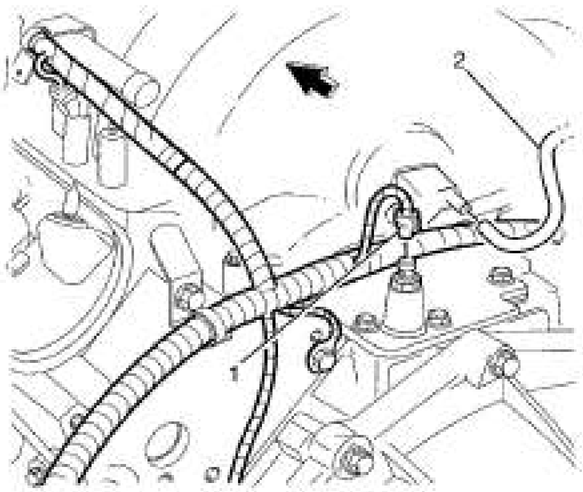
11. Disconnect the (PCV) Positive Crankcase Ventilation hose (3) from the intake manifold (1) and the valley cover (2).



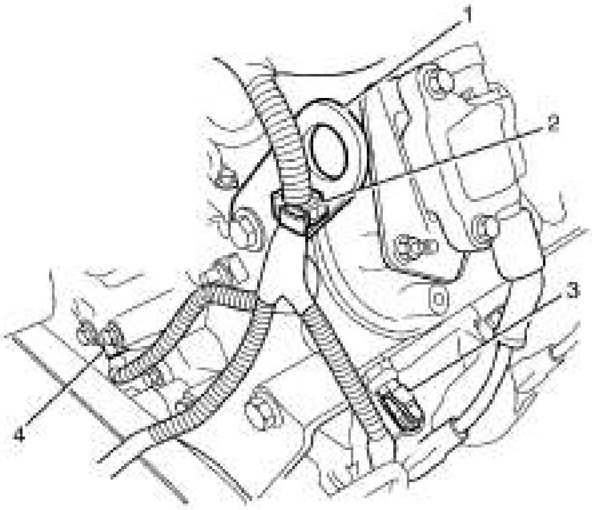
12. Disconnect the alternator wiring harness connector (1) from the alternator.



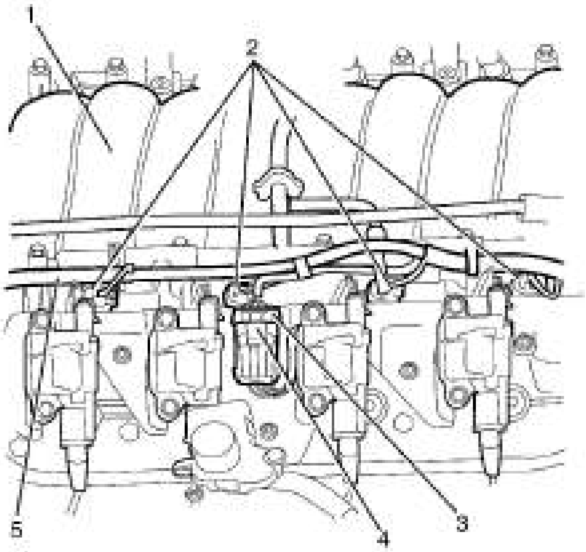
13. Compress the vacuum brake booster hose retaining clamp (2) at the intake manifold vacuum port (1) and slide 50 mm (2 in) back along the vacuum brake booster hose (3).
14. Disconnect the vacuum brake booster hose (3) from the intake manifold vacuum port (1).



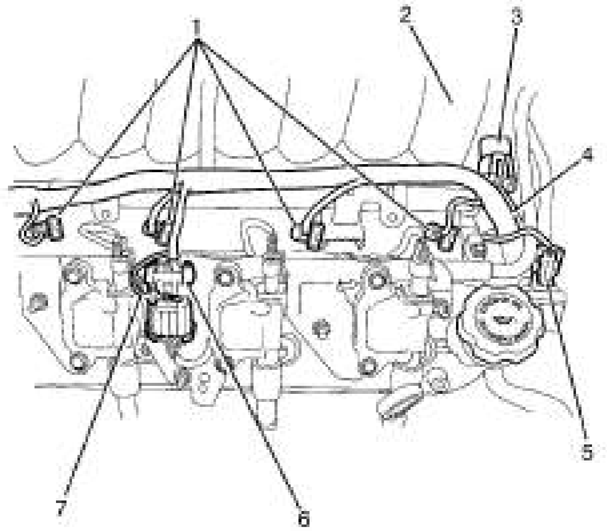
15. Disconnect the oil pressure sensor wiring harness connector (1) from the oil pressure sensor.
16. Disconnect the HVAC vacuum hose (2) from the intake manifold.



17. Disconnect the camshaft position sensor connector (4) from the camshaft position sensor.
18. Disconnect the coolant temperature sensor connector (3) from the coolant temperature sensor.
19. Detach the wiring harness retaining clip (2) from the engine lifting bracket (1).



20. Disconnect the left side fuel injector wiring harness connectors (2) from the fuel injectors.
21. Remove the Connector Position Assurance (CPA) lock (4) from the left side ignition coil main connector (3).
22. Disconnect the left side ignition coil main connector (3) from the ignition coil wiring harness.
23. Reposition and secure the left side fuel injector wiring harness (5) away from the intake manifold (1).



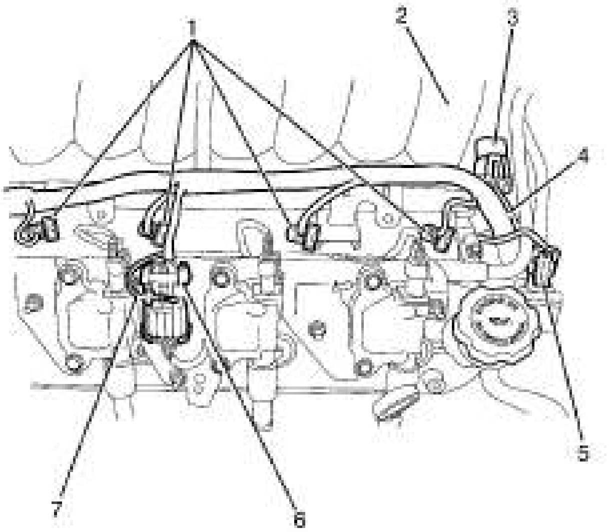
24. Disconnect the right side fuel injector wiring harness connectors (1) from the fuel injectors.
25. Remove the CPA lock (7) from the right side ignition coil main connector (6).
26. Disconnect the right side ignition coil main connector (6) from the ignition coil wiring harness.
27. Disconnect the canister purge valve (5) wiring harness connector.
28. Disconnect the manifold absolute pressure (MAP) sensor wiring harness connector (3) from the MAP sensor.
29. Reposition and secure the right side fuel injector wiring harness (4) away from the intake

manifold (2).

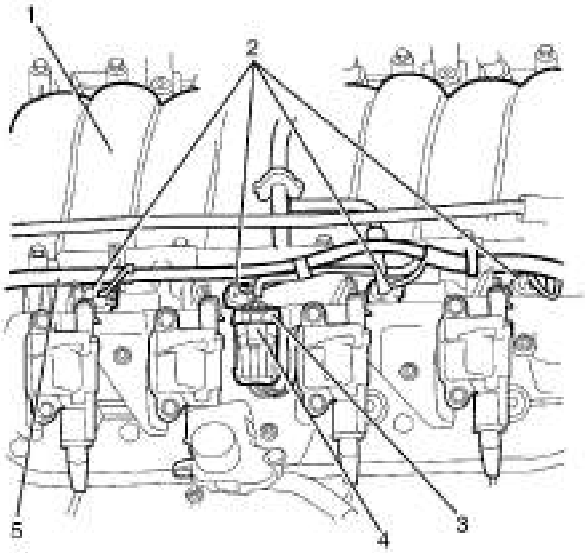
30. Remove the intake manifold. Refer to Intake Manifold Installation.
31. Clean and inspect the intake manifold. Refer to Intake Manifold Cleaning and Inspection.

Installation Procedure

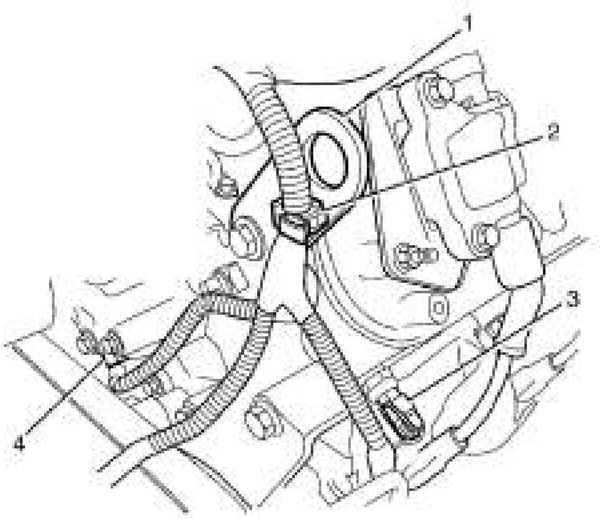
1. Install the intake manifold. Refer to Intake Manifold Installation.



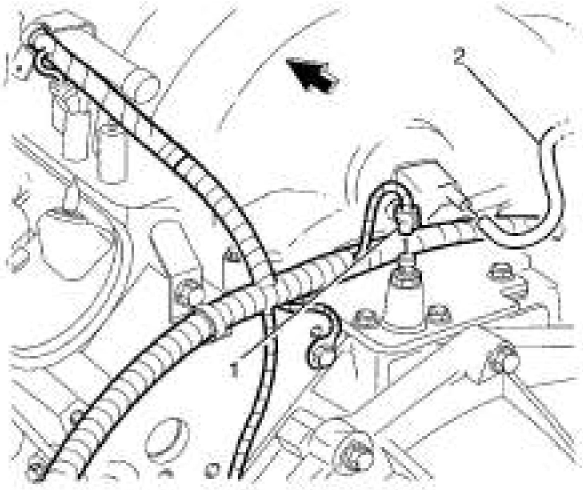
2. Position the right side fuel injector wiring harness (4) on the intake manifold (2).
3. Connect the Manifold Absolute Pressure (MAP) sensor wiring harness connector (3) to the MAP sensor.
4. Connect the canister purge valve wiring harness connector (5).
5. Connect the right side ignition coil main connector (6) to the ignition coil wiring harness.
6. Install the Connector Position Assurance (CPA) lock (7) from the right side ignition coil main connector (6).
7. Connect the right side fuel injector wiring harness connectors (1) to the fuel injectors.



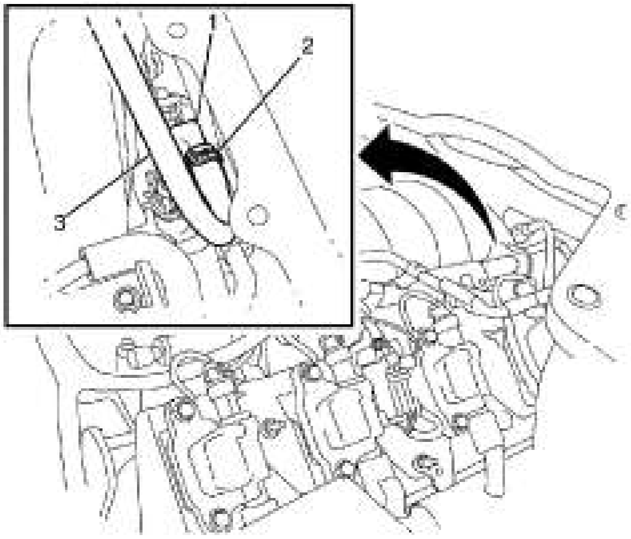
8. Position the left side fuel injector wiring harness (5) back to its original location the intake manifold (1).
9. Connect the left side ignition coil main connector (3) ignition coil wiring harness.
10. Install the CPA lock (4) from the left side ignition coil main connector (3).
11. Connect the left side fuel injector wiring harness connectors (2) to the fuel injectors.



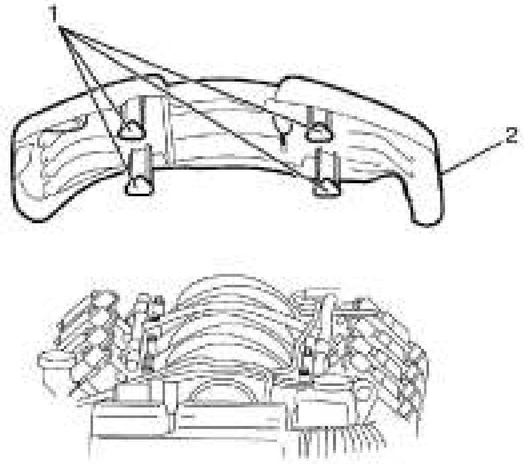
12. Connect the camshaft position sensor connector (4) to the camshaft sensor.
13. Connect the coolant temperature sensor connector (3) to the coolant sensor.
14. Attach the wiring harness retaining clip (2) to the engine lifting bracket (1).



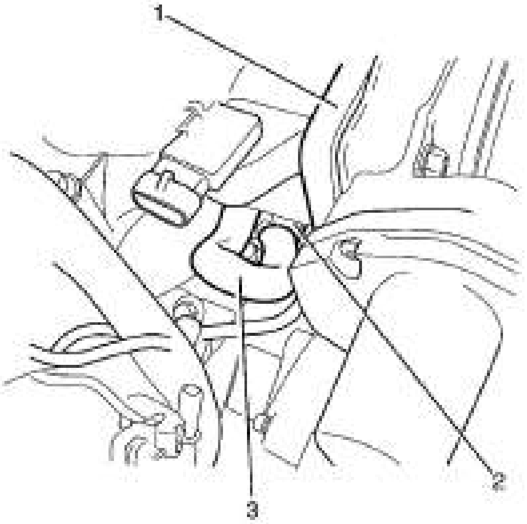
15. Connect the oil pressure sensor wiring harness connector (1) to the oil pressure sensor.
16. Connect the HVAC vacuum hose (2) to the intake manifold.



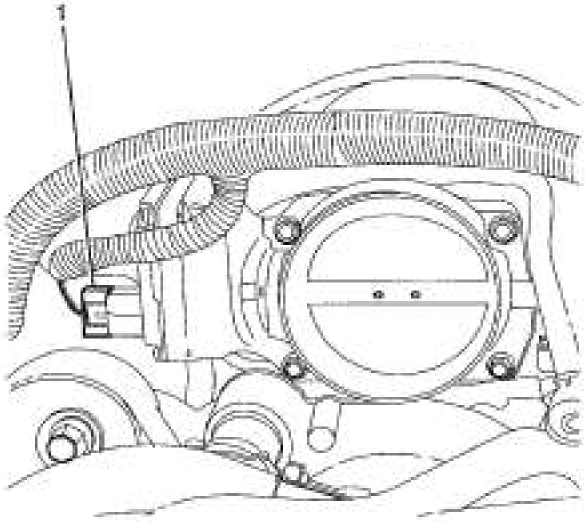
17. Connect the vacuum hose (3) to the intake manifold vacuum port (1).
18. Compress the vacuum hose retaining clamp (2) and slide along the vacuum hose (3) to the correct location to secure the vacuum hose (3) to the intake manifold vacuum port (1).



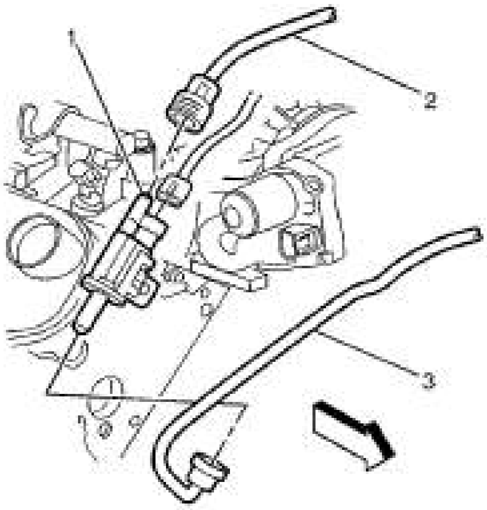
19. Connect the alternator wiring harness connector (1) to the alternator.



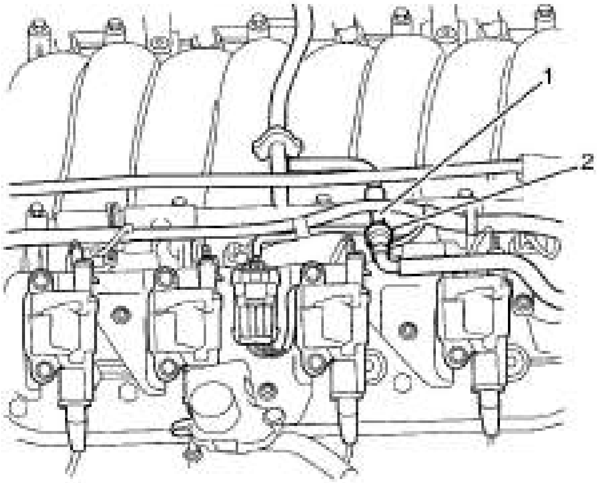
20. Connect the PCV hose (3) to the intake manifold (1) and the valley cover (2).



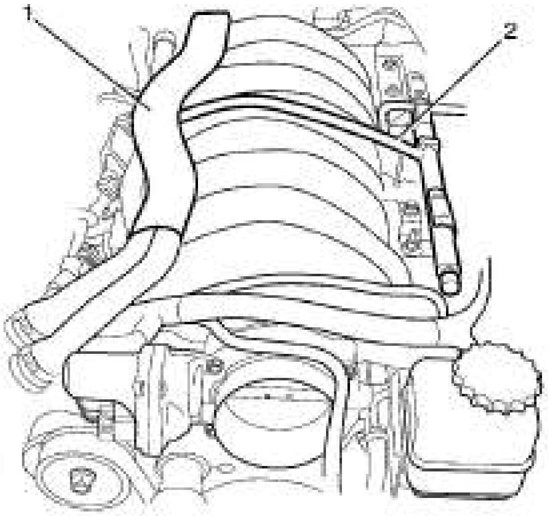
21. Connect the electronic throttle body wiring harness connector (1) to the throttle body.



22. Remove the plug on the throttle body to EVAP purge valve hose (3) and EVAP purge valve (1) ends.
23. Connect the throttle body to EVAP purge valve hose (3) to the EVAP purge valve (1).
24. Remove the plug on the throttle body to the EVAP purge valve to fuel tank hose (2) and EVAP purge valve (1) ends.
25. Connect the EVAP purge valve to fuel tank hose (2) to the EVAP purge valve (1).



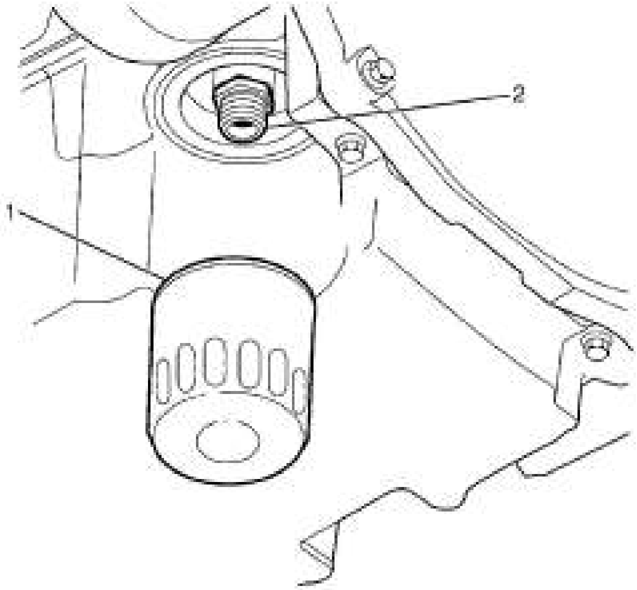
26. Remove the plug on the fuel feed pipe (2) and fuel rail tube (1) end.
27. Connect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



28. Position the heater hoses (1) correctly on the intake manifold (2).
29. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
30. Fill the cooling system. Refer to Cooling System Draining and Filling.
31. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
32. Run engine and check for leaks.
33. Install the engine cover. Refer to Engine Cover Replacement.

Oil Filter Adapter Replacement

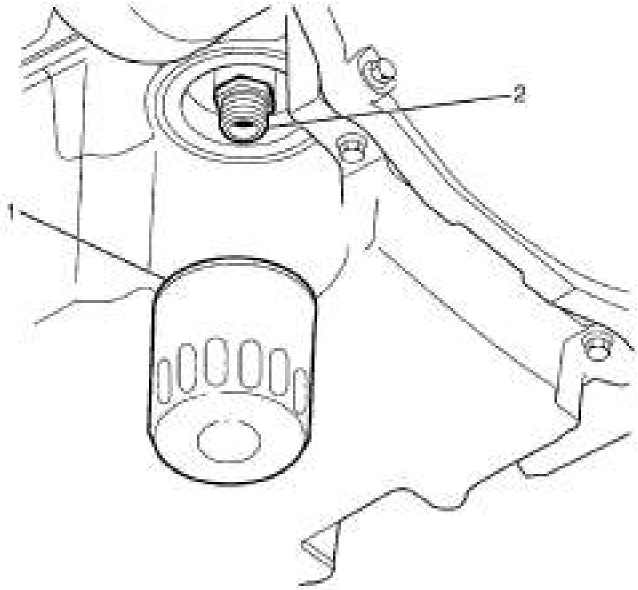
Removal Procedure



1. Remove the oil filter (1).
2. Remove the oil filter adapter (2).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the oil filter adapter (2).

   Tighten
   Tighten the adapter to 55 N·m (40 lb ft).

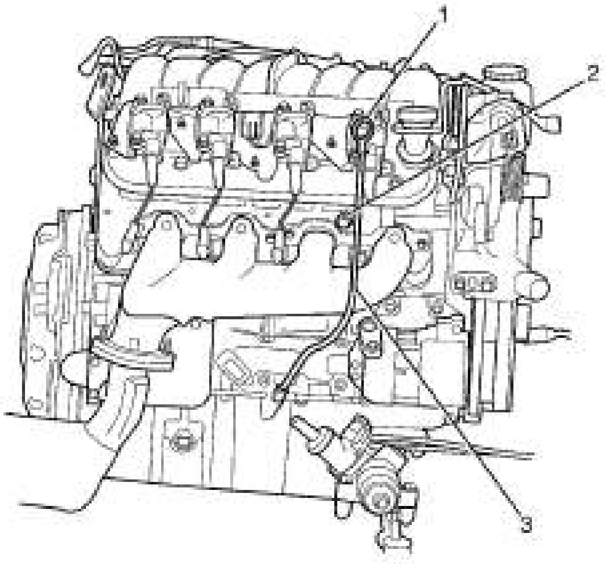
2. Install the oil filter (1).

   Tighten
   Tighten the filter to 30 N·m (22 lb ft).

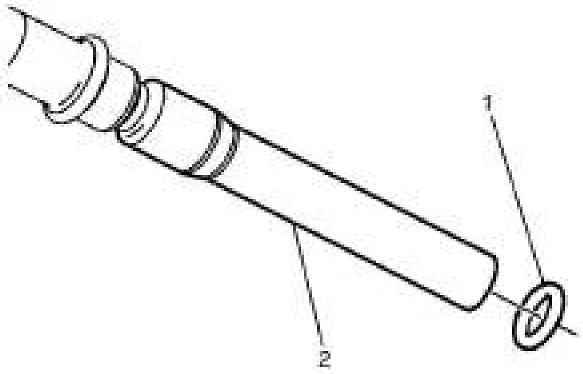
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2086108**

Oil Level Indicator Tube Replacement (L98)

Removal Procedure



1. Remove the oil level indicator (1) from the oil level indicator tube (3).
2. Remove the oil level indicator tube bracket to cylinder head retaining bolt (2).
3. Remove the oil lever indicator tube (3) from the engine.



Important: Inspect the O-ring seal for cuts or damage. The O-ring seal may be re-used if not cut or damaged.

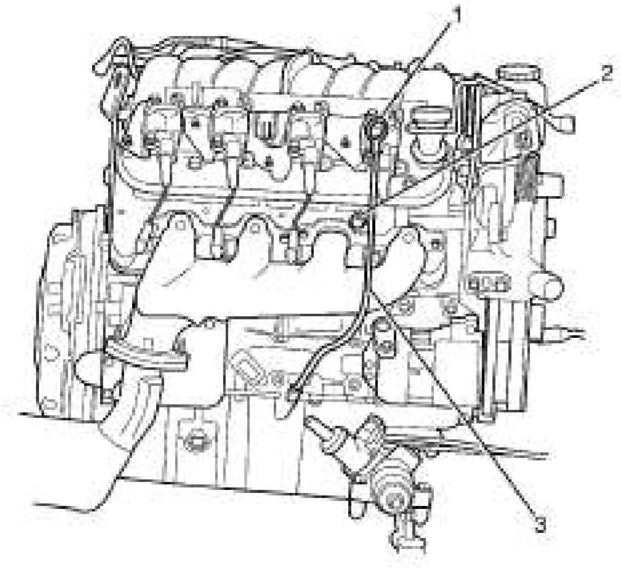
Important: If the oil level indicator tube is not to be reinstalled immediately, plug the opening to prevent dirt entry.

4. Remove and discard the O-ring (1) from the oil level indicator tube (2) if damaged.

Installation Procedure

Important: Fitment of a new O-ring is only necessary if the old O-ring is damaged

1. Lubricate the O-ring seal with clean engine oil.



2. Install the oil level indicator tube (3) into the cylinder block until the collar is flush with the engine block.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the oil level indicator tube to cylinder head retaining bolt (2).

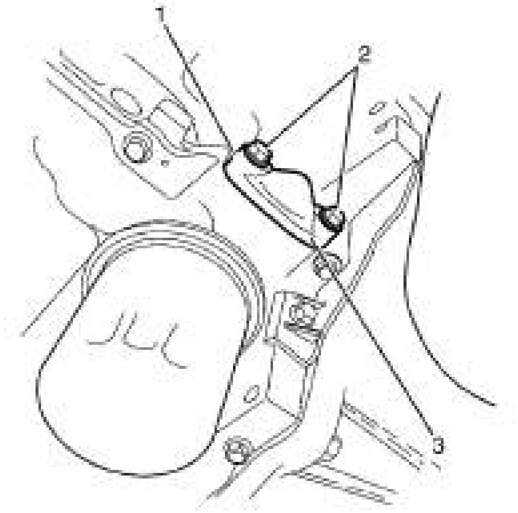
Tighten
Tighten the bolt to 25 N·m (18 lb ft).

4. Install the oil level indicator (1) to the oil level indicator tube.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 1986517**

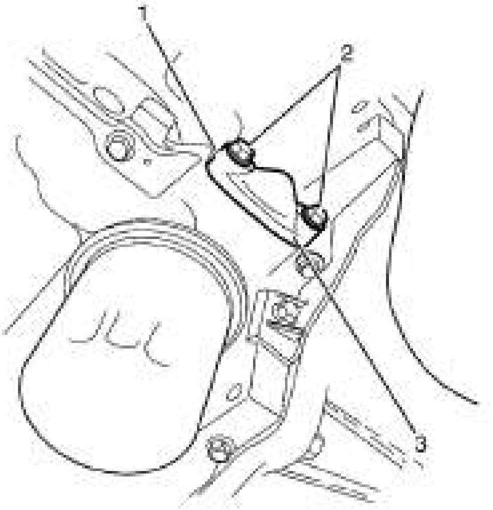
Oil Pan Cover Replacement

Removal Procedure



1. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the oil pan cover to oil pan retaining bolts (2).
3. Remove the cover (1).
4. Remove the gasket (3).

Installation Procedure



1. Position the gasket (3) and cover (1) on the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the retaining bolts (2) for the cover.

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

3. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2037365**

Oil Pan Replacement

Removal Procedure

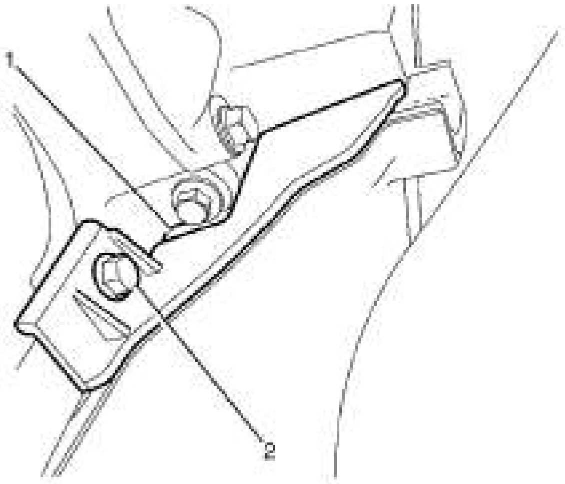
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

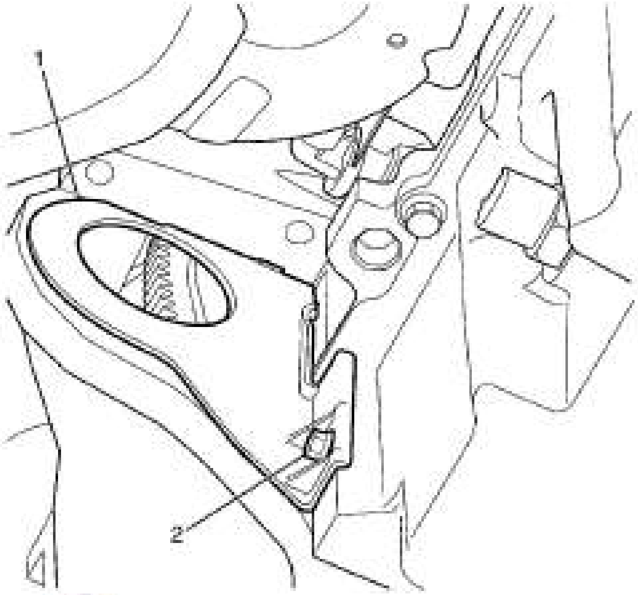
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

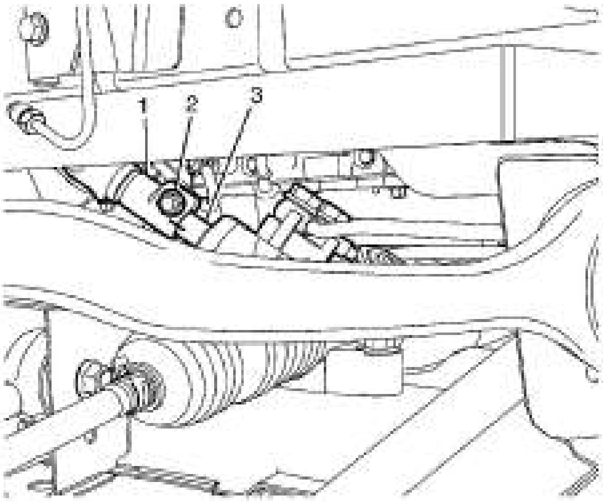
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the air deflector. Refer to Front Air Deflector Replacement.
4. Drain the engine oil and remove the oil filter. Refer to Engine Oil and Oil Filter Replacement.
5. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.
6. Remove the starter motor. Refer to Starter Motor Replacement.



7. Remove the left side close out cover to cylinder block retaining bolt (2).
8. Remove the left side close out cover (1).



9. Remove the right side close out cover to cylinder block retaining bolt (2).
10. Remove the right side close out cover (1).



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

11. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).

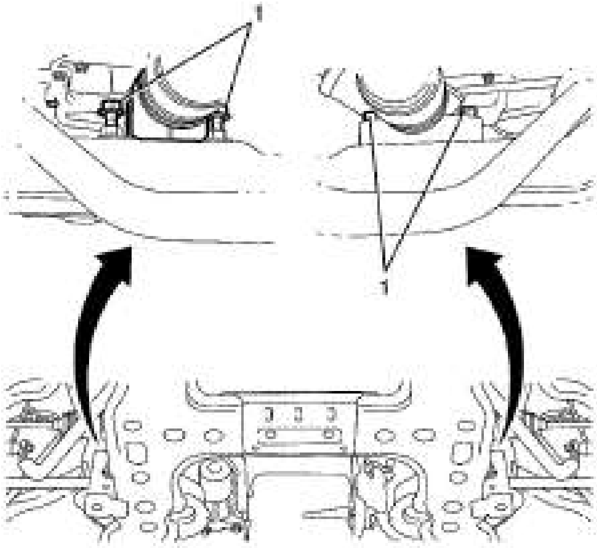
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure the bolt hole is thoroughly cleaned and all micro-encapsulated thread sealant is removed.

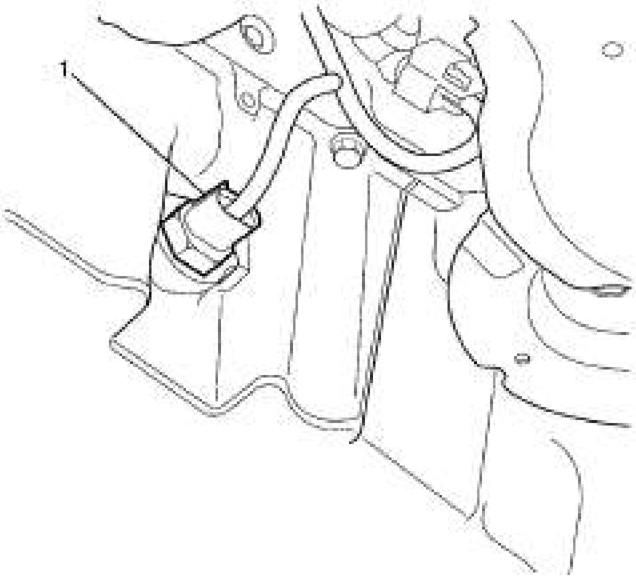
12. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

    Discard the bolt.

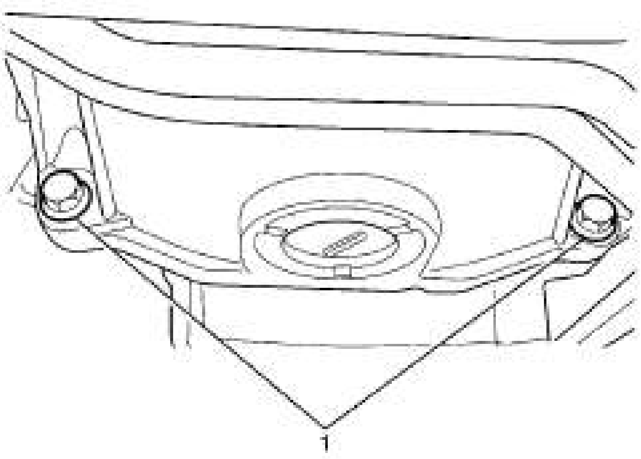
13. Disconnect the intermediate shaft (2) from the pinion shaft (3).



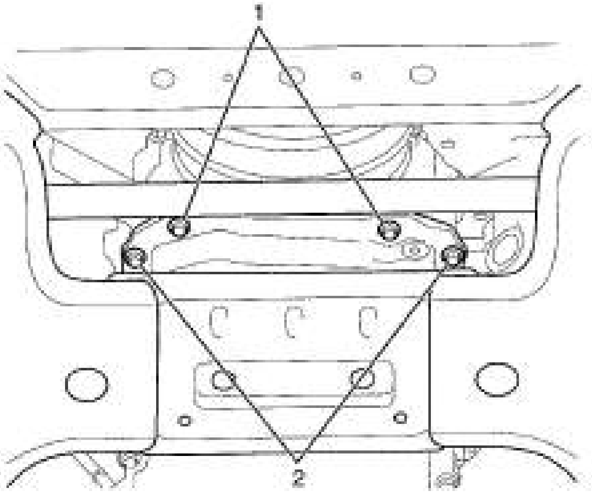
14. Remove the steering gear to subframe retaining bolts (1).
15. Slide the steering gear forward to gain full access to the sump.



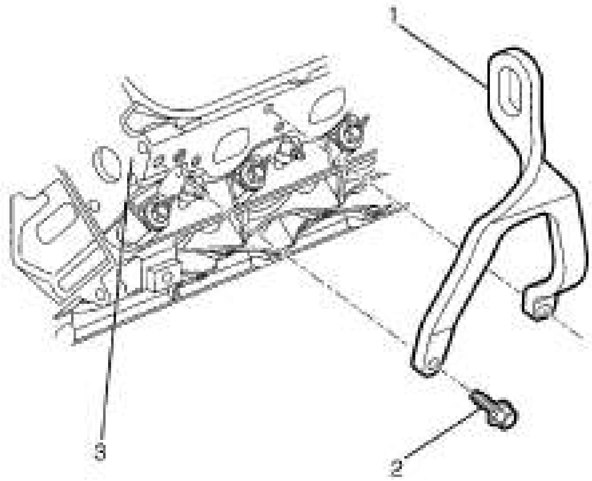
16. Disconnect the oil level/temperature sensor electrical connector (1) from the oil level/temperature sensor.



17. Remove the transmission to oil pan retaining bolts (1).



18. Remove the oil pan to front cover retaining bolts (1).
19. Remove the oil pan to cylinder block front retaining bolts (2).
20. Lower the vehicle.



21. Position the J 41798 (1) on the cylinder head (3).

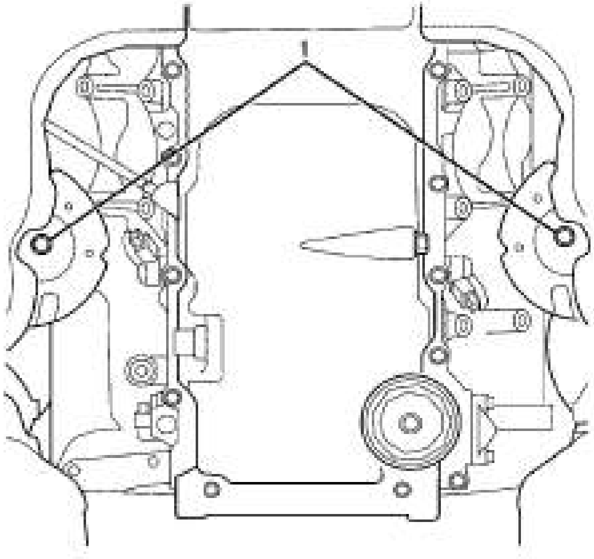
    Notice: Refer to Fastener Notice in the Preface section.

22. Install the J 41798 to cylinder head retaining bolts (2).

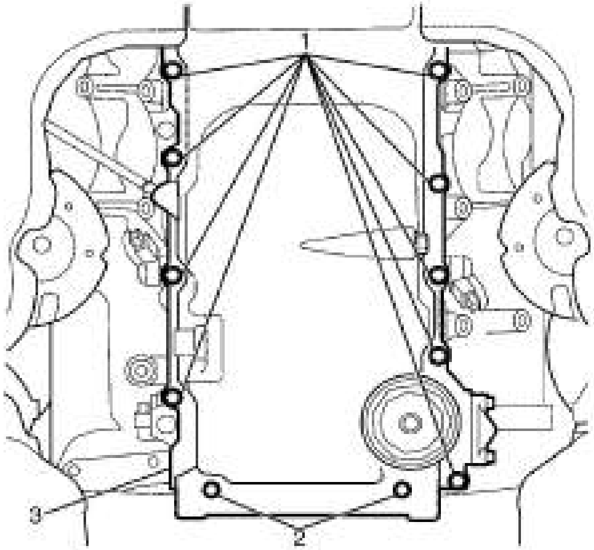
    Tighten
    Tighten the bolts to 50 N·m (36 lb ft).

    Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

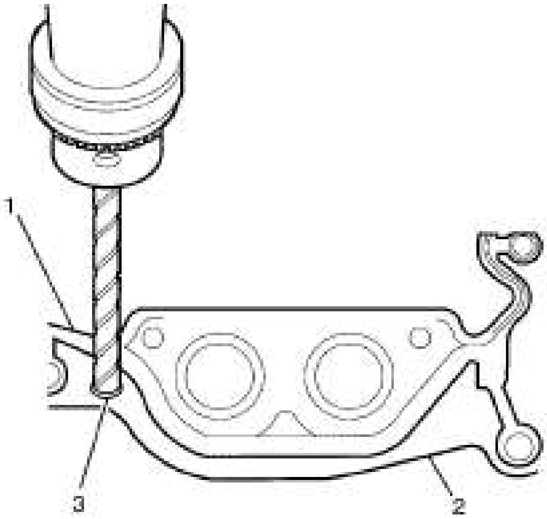
23. Install J 41803 and J 28467-B and raise the engine assembly 20mm.
24. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



25. Remove the lower engine mount to crossmember retaining nut (1) from both engine mounts.
26. Lower the vehicle.



27. Remove the oil pan to engine rear cover retaining bolts (2).
28. Remove the oil pan to cylinder block retaining bolts (1).
29. Remove the oil pan (3).



Important: DO NOT allow foreign material to enter the oil passages of the oil pan, cap, or cover the openings, as required.

Important: Take care not to gouge, score, or damage the oil pan sealing surface.

30. Drill out the retaining rivets (3) from the oil pan, if required.

    Important: The oil pan gasket and rivets are single use only components and must be replaced whenever the oil pan is removed from the cylinder block.

31. Remove the oil pan gasket (1) from the oil pan (2).

    Discard the gasket and rivets.

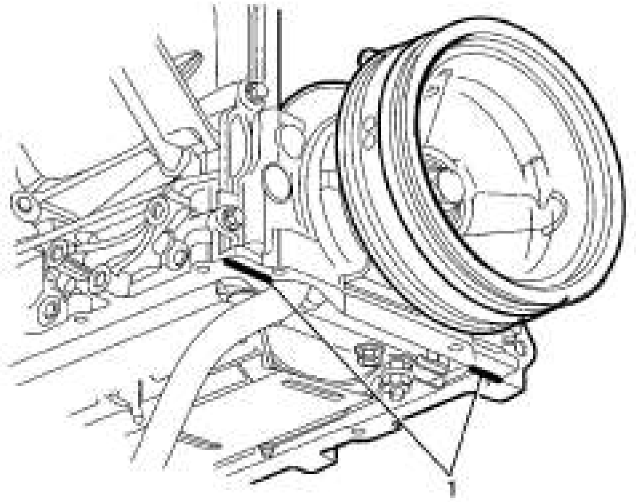
32. Clean and inspect the oil pan as necessary. Refer to Oil Pan Cleaning and Inspection.
33. Clean the base of the engine block. Refer to Replacing Engine Gaskets.

Installation Procedure

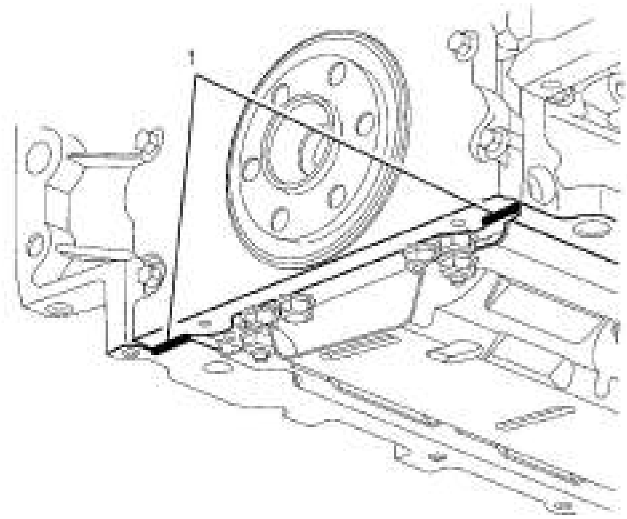
Important: The alignment of the structural oil pan is critical. The rear bolt hole locations of the oil pan provide mounting points for the transmission housing. To ensure the rigidity of the powertrain and correct transmission alignment, it is important that the rear of the block and the rear of the oil pan are flush. The rear of the oil pan must NEVER protrude beyond the engine block and transmission housing plane.

Important: The original oil pan gasket is retained and aligned to the oil pan by rivets. When installing a new gasket, it is not necessary to install new oil pan gasket rivets.

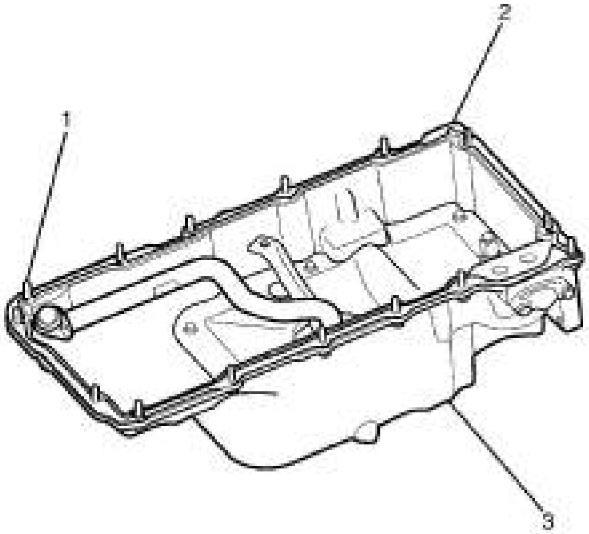
It is not necessary to rivet the NEW gasket to the oil pan.



1. Apply a five mm (0.2 in) bead of sealant 20 mm (0.8 in) long to the engine block (1). Apply the sealant directly onto the tabs of the front cover gasket that protrude into the oil pan surface. Refer to Adhesives, Fluids, Lubricants, and Sealers.

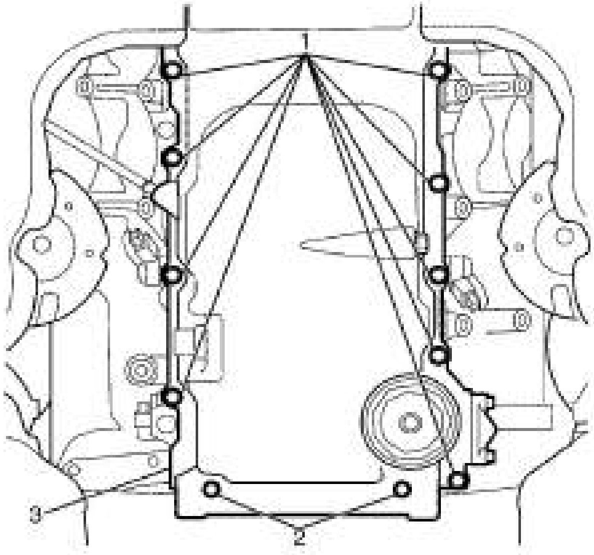


2. Apply a five mm (0.2 in) bead of sealant 20 mm (0.8 in) long to the engine block (1). Apply the sealant directly onto the tabs of the rear cover gasket that protrude into the oil pan surface. Refer to Adhesives, Fluids, Lubricants, and Sealers.

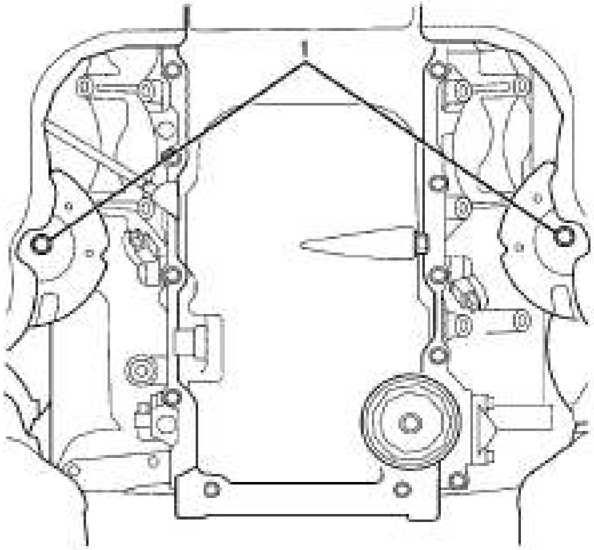


Important: Make sure to align the oil gallery passages in the oil pan and engine block correctly, with the oil pan gasket.

3. Preassemble the oil pan gasket (2) to the oil pan (3).
    - 3.1. Install the oil pan gasket (2) to the oil pan (3).
    - 3.2. Install the oil pan retaining bolts (1) to the oil pan (3) and through the oil pan gasket (2).



4. Install the oil pan assembly (3).
5. Install the oil pan to cylinder block retaining bolts (1) finger tight. Do not over tighten.
6. Install the oil pan to engine rear cover retaining bolts (2) finger tight. Do not over tighten.
7. Lower the vehicle.
8. Lower the engine to engage the engine mounts to the front subframe.



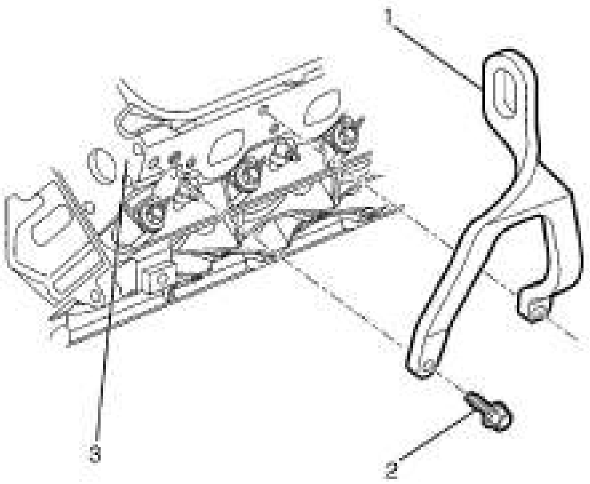
9. Raise the vehicle.

Notice: Refer to Fastener Notice in the Preface section.

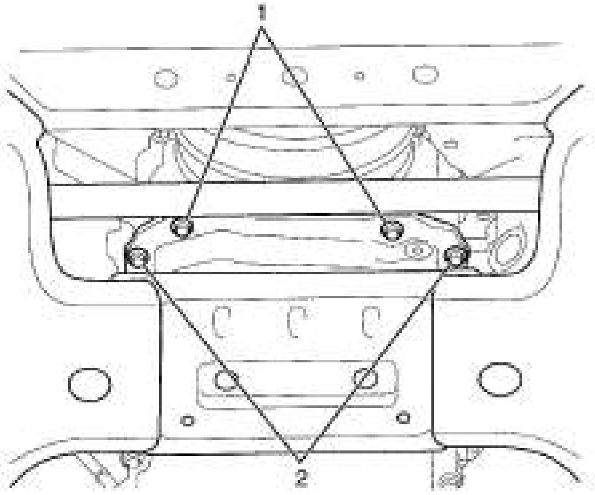
10. Install the lower engine mount to front subframe retaining nuts (1) on both engine mounts.

Tighten
Tighten the nut to 80 N·m (59 lb ft).

11. Lower the vehicle.
12. Remove J 41803 and J 28467-B from the engine.



13. Remove the J 41798 (1) from the cylinder head (2).



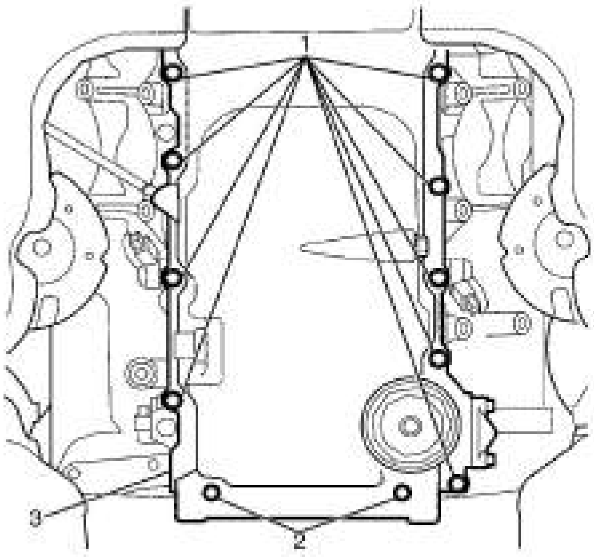
14. Install the oil pan to front cover retaining bolts (1) finger tight. Do not over tighten.
15. Install the oil pan to cylinder block retaining bolts (2) finger tight. Do not over tighten.
16. Place a straight edge across the rear of the engine block and the rear of the oil pan at the transmission housing mounting surfaces.
17. Align the oil pan until the rear of engine block and the rear of oil pan are flush or even.
18. Measure the oil pan-to-engine block alignment.
    - 18.1. Place a straight edge across the rear of the engine block and rear of the oil pan at the transmission housing mounting surfaces.

Important: The rear of the oil pan must NEVER protrude beyond the engine block and transmission housing mounting surfaces.

18.2. Insert a feeler gauge between the straight edge and the oil pan transmission housing mounting surface and check to make sure that there is no more than a 0.25 mm (0.01 in) gap between the pan and the straight edge.

18.3. If the oil pan alignment is not within specifications, remove the oil pan and repeat procedures 17 through to 19.

Notice: Refer to Fastener Notice in the Preface section.

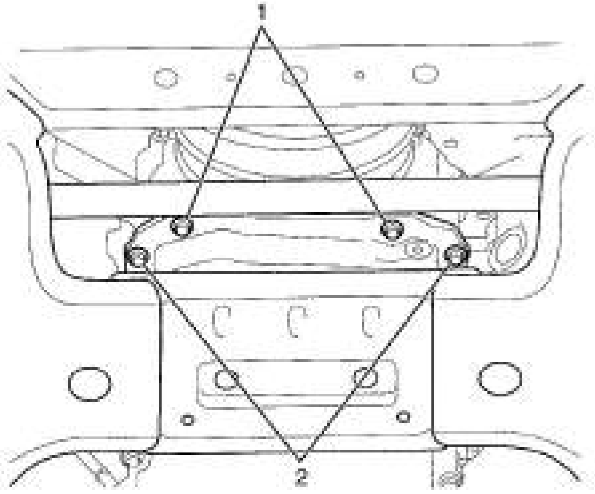


19. Tighten the M8 oil pan to cylinder block retaining bolts (1).

Tighten
Tighten the bolt to 25 N·m (18 lb ft).

20. Tighten the M6 oil pan to engine rear oil seal housing retaining bolts (2).

Tighten
Tighten the bolt to 12 N·m (106 lb in).



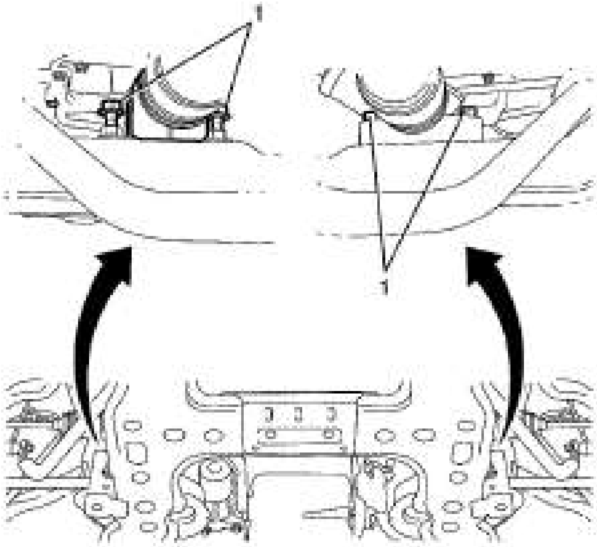
21. Tighten the oil pan to cylinder block retaining bolts (2).

    Tighten
    Tighten the bolt to 25 N·m (18 lb ft).

22. Tighten the oil pan to front cover retaining bolts (1).

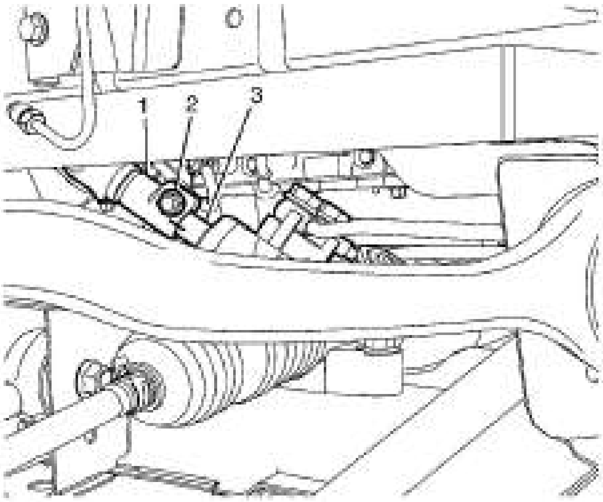
    Tighten
    Tighten the bolt to 25 N·m (18 lb ft).

23. Position the steering gear in the correct location.



24. Install the steering gear to subframe retaining bolts (1).

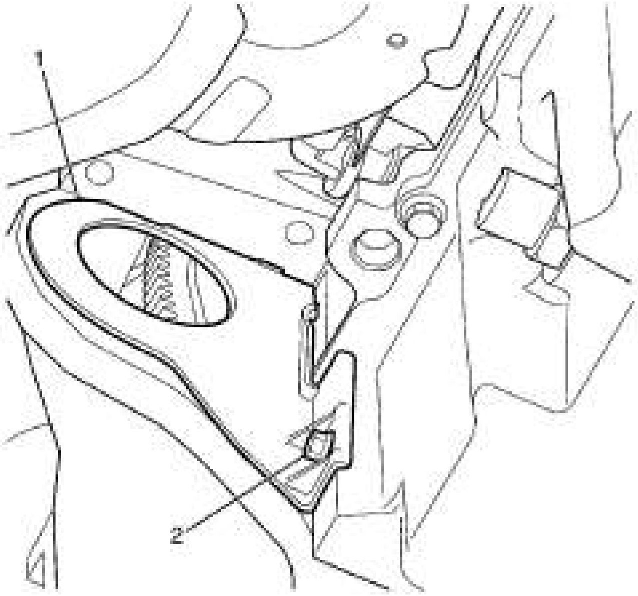
Tighten
Tighten the bolts to 65 N·m (48 lb ft).



Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

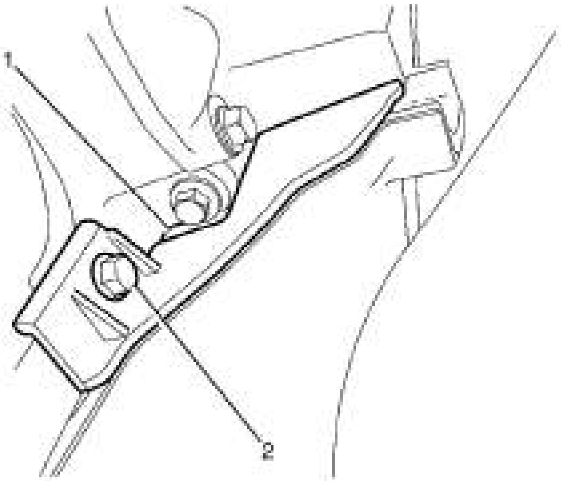
25. Connect the intermediate steering shaft (1) to the pinion shaft (3).
26. Install the intermediate steering shaft to pinion shaft NEW retaining bolt (2).

Tighten
Tighten the bolt to 25 N·m (18 lb ft).



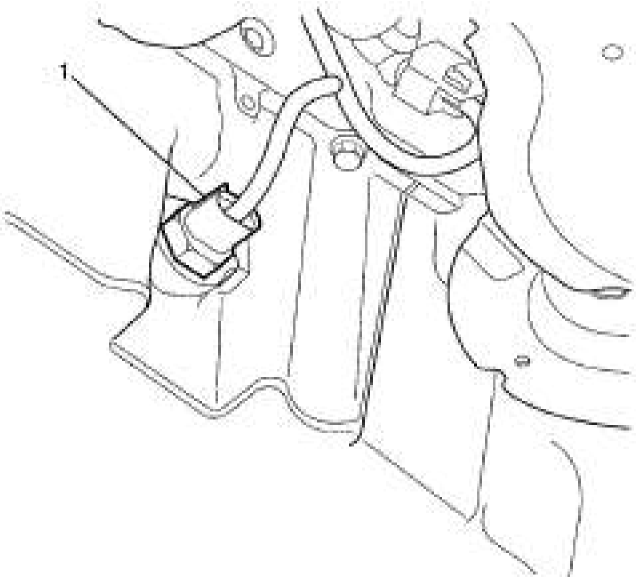
27. Install the right side close out cover (1).
28. Install the right side close out cover to cylinder block retaining bolt (2).

Tighten
Tighten the bolt to 12 N·m (106 lb in).



29. Install the left side close out cover (1).
30. Install the left side close out cover to cylinder block retaining bolt (2).

Tighten
Tighten the bolt to 12 N·m (106 lb in).



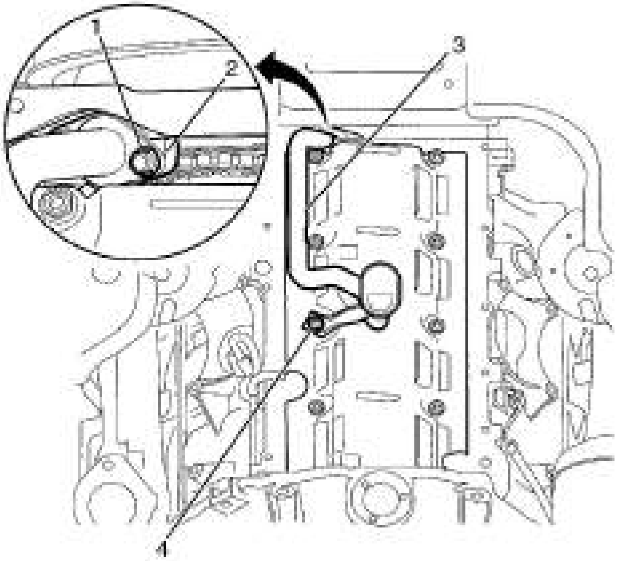
31. Connect the oil level/temperature sensor electrical connector (1) to the oil level/temperature sensor.
32. Install the starter motor. Refer to Starter Motor Replacement.
33. Install the air deflector. Refer to Front Air Deflector Replacement.
34. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
35. Lower the vehicle to the ground
36. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
37. Replace the engine oil and oil filter. Refer to Engine Oil and Oil Filter Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 2037122

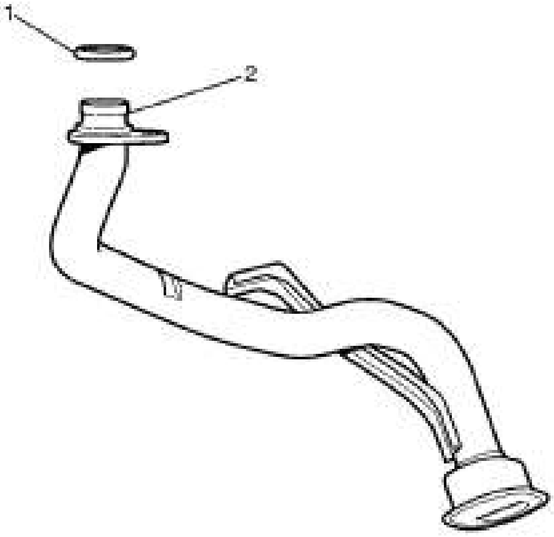
Oil Pump, Screen, and Crankshaft Oil Deflector Replacement

Removal Procedure

1. Remove the engine oil pan. Refer to Oil Pan Replacement.
2. Remove the engine front cover. Refer to Engine Front Cover Replacement.



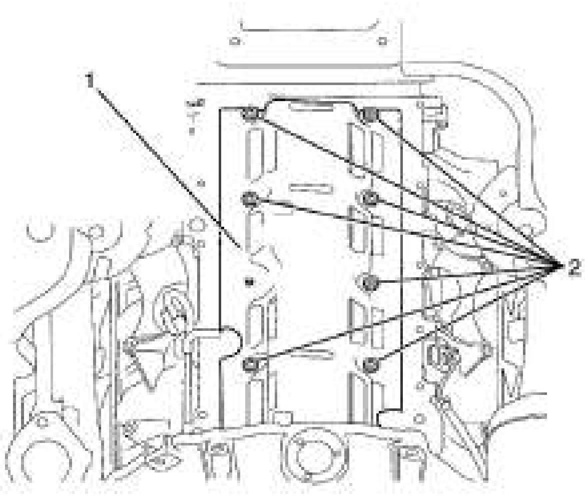
3. Remove the oil pump screen and tube assembly to oil pump retaining bolt (1).
4. Remove the oil pump screen and tube assembly to crankshaft oil deflector retaining nut (4).
5. Remove the oil pump screen and tube assembly (3) from the oil pump (2).



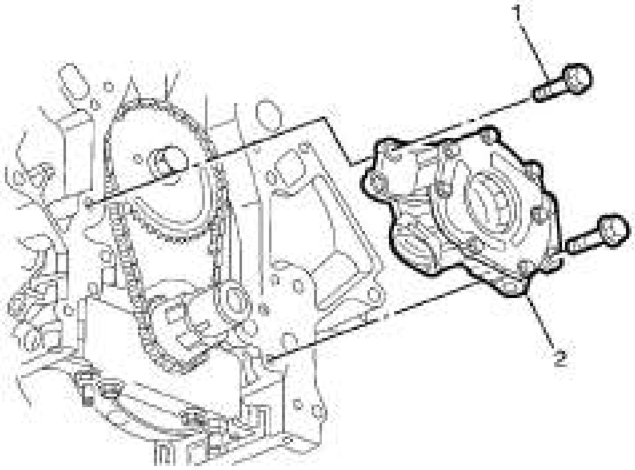
Important: The oil pump screen and tube assembly O-ring seal (1) is a single use only component and must be replaced whenever the oil pump screen and tube assembly (2) is removed.

6. Remove the oil pump screen and tube assembly O-ring seal (1) from the oil pump screen and tube assembly (2).

   Discard the oil pump screen and tube assembly O-ring seal (1).



7. Remove the remaining crankshaft oil deflector retaining nuts (2).
8. Remove the crankshaft oil deflector (1).



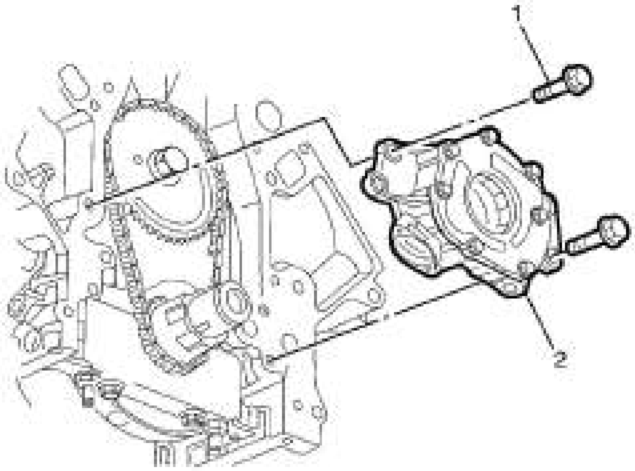
9. Remove the oil pump bolts (1).

   Important: Do not allow dirt or debris to enter the oil pump, cap the ends as necessary.

10. Remove the oil pump (2).
11. Clean and inspect the oil pump. Refer to Oil Pump Cleaning and Inspection.

Installation Procedure

Important: Inspect the engine block oil gallery passages. These surfaces must be clear and free of debris or restrictions.

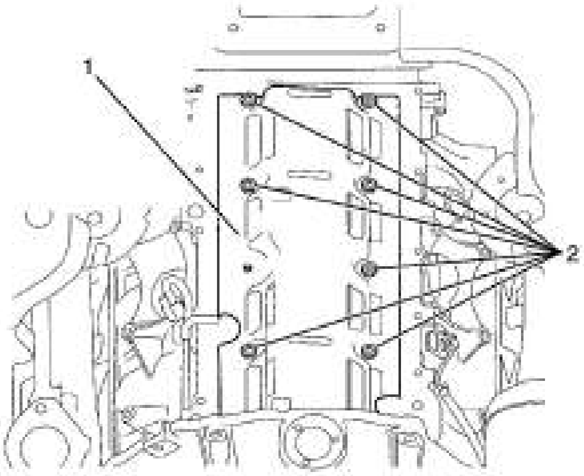


1. Align the splined surfaces of the crankshaft sprocket and the oil pump drive gear and install the oil pump (1).

   Notice: Refer to Fastener Notice in the Preface section.

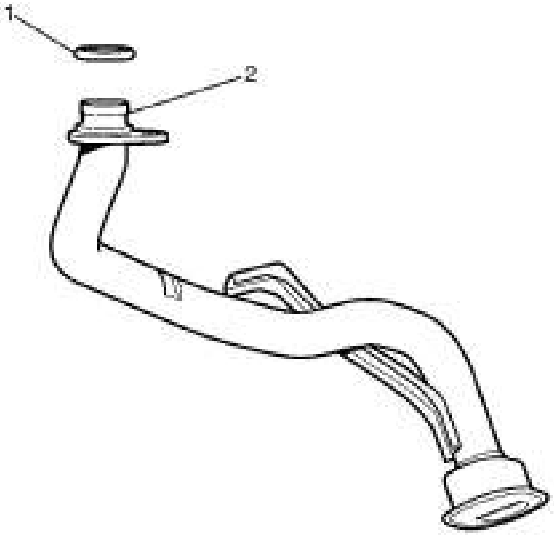
2. Install the oil pump to engine block retaining bolts (2).

   Tighten
   Tighten the bolts to 25 N·m (18 lb ft).



3. Install the crankshaft oil deflector (1).
4. Install the crankshaft oil deflector retaining nuts (2).

Tighten
Tighten the nuts to 25 N·m (18 lb ft).



5. Lubricate a NEW oil pump screen and tube assembly O-ring seal (1) with clean engine oil.
6. Install the NEW oil pump screen and tube assembly O-ring seal (1) onto the oil pump screen and tube assembly (2).

Important: Push the oil pump screen and tube assembly (3) completely into the oil pump (2) prior to tightening the oil pump screen and tube assembly to oil pump retaining bolt (1). Do not allow the oil pump screen and tube assembly to oil pump retaining bolt (1) to pull the oil pump screen and tube assembly (3) into the oil pump (2).

Important: Align the oil pump screen brackets with the correct crankshaft bearing cap studs.

7. Install the oil pump screen and tube assembly (3).
8. Install the oil pump screen and tube assembly to oil pump retaining bolt (1).

   Tighten
   Tighten the bolt to 12 N·m (106 lb in).

9. Install the oil pump screen and tube assembly to crankshaft oil deflector retaining nut (4).

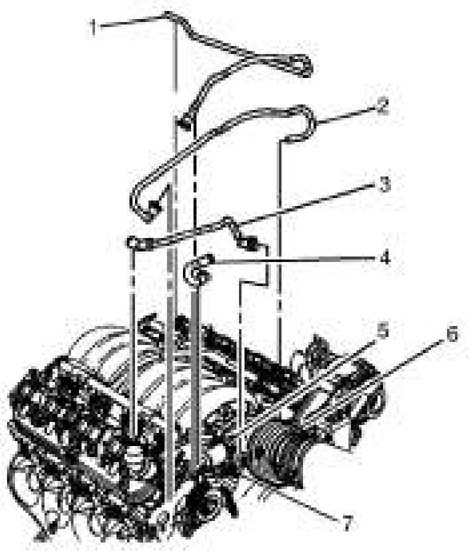
   Tighten
   Tighten the nut to 25 N·m (18 lb ft).

10. Install the engine front cover. Refer to Engine Front Cover Replacement.
11. Install the engine oil pan. Refer to Oil Pan Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038124**

Positive Crankcase Ventilation Hose / Pipe / Tube Replacement

Removal Procedure

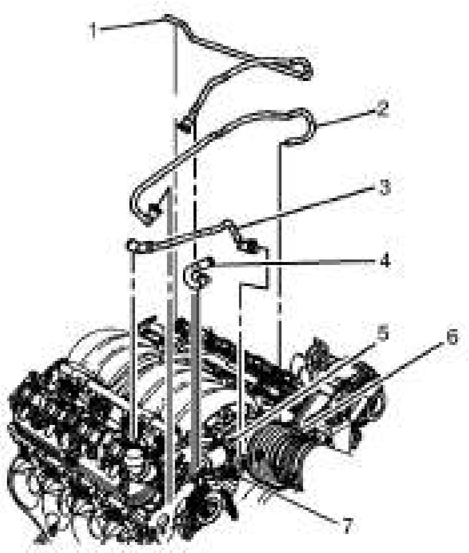


1. Remove the engine cover. Refer to Engine Cover Replacement.

   Important: In the following service procedure, it maybe necessary to remove the evaporative emission (EVAP) valve assembly to gain access to the positive crankcase ventilation hose.

2. Remove the evaporative emission canister purge valve (5). Refer to Evaporative Emission Canister Purge Solenoid Valve Replacement.
3. Remove the EVAP pipes (1) and (2).
4. Remove the EVAP pipe (3) from the air intake duct (6) and the valve cover.
5. Remove the hose (4) from the throttle body (7) and the engine valley cover.

Installation Procedure



1. Install the hose (4) from the throttle body (7) and the engine valley cover.
2. Install the EVAP pipe (3) from the air intake duct (6) and the valve cover.
3. Install the evaporative emission canister purge valve (5). Refer to Evaporative Emission Canister Purge Solenoid Valve Replacement.
4. Install the EVAP pipes (1) and (2).
5. Install the engine cover. Refer to Engine Cover Replacement.

Valve Lifter Replacement

Removal Procedure

1. Remove the cylinder head. Refer to Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side.
2. Remove the valve lifters. Refer to Valve Lifter Removal.

Installation Procedure

1. Install the valve lifters. Refer to Valve Lifter Installation.
2. Install the cylinder head. Refer to Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | Document ID: 2037364

Valve Rocker Arm and Push Rod Replacement

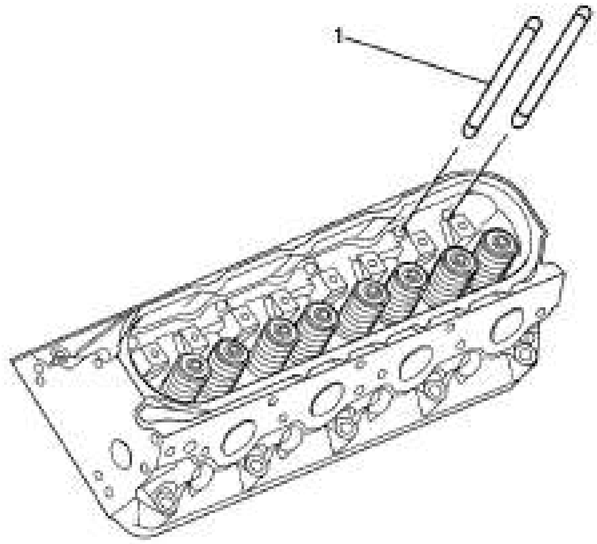
Removal Procedure

1. Remove the valve rocker arm covers. Refer to Valve Rocker Arm Cover Replacement - Left Side or Valve Rocker Arm Cover Replacement - Right Side.
2. Remove the valve rocker arm and push rods. Refer to Valve Rocker Arm and Push Rod Removal.
3. Clean and inspect the valve rocker arms and pushrods. Refer to Valve Rocker Arm and Push Rod Cleaning and Inspection.

Installation Procedure

Important:

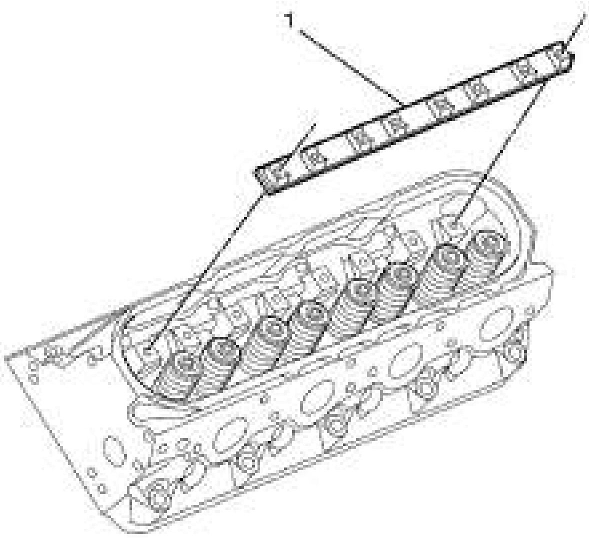
- When using the valve train components again, always install the components to the original location and position.
- Valve lash is net build, no valve adjustment is required.



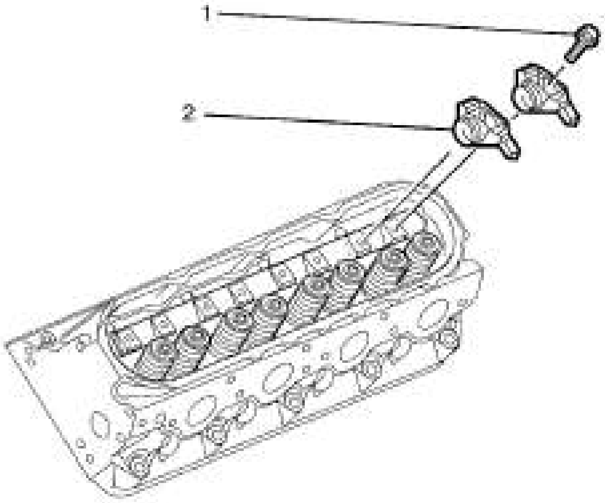
1. Lubricate the pushrods (1) with clean engine oil.

Important: Make sure the pushrods (1) seat correctly to the valve lifter sockets.

2. Install the pushrods (1).



3. Install the valve rocker arm pivot support (1).

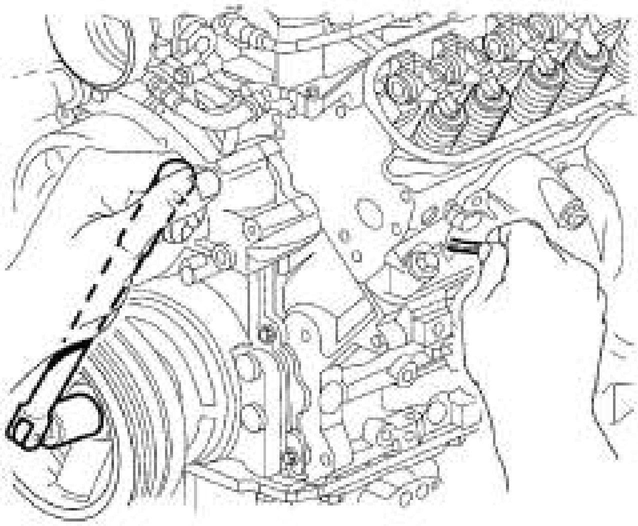


4. Lubricate the valve rocker arms (2) and pushrods with clean engine oil.
5. Lubricate the flange of the valve rocker arm bolts (1) with clean engine oil.

Important:

- Make sure the pushrods seat correctly to the ends of the rocker arms.
- DO NOT tighten the rocker arm bolts at this time.

6. Install the rocker arms and rocker arm retaining bolts.



Important: The Number 1 piston is at the compression stroke when the Number 6 cylinder inlet and exhaust valves are rocking, that is when the exhaust valve is at the end of its upward travel while the intake valve starts its downward movement.

Important: The engine firing order is 1-8-7-2-6-5-4-3. Cylinder numbers are 1-3-5-7 are on the left bank and 2-4-6-8 are on the right bank.

7. Rotate the crankshaft until number one piston is at top dead centre of compression stroke.

   Notice: Refer to Fastener Notice in the Preface section.

8. With the engine in the number one firing position, tighten the following valve rocker arm retaining bolts:

   Tighten
   - Tighten exhaust valve rocker arm retaining bolts 1, 2, 7, and 8 to 30 N·m (22 lb ft).
   - Tighten intake valve rocker arm retaining bolts 1, 3, 4, and 5 to 30 N·m (22 lb ft).
9. Rotate the crankshaft 360 degrees.
10. Tighten the following valve rocker arm retaining bolts:

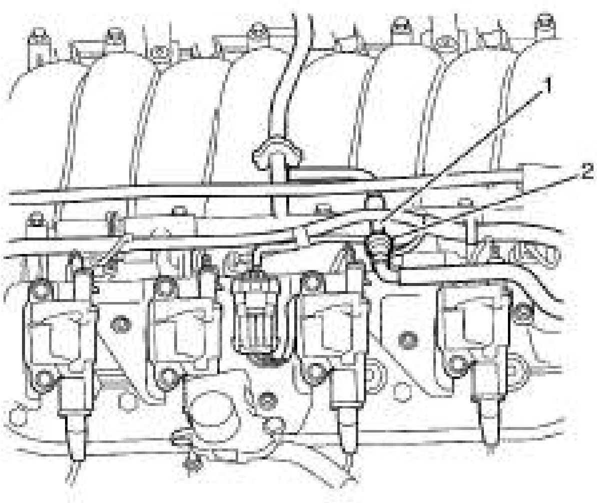
    Tighten
    - Tighten exhaust valve rocker arm retaining bolts 3, 4, 5, and 6 to 30 N·m (22 lb ft).
    - Tighten intake valve rocker arm retaining bolts 2, 6, 7, and 8 to 30 N·m (22 lb ft).
11. Install the valve rocker arm covers. Refer to Valve Rocker Arm Cover Replacement - Left Side or Valve Rocker Arm Cover Replacement - Right Side..

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038127**

Valve Rocker Arm Cover Replacement - Left Side

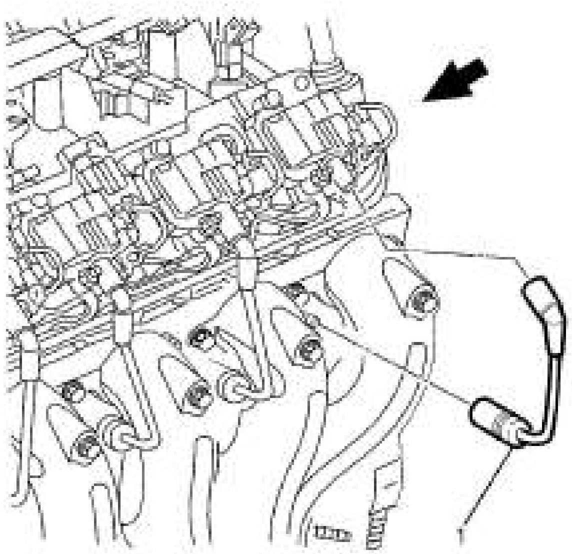
Removal Procedure

1. Remove the dress engine cover. Refer to Engine Cover Replacement .
2. Depressurize the fuel system. Refer to Fuel Pressure Relief.
3. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

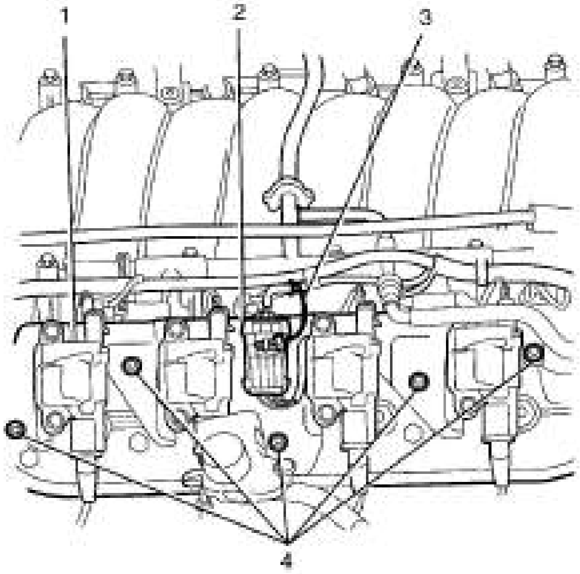


Important: Plug or cap the fuel feed pipe (2) and fuel rail tube (1) ends to prevent fuel leaks and/or contamination.

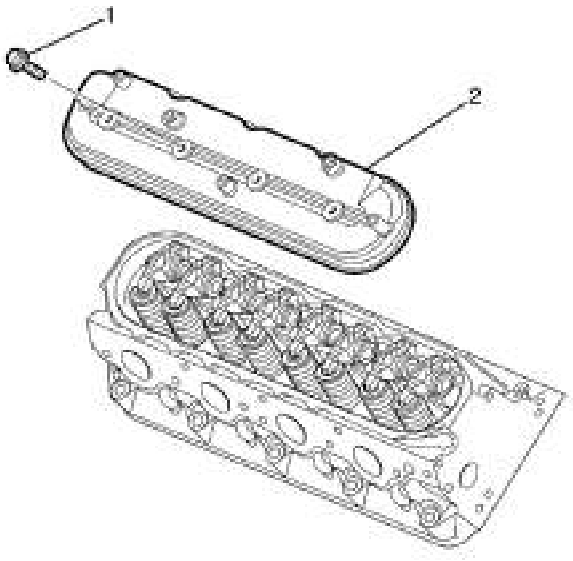
4. Disconnect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



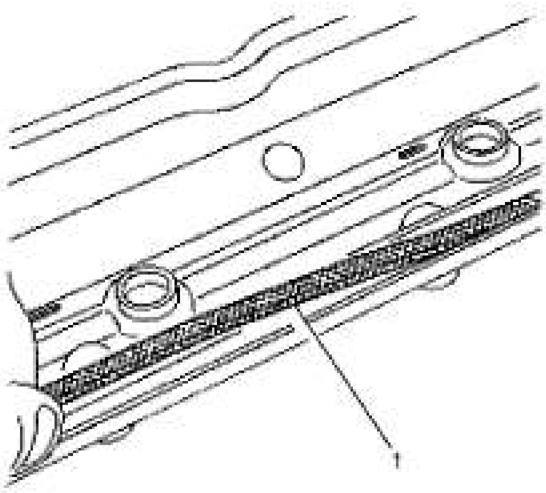
5. Remove the spark plug leads (1).



6. Remove the Connector Position Assurance (CPA) lock (3) from the ignition coil main connector (2).
7. Disconnect the ignition coil main connector (2).
8. Remove the ignition coil assembly to valve rocker arm cover retaining studs (4).
9. Remove the ignition coil assembly (1).



10. Loosen the valve rocker arm cover to cylinder head retaining bolts (1).
11. Remove the valve rocker arm cover (2).



Important: The valve rocker arm cover gasket is a single use only component and must be replaced whenever the valve rocker arm cover is removed from the cylinder head.

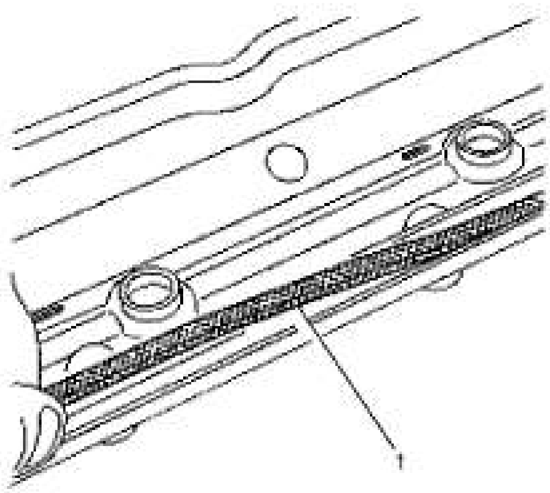
12. Remove the valve rocker arm cover gasket (1).

    Discard the valve rocker arm cover gasket (1).

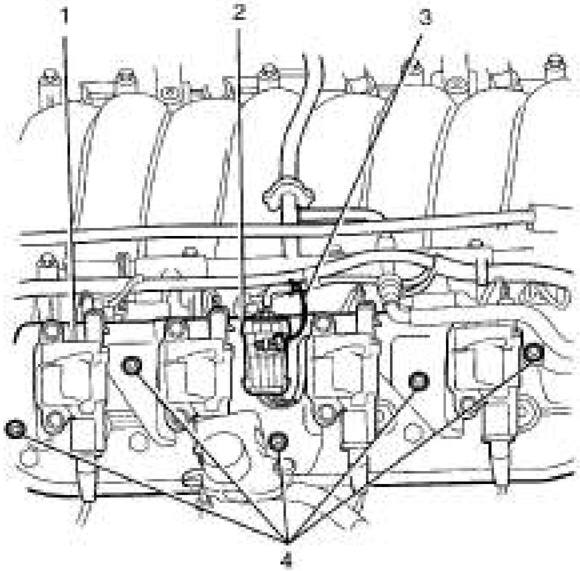
Installation Procedure

Important:

- All gasket surfaces should be free of oil and other foreign material during assembly.
- DO NOT reuse the valve rocker arm cover gasket.
- The valve rocker arm cover bolt grommets may be reused.
- If the positive crankcase ventilation (PCV) valve grommet has been removed from the rocker arm cover, install a NEW grommet during assembly.



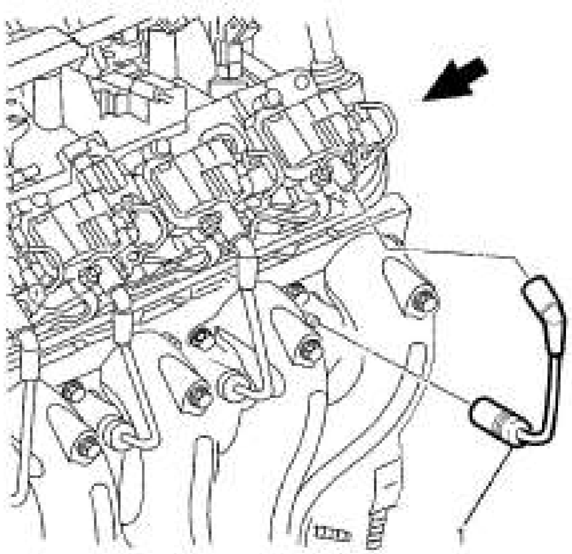
1. Install a NEW valve rocker arm cover gasket (1).
2. Install the valve rocker arm cover. Refer to Valve Rocker Arm Cover Installation - Left Side.



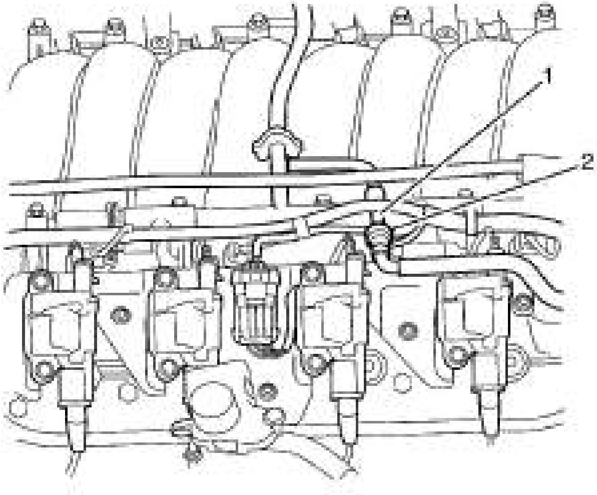
3. Install the ignition coil assembly (1).
4. Install the ignition coil bracket to valve rocker arm cover retaining studs (4).

Tighten
Tighten the studs to 12 N·m (106 lb in).

5. Connect the ignition coil main connector (2).
6. Install the Connector Position Assurance (CPA) lock (3) from the ignition coil main connector (2).



7. Install the spark plug leads (1).



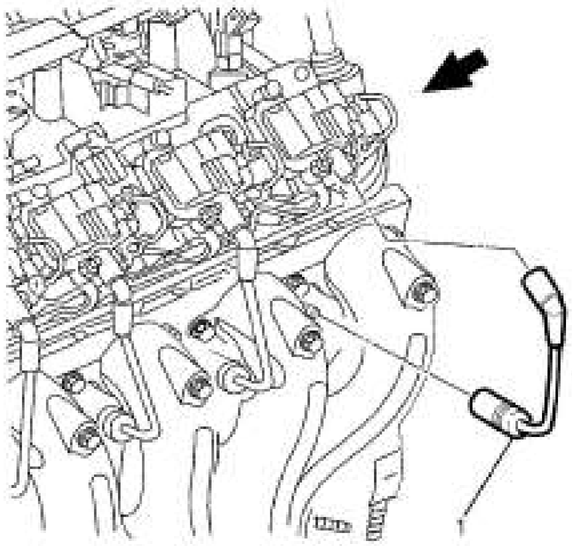
8. Remove the plug on the fuel feed pipe (2) and fuel rail tube (1) ends.
9. Connect the fuel rail feed pipe (2) quick connect fitting. Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.
10. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
11. Install the dress engine cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - On Vehicle | **Document ID: 2038129**

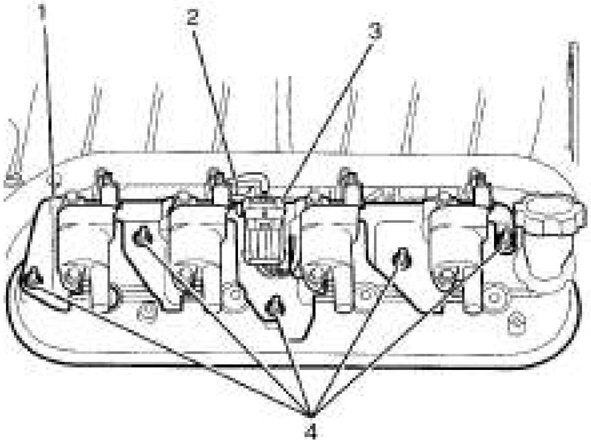
Valve Rocker Arm Cover Replacement - Right Side

Removal Procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine cover. Refer to Engine Cover Replacement .

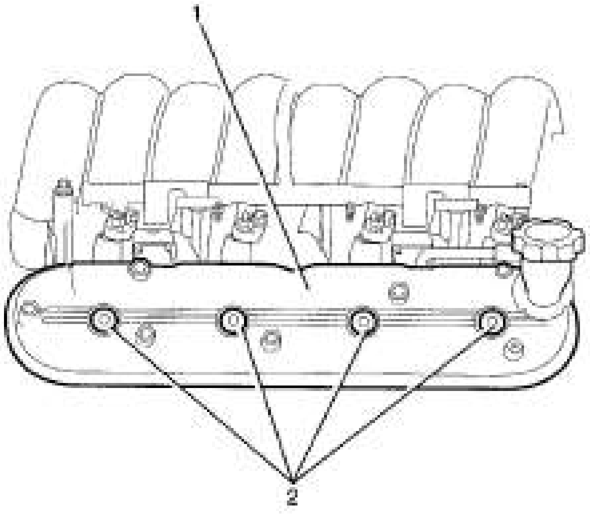


3. Remove the spark plug leads (1).

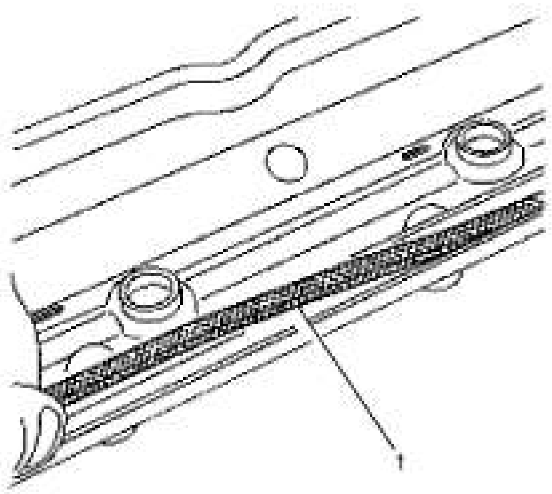


4. Remove the CPA lock (2) from the ignition coil main connector (3).
5. Disconnect the ignition coil main connector (3).

6. Remove the ignition coil assembly to valve rocker arm cover retaining studs (4).
7. Remove the ignition coil assembly (1).



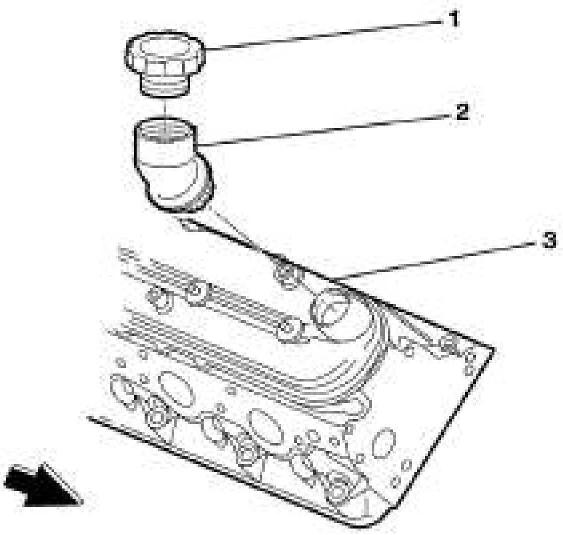
8. Remove the valve rocker arm cover retaining bolts (2) and valve rocker arm cover (1).
9. Remove the valve rocker arm cover (1). Refer to Valve Rocker Arm Cover Installation - Right Side.



Important: The valve rocker arm cover gasket is a single use only component and must be replaced whenever the valve rocker arm cover is removed from the cylinder head.

10. Remove the valve rocker arm cover gasket (1).

    Discard the valve rocker arm cover gasket (1).



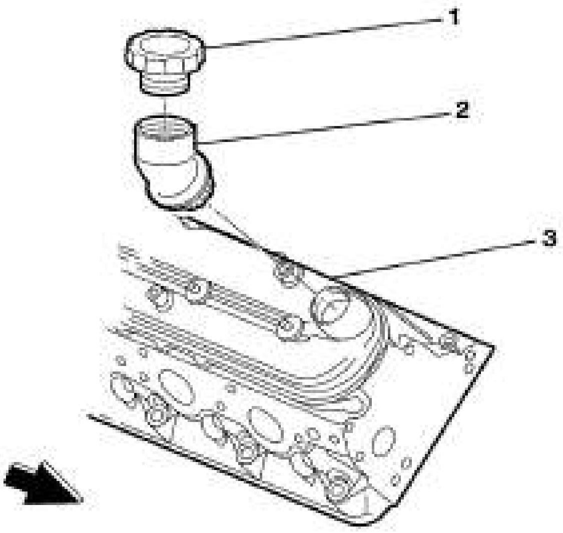
11. Remove the oil fill cap (1) from the oil fill tube (2).

    Important: Do not remove the oil fill tube from the cover, unless service is required. If the oil fill tube has been removed from the cover, install a NEW tube during assembly.

12. Remove the oil fill tube (2), from the right hand valve rocker arm cover (3) if required.

    Discard the oil fill tube (2).

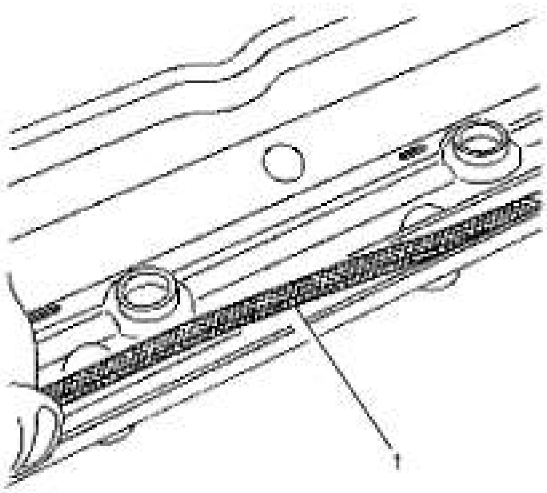
Installation Procedure



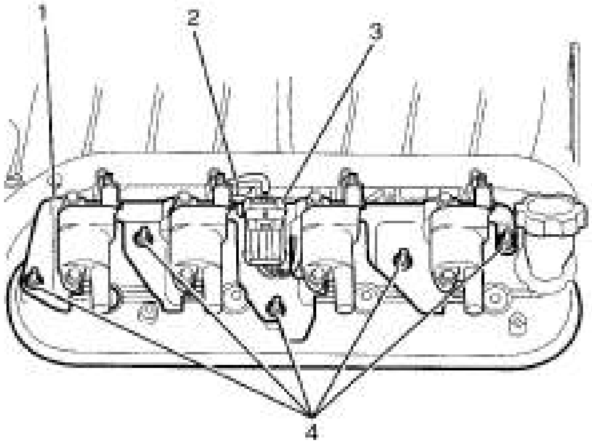
1. Install the NEW oil fill tube (2), to the right hand valve rocker arm cover (3) if required.
2. Install the oil fill cap (1) to the oil fill tube (2).

Important:

- All gasket surfaces should be free of oil and other foreign material during assembly.
- DO NOT reuse the valve rocker arm cover gasket.
- The valve rocker arm cover bolt grommets may be reused.



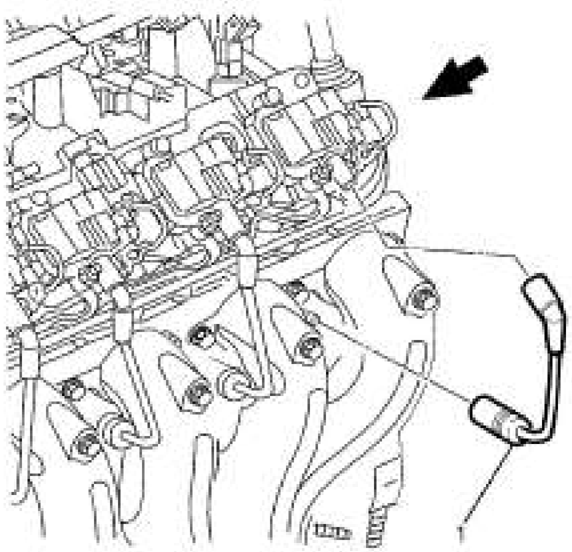
3. Install a NEW valve rocker arm cover gasket (1).
4. Install the valve rocker arm cover. Refer to Valve Rocker Arm Cover Installation - Right Side.



5. Install the ignition coil assembly (1).
6. Install the ignition coil bracket to valve rocker arm cover retaining studs (4).

   Tighten
   Tighten the studs to 12 N·m (106 lb in).

7. Connect the ignition coil main connector (3).
8. Install the CPA lock (2) from the ignition coil main connector (3).



9. Install the spark plug leads (1).
10. Install the engine cover. Refer to Engine Cover Replacement .

Valve Stem Oil Seal and Valve Spring Replacement

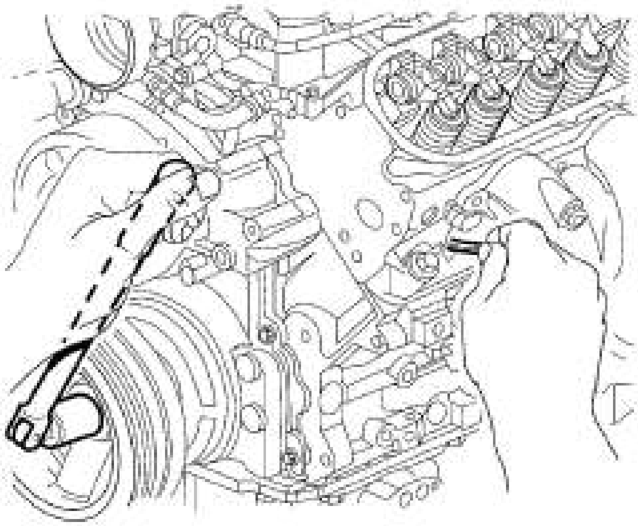
Tools Required

- J 22794 Spark Plug Port Adapter
- J 38606 Valve Spring Compressor (Head-on)

Removal Procedure

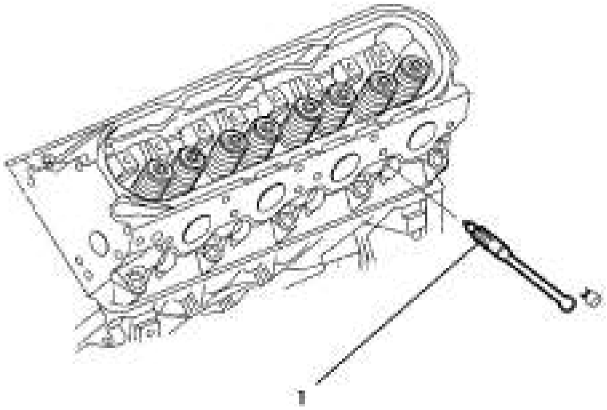
Important: Store all valve train components in the same order they are removed. Make sure all valve train components are installed in the same location as on removal.

1. Remove the valve rocker arms. Refer to Valve Rocker Arm and Push Rod Cleaning and Inspection.
2. Remove the spark plug. Refer to Spark Plug Replacement.

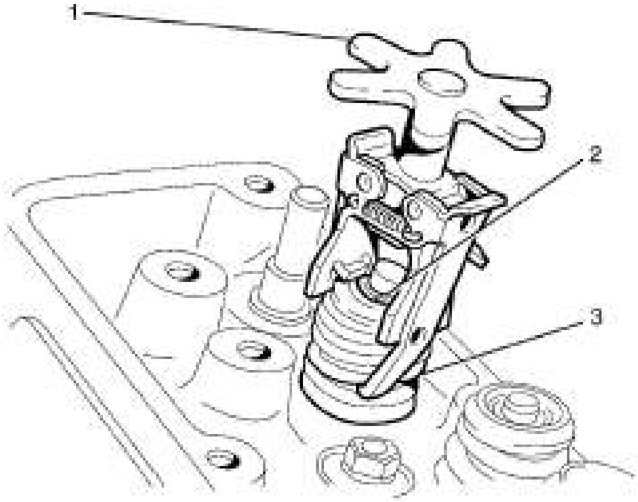


Important: This operation can be performed with the cylinder at the bottom of its stroke, however with the piston at TDC the valve will not fall into the cylinder if the air supply is accidentally disconnected during the operation.

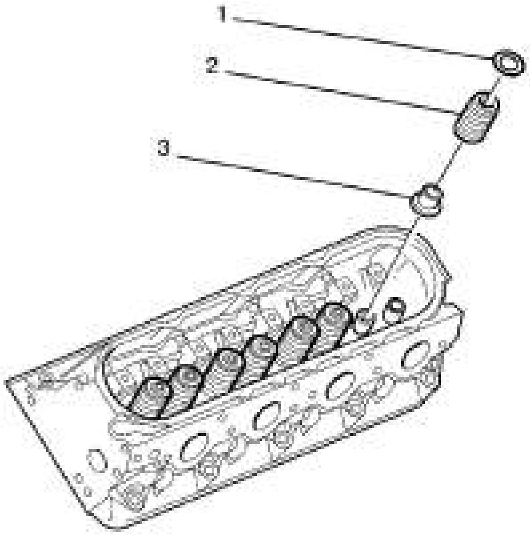
3. Using a socket and handle on the crankshaft pulley retaining bolt, rotate the crankshaft until the piston of the cylinder being serviced is at the Top Dead Centre (TDC) of the compression stroke.



4. Install the J 22794 (1) or equivalent into the spark plug hole of the cylinder being serviced.
5. Attach a compressed air line to J 22794 (1) and apply a constant supply of air pressure to the cylinder being serviced.
6. Tap the end of the valve stem with a soft face hammer in order to dislodge the valve spring cap retaining collets.

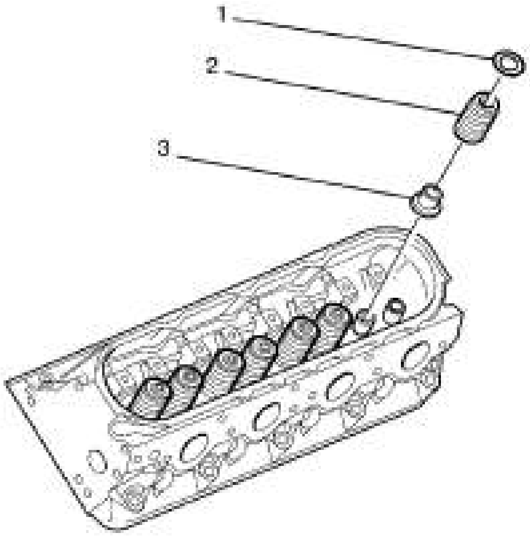


7. Use J 38606 (1) in order to compress the valve spring (3).
8. Remove the valve spring retaining cap collets (2).
9. Carefully release the valve spring (3) tension.
10. Remove the J 38606 (1).



11. Remove the valve spring cap (1).
12. Remove the valve spring (2).
13. Remove the valve stem oil seal (3).

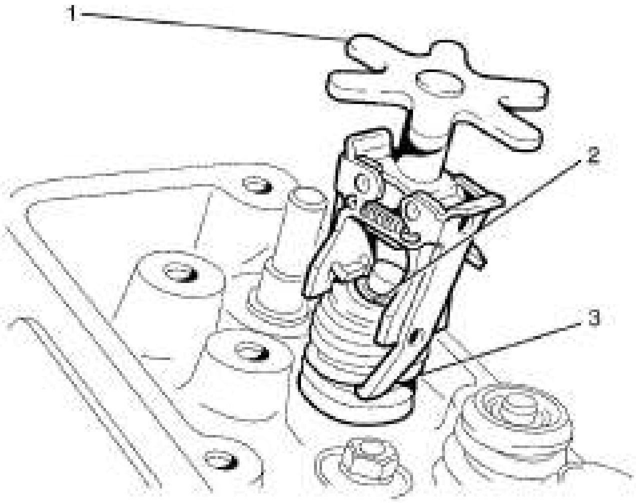
Installation Procedure



1. Clean the cylinder head valve spring seat and/or shim area.

   Important: The valve stem oil seal alignment and position on the valve guide is critical. An incorrectly installed valve stem oil seal may lead to above acceptable oil consumption and increased vehicle emissions.

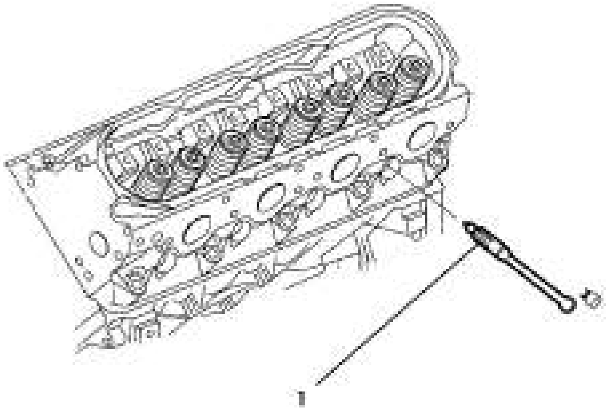
2. Install the valve stem oil seal (3). onto the guide.
3. Install the valve spring (2).
4. Install the valve spring cap (1).



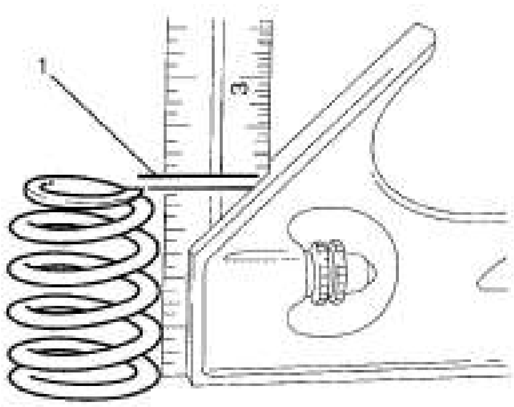
5. Use J 38606 (1) in order to compress the valve spring (3).
6. Compress the valve spring using the J 38606 (1).

   Important: Use clean grease or petroleum jelly to retain the valve spring retaining collets (2)

7. Install the valve spring retaining collets (2).
8. Release the J 38606 (1) making sure both valve spring retaining collets have seated correctly.
9. Lightly tap the valve stem with a soft faced hammer to seat the valve stem collets.



10. Disconnect and remove the compressed air supply from the J 22794 (1).
11. Remove the J 22794 (1) from the spark plug hole.

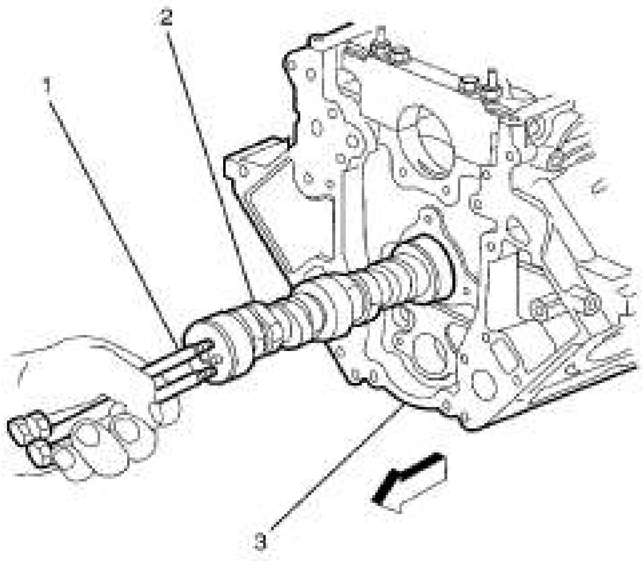


12. Measure the valve spring installed height using a ruler.

    Measure from the base of the valve spring to the top of the valve spring.

    - If the installed height exceeds 46.25 mm (1.82 in), install a valve spring shim of approximately 0.5 mm (0.02 in) thick.
    - Do not shim the valve spring to obtain less than the specified height.
    - Do not assemble the components without a spring shim on the cylinder head.
13. Install the spark plug. Refer to Spark Plug Replacement.
14. Install the valve rocker arms. Refer to Valve Rocker Arm and Push Rod Cleaning and Inspection.

Camshaft Installation (L98, LS2)

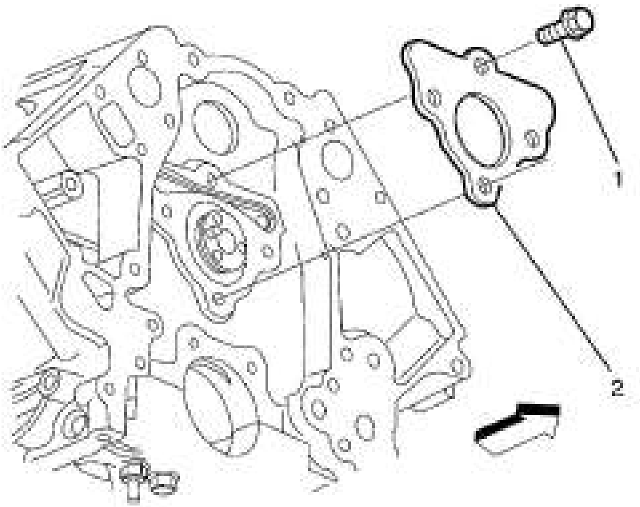


1. Lubricate the camshaft (2) journals and bearings with clean engine oil.
2. Install M8 -1.25 x 100 mm (M8 -1.25 x 4.0 in) bolts (1) in the front of the camshaft (2).

   Important: All camshaft journals are the same diameter, so care must be used in removing or installing the camshaft to avoid damage to the camshaft bearings.

3. Using the bolts (1) as a handle, carefully install the camshaft (2) into the cylinder block (3).
4. Remove the bolts (1) from the front of the camshaft (2).

   Notice: Refer to Fastener Notice in the Preface section.



Important: The gasket surface on the engine block should be clean and free of dirt or debris.

5. Install the camshaft retainer (2).
6. Install the camshaft retainer to cylinder block retaining bolts (1).

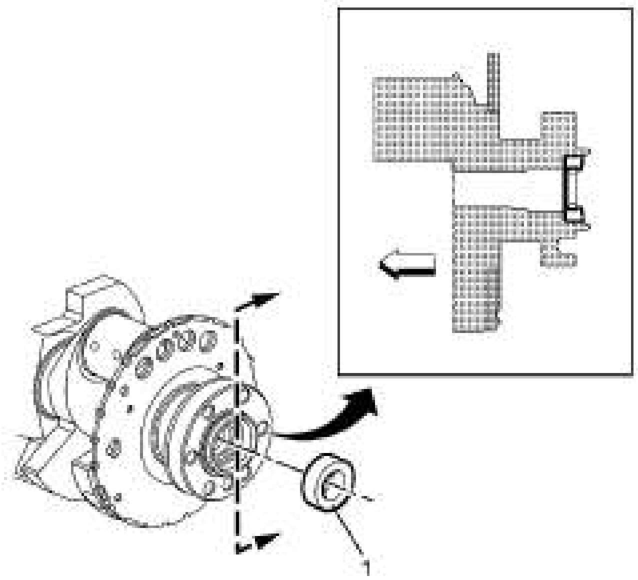
Tighten
Tighten the bolts to 25 N·m (18 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | Document ID: 1986601

Clutch Pilot Bearing Installation

Tools Required

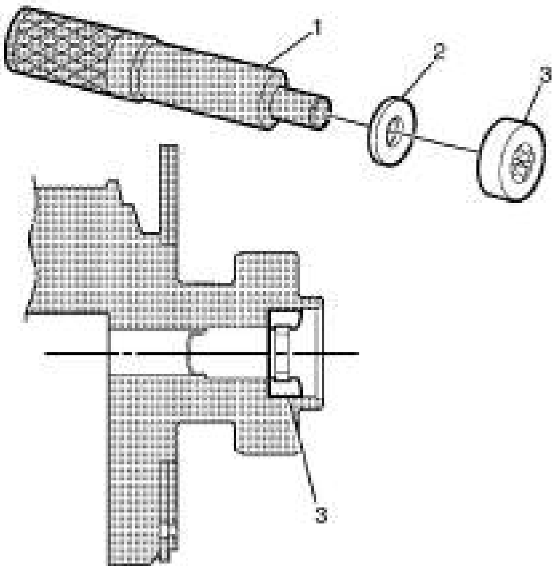
J 38836 Bushing Installer and Clutch Arbor



Important: Make sure that the crankshaft rear oil gallery plug (1) is not a loose fit, damaged or leaking.

Important: The correct depth (a) for the oil gallery plug is 31.2 to 31.6 mm.

1. Apply sealant LOCTITE R 242 and install it to the correct depth, If replacing the oil gallery plug (1).



Important: Use a 5/8 inch flat washer (2) against the tool to support the bearing races.

Important: When installed correctly the bearing should be flush with the crankshaft counter-bore.

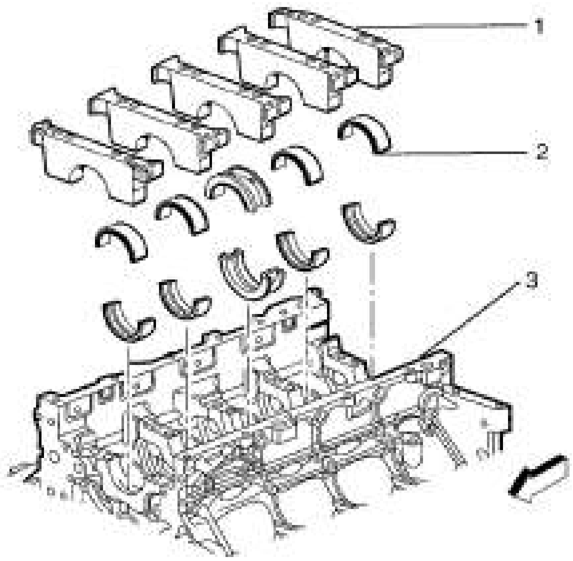
2. Install the clutch pilot bearing (3) to the rear of the crankshaft, using J 38836 (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 1986487**

Crankshaft and Bearing Installation

Tools Required

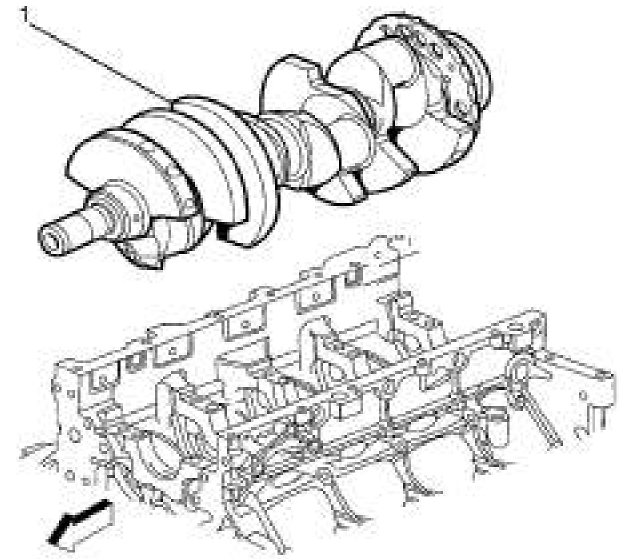
J 45059 Angle Meter



Important: The crankshaft bearings (2) MUST be installed to their original position after performing an oil clearance check.

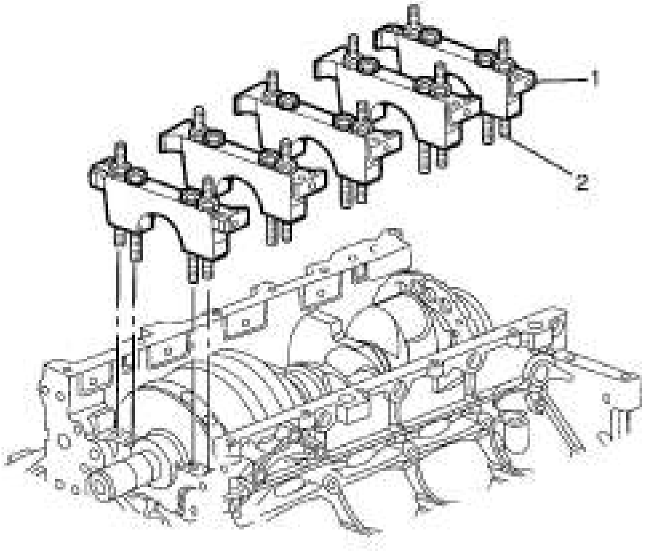
Important: Do not apply engine oil to the back of the crankshaft bearings (2).

1. Install the crankshaft bearings (2) into the bearing caps (1) and the cylinder block (3).
2. Apply clean engine oil to the bearing halves and crankshaft journals.



Important: Make sure the crankshaft (1) is held square to avoid damaging the centre main thrust bearing or the reluctor ring teeth. Nicks, burrs or other damage to the teeth may effect on-board diagnostics (OBD) II system performance.

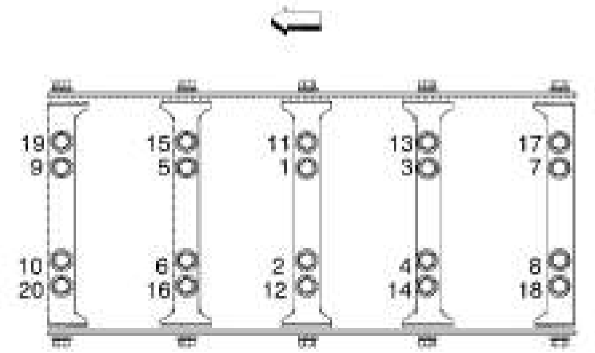
3. Install the crankshaft (1).



Important: The crankshaft bearing caps are machined with the engine block for the correct clearances. The crankshaft bearing caps MUST be installed to their original position and direction.

4. Install the crankshaft bearing caps (1).
5. Install the crankshaft bearing cap bolts and studs (2).

Notice: Refer to Fastener Notice in the Preface section.



Important: Perform the Stage 1 for bolts and studs 1-20 and then continue with Stage 2. Use the J 45059 to achieve an accurate second reading, noting the different turn angles for the bolts and the studs.

6. Tighten the crankshaft bearing cap bolts and studs (2) in the sequence shown.

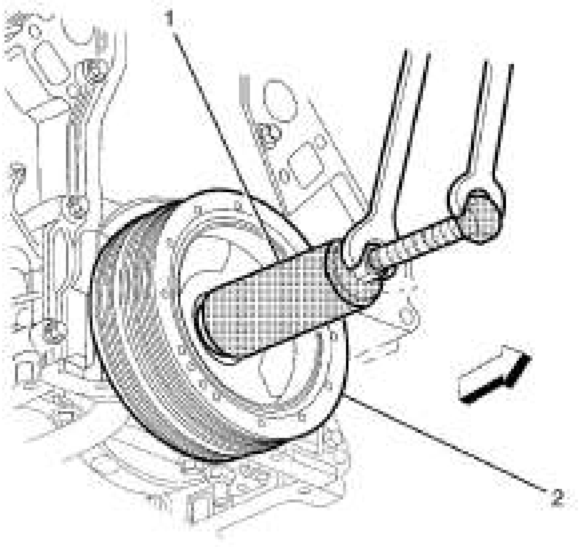
Tighten

1. Tighten the crankshaft bearing cap to cylinder block inner retaining bolts (1 - 10) a first pass in sequence to 20 N·m (14 lb ft).
2. Tighten the crankshaft bearing cap to cylinder block inner retaining bolts (11 - 20) a first pass in sequence to 20 N·m (14 lb ft).
3. Tighten the crankshaft bearing cap to cylinder block inner retaining bolts (1 - 10) a second pass in sequence an additional 80 degrees using the J 45059 .
4. Tighten the crankshaft bearing cap to cylinder block inner retaining bolts (11 - 20) a second pass in sequence an additional 53 degrees using the J 45059 .

Crankshaft Balancer Installation (L98, LS2)

Tools Required

- J 41478 Crankshaft Front Oil Seal Installer
- J 41665 Crankshaft Balancer and Sprocket Installer
- J 42386-A Flywheel Holding Tool
- J 45059 Angle Meter



1. Use J 41665 (1) to install the crankshaft balancer (2).
   1.1. Assemble the threaded rod, nut, washer and installer.

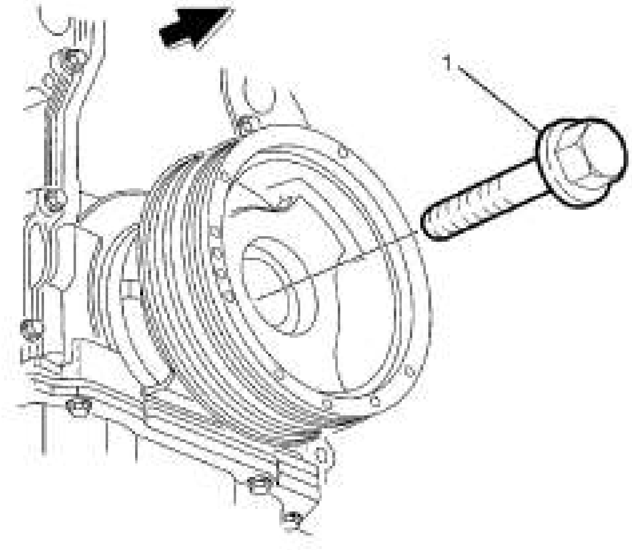
   Insert the smaller end of the installer into the front of the crankshaft balancer (2).

   1.2. Use a wrench and hold the hex end of the threaded rod.
   1.3. Use a second wrench and rotate the installation tool nut clockwise, until the crankshaft balancer (2) is started onto the crankshaft.
   1.4. Remove the tool and reverse the installation tool.

   Position the larger end of the installer against the front of the crankshaft balancer (2).

   1.5. Use a wrench and hold the hex end of the threaded rod.
   1.6. Use a second wrench and rotate the installation tool nut clockwise, until the crankshaft balancer (2) is installed onto the crankshaft.
   1.7. Remove the J 41665 (1).

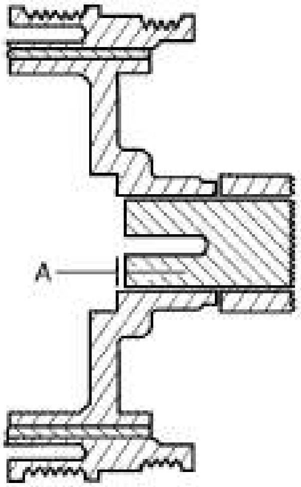
Notice: Refer to Fastener Notice in the Preface section.



2. Install the used crankshaft balancer retaining bolt (1).

   Tighten
   Tighten the bolt to 330 N·m (240 lb ft).

3. Remove the used crankshaft balancer retaining bolt (1).



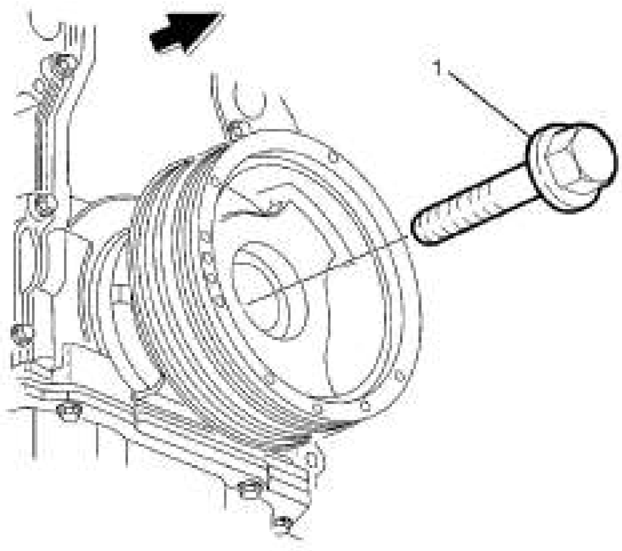
4. Measure the distance the balancer protrudes from the crankshaft nose and ensure dimension (A) is to specification

   Specification

Dimension (A): 2.4-4.48 mm (0.094-0.176 in)

If the balancer is not installed to the correct dimensions, install the J 41665 and repeat the installation procedure.

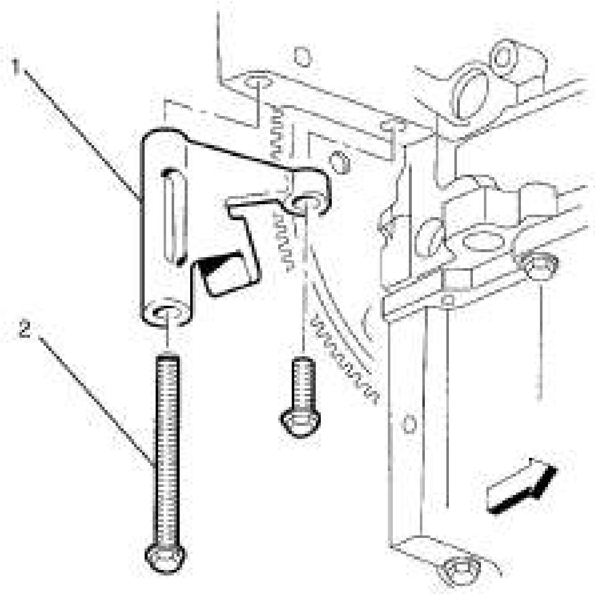
Notice: Refer to Fastener Notice in the Preface section.



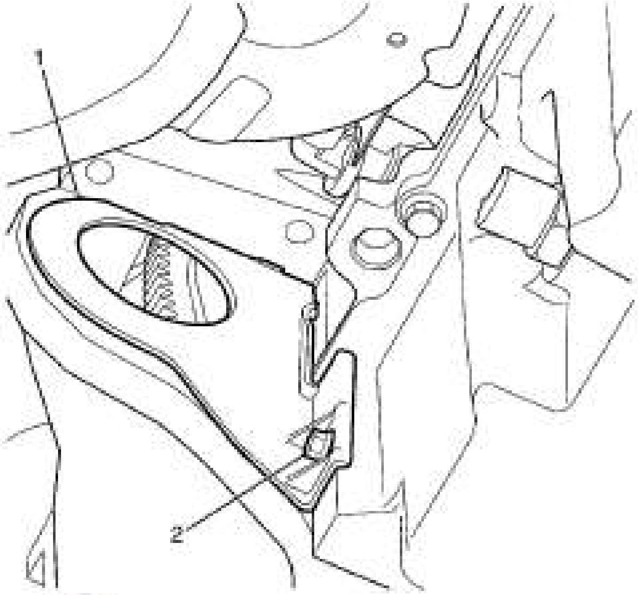
5. Install the NEW crankshaft balancer retaining bolt (1).

Tighten

- First Pass: Tighten the bolts to 50 N·m (37 lb ft).
- Final Pass: Tighten an additional 140 degrees using the J 45059 .



6. Remove the J 42386-A to cylinder block retaining bolts (2).
7. Remove the J 42386-A (1).



8. Install the right transmission cover (1).

Notice: Refer to Fastener Notice in the Preface section.

9. Install the right transmission cover (1) to engine oil pan retaining bolt (2).

Tighten
Tighten the bolt to 12 N·m(106 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2086073**

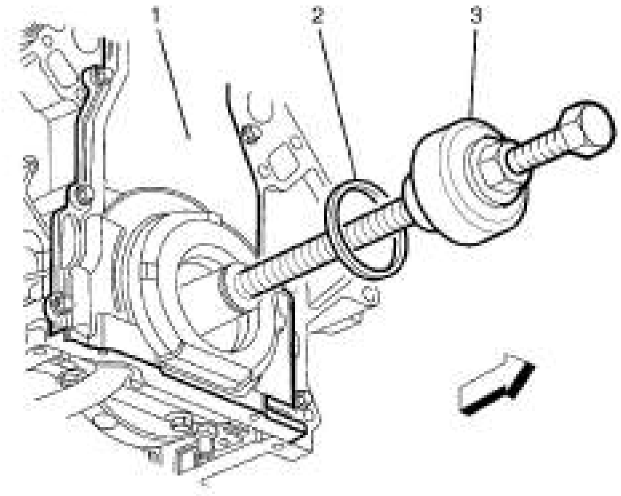
Crankshaft Front Oil Seal Installation (L98, LS2)

Tools Required

J 41478 Crankshaft Front Oil Seal Installer

Important:

- Do not lubricate the oil seal sealing surface.
- Do not reuse the crankshaft oil seal.
- Lubricate the outer edge of the oil seal with clean engine oil.
- Lubricate the front engine cover oil seal bore with clean engine oil.



1. Install the crankshaft front oil seal onto the J 41478 (3) guide.
2. Install the J 41478 (3) threaded rod (with nut, washer, guide, and oil seal) into the end of the crankshaft.
3. Use the J 41478 (3) in order to install the oil seal (2) into the front engine cover (1) bore.
    - 3.1. Use a wrench and hold the hex on the installer tool.
    - 3.2. Use a second wrench and rotate the installer nut clockwise until the seal bottoms in the front engine cover (1) bore.
    - 3.3. Remove the tool.
    - 3.4. Inspect the oil seal for correct installation. The oil seal should be installed evenly and completely into the front cover bore.

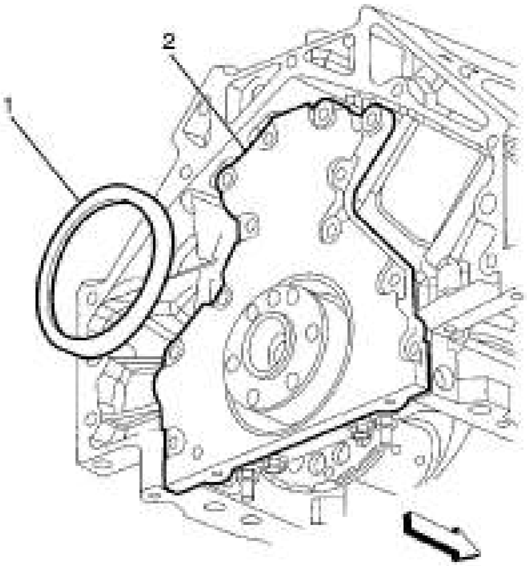
Crankshaft Rear Oil Seal Installation (L98, LS2)

Tools Required

J 41479 Crankshaft Rear Oil Seal Installer

Important:

- Do not lubricate the oil seal (1) inside diameter (ID) of the crankshaft surface.
- Do not reuse the crankshaft rear oil seal (1).

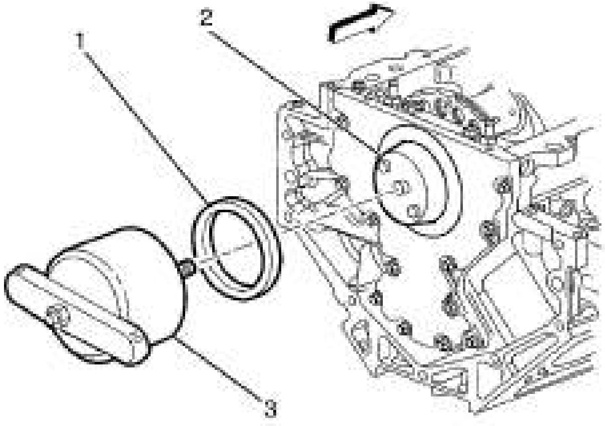


1. Lubricate the outside diameter (OD) of the oil seal (1) with clean engine oil.

   DO NOT allow oil or other lubricants to contact the seal surface.

2. Lubricate the rear cover (2) oil seal bore with clean engine oil.

   DO NOT allow oil or other lubricants to contact the crankshaft surface.



3. Install the J 41479 (3) cone and bolts onto the rear of the crankshaft.

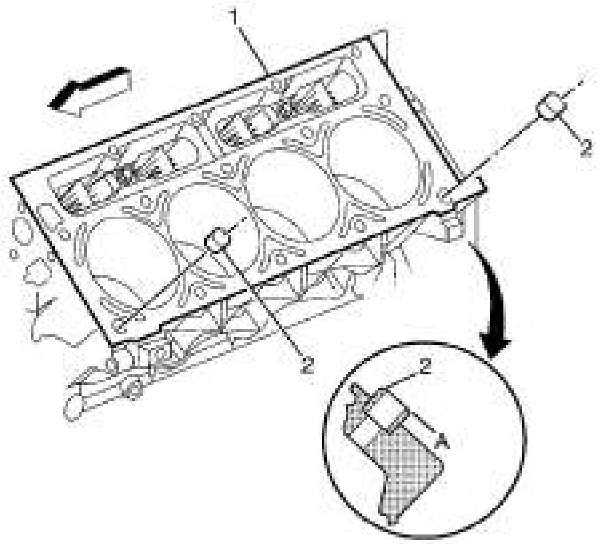
   Important: Do not over tighten the bolts.

4. Tighten the bolts.
5. Install the rear oil seal (1) onto the J 41479 (3) and push the seal to the rear cover bore (2).
6. Thread the J 41479 (3) threaded rod into the tapered cone until the J 41479 (3) contacts the rear oil seal (1).
7. Align the rear oil seal (1) onto the J 41479 (3).
8. Rotate the handle of the J 41479 (3) clockwise until the rear oil seal (1) enters and bottoms into the rear cover bore (2).
9. Remove the J 41479 (3).

Cylinder Head Installation - Left Side (L98, LS2)

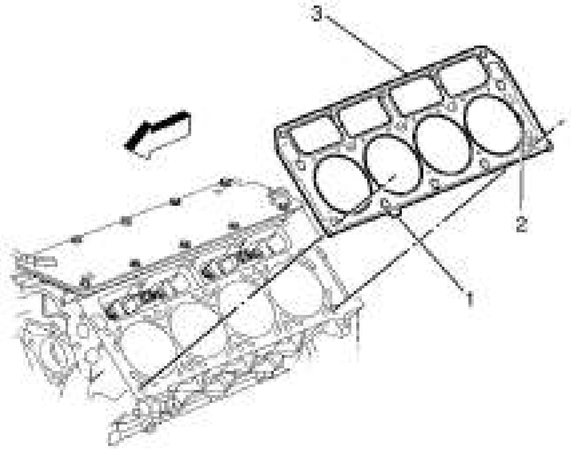
Tools Required

- J 42385-100 Thread Repair Kit
- J 45059 Angle Meter



Important: Make sure the locating sleeves (2) are correctly installed to the maximum height (A) of 8.3 mm (0.33 in).

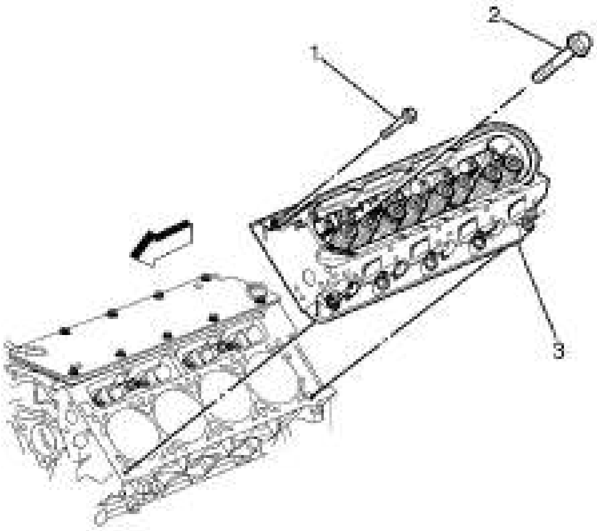
1. Install the locating sleeves (2) into the cylinder block (1).



Important: The cylinder head gasket (3) will fit on either side of the engine. Make sure the tab on the cylinder head gasket (1) is located towards the front half point and the stamping FRONT on the cylinder head gasket (2) is facing the front of the engine.

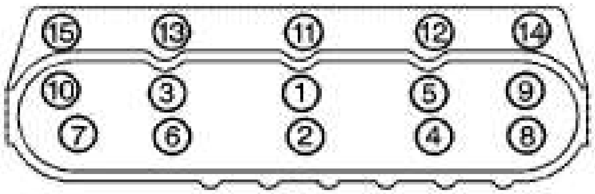
Important: Do not use any type of sealant on the cylinder head gasket (3), unless specified.

2. Install the NEW cylinder head gasket (1) correctly over the locating sleeves.



3. Install the cylinder head (3) onto the locating pins and the gasket.
4. Install the NEW cylinder head bolts (1,2).

Notice: Refer to Fastener Notice in the Preface section.



5. Tighten the cylinder head bolts.

Tighten

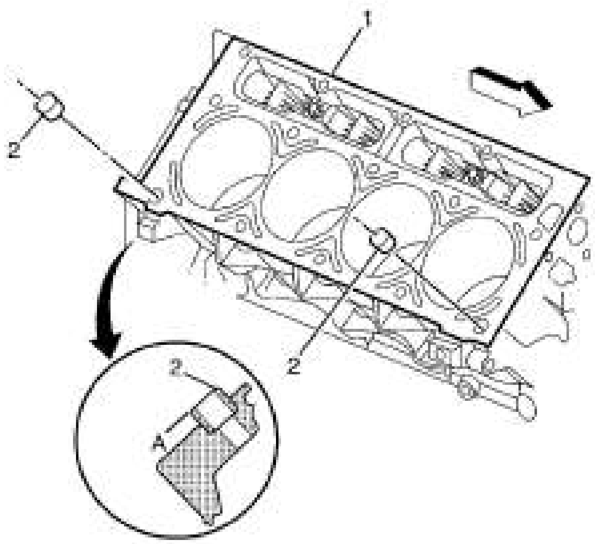
- First Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 30 N·m (22 lb ft).
- Second Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 90 degrees using the J 45059 .
- Final Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 70 degrees using the J 45059 .
- Tighten the M8 cylinder head bolts (11-15) to 30 N·m (22 lb ft). Begin with the centre bolt (11) and alternating side-to-side, work outward tightening all of the bolts.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2086082**

Cylinder Head Installation - Right Side (L98, LS2)

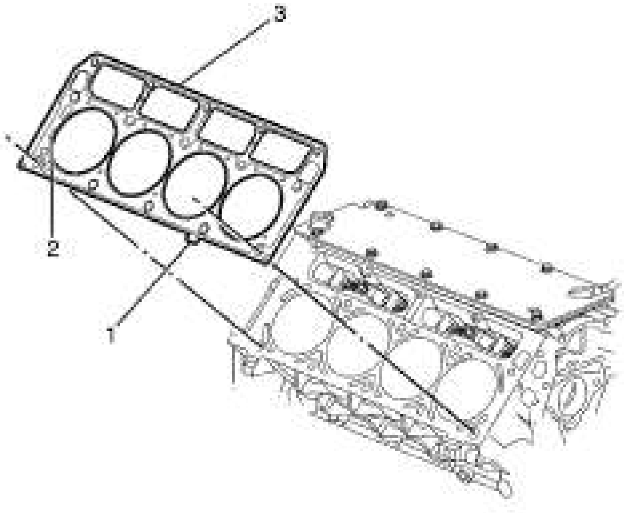
Tools Required

- J 42385-100 Thread Repair Kit
- J 45059 Angle Meter



Important: Make sure the locating sleeves (2) are correctly installed to the maximum height (A) of 8.3 mm (0.33 in).

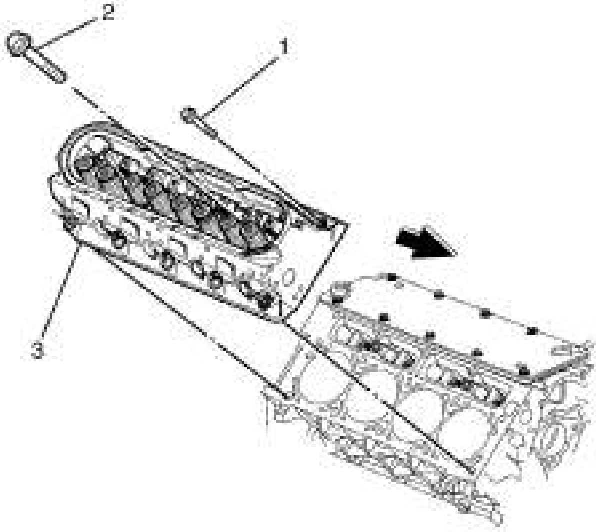
1. Install the locating sleeves (2) into the cylinder block (1).



Important: The cylinder head gasket (3) will fit on either side of the engine. Make sure the tab on the cylinder head gasket (1) is located towards the front half point and the stamping FRONT on the cylinder head gasket (2) is facing the front of the engine.

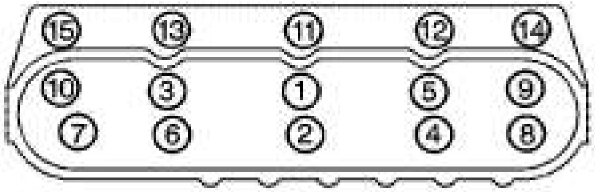
Important: Do not use any type of sealant on the cylinder head gasket (1), unless specified.

2. Install the NEW cylinder head gasket (1) correctly over the locating sleeves.



3. Install the cylinder head (3) onto the locating pins and the gasket.
4. Install the NEW cylinder head bolts (1,2).

Notice: Refer to Fastener Notice in the Preface section.

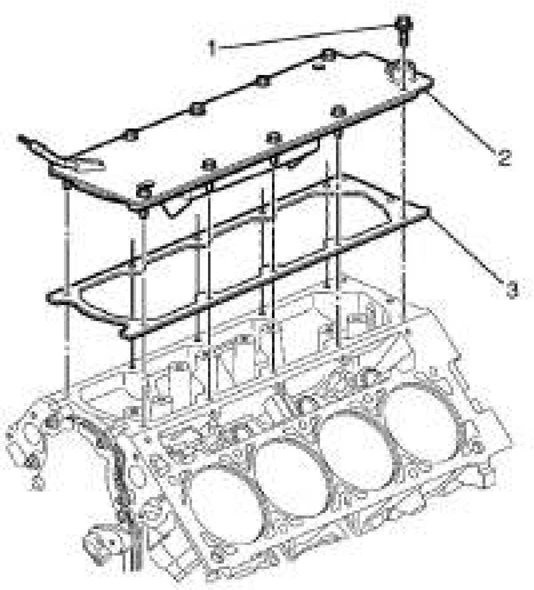


5. Tighten the cylinder head bolts.

Tighten

- First Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 30 N·m (22 lb ft).
- Second Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 90 degrees using the J 45059 .
- Final Pass: Tighten the M11 cylinder head bolts (1-10) in sequence to 70 degrees using the J 45059 .
- Tighten the M8 cylinder head bolts (11-15) to 30 N·m (22 lb ft). Begin with the centre bolt (11) and alternating side-to-side, work outward tightening all of the bolts.

Engine Block Valley Cover Installation (L98, LS2)



Important: All gasket surfaces should be free of oil or other foreign material during assembly.

1. Install the NEW valley cover gasket (3).
2. Install the valley cover (2).

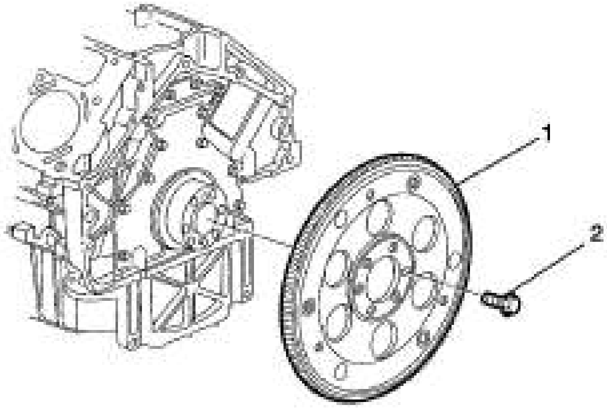
Notice: Refer to Fastener Notice in the Preface section.

3. Install the valley cover to cylinder block retaining bolts (1).

Tighten
Tighten the bolts to 25N·m (18 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | Document ID: 2086094

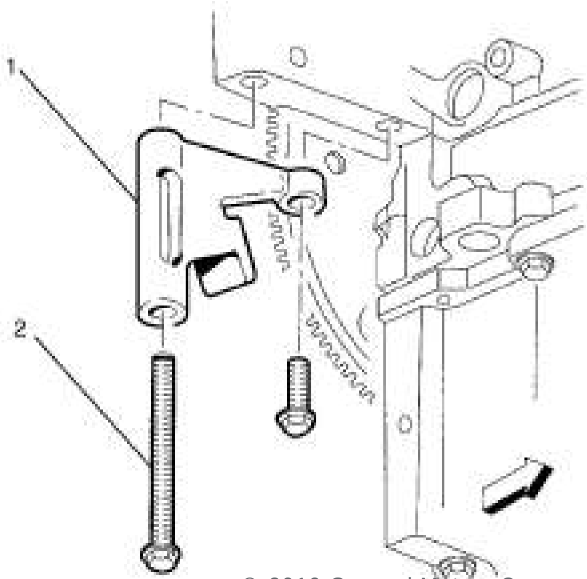
Engine Flywheel Installation (L98, LS2)



Important: The flexplate (1) will not initially seat against the crankshaft flange, but will be pulled onto the crankshaft by the flexplate to crankshaft retaining bolts (2). This procedure requires a 3 stage tightening process.

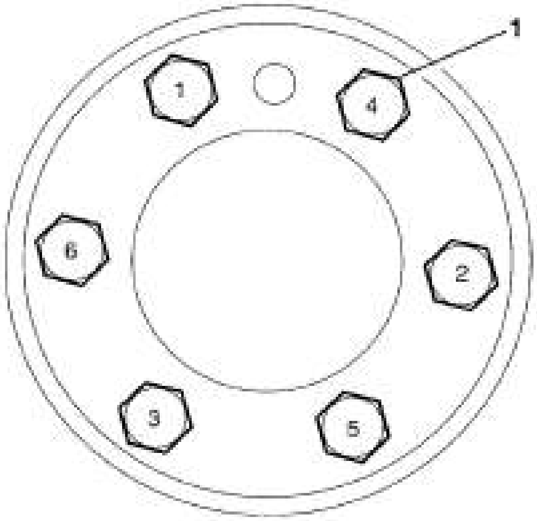
1. Install the flexplate (1).

Notice: Refer to Fastener Notice in the Preface section.



Important: Make sure the teeth of the J 42386-A J 42386-A (1) engage correctly with the ring gear teeth, before tightening the flexplate bolts.

2. Install the J 42386-A J 42386-A (1), using the two starter motor to cylinder block retaining bolts (2).



3. Install the NEW flexplate to crankshaft retaining bolts.

Tighten

- Tighten a first pass in sequence to 20 N·m (15 lb ft).
- Tighten a second pass in sequence to 50 N·m (37 lb ft).
- Tighten a final pass in sequence to 100 N·m (74 lb ft).

Engine Front Cover Installation

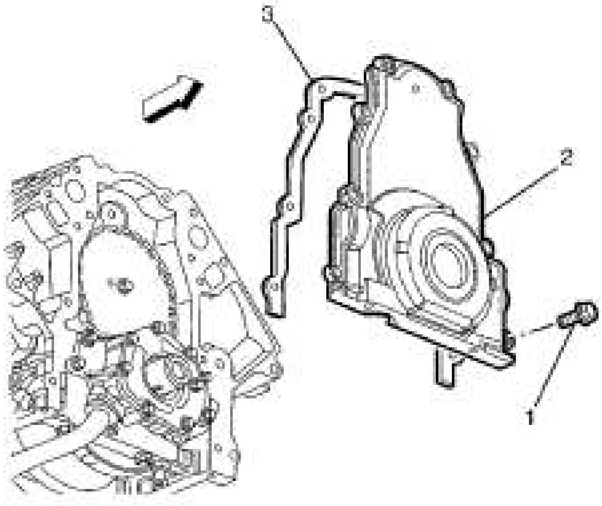
Tools Required

- J 41480 Front and Rear Cover Alignment
- J 41476 Front and Rear Cover Alignment Tool

Installation Procedure

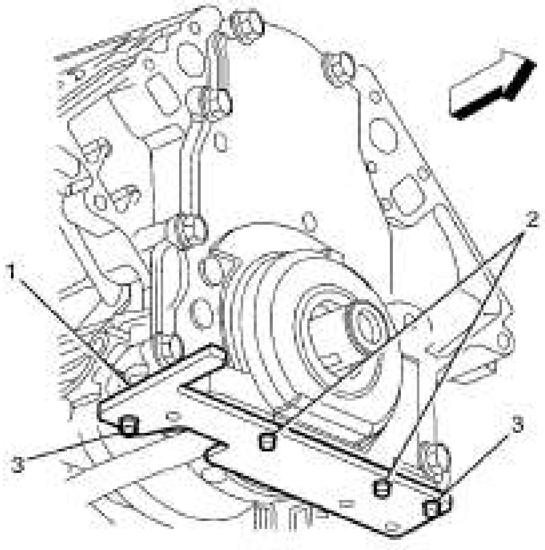
Important:

- Do not use the crankshaft oil seal or the engine front cover gasket again.
- Do not apply any type of sealant to the front cover gasket, unless specified.
- The special tools in this procedure are used to correctly align the engine front cover at the oil pan surface and to centre the crankshaft front oil seal.
  - All gasket surfaces should be free of oil or other foreign material during assembly.
  - The crankshaft front oil seal MUST be centred in relation to the crankshaft.
  - The oil pan sealing surface at the front cover and engine block MUST be aligned within specifications.
  - An incorrectly aligned front cover may cause premature front oil seal wear and/or engine assembly oil leaks.



1. Install the engine front cover gasket (3) and engine front cover (2).
2. Install the engine front cover retaining bolts (1).

DO NOT fully tighten at this stage.



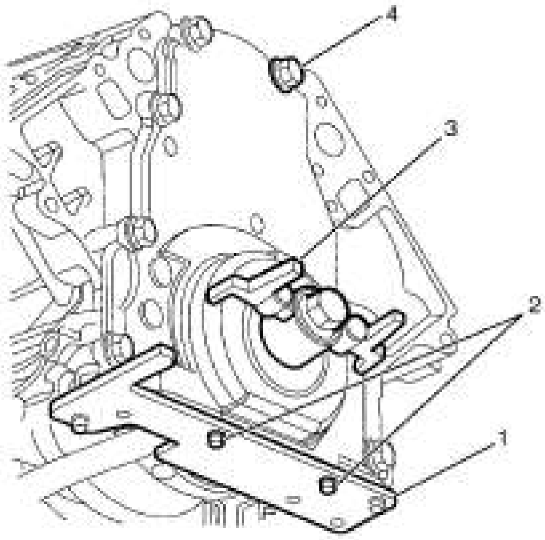
3. Position the J 41480 (1), and start the engine front cover aligning tool to front cover bolts (2).

   DO NOT fully tighten at this stage.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the engine front cover aligning tool to cylinder block retaining bolts (3).

   Tighten
   Tighten the bolts to 25 N·m (18 lb ft).



Important: Align the tapered legs of the J 41476 (3) with the machined alignment surfaces on the front cover.

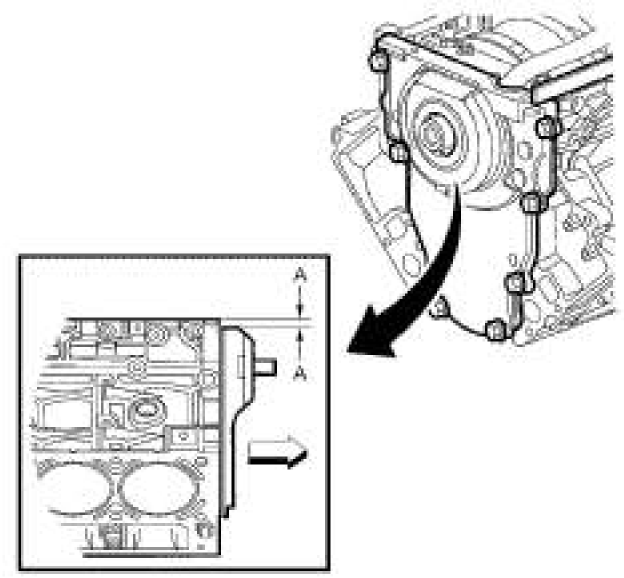
5. Install the J 41476 (3).
6. Install the crankshaft balancer retaining bolt and tighten the crankshaft balancer bolt by hand until firm. Do not over tighten.
7. Tighten the engine front cover aligning tool to front cover bolts (2).

Tighten
Tighten the bolts to 25 N·m (18 lb ft).

8. Tighten the engine front cover to cylinder block retaining bolts (4).

Tighten
Tighten the bolts to 25 N·m (18 lb ft).

9. Remove the J 41476 (3).
10. Remove the J 41480 (1).



11. Measure the oil pan surface flatness, front cover-to-engine block.
    - 11.1. Place a straight edge across the engine block and front cover oil pan sealing surfaces.

Avoid contact with the portion of the gasket that protrudes into the oil pan surface.

    - 11.2. Insert a feeler gauge between the front cover and the straight edge tool. The cover must be flush with the oil pan surface, or no greater than (A) below flush.

Specification
Dimension (A): 0.5 mm (0.02 in)

12. If the front cover-to-engine block oil pan surface alignment is not within specifications, repeat the cover alignment procedure.
13. If the correct front cover-to-engine block alignment cannot be obtained, replace the front cover.

Engine Prelubing (L98, LS2)

Tools Required

J 45299 Engine Pre-Luber

> **Important:** A constant and continuous flow of clean engine oil is required in order to correctly prime the engine. Be sure to use an approved engine oil as specified in the owners manual.

1. Remove the engine oil filter and fill with clean engine oil.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the oil filter.

   Tighten
   Tighten the filter to 30 N·m (22 lb ft).

3. Remove the engine block left front oil gallery plug.
4. Install the M16 x 1.5 adapter.
5. Install the flexible hose to the adapter and open the valve.
6. Pump the handle on the J 45299 in order to flow a minimum of 1-1.9 litres (1-2 quarts) engine oil. Observe the flow of engine oil through the flexible hose and into the engine assembly.
7. Close the valve and remove the flexible hose and adapter from the engine.
8. Install the gallery plug to the engine.

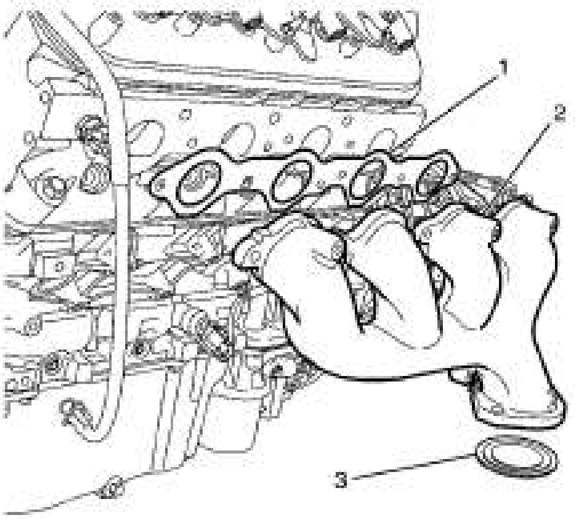
   Tighten
   Tighten the plug to 60 N·m (44 lb ft).

9. Top-off the engine oil to the correct level.

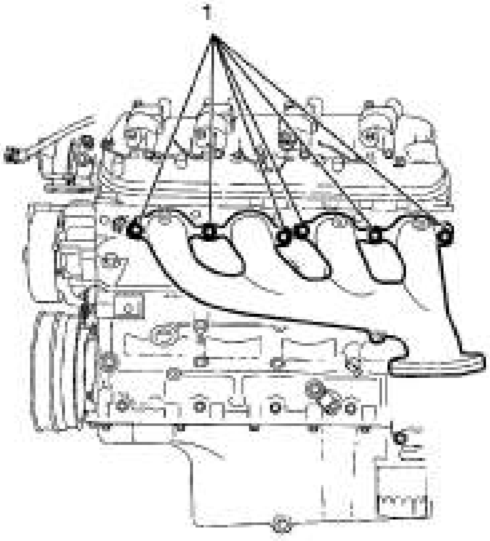
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2110818**

Exhaust Manifold Installation - Left Side (LWB SWB)

Notice: Refer to Hot Exhaust System Caution in the Preface section.



1. Install the exhaust manifold (2), NEW exhaust manifold gasket (1) and sealing ring (3).



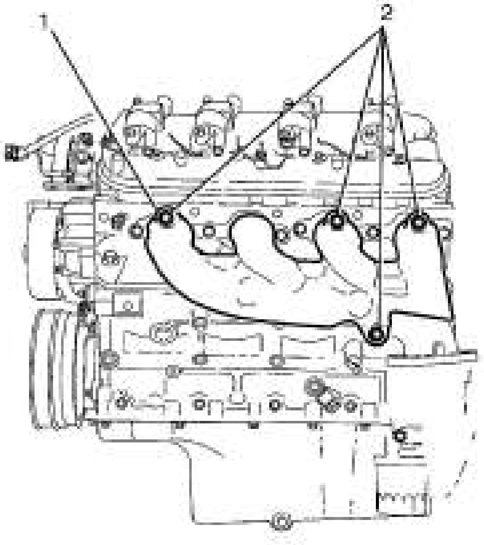
2. Apply a 5 mm (0.2 in) wide band of threadlock, or equivalent, to the threads of the exhaust manifold to cylinder head retaining bolts (1). Refer to Adhesives, Fluids, Lubricants, and Sealers.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the exhaust manifold to cylinder head retaining bolts (1).

   Tighten

   - First Pass: Tighten the bolts to 15 N·m (11 lb ft). Tighten the exhaust manifold bolts beginning with the centre 2 bolts. Alternate from side-to-side, and work toward the outside bolts.
   - Final Pass: Tighten the bolts to 20 N·m (15 lb ft). Tighten the exhaust manifold bolts beginning with the centre 2 bolts. Alternate from side-to-side, and work toward the outside bolts.
4. Using a flat punch, bend over the exposed edge of the exhaust manifold gasket at the rear of the left cylinder head.



5. Install the exhaust manifold heat shield (1).
6. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (2).

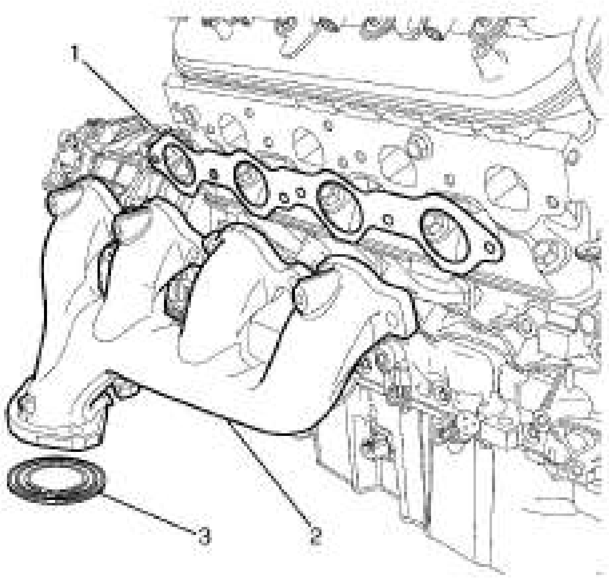
   Tighten

   Tighten the bolts to 10 N·m (89 lb in).

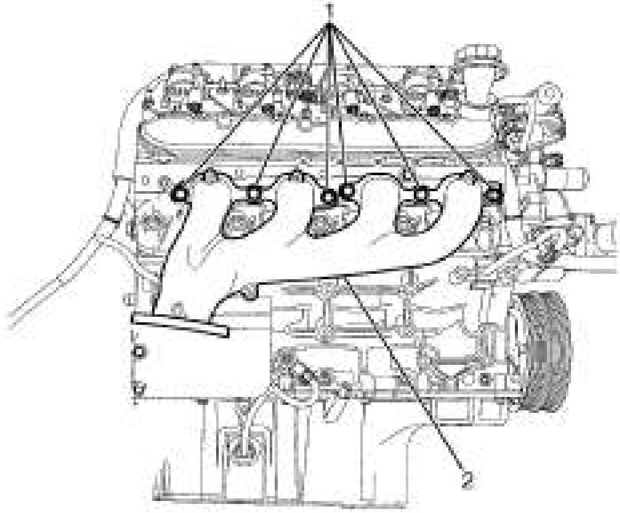
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2096413**

Exhaust Manifold Installation - Right Side (LWB SWB)

Notice: Refer to Hot Exhaust System Caution in the Preface section.



1. Install NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).
2. Install the exhaust manifold assembly to engine.

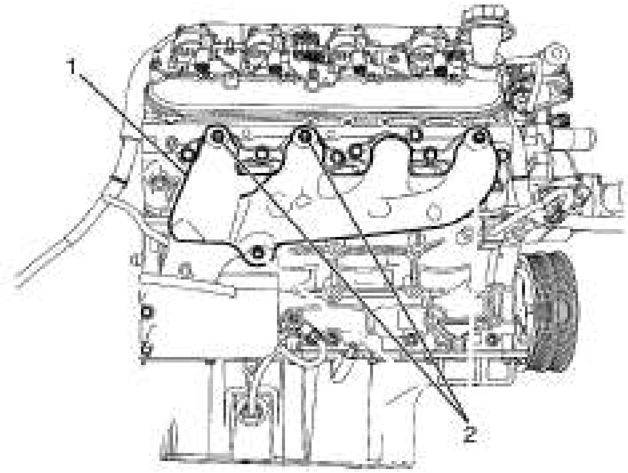


Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

3. Install the NEW exhaust manifold to cylinder head retaining bolts (1).
4. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten

- First Pass: Tighten the bolts to 15 N·m (11 lb ft). Tighten the exhaust manifold bolts beginning with the centre 2 bolts. Alternate from side-to-side, and work toward the outside bolts.
- Final Pass: Tighten the bolts to 20 N·m (15 lb ft). Tighten the exhaust manifold bolts beginning with the centre 2 bolts. Alternate from side-to-side, and work toward the outside bolts.

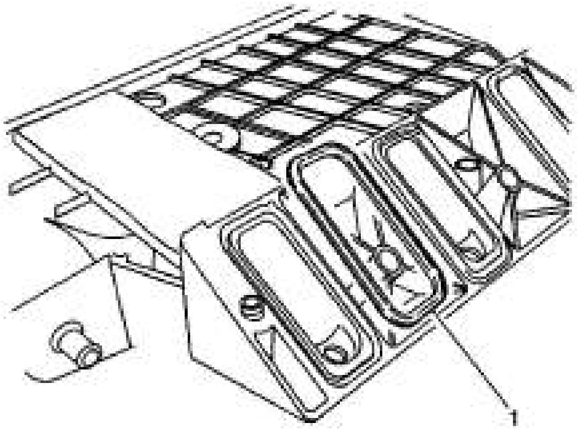


5. Install the exhaust manifold heat shield (1).
6. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (2).

Tighten

Tighten the bolts to 10 N·m (89 lb in).

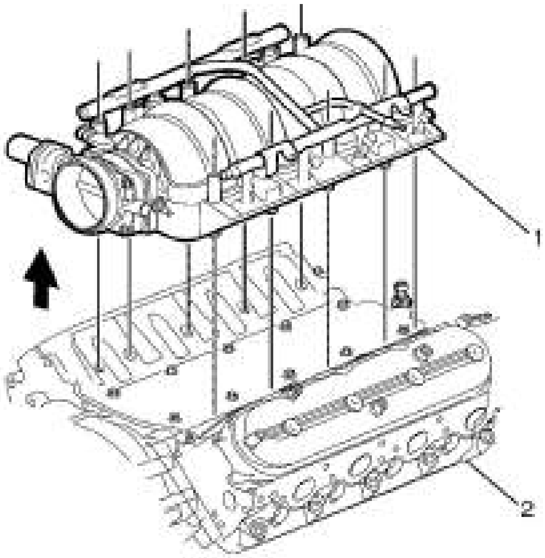
Intake Manifold Installation (L98, LS2)



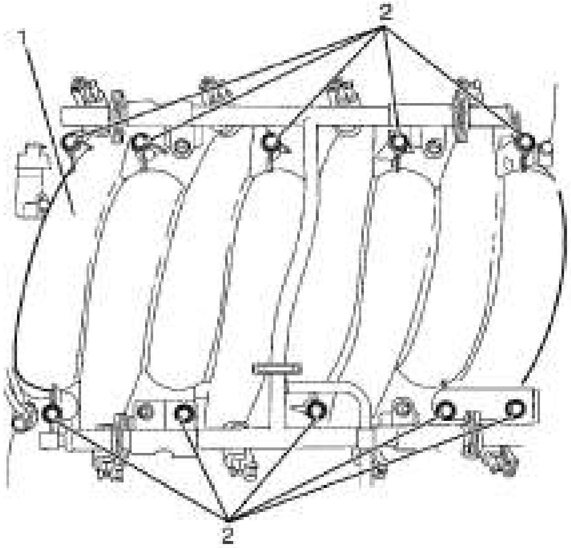
Important: DO NOT reuse the intake manifold gaskets. Install NEW intake manifold gaskets.

Important: The intake manifold, throttle body, fuel injection rail and fuel injectors may be installed as an assembly. If not servicing the individual components, install the intake manifold as a complete assembly.

1. Install NEW intake manifold to cylinder head gaskets (1).

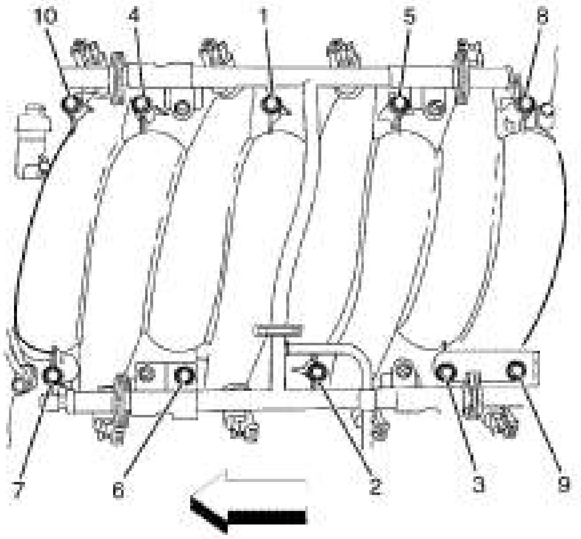


2. Remove the lint free cloth from the engine (2).
3. Install the intake manifold (1) to the engine (2).



4. Apply a 5 mm bead of thread sealant such as LOCTITE 242™ or equivalent to the cleaned threads of the intake manifold to cylinder head retaining bolts (2).
5. Install the intake manifold to cylinder head retaining bolts (2).

   Notice: Refer to Fastener Notice in the Preface section.



6. Tighten the intake manifold to cylinder head retaining bolts (2).

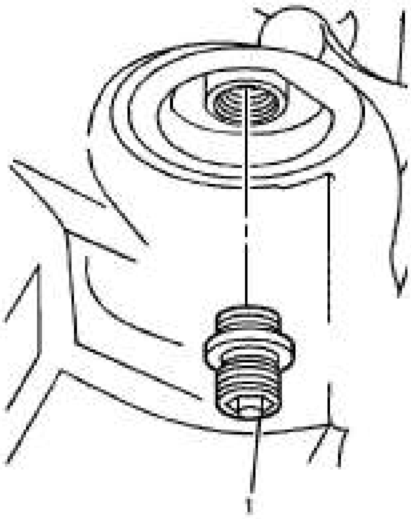
Tighten

- First Pass: Tighten in sequence to 5 N·m (44 lb in).
- Final Pass: Tighten in sequence to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 1975760**

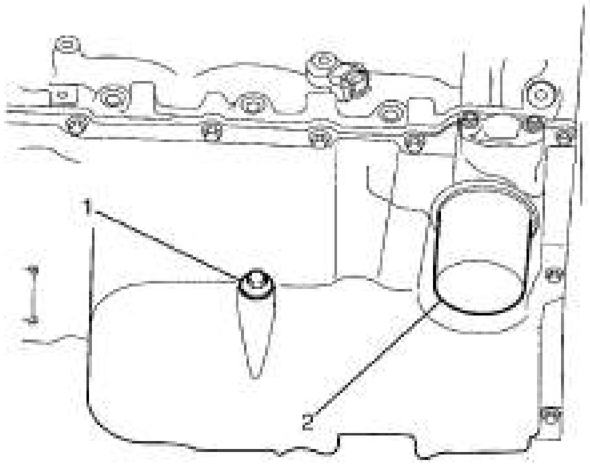
Oil Filter, Adapter, and Pan Cover Installation

Notice: Refer to Fastener Notice in the Preface section.



1. Install the oil filter fitting (2).

Tighten
Tighten the fitting to 55 N·m (40 lb ft).

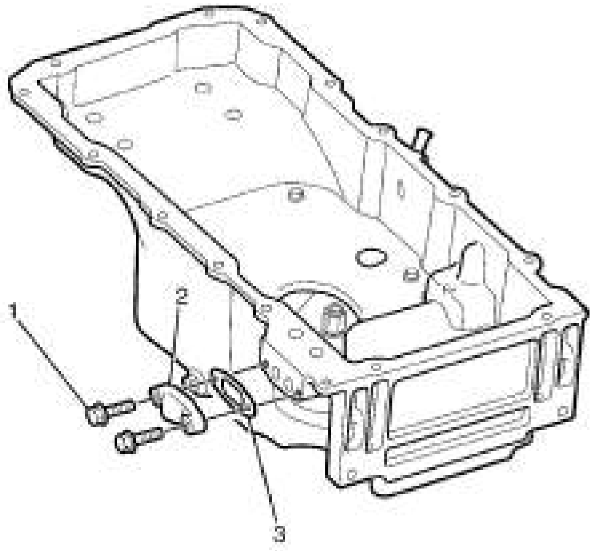


2. Lubricate the oil filter seal with clean engine oil.
3. Install the oil filter (2).

   Tighten
   Tighten the filter to 30 N·m (22 lb ft).

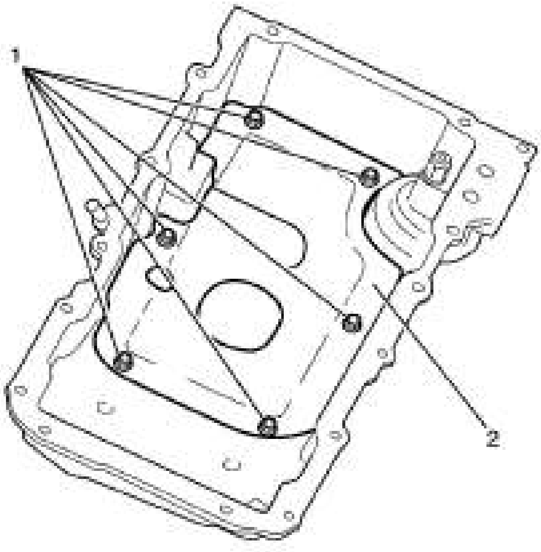
4. Install the oil pan drain plug (1).

   Tighten
   Tighten the plug to 25 N·m (18 lb ft).



5. Install the gasket (3), cover (2), and bolts (1).

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

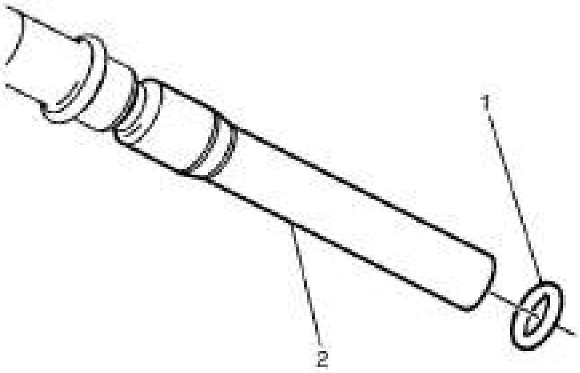


6. Install the oil pan baffle (2).
7. Install the oil pan baffle to oil pan retaining bolts (1).

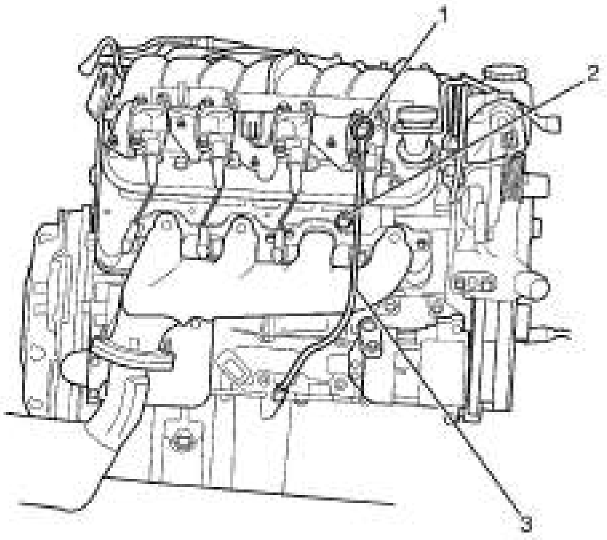
   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | Document ID: 2086093

Oil Level Indicator and Tube Installation



1. Inspect the O-ring seal (1) for cuts or damage. If the O-ring seal (1) is not cut or damaged, it may be used again.
2. Lubricate the O-ring seal (1) with clean engine oil.
3. Install the O-ring seal (1) onto the oil level indicator tube (2).



4. Install the oil level indicator tube (2) to the engine and rotate into correct position.

Notice: Refer to Fastener Notice in the Preface section.

5. Install oil level indicator tube to cylinder head bracket retaining bolt (3).

   Tighten
   Tighten the bolt to 25 N·m (18 lb ft).

6. Install the oil level indicator (1) to the oil level indicator tube (2).

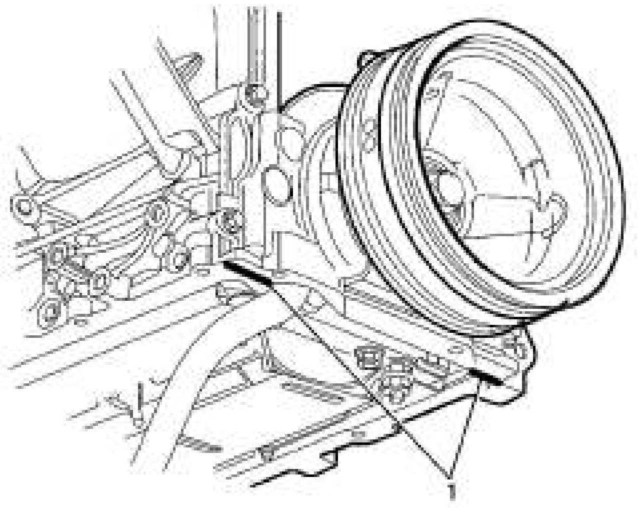
Oil Pan Installation

Installation Procedure

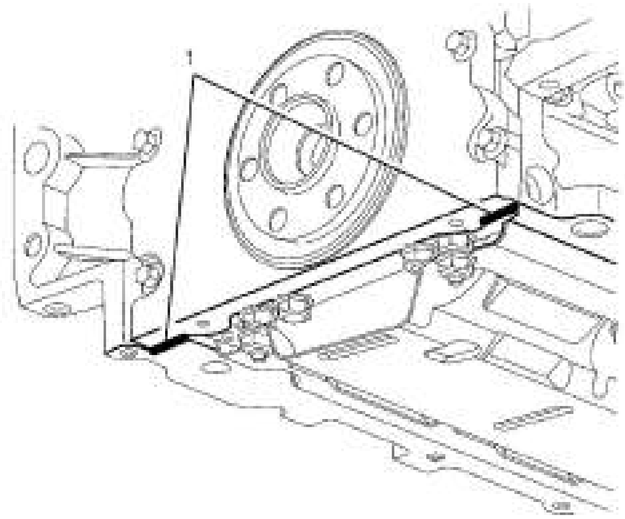
Important: The alignment of the structural oil pan is critical. The rear bolt hole locations of the oil pan provide mounting points for the transmission housing. To ensure the rigidity of the powertrain and correct transmission alignment, it is important that the rear of the block and the rear of the oil pan are flush or even. The rear of the oil pan must NEVER protrude beyond the engine block and transmission housing plane.

Important: The original oil pan gasket is retained and aligned to the oil pan by rivets. When installing a new gasket, it is not necessary to install new oil pan gasket rivets.

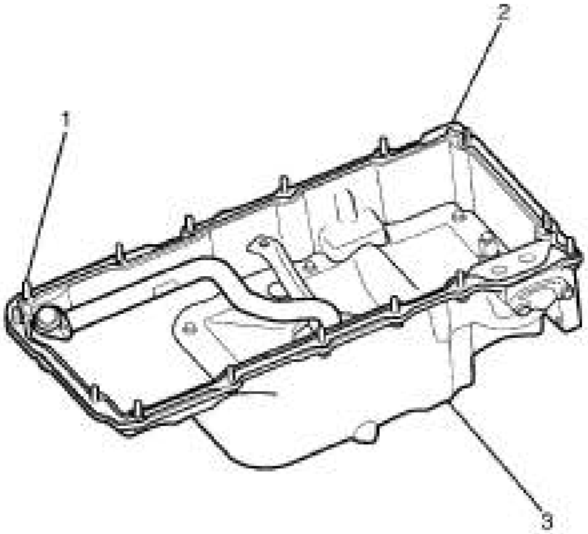
It is not necessary to rivet the NEW gasket to the oil pan.



1. Apply a 5 mm (0.2 in) bead of sealant 20 mm (0.8 in) long to the engine block (1). Apply the sealant directly onto the tabs of the front cover gasket that protrude into the oil pan surface. Refer to Adhesives, Fluids, Lubricants, and Sealers.

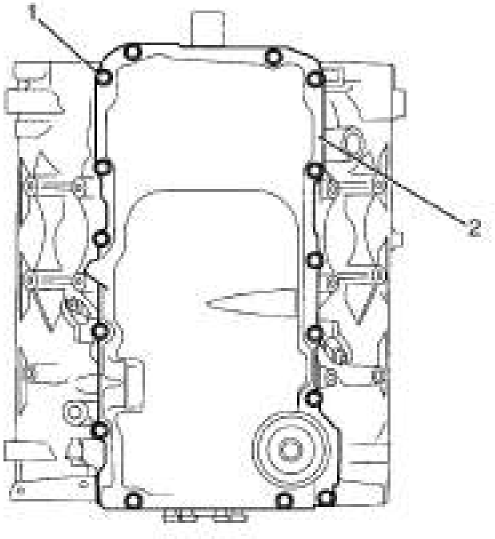


2. Apply a 5 mm (0.2 in) bead of sealant 20 mm (0.8 in) long to the engine block (1). Apply the sealant directly onto the tabs of the rear cover gasket that protrude into the oil pan surface. Refer to Adhesives, Fluids, Lubricants, and Sealers.



Important: Be sure to align the oil gallery passages in the oil pan and engine block correctly, with the oil pan gasket.

3. Preassemble the oil pan gasket (2) to the oil pan (3).
   - 3.1. Install the oil pan gasket (2) to the oil pan (3).
   - 3.2. Install the oil pan retaining bolts (1) to the oil pan (3) and through the oil pan gasket (2).

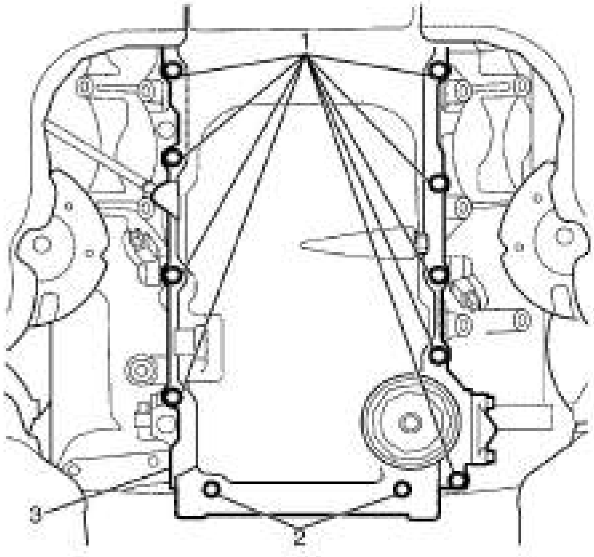


4. Tighten the oil pan to cylinder block retaining bolts (1) finger tight. Do not over tighten.
5. Tighten the oil pan to engine rear cover retaining bolts (2) finger tight. Do not over tighten.
6. Place a straight edge across the rear of the engine block and the rear of the oil pan at the transmission housing mounting surfaces.
7. Align the oil pan until the rear of engine block and the rear of oil pan are flush or even.
8. Measure the oil pan-to-engine block alignment.
   8.1. Place a straight edge across the rear of the engine block and rear of the oil pan at the transmission housing mounting surfaces.

   Important: The rear of the oil pan must NEVER protrude beyond the engine block and transmission housing mounting surfaces.

   8.2. Insert a feeler gauge between the straight edge and the oil pan transmission housing mounting surface and check to make sure that there is no more than a 0.25 mm (0.01 in) gap between the pan and the straight edge.
   8.3. If the oil pan alignment is not within specifications, remove the oil pan and repeat the above procedure.

Notice: Refer to Fastener Notice in the Preface section.

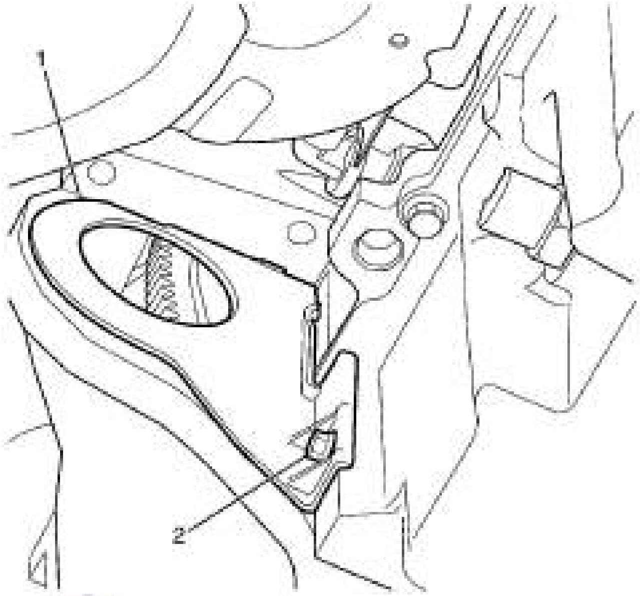


9. Tighten the oil pan to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolt to 25 N·m (18 lb ft).

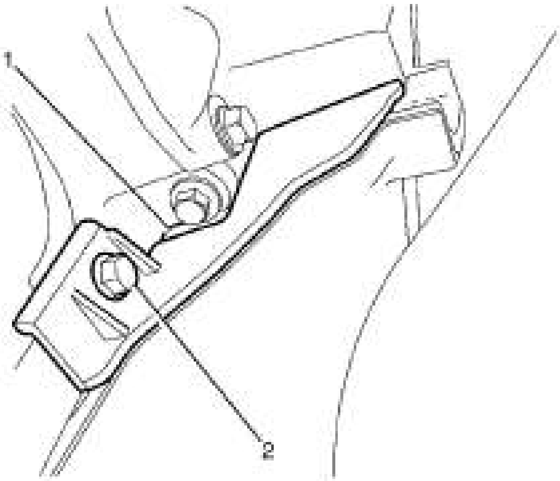
10. Tighten the oil pan to engine rear cover retaining bolts (2).

    Tighten
    Tighten the bolt to 12 N·m (106 lb in).



11. Install the right side close out (1).
12. Install the right side close out cover to cylinder block retaining bolt (2).

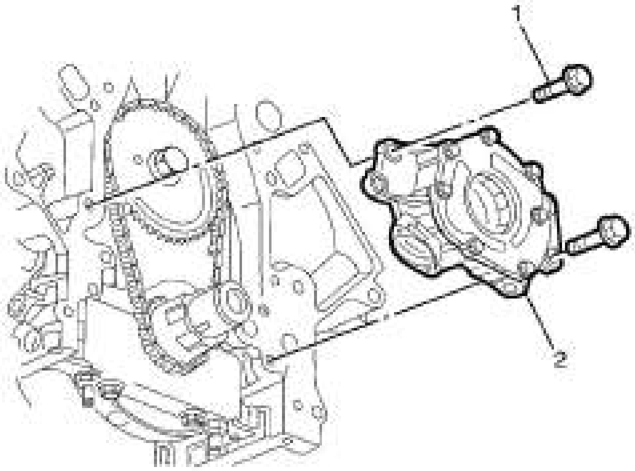
Tighten
Tighten the bolt to 12 N·m (106 lb in).



13. Install the left side close out (1).
14. Install the left side close out cover to cylinder block retaining bolt (2).

Tighten
Tighten the bolt to 12 N·m (106 lb in).

Oil Pump, Screen and Crankshaft Oil Deflector Installation (L98, LS2)



Important: Inspect the oil pump and engine block oil gallery passages. These surfaces must be clear and free of debris or restrictions.

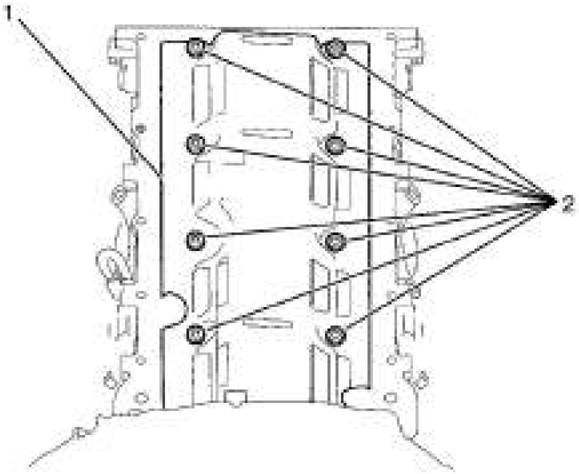
Important: Install the oil pump (1) onto the crankshaft sprocket until the pump housing contacts the face of the engine block.

1. Align the splined surfaces of the crankshaft sprocket and the oil pump drive gear and install the oil pump (2).

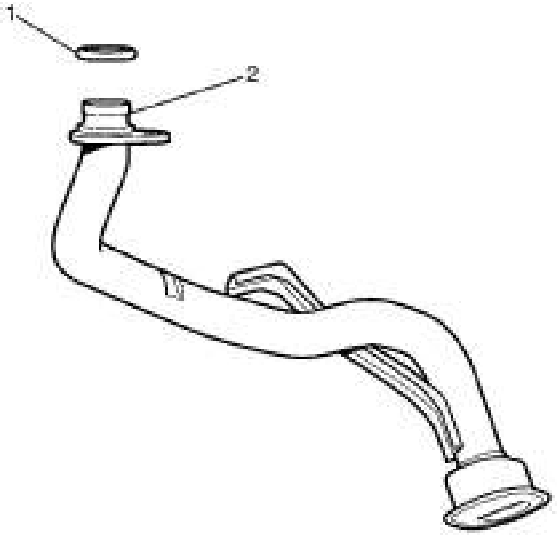
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the oil pump retaining bolts (1).

   Tighten
   Tighten the oil pump retaining bolts to 25 N·m (18 lb ft).



3. Install the crankshaft oil deflector (1).



4. Lubricate a NEW oil pump screen O-ring seal with clean engine oil.
5. Install the NEW O-ring seal onto the oil pump screen.

Important:

- Push the oil pump screen tube completely into the oil pump prior to tightening the bolt. Do not allow the retaining bolt to pull the tube into the pump.
- Align the oil pump screen mounting brackets with the correct crankshaft bearing cap bolt/studs.

6. Install the oil pump screen.
7. Install the oil pump screen retaining bolt and the deflector retaining nuts.

Tighten

1. Tighten the bolt to 12 N·m (106 lb in).
2. Tighten the nuts to 25 N·m (18 lb ft).

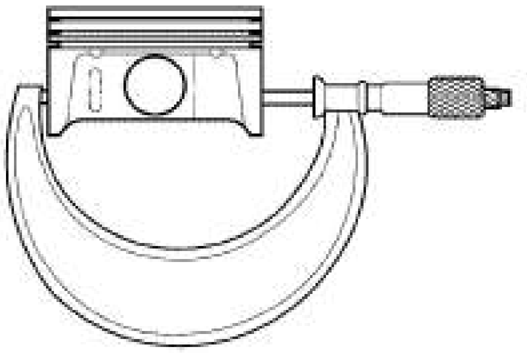
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | Document ID: 2086062

Piston, Connecting Rod, and Bearing Installation (L98, LS2)

Tools Required

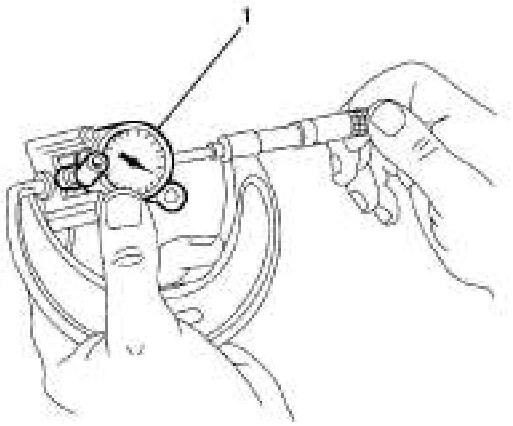
- J 8037 Ring Compressor
- J 8087 Cylinder Bore Gage
- J 41556 Connecting Rod Guide
- J 45059 Angle Meter

Piston Selection

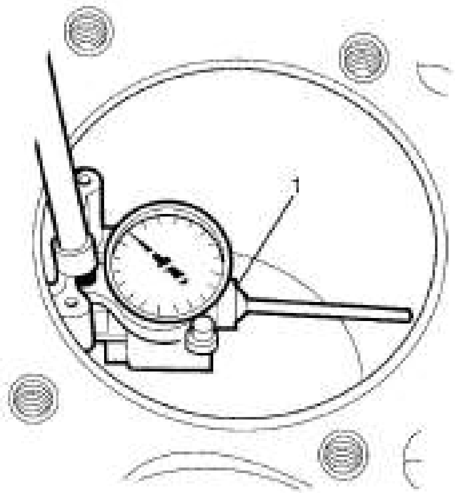


Important: Measurements of all components should be taken with the components at normal room temperature. For correct piston fit, the engine block cylinder bores must not have above acceptable wear or taper. A used piston, pin, and connecting rod assembly may be installed if, after inspection is within specifications.

1. With a micrometer at a right angle, measure the piston outside diameter (OD). Measure the diameter 43 mm (1.69 in) from the top of the piston. Refer to Engine Mechanical Specifications.
2. Record the piston OD.

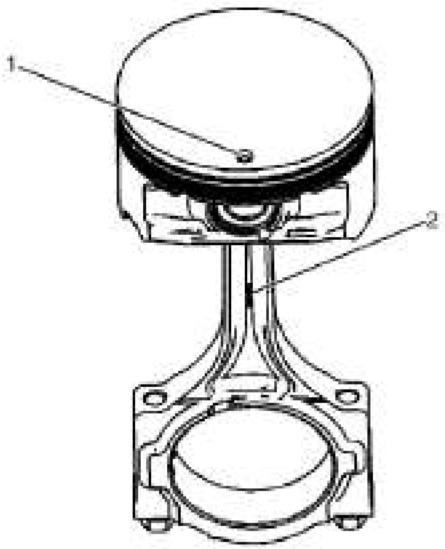


3. Adjust the micrometer to the recorded piston OD.
4. Insert the J 8087 (1) into the micrometer and zero the gage dial.



5. Using the J 8087 (1), measure the cylinder bore inside diameter (ID). Measure at a point 64 mm (2.5 in) from the top of the cylinder.
6. Record the cylinder bore ID.
7. Subtract the piston OD from the cylinder bore ID to determine the piston-to-bore clearance. Refer to Engine Mechanical Specifications.
8. If the correct clearance cannot be obtained, select another piston, pin, and connecting rod assembly and again measure the clearances. If the correct fit cannot be obtained, the cylinder bore may require honing for an oversize piston.

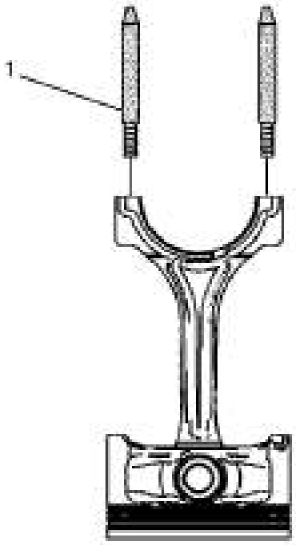
Piston, Pin, and Connecting Rod Installation



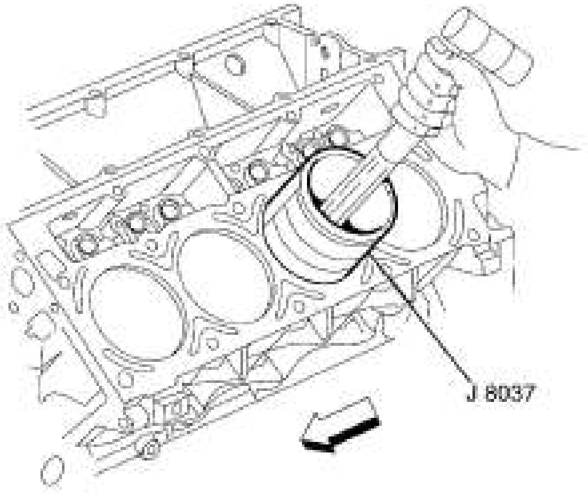
1. Liberally lubricate the cylinder walls, piston rings and piston skirts with engine oil.

   Important: The piston is directional and must be installed in the cylinder block in the correct direction.

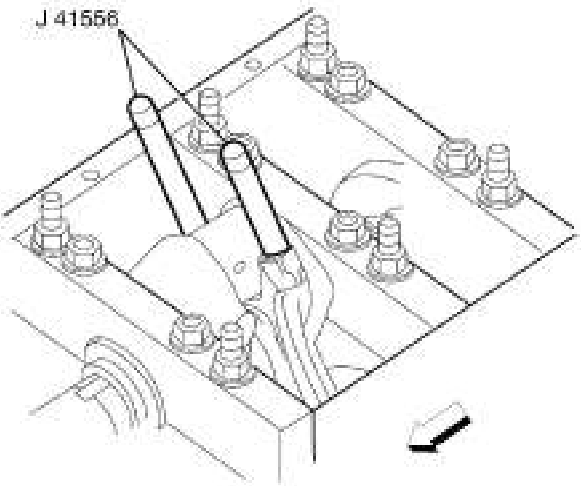
2. Select the correctly numbered piston/connecting rod assembly for the cylinder. A dot (1) showing proper piston orientation is located on the top of the piston.



3. Install the J 41556 to the connecting rod.

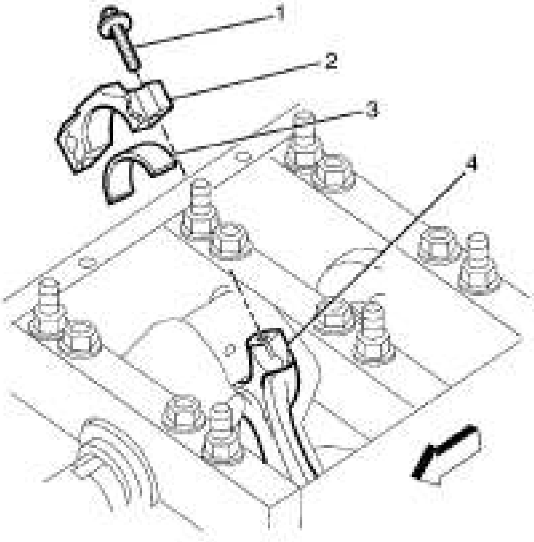


4. Install the J 8037 onto the piston and compress the piston rings.
5. Install the piston, pin, and connecting rod assembly into the cylinder bore. Hold the piston ring compressor firmly against the engine block. Using a soft hammer handle, lightly tap the top of the piston until all the piston rings have entered the cylinder bore.



6. Use the J 41556 (1) to guide the connecting rod onto the crankshaft journal.
7. Remove the J 41556 (1) from the connecting rod.

Notice: Refer to Fastener Notice in the Preface section.

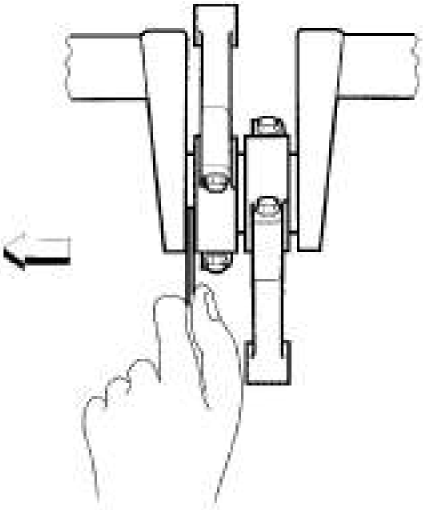


Important: The connecting rod and cap must be assembled with the mating surfaces correctly aligned.

8. Install the bearing cap (3), bearing half (2), and connecting rod bolts (1) to the connecting rod (4).

Tighten

1. Tighten the bolts a first pass to 20 N·m (15 lb ft).
2. Tighten the bolts a final pass to 75 degrees using the J 45059 .

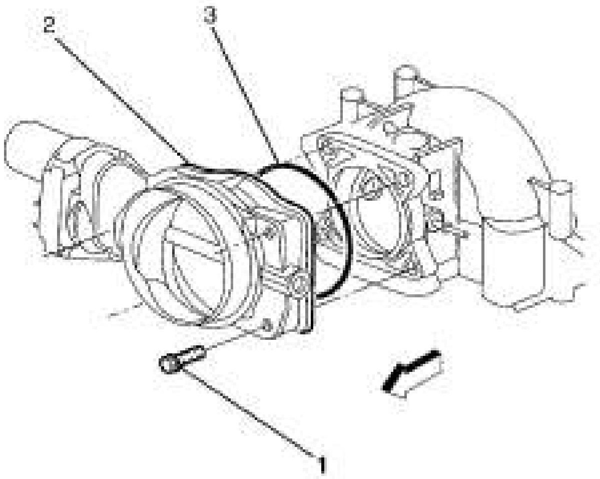


9. Measure the connecting rods for the correct side clearance. Refer to Engine Mechanical Specifications.

Service Prior to Assembly

- Dirt or debris will cause premature wear of the rebuilt engine. Clean all components. Refer to Cleanliness and Care.
- Use the correct tools to measure components when inspecting for above acceptable wear. Components that are not within the manufacturers specifications must be repaired or replaced.
- When the components are installed into an engine, return the components to their original location, position and direction. Refer to Separating Parts.
- During assembly, lubricate all moving parts with clean engine oil. This provides initial lubrication when the engine is first started.

Throttle Body Installation (L98, LS2)



Important: DO NOT use the throttle body gasket again. Install a NEW gasket during assembly.

Important: Align the locating tab of the gasket with the notch in the manifold.

1. Install the throttle body gasket (2).
2. Install the throttle body (1).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the throttle body to intake manifold retaining bolts (3).

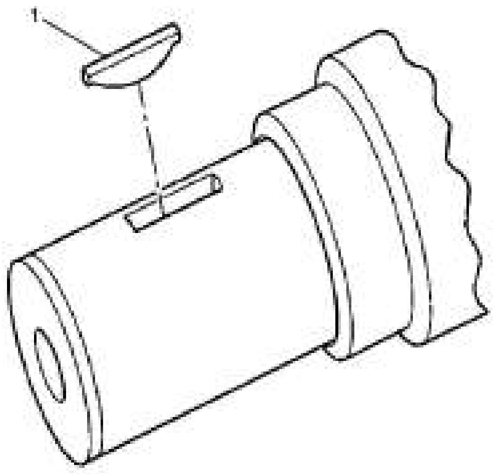
Tighten
Tighten the bolts to 10 N·m (89 lb in).

Timing Chain and Sprocket Installation (L98, LS2)

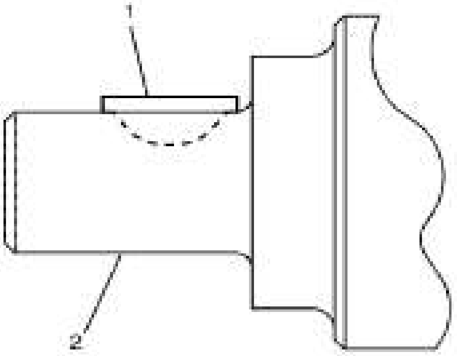
Tools Required

- EN 46330 Timing Chain Tensioner Retaining Pin
- J 41478 Crankshaft Front Oil Seal Installer
- J 41665 Crankshaft Balancer and Sprocket Installer
- J 45059 Angle Meter

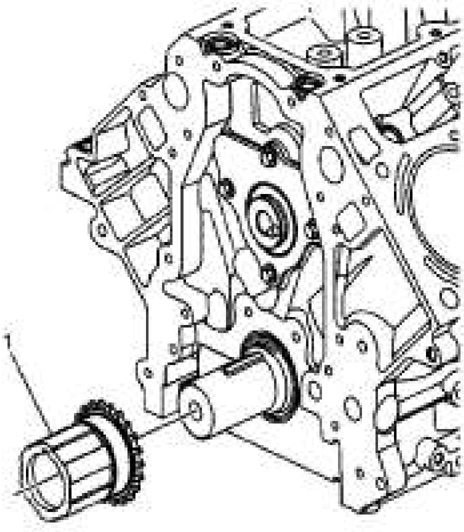
Installation Procedure



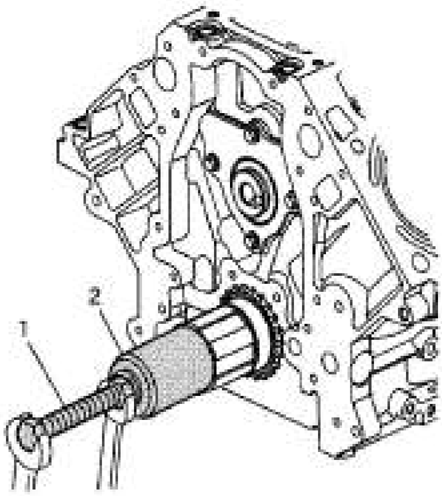
1. Install the crankshaft sprocket key (1) if removed.



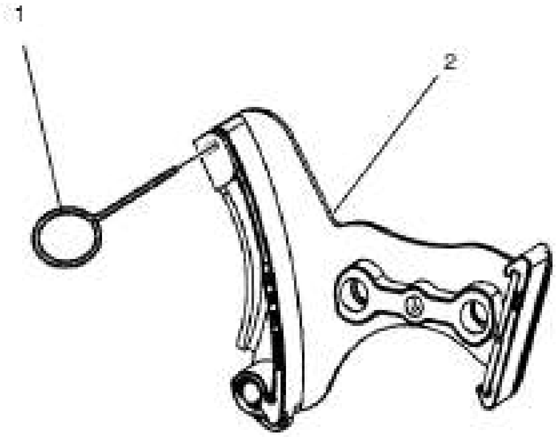
2. Tap the key (1) into the key way until both ends of the key bottom onto the crankshaft (2).



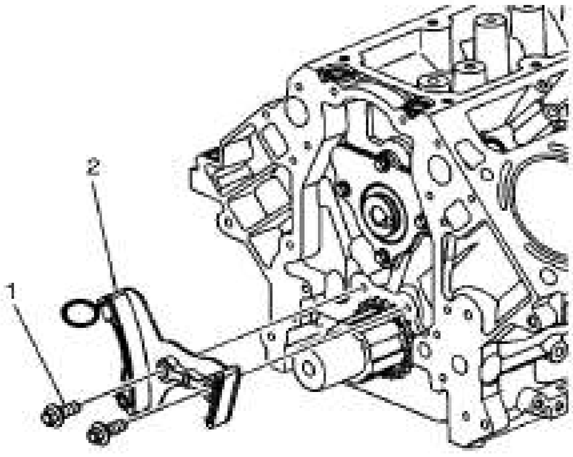
3. Install the crankshaft sprocket (1) onto the front of the crankshaft. Align the crankshaft key with the crankshaft sprocket key way.



4. Use the J 41478 (1) and the J 41665 (2) in order to install the crankshaft sprocket. Install the sprocket onto the crankshaft until fully seated against the crankshaft flange.

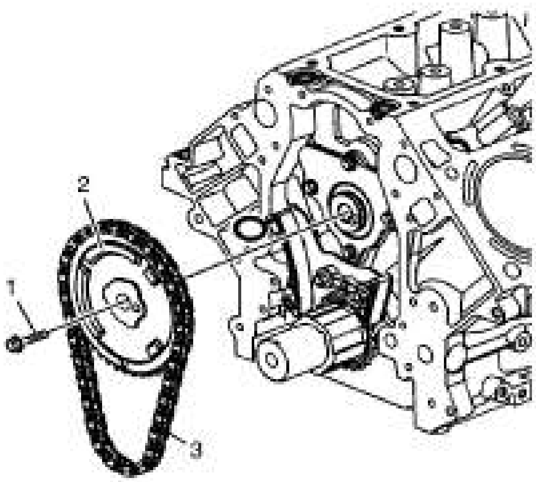


5. Compress the timing chain tensioner guide (2) and install the EN 46330 (1).



6. Install the timing chain tensioner (2) and bolts (1).

   Tighten
   Tighten the bolts to 25 N·m (18 lb ft).

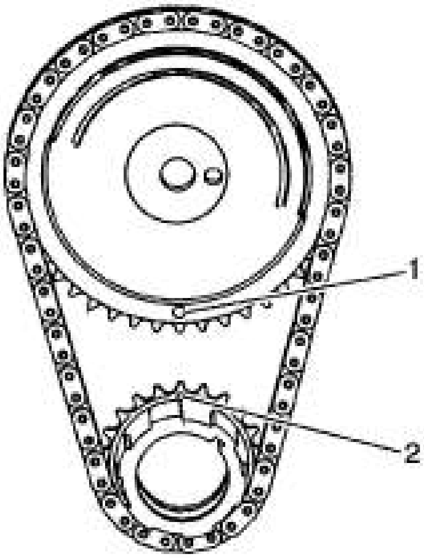


7. Position the camshaft sprocket (2) so the timing mark is in the 6 o'clock position.

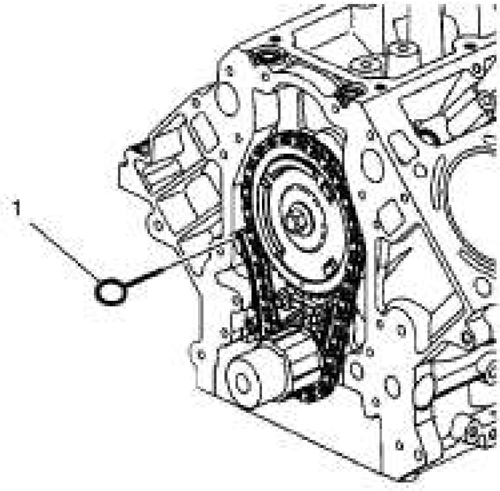
   Important: The sprocket teeth and timing chain must mesh.

   Important: The camshaft and the crankshaft sprocket alignment marks MUST be aligned correctly.

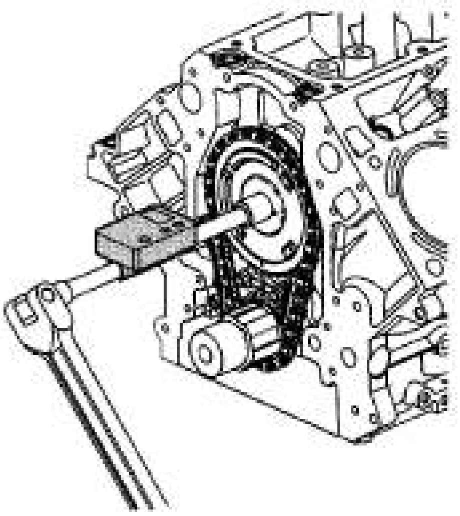
8. Install the camshaft sprocket (2), timing chain (3) and bolt (1).



9. Inspect the sprockets for correct alignment. The mark on the camshaft sprocket (1) should be located in the 6 o'clock position and the mark on the crankshaft sprocket (2) should be located in the 12 o'clock position.



10. Remove the EN 46330 (1).

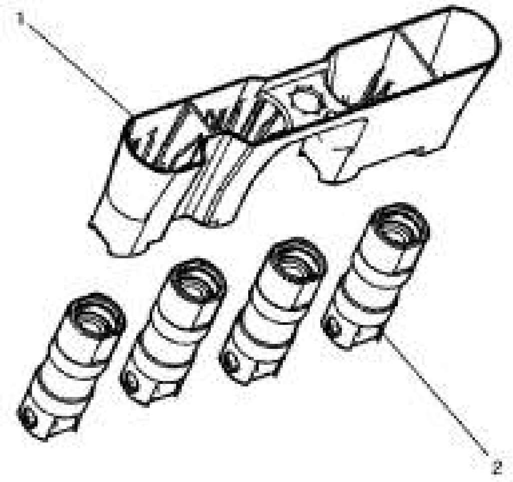


11. Tighten the camshaft sprocket bolt.

    Tighten
    Tighten a first pass to 75 N·m (55 lb ft).

    Tighten an additional 50 degrees using J 45059 .

Valve Lifter Installation

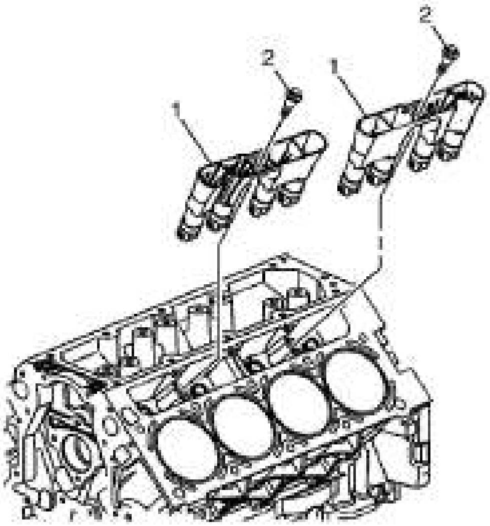


Important:

- If camshaft replacement is required, the valve lifters must also be replaced.
- When using the valve train components again, always install the components to the original location and position. Refer to Separating Parts.

1. Lubricate the valve lifters (1) and the engine block valve lifter bores with clean engine oil.
2. Insert the valve lifters (1) into the valve lifter guides (2).

   Align the flat area on the top of the valve lifter with the flat area in the valve lifter guide bore. Push the valve lifter completely into the valve lifter guide bore.



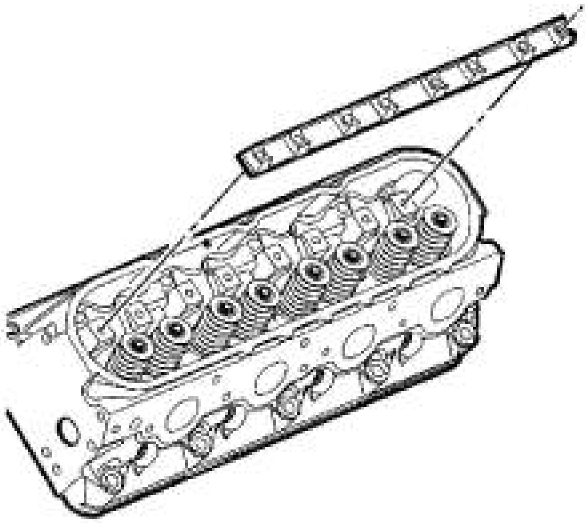
3. Install the valve lifter and guide assembly (1) to the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the valve lifter guide retaining bolts (2).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

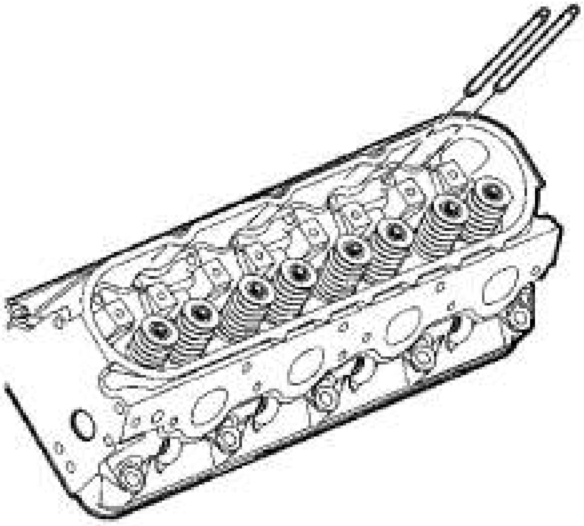
Valve Rocker Arm and Push Rod Installation (LS3)



Important:

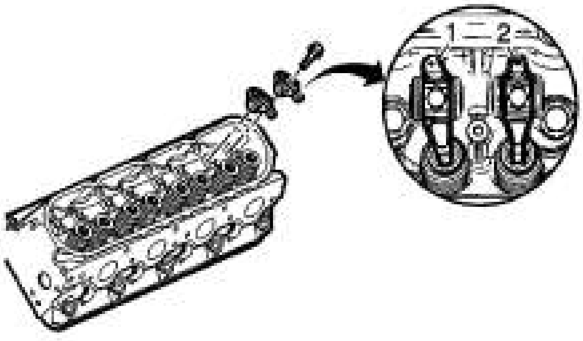
- When using the valve train components again, always install the components to the original location and position.
- Valve lash is net build. No valve adjustment is required.

1. Lubricate the valve rocker arms and pushrods with clean engine oil.
2. Lubricate the flange of the valve rocker arm bolts with clean engine oil.
3. Install the valve rocker arm pivot support.



Important: Ensure the pushrods seat properly to the valve lifter sockets.

4. Install the pushrods.

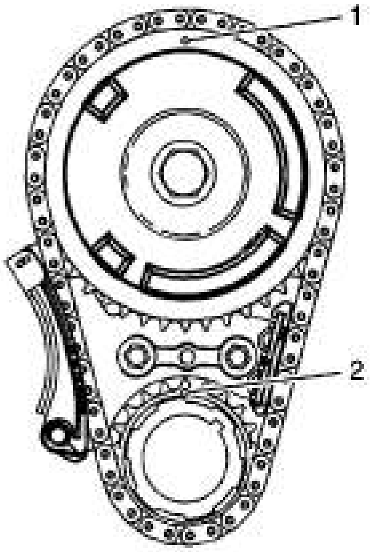


Important:

- Ensure the pushrods seat properly to the ends of the rocker arms.
- DO NOT tighten the rocker arm bolts at this time.

5. Install the rocker arms and bolts.

The intake rocker arms (1) have an offset design.



6. Rotate the crankshaft until number 1 piston is at top dead center of compression stroke.

   In this position, cylinder number 1 rocker arms will be off lobe lift, and the crankshaft sprocket key will be at the 1:30 position. The camshaft and crankshaft sprocket alignment marks (1, 2) will be in the 12 o'clock position. If viewing from the rear of the engine, the additional crankshaft pilot hole, non-threaded, will be in the 10:30 position.

   The engine firing order is 1, 8, 7, 2, 6, 5, 4, 3.

   Cylinders 1, 3, 5 and 7 are left bank.

   Cylinders 2, 4, 6, and 8 are right bank.

   Notice: Refer to Fastener Notice in the Preface section.

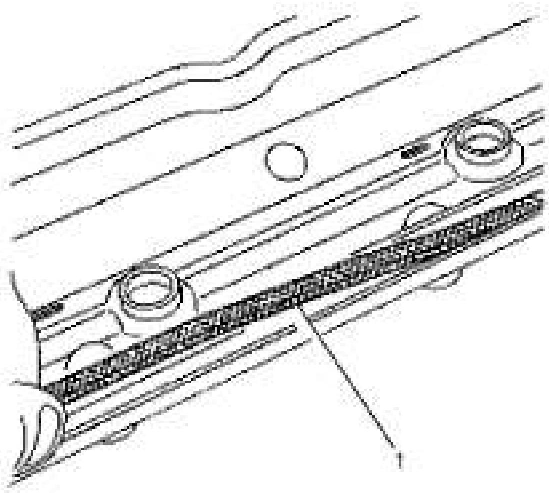
7. With the engine in the number 1 firing position, tighten the following valve rocker arm bolts:

   Tighten
   - Tighten the exhaust valve rocker arm bolts 1, 2, 7, and 8 to 30 N·m (22 lb ft).
   - Tighten the intake valve rocker arm bolts 1, 3, 4, and 5 to 30 N·m (22 lb ft).
8. Rotate the crankshaft 360 degrees.
9. Tighten the following valve rocker arm bolts:

   Tighten
   - Tighten the exhaust valve rocker arm bolts 3, 4, 5, and 6 to 30 N·m (22 lb ft).
   - Tighten the intake valve rocker arm bolts 2, 6, 7, and 8 to 30 N·m (22 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2086083**

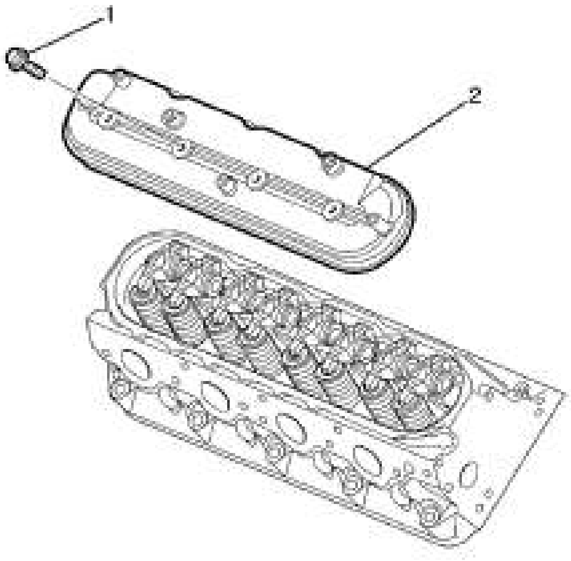
Valve Rocker Arm Cover Installation - Left Side (L98, LS2)



Important:

- All gasket surfaces should be free of oil or other foreign material during assembly.
- DO NOT use the valve rocker arm cover gasket again.
- The valve rocker arm cover bolt grommets may be used again if not damaged.

1. Install a NEW gasket (1) into the valve rocker arm cover.



2. Install the valve rocker arm cover (2).

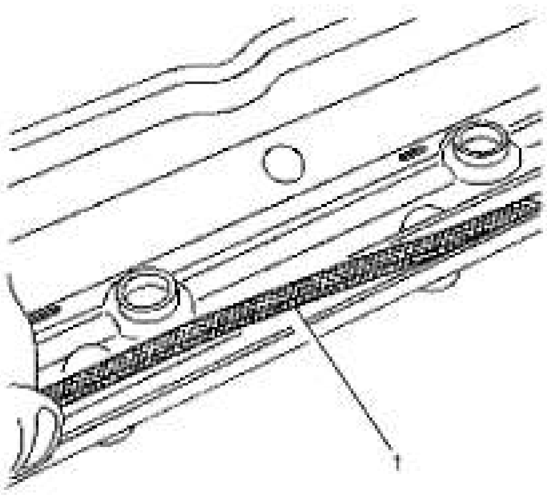
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the valve rocker arm cover to cylinder head retaining bolts (1) with grommets.

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions - Off Vehicle | **Document ID: 2086085**

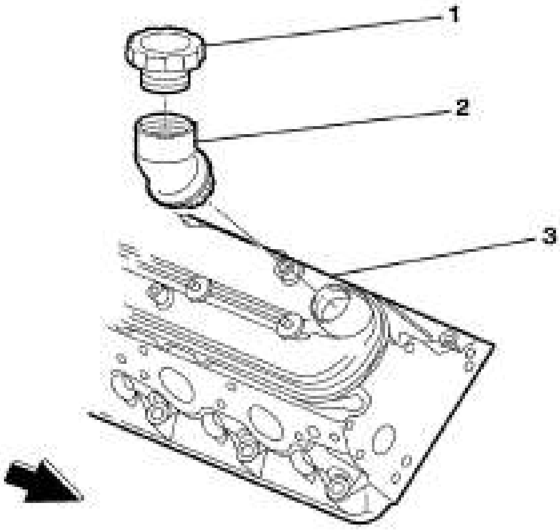
Valve Rocker Arm Cover Installation - Right Side (L98, LS2)



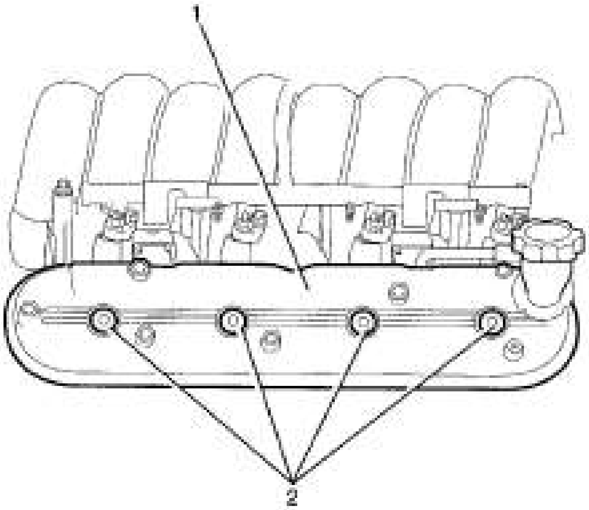
Important:

- All gasket surfaces should be free of oil or other foreign material during assembly.
- DO NOT use the valve rocker arm cover gasket again.
- The valve rocker arm cover bolt grommets may be used again if not damaged.

1. Install a NEW gasket (1) into the valve rocker arm cover.



2. Install a NEW oil fill tube (2) to the valve rocker arm cover (3).
3. Install the oil fill cap (1) to the oil fill tube (2).



4. Install the valve rocker arm cover (1).

   Notice: Refer to Fastener Notice in the Preface section.

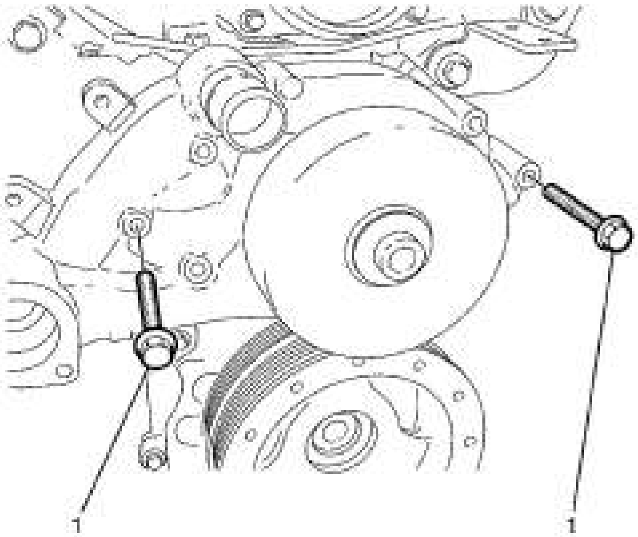
5. Install the valve rocker arm cover retaining bolts (2) with grommets.

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

Water Pump Installation (L98, LS2)

Notice: DO NOT use cooling system seal tabs, or similar compounds, unless otherwise instructed. The use of cooling system seal tabs, or similar compounds, may restrict coolant flow through the passages of the cooling system or the engine components. Restricted coolant flow may cause engine overheating and/or damage to the cooling system or the engine components/assembly.

Important: Ensure all mating surfaces are clean and free of grease.



1. Insert two retaining bolts (1) at each end of the pump, place the new gasket of the bolts and use this as a guide to install the pump.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install and tighten the remaining bolts.

   Tighten
   Tighten the water pump pulley bolts to 25 N·m (18 lb ft).

Cleanliness and Care

- Throughout this section, it should be understood that correct cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.
- When any internal engine parts are serviced, care and cleanliness is important.
- When components are removed for service, they should be marked, organized or retained in a specific order for assembly. Refer to Separating Parts in Engine Mechanical - 6.0L.
- At the time of installation, components should be installed in the same location and with the same mating surface as when removed.
- An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in millimetres or thousandths of an inch. These surfaces should be covered or protected to avoid component damage.
- A liberal coating of clean engine oil should be applied to friction areas during assembly.
- Correct lubrication will protect and lubricate friction surfaces during initial operation.

Crankcase Ventilation System Description

A closed crankcase ventilation system is used in order to provide a more complete scavenging of crankcase vapours. Filtered air from the air induction system duct is supplied to the crankcase, mixed with blow-by vapours, and passes through a crankcase ventilation metering device before entering the intake manifold. The primary component in the positive crankcase ventilation (PCV) system is the PCV flow metering device (or orifice). Vacuum changes within the intake manifold result in flow variations of the blow-by vapours. If abnormal operating conditions occur, the design of the PCV system permits above acceptable amounts of blow-by vapours to back flow through the crankcase vent tube and into the engine induction system to be consumed during normal combustion. This engine ventilation system design minimizes oil consumption and significantly reduces the potential for oil ingestion during vehicle limit handling manoeuvres.

L98 Engine

The L98 engine utilizes an integral positive crankcase ventilation (PCV) system which is located in the engines valley cover beneath the intake manifold. The engine valley cover contains composite oil separating baffles and PCV plumbing. Filtered fresh air is routed from up stream of the throttle plate to the front of the right valve rocker arm cover through a formed nylon tube. The design of the rocker cover shields rocker arm oil spray thereby reducing the potential for oil being drawn into the throttle bore area during back flow of the ventilation system. Blow-by vapours are routed from the valley cover through a fixed orifice (2.5 mm) within a steel PCV tube, then through a formed rubber hose before entering the intake manifold behind the throttle body.

Drive Belt System Description

The drive belt system consists of the following components:

- The drive belt
- The drive belt tensioner
- The drive belt idler pulley
- The crankshaft balancer pulley
- The accessory drive component mounting brackets
- The accessory drive components
  - The power steering pump
  - The alternator
  - The A/C compressor
  - The water pump

The drive belt system may use 1 belt or 2 belts. The drive belt is thin so that it can bend backwards and has several ribs to match the grooves in the pulleys. The drive belts are made of different types of rubbers -- chloroprene or EPDM -- and have different layers or plies containing either fibre cloth or cords for reinforcement.

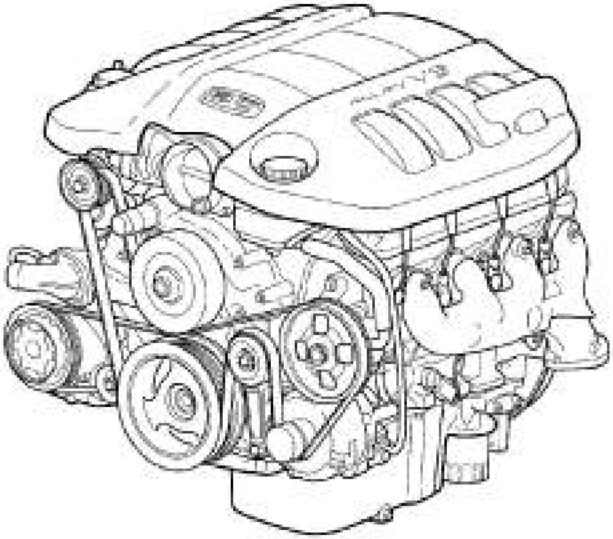
Both sides of the drive belt may be used to drive the different accessory drive components. When the back side of the drive belt is used to drive a pulley, the pulley is smooth.

The drive belt is pulled by the crankshaft balancer pulley across the accessory drive component pulleys. The spring loaded drive belt tensioner keeps constant tension on the drive belt to prevent the drive belt from slipping. The drive belt tensioner arm will move when loads are applied to the drive belt by the accessory drive components and the crankshaft.

The drive belt system may have an idler pulley, which is used to add wrap to the adjacent pulleys. Some systems use an idler pulley in place of an accessory drive component when the vehicle is not equipped with the accessory.

Engine Component Description (L98, LS2)

The 6.0 Litre V8 Engine



Camshaft and Drive System

A billet steel 1-piece camshaft is supported by 5 bearings pressed into the engine block. The camshaft timing sprocket is mounted to the front of the camshaft and is driven by the crankshaft sprocket through the camshaft timing chain. The camshaft position (CMP) sensor lobes are incorporated into the front face of the camshaft sprocket with the CMP sensor mounted in the engine front cover. A timing chain tensioner is mounted to the front of the engine block above the crankshaft sprocket. The externally splined crankshaft sprocket is positioned to the crankshaft by a key and key way. The crankshaft sprocket external splines drive the oil pump drive gear. A retaining plate mounted to the front of the engine block maintains camshaft location.

Crankshaft

The crankshaft is cast nodular iron. The crankshaft is supported by 5 crankshaft bearings. The bearings are retained by crankshaft bearing caps which are machined with the engine block for correct alignment and clearance. The crankshaft journals are undercut and rolled. The centre main journal is the thrust journal. A crankshaft position (CKP) reluctor ring is press fit mounted at the rear of the crankshaft. The reluctor ring is not serviceable separately.

Cylinder Heads

The cylinder heads are cast aluminium and have pressed in place powdered metal valve guides and valve seats. Passages for the engine coolant air bleed system are at the front of each cylinder head. The valve rocker arm covers are retained to the cylinder heads by 4 centre mounted rocker arm cover bolts.

Engine Block

The engine block is a cam-in-block deep skirt 90 degree V configuration with 5 crankshaft bearing caps. The engine block is cast aluminium. The 5 crankshaft bearing caps each have 4 vertical M10 and 2 horizontal M8 mounting bolts. The camshaft is supported by 5 camshaft bearings pressed into the block.

Exhaust Manifolds

The exhaust manifolds are a 1-piece cast iron design. The exhaust manifolds direct exhaust gasses from the combustion chambers to the exhaust system. Each manifold also has an externally mounted heat shield that is retained by bolts.

Intake Manifold

The intake manifold is a 1-piece composite design that incorporates brass threaded inserts for mounting the fuel rail, throttle body, and wire harness studs. Each side of the intake manifold is sealed to the cylinder head by a non-reusable push-in-place silicone sealing gasket. The electronically actuated throttle body bolts to the front of the intake manifold. The throttle body is sealed by a 1-piece push-in-place silicone gasket. The fuel rail assembly, with 8 separate fuel injectors, is retained to the intake by 4 bolts. The injectors are seated into their individual manifold bores with O-ring seals to provide sealing. A fuel rail stop bracket is retained to the rear left of the intake manifold by mounting bolts. The manifold absolute pressure (MAP) sensor is installed and retained to the top front of the intake manifold and sealed by an O-ring seal. The evaporative emission (EVAP) canister purge solenoid valve is mounted to the front of the right cylinder head. There are no coolant passages within the intake manifold.

Oil Pan

The structural rear-sump oil pan is cast aluminium. Incorporated into the design is the oil filter mounting boss, drain plug opening, baffle, oil filter bypass valve, and oil level indicator tube opening. The oil pressure relief valve is also internal to the oil filter. Alignment of the structural oil pan to the rear of the engine block and transmission housing is critical.

Piston and Connecting Rod Assembly

The pistons are cast aluminium. The pistons use 2 compression rings and 1 oil control ring assembly. The piston is a low friction, lightweight design with a flat or recessed top and barrel shaped skirt. The piston pins are chromium steel and are a full-floating design. The connecting rods are powdered metal. The connecting rods are fractured at the connecting rod journal and then machined for the correct clearance. All applications use a piston with a graphite coated skirt. The piston and pin are to be serviced as an assembly.

Valve Rocker Arm Cover Assemblies

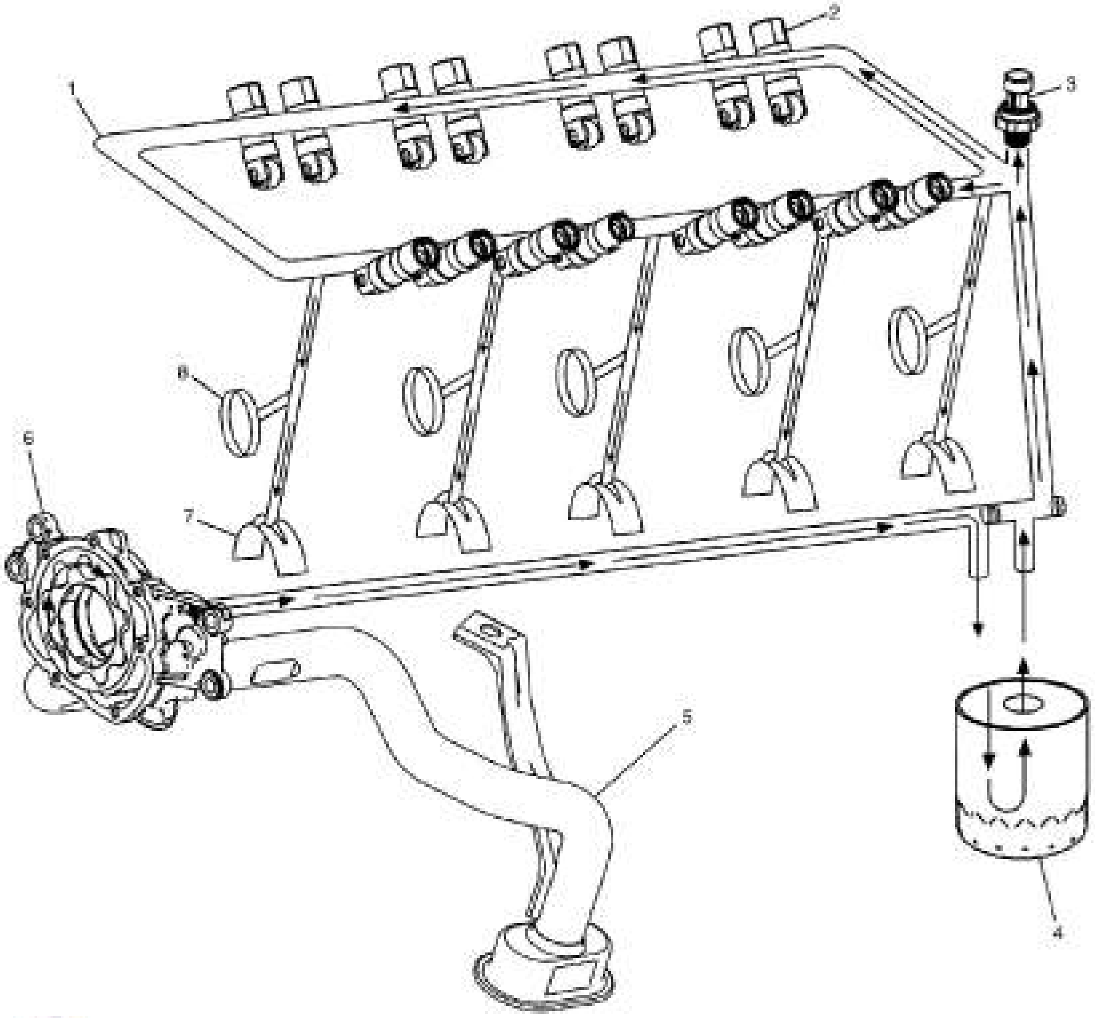
The valve rocker arm covers are cast aluminium and use a pre-moulded silicon gasket for sealing. Mounted to each rocker cover are the coil and bracket assemblies. Incorporated into the right cover is the oil fill tube and the positive crankcase ventilation (PCV) fresh air passage.

Valve Train

Motion is transmitted from the camshaft through the hydraulic roller valve lifters and tubular pushrods to the roller type rocker arms. The nylon valve lifter guides position and retain the valve lifters. The valve rocker arms for each bank of cylinders are mounted on pedestals or pivot supports. Each rocker arm is retained on the pivot support and cylinder head by a bolt. Valve lash is net build.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Description and Operation | Document ID: 2086102

Lubrication Description (L98, LS2)



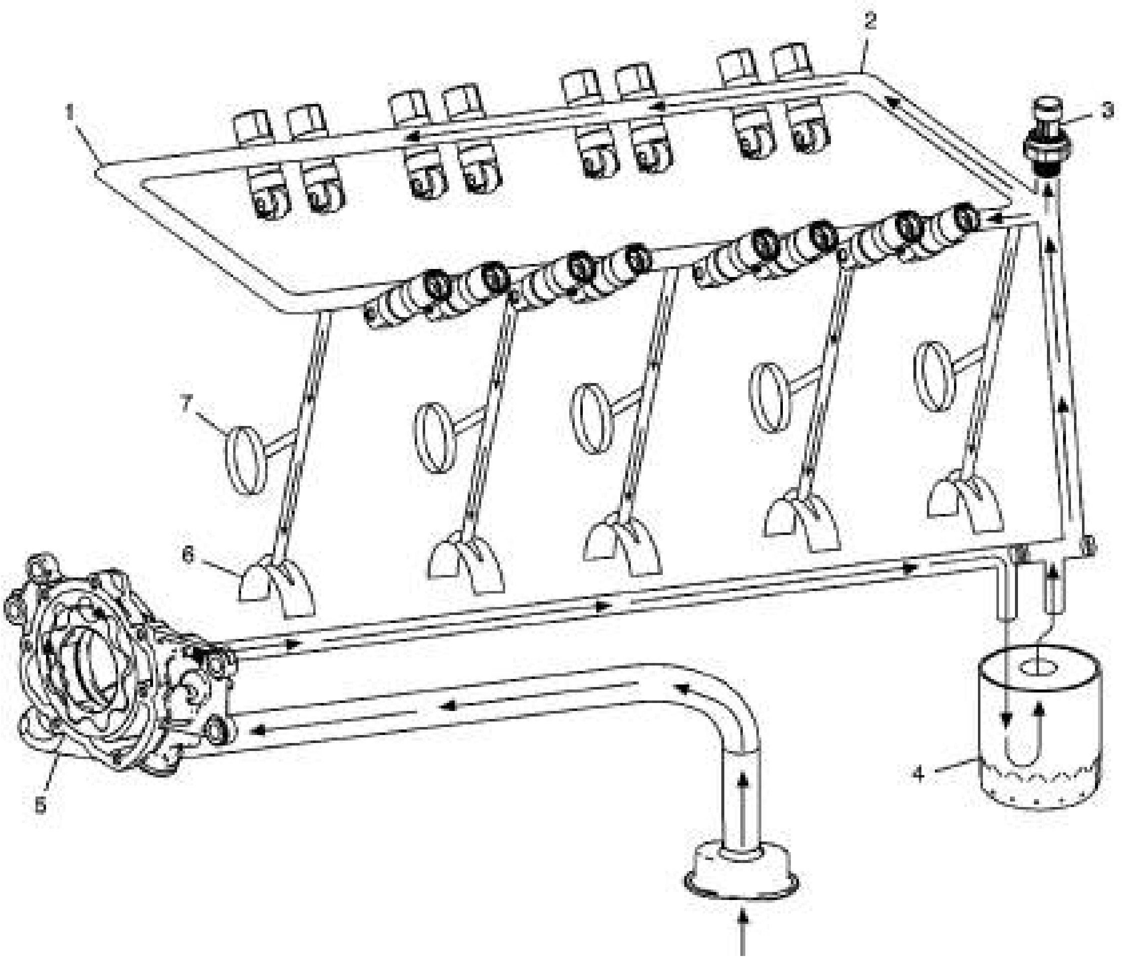
Engine lubrication is supplied by a gerotor type oil pump assembly (6). The pump is mounted on the front of the engine block and driven directly by the crankshaft sprocket. The pump gears rotate and draw oil from the oil pan sump through a pick-up screen and pipe (5). The oil is pressurized as it passes through the pump and is sent through the engine block lower oil gallery. Contained within the oil pump assembly (6) is a pressure relief valve that maintains oil pressure within a specified range.

Pressurized oil is directed through the engine block oil gallery (1) to the full flow oil filter (4) where harmful contaminants are removed. A bypass valve is incorporated into the oil pan at the oil filter, which permits oil flow in the event the filter becomes restricted.

Oil is then directed from the filter to the upper main oil galleries (1). Oil from the left upper oil gallery is directed to the crankshaft bearings (7) and camshaft bearings (8). Oil that has entered both the upper main oil galleries also pressurizes the valve lifter assemblies (2) and is then pumped through the pushrods to lubricate the valve rocker arms and valve stems. Oil returning to the pan is directed by the crankshaft oil deflector. The oil pressure sensor (3) is located at the top rear of the engine.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Description and Operation | **Document ID: 2093559**

Lubrication Description (LS3)



Engine lubrication is supplied by a gerotor type oil pump assembly (5). The pump is mounted on the front of the engine block and driven directly by the crankshaft sprocket. The pump gears rotate and draw oil from the oil pan sump through a pick-up screen and pipe. The oil is pressurized as it passes through the pump and is sent through the engine block lower oil gallery. Contained within the oil pump assembly is a pressure relief valve that maintains oil pressure within a specified range.

Pressurized oil is directed through the engine block lower oil gallery to the full flow oil filter (4) where harmful contaminants are removed. A bypass valve is incorporated into the new design oil filter, which permits oil flow in the event the filter becomes restricted.

Oil is then directed from the filter to the upper main oil galleries (1). Oil from the left upper oil gallery is directed to the crankshaft bearings (6) and camshaft bearings (7). Oil that has entered both the upper main oil galleries also pressurizes the valve lifter assemblies (2) and is then pumped through the pushrods to lubricate the valve rocker arms and valve stems. Oil returning to the pan is directed by the crankshaft oil deflector. The oil pressure sensor (3) is located at the top rear of the engine.

Replacing Engine Gaskets

Tools Required

J 28410 Gasket Remover

Gasket Use and Applying Sealants

- Do not use any gasket again unless specified.
- Gaskets that can be used again will be identified in the service procedure.
- Do not apply sealant to any gasket or sealing surface unless called out in the service information.

Separating Components

- Use a rubber mallet to separate components.
- Bump the part sideways to loosen the components.
- Bumping should be done at bends or reinforced areas to prevent distortion of parts.

Cleaning Gasket Surfaces

- Remove all gasket and sealing material from the part using the J 28410 .
- Care must be used to avoid gouging or scraping the sealing surfaces.
- Do not use any other method or technique to remove sealant or gasket material from a part.
- Do not use abrasive pads, sand paper, or power tools to clean the gasket surfaces.
  - These methods of cleaning can cause damage to the component sealing surfaces.
  - Abrasive pads also produce a fine grit that the oil filter cannot remove from the oil.
  - This grit is abrasive and has been known to cause internal engine damage.

Assembling Components

Notice: Refer to Sealant Notice in the Preface section.

- When assembling components, use only the sealant specified or equivalent in the service procedure.
- Sealing surfaces should be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.
- Components requiring lubrication will be identified in the service procedure.
- When applying sealant to a component, apply the amount specified in the service procedure.
- Tighten bolts to specifications. Do not over tighten.

Separating Parts

Important:

- Many internal engine components will develop specific wear patterns on their friction surfaces.
- When disassembling the engine, internal components MUST be separated, marked, or organized in such a way as to make sure installation to their original location and position.

Separate, mark, or organize the following components:

- Piston and the piston pin
- Piston to the specific cylinder bore
- Piston rings to the piston
- Connecting rod location and orientation to the crankshaft journal
- Connecting rod to the bearing cap

  A paint stick or etching/engraving type tool are recommended. Stamping the connecting rod or cap near the bearing bore may affect component geometry.
- Crankshaft main and connecting rod bearings
- Camshaft and valve lifters
- Valve lifters, lifter guides, pushrods and rocker arm assemblies
- Valve to the valve guide
- Valve spring to the cylinder head location
- Engine block main bearing cap location and direction
- Oil pump drive and driven gears

Tools and Equipment

Special tools are listed and illustrated throughout this section, with a complete listing at the end of the section. These tools, or their equivalents, are specially designed to quickly and safely accomplish the operations for which they are intended. The use of these special tools also minimize possible damage to engine components. Some precision measuring tools are required for inspection of certain critical components. Torque wrenches and a torque angle meter are necessary for the correct tightening of various fasteners.

To correctly service the engine assembly, the following items should be readily available:

- Approved eye protection and safety gloves
- A clean, well lit, work area
- A suitable parts cleaning tank
- A compressed air supply
- Trays or storage containers to keep parts and fasteners organized
- An adequate set of hand tools
- Approved engine repair stand
- An approved engine lifting device that will adequately support the weight of the components

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Description and Operation | **Document ID: 1991376**

Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant

Pipe Joint Compound

Important: Three types of sealer are commonly used in engines. These are room temperature vulcanizing (RTV) sealer, anaerobic gasket eliminator sealer, and pipe joint compound. The correct sealer and amount must be used in the correct location to prevent oil leaks. DO NOT interchange the 3 types of sealers. Use only the specific sealer or the equivalent as recommended in the service procedure.

- Pipe joint compound is a pliable sealer that does not completely harden. This type of sealer is used where two non-rigid parts, such as the oil pan and the engine block, are assembled together.
- Do not use pipe joint compound in areas where extreme temperatures are expected. These areas include: exhaust manifold, head gasket, or other surfaces where gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.

  To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.

Notice: Refer to Sealant Notice in the Preface section.

- Apply the pipe joint compound to a clean surface. Use a bead size or quantity as specified in the procedure. Run the bead to the inside of any bolt holes.
- Apply a continuous bead of pipe joint compound to one sealing surface. Sealing surfaces to be resealed must be clean and dry.
- Tighten the bolts to specifications. Do not over tighten.

RTV Sealer

- RTV sealant hardens when exposed to air. This type of sealer is used where two non-rigid parts, such as the intake manifold and the engine block, are assembled together.
- Do not use RTV sealant in areas where extreme temperatures are expected. These areas include: exhaust manifold, head gasket, or other surfaces where a gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.

  To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.

Notice: Refer to Sealant Notice in the Preface section.

- Apply RTV sealant to a clean surface. Use a bead size as specified in the procedure. Run the bead to the inside of any bolt holes.
- Assemble components while the RTV sealant is still wet, within 3 minutes. Do not wait for the RTV sealant to skin over.
- Tighten bolts to specifications. Do not over tighten.

Anaerobic Sealer

- Anaerobic gasket eliminator hardens in the absence of air. This type of sealer is used where two rigid parts, such as castings, are assembled together. When two rigid parts are disassembled and no sealer or gasket is readily noticeable, the parts were probably assembled using a gasket eliminator.
- Follow all safety recommendations and directions that are on the container.

  To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply a continuous bead of gasket eliminator to one flange. Surfaces to be sealed must be clean and dry.

Notice: Refer to Sealant Notice in the Preface section.

- Spread the sealer evenly with your finger to get a uniform coating on the sealing surface.

  Important: Anaerobic sealed joints that are partially torqued and allowed to cure more than five minutes may result in incorrect shimming and sealing of the joint.

- Tighten bolts to specifications. Do not over tighten.
- After correctly tightening the fasteners, remove the excess sealer from the outside of the joint.

Special Tools (L98, LS2)

Illustration	Tool Number / Description
	J 3049-A Valve Lifter Remover
	J 6125-1B Slide Hammer with Adapter

Suction Pipe Upper to Suction Pipe Lower Retaining Nut	22 N-m	16 lb ft
Suction Pipe/Liquid Pipe Pad to TX Valve Retaining Nut	22 N-m	16 lb ft
Suction Pipe/Liquid Pipe Retaining Clip to Left Front Chassis Rail Retaining Bolt	22 N-m	16 lb ft
Suction/Discharge Pipe to Compressor Retaining Bolt	22 N-m	16 lb ft
TX Valve Retaining Bolts	4 N-m	35 lb in

Compressor Specifications

Component	Application	Specification
A/C System Refrigerant Oil	Type	PAG Oil Denso ND 8
Refrigerant	Type	HFC R-134a
Compressor	Make Type	Denso 6SEU16C Variable Stroke, Clutch-less, Electronic Control Valve

Refrigerant System Capacities

Refrigerant System Capacities

Application	Specification	
	Metric	Imperial
PAG Oil Denso ND 8		
Compressor Replacement		
- The Denso Service Compressor is precharged with the total system specified amount of PAG Oil	Refer to Air Conditioning Compressor Oil Balancing	
Condenser Replacement	30-40 ml	1 -- 1.4 oz
Filter Drier Replacement	15-20 ml	0.5 --0.7 oz
Evaporator Replacement	30-40 ml	1 -- 1.4 oz
- Total System PAG Oil Capacity	100-140 ml	3.3 -- 4.7 oz
HFC R-134a		
- Refrigerant Charge	580 g	20.5 oz
If more than the specified amount of PAG oil was drained from a component, add the equal amount of oil drained.		

Symptoms - Heating, Ventilation, and Air Conditioning

Important: Review the system operation in order to familiarise yourself with the system functions. Refer to:

- Air Delivery Description and Operation Manual or Air Delivery Description and Operation Automatic.
- Air Temperature Description and Operation Manual or Air Temperature Description and Operation Automatic.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.
- The A/C compressor will not operate in cold outside air temperatures. Refer to Air Temperature Description and Operation.
- The following conditions may cause window fogging:
  - Wet carpet or mats
  - High humidity
  - Interior water leak
  - Blocked A/C evaporator drain tube
  - Maximum passenger capacity
  - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:

  Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Blower Motor Malfunction.
- Leak Testing.
- Defrosting Insufficient.
- Noise Diagnosis - Blower Motor.
- Noise Diagnosis - Air Conditioning (A/C) System.
- Noise Diagnosis - HVAC Module

- Odor Diagnosis.

Diagnostic Starting Point - Heating, Ventilation and Air Conditioning

The Heating, Ventilation and Air Conditioning (HVAC) system is divided into 3 separate sections. The first, Heating, Ventilation and Air Conditioning, has all procedures that pertain to a HVAC component or function that is not specifically associated with the manual or automatic control system. The second, HVAC Systems - Manual, has procedures specific to the Manual control system and the third, HVAC systems - Automatic, has procedures specific to the automatic control system. The DTCs and scan tool data that support the manual HVAC system are also relevant for the automatic HVAC system. To minimise data duplication this information is located in HVAC Systems - Automatic.

Begin the system diagnosis with the Diagnostic System Check - Vehicle . The diagnostic system check will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the diagnostic system check will identify the correct procedure for diagnosing the system and where the procedure is located.

Review the description and operation information to help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is an abnormal operation. The HVAC description and operation information is divided into the following:

- Air Delivery Description and Operation -- Manual or Air Delivery Description and Operation -- Automatic.
- Air Temperature Description and Operation -- Manual or Air Temperature Description and Operation -- Automatic.

The air delivery description and operation contains the following topics:

- HVAC control components.
- Air speed.
- Air distribution.
- Recirculation operation.

The air temperature description and operation contains the following topics:

- HVAC control components.
- Heating and A/C operation.
- Engine coolant.
- A/C cycle.

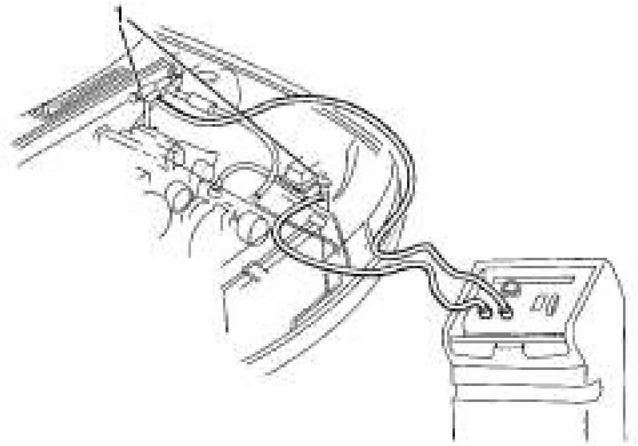
Air Conditioning (A/C) System Performance Test

Table 1: A/C Performance Table

Table 2: Refrigerant-134a Pressure-Temperature Relationship

Important:

- Before carrying out the high/low pressure and centre vent temperature testing, make sure that the vehicles A/C system has no visual or operational defects and that all refrigerant recovery and recharging safety requirements are adhered to. Refer to Refrigerant Recovery and Recharging.
- Before commencing the testing follow the vehicle set up procedure. Failure to correctly set the vehicle up for testing will provide inaccurate diagnosis when comparing actual pressure readings to the table below.



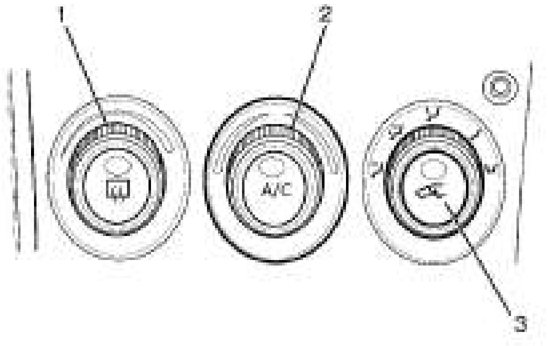
1. Connect the calibrated high/low pressure gauges to the A/C system (1).

   Important: Both high and low pressures should be within 50kPa of each other, if not a blockage may be present in the system.

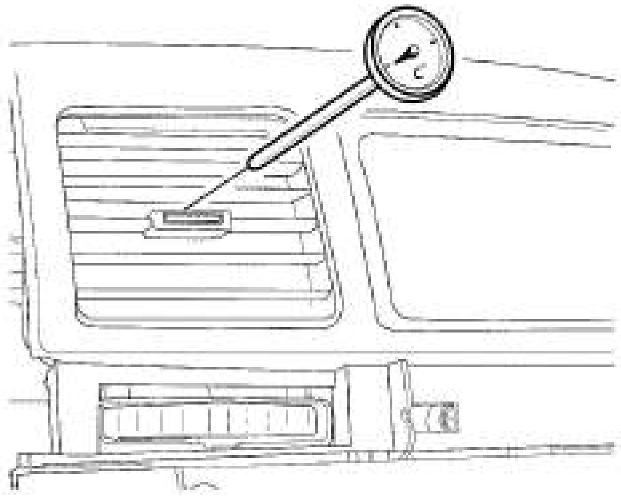
2. Confirm that the static pressures (vehicle not started or A/C engaged) are correct.

   Important: When possible the vehicle should be tested in direct sunlight, especially in the case of climate control vehicles using solar sensors.

3. Record the ambient temperature conditions and the relative humidity at the time of the test.
4. DO NOT test the vehicle with the condenser air flow restricted, such as against a wall.



5. Set the blower motor speed control (1) to the highest blower motor speed.
6. Set the temperature control (2) to the maximum cold setting.
7. Set the air intake mode control (3) to fresh air intake mode.



8. Set the mode outlet control to the face position with the instrument panel louvres open and facing straight ahead.

   Important: Make sure that the thermometer probe is inserted to a length of approximately 50mm.

9. Insert a thermometer centrally into the face vent.
10. Turn the engine ON and run at idle speed.
11. Close all vehicle doors and windows.
12. Close the vehicle engine hood.

Important: For Accurate testing the relative humidity percentage (RH%) should be known, as you will see the pressures and vent temperatures alter as RH% changes. Refer to the A/C performance table below.

13. Make sure accurate pressure gauges are connected to the A/C system.
14. Turn the engine OFF and compare the readings with the data in the A/C performance table. A normally operating A/C system should not exceed levels shown. If the readings exceed the table limits, refer to Symptoms - HVAC Systems - Manual.

A/C Performance Table

Engine Speed (RPM)	Relative Humidity (%)	Ambient Air Temperature		Centre Air Outlet Temperature		Gauge Pressure Low Side Pressure		Gauge Pressure High Side Pressure	
		°F	°C	°F	°C	psi	kPa	psi	kPa

Refrigerant-134a Pressure-Temperature Relationship

°C	°F	kPa	psig	°C	°F	kPa	psig
DEFINITION: This table indicates the pressure of the Refrigerant-134a at various temperatures. For instance, a drum of refrigerant at room temperature of 26.6°C (80°F) will have a pressure of 595.6 kPa (86.4 psi). If the refrigerant is heated to 51.6°C (125°F), the pressure will increase to 1278.8 kPa (185.5 psi). The refrigerant also can be used conversely in order to determine the temperature at which the Refrigerant-134a boils under various pressures. For example, at a pressure of 188.2 kPa (27.3 psi), the Refrigerant-134a boils at 0°C (32°F).							
				15.5	60	392.3	56.9

Heating Performance Diagnostic

Step	Action	Yes	No
DEFINITION: Heating system performance.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - Heating, Ventilation, and Air Conditioning in HVAC
2	1. Start the engine. 2. Allow the engine to idle. Does the engine reach normal operating temperature?	Go to Step 3	Go to Step 9
3	**Caution:** Refer to Moving Parts and Hot Surfaces Caution in the Preface section. 1. Select the FLOOR mode. 2. Select the minimum blower speed. 3. Select the warmest temperature setting. 4. Feel the temperature of the inlet and outlet heater hoses at the heater core. Does the inlet heater hose feel warmer than the outlet heater hose?	Go to Step 7	Go to Step 4
4	1. Place a thermometer in the centre air outlet. 2. Secure a thermometer to the heater core outlet heater hose. 3. Select the maximum blower speed. 4. Select the warmest temperature setting. 5. Record the temperature at the following locations: • The centre I/P PANEL air outlet. • The heater core outlet heater hose. 6. Compare the recorded temperatures. Are the 2 temperature readings about equal?	Go to Step 5	Go to Step 6
5	1. Inspect and repair the following areas of the vehicle for cold air leaks: • The cowl. • The recirculation door. • The HVAC module case. 2. Perform the necessary repairs. Are the repairs complete?	Go to Step 10	--
	1. Inspect the temperature door operation. Refer to Diagnostic System Check - Vehicle.		

6	2. Perform any necessary repairs. Are the repairs complete?	Go to Step 10	--
7	1. Turn OFF the engine. 2. Backflush the heater core. 3. Start the engine. 4. Select the FLOOR mode. 5. Select the minimum blower speed. 6. Select the warmest temperature setting. 7. Feel the temperature of the inlet and outlet heater hoses at the heater core. Does the inlet heater hose feel warmer than the outlet heater hose?	Go to Step 8	Go to Step 10
8	Replace the heater core. Refer to Heater Core Replacement. Is the repair complete?	Go to Step 10	--
9	Repair the low engine temperature concern. Refer to Engine Fails To Reach Normal Operating Temperature. Is the repair complete?	Go to Step 10	--
10	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Leak Testing

Tools Required

- J 41447 R-134a A/C Tracer Dye Box of 24.
- J 42220 Universal 12 V Leak Detection Lamp.
- J 43872 Fluorescent Dye Cleaner.
- J 43872 Soapy Water Solution.
- J-46053 Electronic Leak Detector.
- J 46297 A/C Dye Injector Kit.
- J 46297-12 Replacement Dye Cartridges.

Refrigerant Leak Testing

Caution: Refer to Safety Glasses Caution in the Preface section.

Verifying some passive leaks may require using the electronic leak detector, and the addition of fluorescent dye. The fluorescent dye mixes and flows with the polyalkylene glycol (PAG) oil throughout the refrigerant system. The only time that adding additional fluorescent dye is required is after flushing the A/C system.

Fluorescent Leak Detector

Important: Always use the coloured glasses provided with your ultra violet lamp as these enhance the fluorescent dye colour.

Fluorescent dye will assist in locating any leaks from the A/C system.

Important: PAG oil is water soluble.

- Condensation on the evaporator core or the refrigerant lines may wash the PAG oil and fluorescent dye away from the actual leak. Condensation may also carry the fluorescent dye through the HVAC module drain.
- Leaks in the A/C system will be indicated in a light green or yellow colour when using the leak detection lamp.

  Use the leak detection lamp in the following areas:
  - All fittings or connections that use seal washers or an O-ring.
  - All of the A/C components.
  - The A/C compressor shaft seal.
  - The A/C hoses and pressure switches.
  - The HVAC module drain pipe (if the evaporator core is suspected of leaking).
  - The service port sealing caps (the sealing cap is the primary seal for the service ports).
- Follow the instructions supplied with the J 42220 .

- To prevent false diagnosis in the future, thoroughly clean the residual dye from any area where leaks were found. Use a rag and the approved J 43872 containing fluorescent dye cleaner.

Fluorescent Dye Injection

Important: Avoid spilling fluorescent dye on the vehicle paint work, clean off straight away using an approved fluorescent dye cleaning agent.

Important: Use only fluorescent dye approved by the vehicle manufacturer.

- J 41447 can be poured directly into a removed A/C component.
- J 46297-12 is injected into the low side port using J 46297 .
- Not all fluorescent dyes are compatible with PAG oil. Some types of fluorescent dye decrease the oil viscosity or may chemically react with the oil.
- R-134a leak detection dye requires time to work. Depending upon the leak rate, a leak may not become visible for a duration between 15 minutes and 7 days.

Important: Do NOT overcharge the A/C system with dye. Use only one 7.39 ml (0.25 oz) charge.

- To prevent false diagnosis, thoroughly clean any residual dye from the service port with a shop cloth and the approved J 43872 containing fluorescent dye cleaner.

Electronic Leak Detector

Make sure that the vehicle has at least 0.2 kg of refrigerant in the A/C refrigeration system in order to perform a leak test. Refer to Refrigerant Recovery and Recharging , for the recharging of the A/C system.

Make sure that fresh batteries are installed at regular intervals, false readings may occur as a result of the batteries not being fully charged.

Make sure that the sensing tip inlet is free of dirt, also make sure that the sensing tip is kept at a distance of 5mm from the components/areas being tested.

Important: Follow a continuous path in order to make sure that all possible leaks are detected. Test all areas of the system for leaks.

Follow the instructions supplied with the electronic leak detector.

Soapy Water

Fill the approved J 43872 with a solution of 50% water and 50% dish washing liquid. Operate the A/C system and spray the soapy solution over the joints and components. When a leak is evident the solution will bubble up.

This is an ideal method for hose and joint leaks.

Noise Diagnosis - Air Conditioning (A/C) System

Step	Action	Yes	No
DEFINITION: Noise originating from the A/C compressor, drive belt or the A/C lines.			
1	Were you sent here from HVAC Symptoms or another diagnostic table?	Go to Step 2	Go to Diagnostic System Check - Vehicle.
2	Inspect and if necessary rectify any faults with the accessory drive belt and drive belt tensioner.	Go to Step 3	
3	Run the engine and check for possible compressor noise. Does the noise last longer than 30 seconds?	Go to Step 5	Go to Step 4
4	• Allow the engine to run for a few minutes. • Stop engine and let it rest for a minute. • Restart engine. Is any noise detected using this procedure?	Go to Step 6	It is normal to observe a liquid sludging condition. This may occur after extended system shut down at warmer ambient temperatures, followed by an overnight ambient temperature drop
5	Check if the system has a low refrigerant charge. Is there enough system gas?	Go to Step 7	Go to Step 8
6	Check if the thermostatic expansion (TX) valve is stuck closed or open. Is the TX valve stuck?	Carry out TX valve diagnosis. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement.	Go to Step 7
7	Check for any loose compressor bolt and/or A/C plumbing contacting the bodywork. Is there any A/C plumbing contacting the bodywork or mounting bolts loose?	Tighten bolts and/or relocate plumbing	Go to Step 8
	1. Recover refrigerant and replace compressor.		

8	2. Recharge the system Are the gas pressures within specification?	System checks complete	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Diagnostic Information and Procedures | Document ID: 1979566

Noise Diagnosis - Blower Motor

Step	Action	Yes	No
DEFINITION: Noise originating from the blower motor.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Manual.
2	Inspect the air inlet grille for debris. Is debris present?	Go to Step 8	Go to Step 3
3	1. Sit inside the vehicle. 2. Close the vehicle doors and windows. 3. Turn ON the ignition, with the engine OFF. 4. Cycle the blower motor through all of the speeds and modes in order to determine where and when the noise occurs. Is a noise evident during the blower operation?	Go to Step 4	Go to Step 11
4	Inspect for vibration at each blower motor speed by feeling the blower case. Is excess vibration present?	Go to Step 6	Go to Step 5
5	Listen to the blower motor at each speed. Is the blower motor making a squeaking or chirping noise?	Go to Step 9	Go to Step 11
6	1. Remove the blower motor. Refer to Blower Motor Replacement. 2. Inspect the blower motor impeller for deposits of foreign material. 3. Inspect the blower motor for deposits of foreign material. Did you find any foreign material on the blower motor or blower motor impeller?	Go to Step 8	Go to Step 7
7	Inspect the blower motor for the following conditions: - Cracked blades. - A loose impeller retainer. - Incorrect impeller alignment. Did you find any of these conditions?	Go to Step 9	Go to Step 10
8	Remove the foreign material. Is the action complete?	Go to Step 10	--
	Replace the blower motor. Refer to Blower Motor		

9	Replacement. Is the repair complete?	Go to Step 11	--
10	Install the blower motor. Refer to Blower Motor Replacement. Is the action complete?	Go to Step 11	--
11	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Noise Diagnosis - HVAC Module

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module assembly.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Diagnostic System Check - Vehicle.
2	1. Start the engine. 2. Cycle through all of the following: • Blower motor speeds. • HVAC modes. • Temperature control settings. 3. Determine the type of noise: • Scrape, pop. • Tick/click, chirp or groaning. • Air rush/whistle. Is a scrape or pop noise evident when selecting modes or temperature settings?	Go to Step 6	Go to Step 3
3	Is a tick/click, chirping, groaning or scraping noise present, but decreases as blower motor speed is decreased?	Go to Step 6	Go to Step 4
4	Is an air rush/whistle noise evident in all modes but not all temperature settings?	Go to Step 6	Go to Step 5
5	Is an air rush/whistle noise evident only in defrost or floor mode?	Go to Step 6	Go to Step 6
6	Remove the I/P carrier. Refer to Instrument Panel Retainer Replacement. 1. Inspect the air flow doors for correct operation. 2. Inspect the ducts for obstructions or foreign materials. Were any of these conditions found?	Go to Step 9	Go to Step 7
7	Inspect the mode and temperature doors and seals for warping or cracking. Are the doors in normal condition?	Go to Step 10	Go to Step 8
8	Replace the appropriate door and/or seals. Is the repair complete?	Go to Step 10	--
9	Remove any obstructions or foreign material found. Is the action complete?	Go to Step 10	--
	Install the I/P carrier. Refer to Instrument Panel		

10	Retainer Replacement. Is the action complete?	Go to Step 11	--
11	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Odor Diagnosis

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module assembly.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	1. Start the engine. 2. Cycle through all of the following: • Blower motor speeds. • HVAC modes. • Temperature control settings. 3. Determine the type of noise: • Scrape, pop. • Tick/click, chirp or groaning. • Air rush/whistle. Is a scrape or pop noise evident when selecting modes or temperature settings?	Go to Step 6	Go to Step 3
3	Is a tick/click, chirping, groaning or scraping noise present, but decreases as blower motor speed is decreased?	Go to Step 6	Go to Step 4
4	Is an air rush/whistle noise evident in all modes but not all temperature settings?	Go to Step 6	Go to Step 5
5	Is an air rush/whistle noise evident only in defrost or floor mode?	Go to Step 6	Go to Step 6
6	Remove the I/P carrier. Refer to Instrument Panel Retainer Replacement . 1. Inspect the air flow doors for correct operation. 2. Inspect the ducts for obstructions or foreign materials. Were any of these conditions found?	Go to Step 9	Go to Step 7
7	Inspect the mode and temperature doors and seals for warping or cracking. Are the doors in normal condition?	Go to Step 10	Go to Step 8
8	Replace the appropriate door and/or seals. Is the repair complete?	Go to Step 10	--
9	Remove any obstructions or foreign material found. Is the action complete?	Go to Step 10	--
	Install the I/P carrier. Refer to Instrument Panel		

10	Retainer Replacement . Is the action complete?	Go to Step 11	--
11	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1977370**

Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement

Tools Required

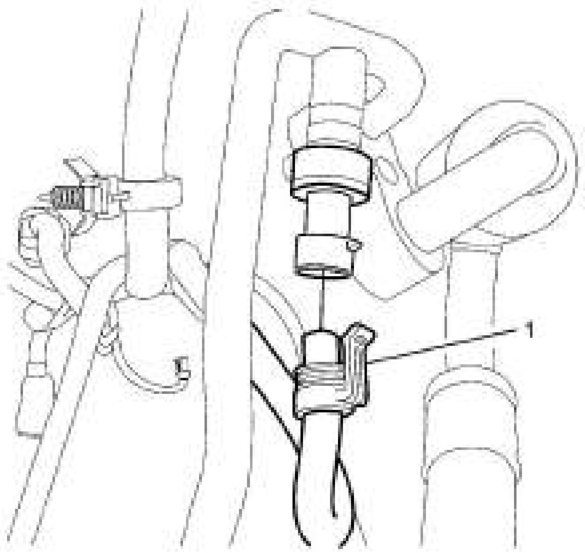
J 39400 Halogen Leak Tester

Removal Procedure

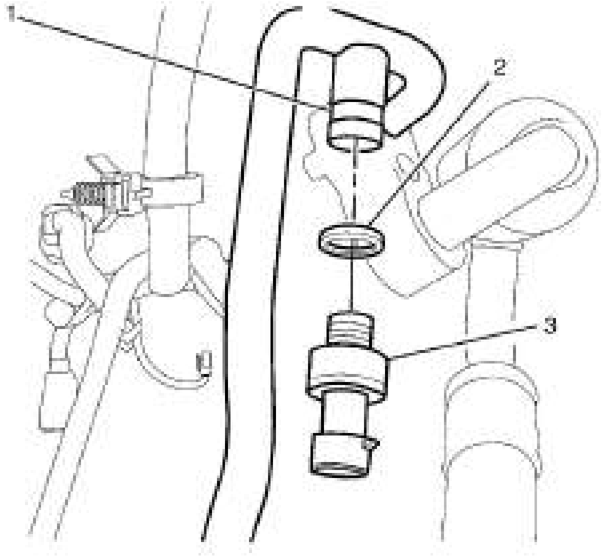
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



2. Disconnect the A/C refrigerant pressure sensor electrical connector (2).



Important: A Schrader valve is fitted to the A/C refrigerant pressure sensor port (1). Upon removal of the A/C refrigerant pressure sensor (3) you will, for a very short period, hear refrigerant escape until the Schrader valve reseats. If refrigerant continues to escape while removing the A/C refrigerant pressure sensor (3) STOP IMMEDIATELY. The Schrader valve has a fault and the refrigerant will have to be recovered.

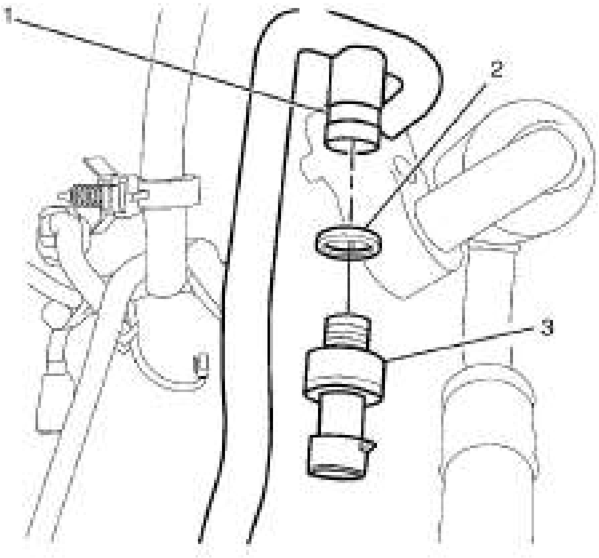
3. Remove the A/C refrigerant pressure sensor (3) from the A/C refrigerant pressure sensor port (1).

   Important: The O-ring seal (2) is a single use item and must be discarded after use.

4. Remove the O-ring seal (2). Refer to O-Ring Replacement .

   Discard the O-ring seal.

Installation Procedure

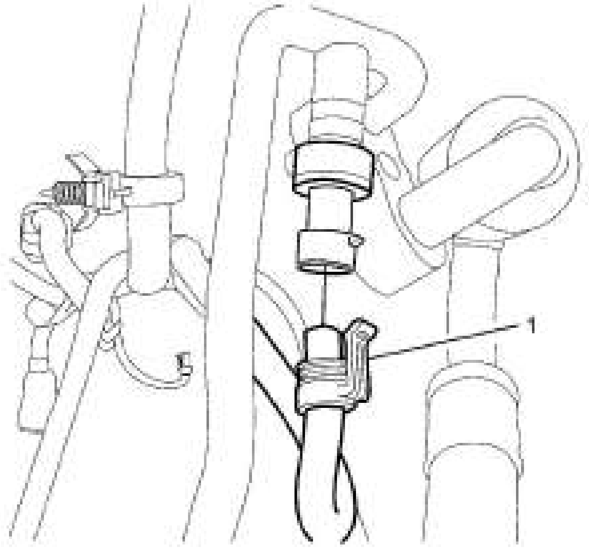


1. Install the NEW O-ring seal (2). Refer to O-Ring Replacement .

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the A/C refrigerant pressure sensor to the A/C refrigerant pressure sensor port (1).

   Tighten
   Tighten the sensor to 6 N·m(53 lb ft).



3. Connect the A/C refrigerant pressure sensor electrical connector (1).
4. Lower the vehicle to the ground.
5. Leak test the fittings of the component using the J 39400 .

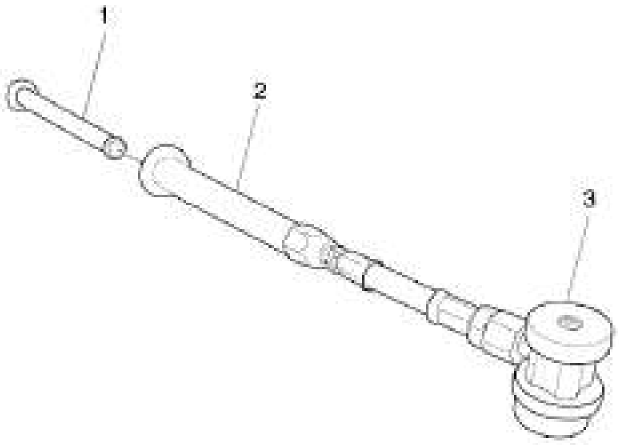
Air Conditioning (A/C) System Oil Charge Replenishing

Tools Required

J 41459 A/C Oil Injector

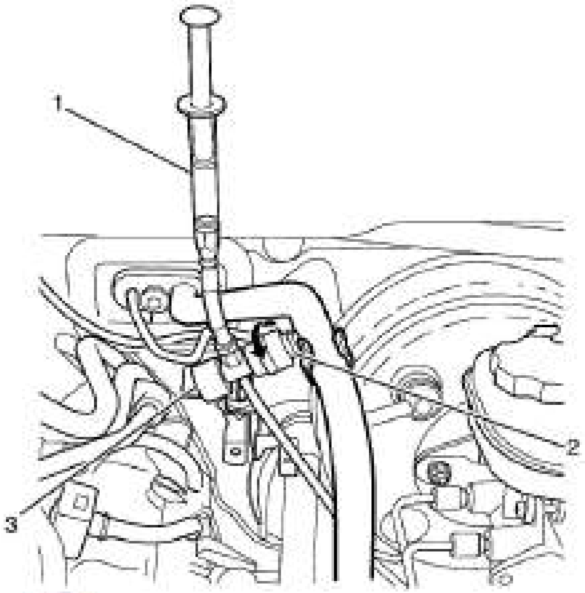
Important: The addition of lubricating oil must be carried out whenever any component is replaced in the A/C system to compensate for oil trapped in the removed component. Carrying out this procedure ensures the A/C system always has the correct amount of oil as specified by the manufacturer.

1. Evacuate the A/C system for a minimum of 30 minutes and to minus 100 kPa negative gauge pressure. Refer to Refrigerant Recovery and Recharging.



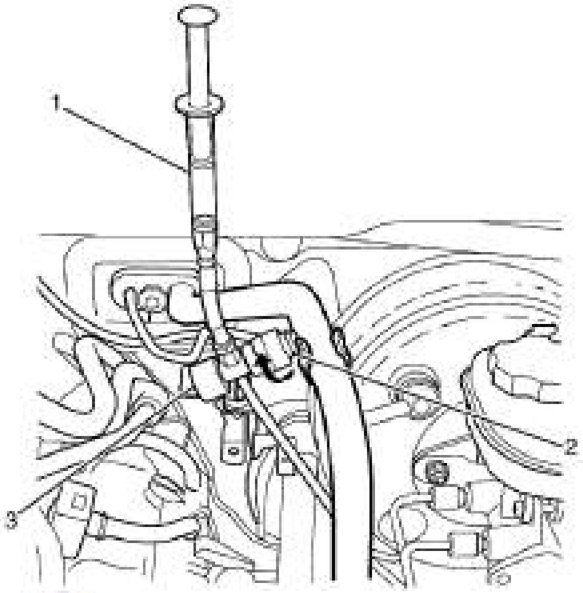
Important: Make sure the valve (3) is in the closed position.

2. Remove the plunger (1) from the J 41459 (2) and pour in the appropriate amount of polyalkylene glycol (PAG) oil specified for the replaced component. Refer to Refrigerant System Capacities.
3. Jiggle the plunger (1) to remove any air in the J 41459 (2).



4. With the A/C system still evacuated, connect the J 41459 (1) to the low side charging port (2).
5. Turn the J 41459 shut off valve tap (3) to the open position to depress the low side charging port (2) schrader valve.

   The oil should now be drawn into the A/C system due to the low pressure in the A/C system.



6. Once all the oil in the J 41459 (1) has moved into the A/C system, turn the shut off valve tap (3) to the closed position.
7. Remove the J 41459 (1) from the low side charging port (2).
8. Repeat steps 2 to 7 if more oil is required.

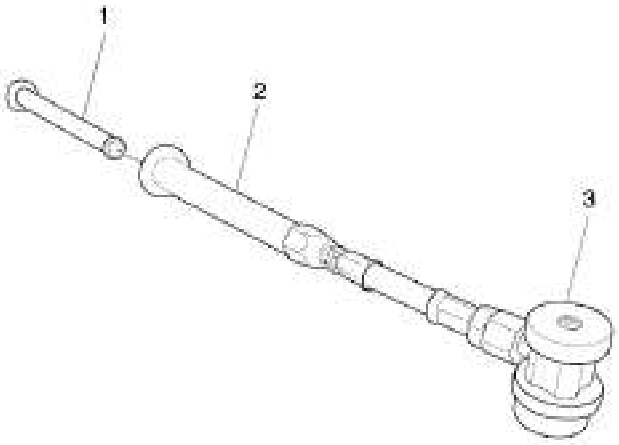
Air Conditioning Clutch Coil Replacement

Tools Required

J 41459 A/C Oil Injector

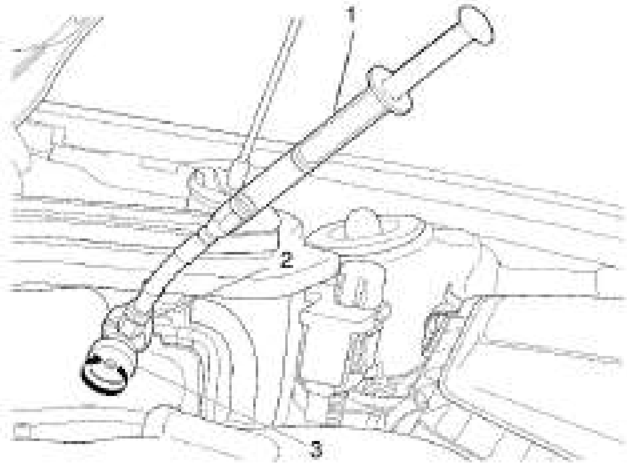
> **Important:** The addition of lubricating oil must be carried out whenever any component is replaced in the A/C system to compensate for oil trapped in the removed component. Carrying out this procedure ensures the A/C system always has the correct amount of oil as specified by the manufacturer.

1. Evacuate the A/C system for a minimum of 30 minutes and to minus 100 kPa negative gauge pressure. Refer to Refrigerant Recovery and Recharging.



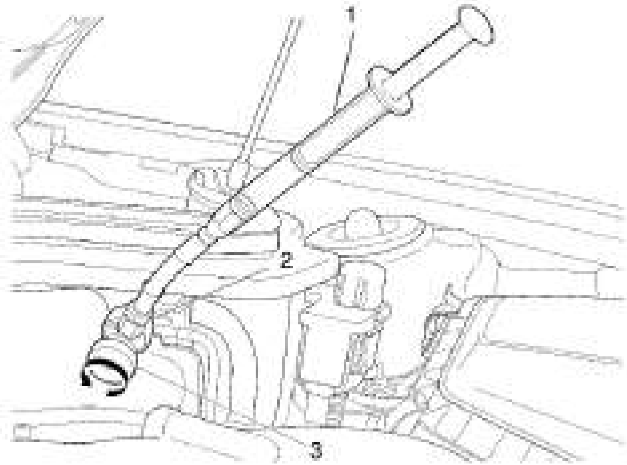
> **Important:** Make sure the valve (3) is in the closed position.

2. Remove the plunger (1) from the J 41459 (2) and pour in the appropriate amount of polyalkylene glycol (PAG) oil specified for the replaced component. Refer to Refrigerant System Capacities.
3. Jiggle the plunger (1) to remove any air in the J 41459 (2).



4. With the A/C system still evacuated, connect the J 41459 (1) to the low side charging port (2).
5. Turn the J 41459 shut off valve tap (3) to the open position to depress the low side charging port (2) schrader valve.

   The oil should now be drawn into the A/C system due to the low pressure in the A/C system.



6. Once all the oil in the J 41459 (1) has moved into the A/C system, turn the shut off valve tap (3) to the closed position.
7. Remove the J 41459 (1) from the low side charging port (2).
8. Repeat steps 2 to 7 if more oil is required.

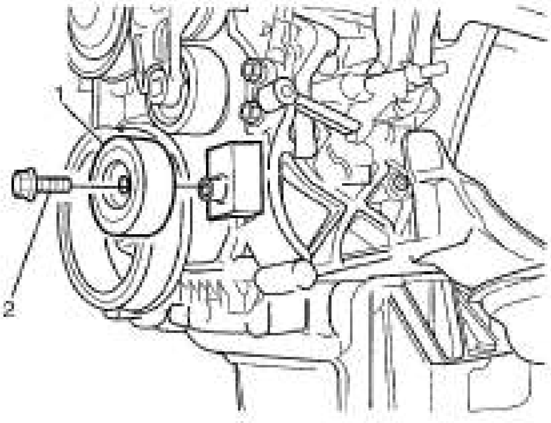
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1998849**

Air Conditioning Compressor Bracket Replacement (3.6L Engine)

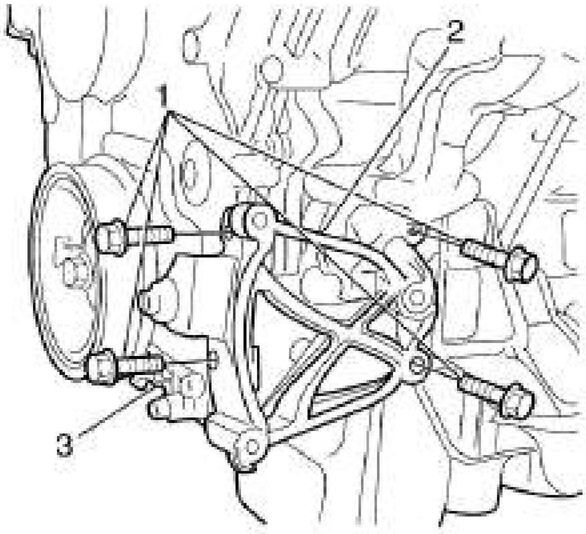
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the compressor. Refer to Air Conditioning Compressor Replacement.

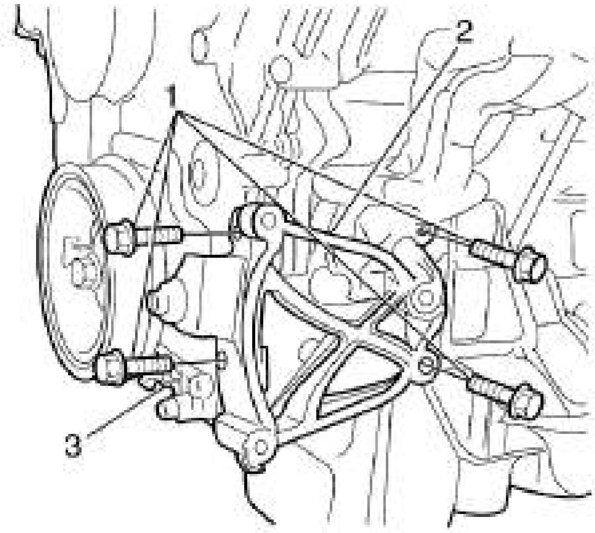


2. Remove the compressor drive belt idler pulley to compressor mounting bracket retaining bolt (2).
3. Remove the compressor drive belt idler pulley (1).



4. Remove the compressor mounting bracket to cylinder block retaining bolts (1).
5. Remove the compressor mounting bracket (2) from the cylinder block (3).

Installation Procedure

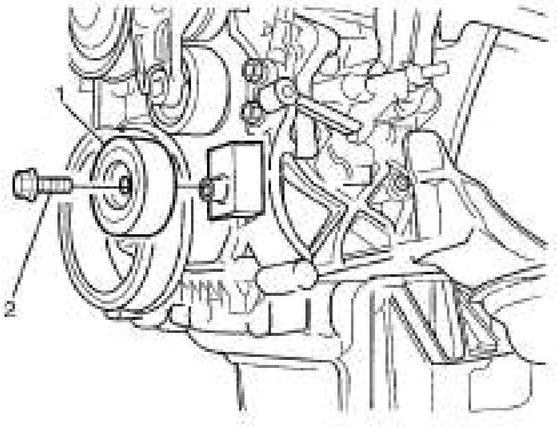


1. Position the compressor mounting bracket (2) to the cylinder block (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the compressor mounting bracket to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolts to 58 N·m (43 lb ft).



3. Install the compressor drive belt idler pulley (1).
4. Install the compressor drive belt idler pulley to compressor mounting bracket retaining bolt (2).

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).

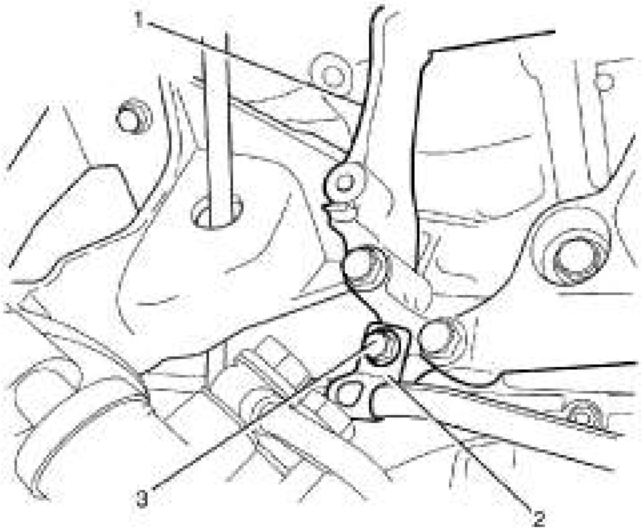
5. Install the compressor. Refer to Air Conditioning Compressor Replacement.

Air Conditioning Compressor Bracket Replacement (6.0L Engine)

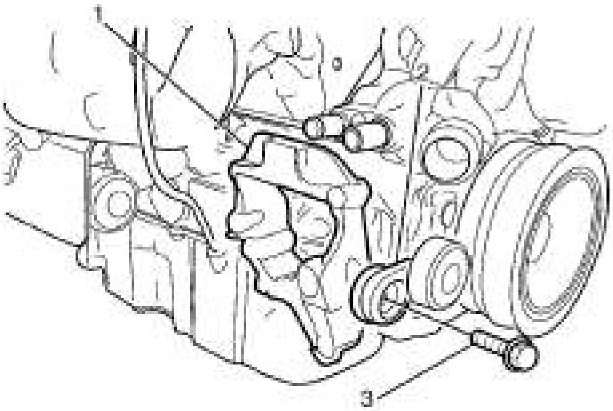
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

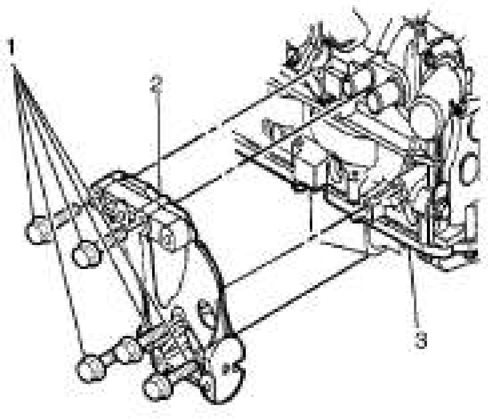
1. Remove the compressor. Refer to Air Conditioning Compressor Replacement.



2. Remove the automatic transmission cooler pipe clamp to A/C bracket retaining bolt (3) if fitted.
3. Position the automatic transmission cooler pipe retaining bracket (2) if fitted, away from the compressor mounting bracket (1).

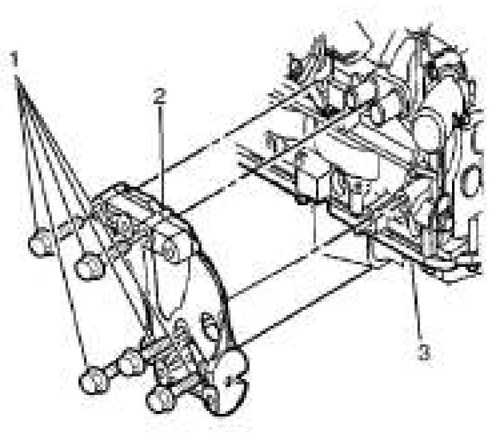


4. Remove the compressor drive belt tensioner to compressor mounting bracket retaining bolt (3).
5. Remove drive belt tensioner (2) from compressor mounting bracket (1).



6. Remove the compressor mounting bracket to cylinder block retaining bolts (1).
7. Remove the compressor bracket (2) from the cylinder block (3).

Installation Procedure

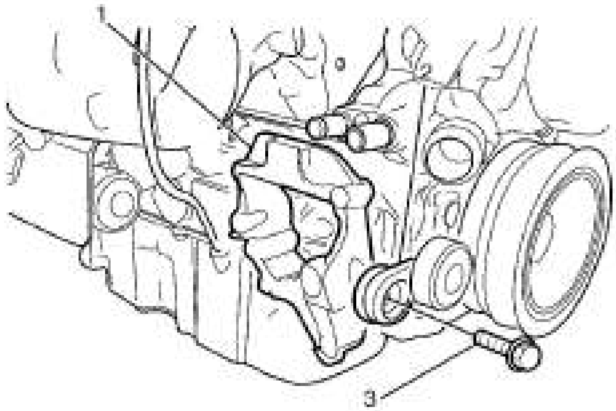


1. Position the compressor mounting bracket (2) to the cylinder block (3).

Notice: Refer to Fastener Notice in the Preface section.

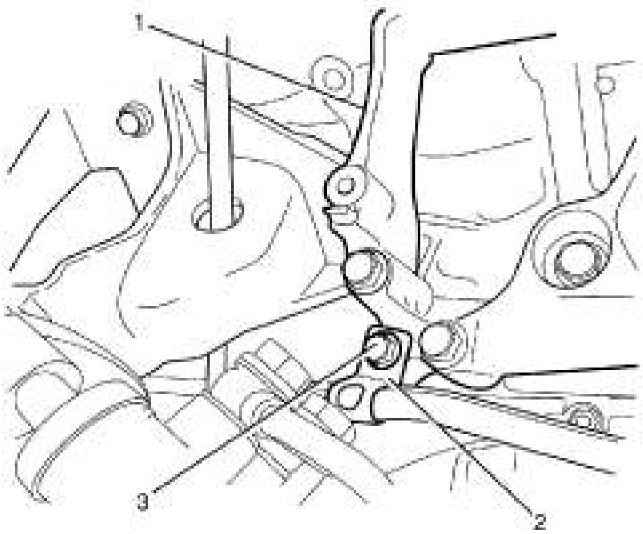
2. Install the compressor mounting bracket to cylinder block retaining bolts (1).

Tighten
Tighten the bolts to 58 N·m (43 lb ft).



3. Position the compressor drive belt tensioner (2) to the compressor mounting bracket (1).
4. Install the compressor drive belt tensioner to compressor mounting bracket retaining bolt (3).

Tighten
Tighten the bolts to 58 N·m (43 lb ft).



5. Position the automatic transmission cooler pipe retaining bracket (2) on the compressor mounting bracket (1) if fitted.
6. Install the automatic transmission cooler pipe clamp to A/C bracket retaining bolt (3).

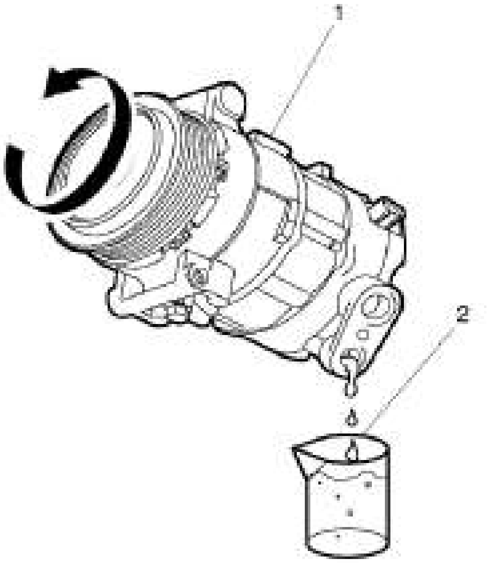
   Tighten
   Tighten the bolt to 22 N·m (16 lb ft).

7. Install the compressor. Refer to Air Conditioning Compressor Replacement.

Air Conditioning Compressor Oil Balancing

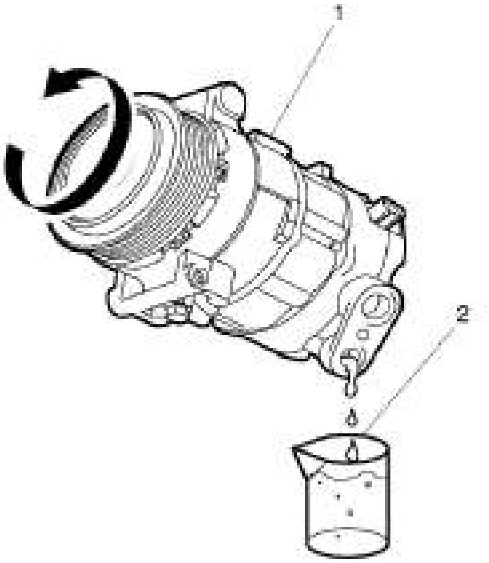
Draining Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.



Important: Rotate the compressor (1) while draining to assist in polyalkylene glycol (PAG) oil removal.

1. Drain and measure the PAG oil from the original compressor (1) into a clean, graduated container (2).
2. Record the amount of PAG oil drained from the removed compressor (1). This measurement will be used during installation of the replacement compressor.
3. Correctly discard the used PAG oil.
4. Clean the graduated cylinder.

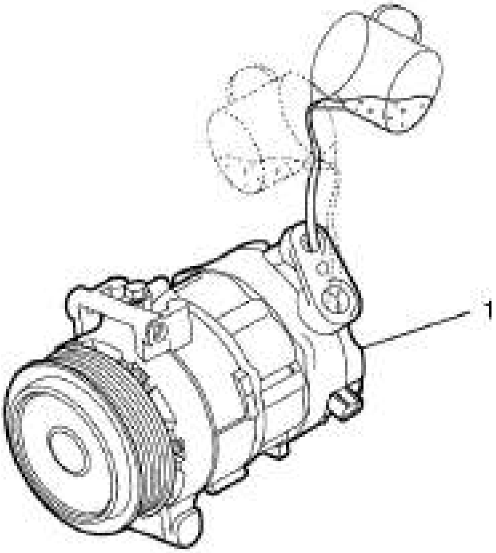


Important: Drain and measure as much of the PAG oil as possible from the NEW compressor (1).

Important: Rotate the compressor (1) while draining to assist in PAG oil removal.

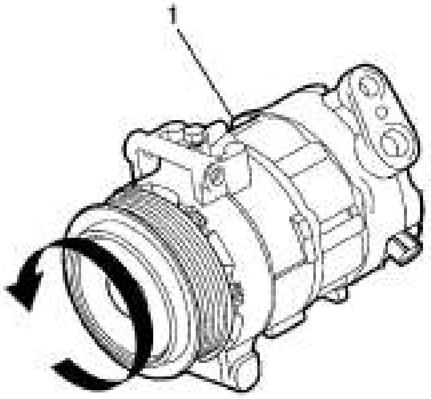
5. Drain the PAG oil from the NEW compressor (1) into a clean, graduated container (2).

Balancing Procedure



Important: If the amount of PAG oil recorded from the removed compressor is less than 60 ml (2.0 fl. oz), disregard the recorded amount and pour a total of 60 ml (2.0 fl. oz) of the NEW PAG oil back into the NEW compressor (1).

1. Add back the same quantity of PAG oil to the NEW compressor (1) that was recorded from the removed compressor.



2. Rotate the NEW compressor (1) three times to lubricate the internal compressor components.
3. If necessary, refer to Refrigerant System Capacities.

Air Conditioning Compressor Replacement (3.6L Engine)

Tools Required

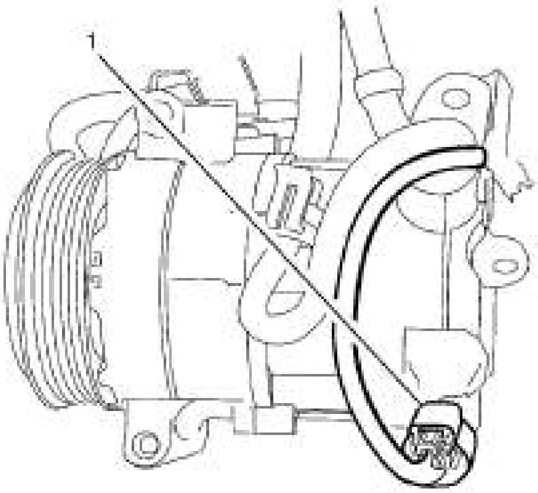
J 39400 Halogen Leak Tester

Removal Procedure

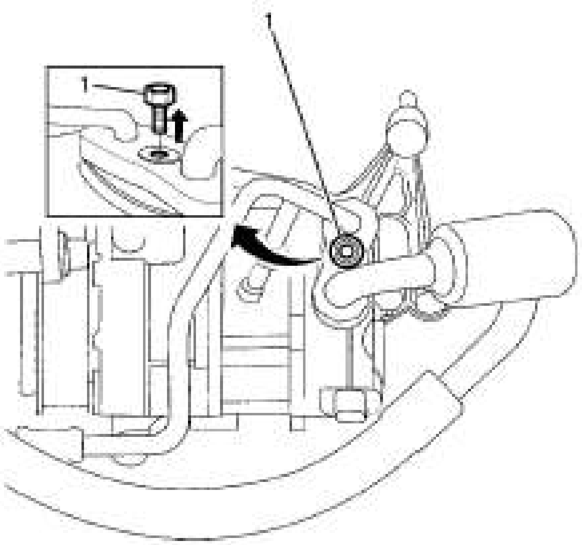
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Battery Disconnect Caution in the Preface section.

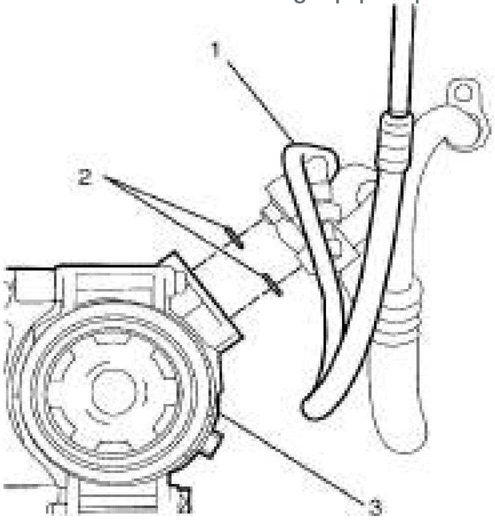
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .
3. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement .
4. Remove the accessory drive belt or air conditioning drive belt. Refer to Drive Belt Replacement .



5. Disconnect the compressor electrical connector (1).



6. Remove the suction/discharge pipes pad to compressor retaining bolt (1).



7. Disconnect the suction/discharge pipe pad (1) from the compressor (3).

Important: The sealing washers (2) are a single use item and must be discarded after use.

8. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

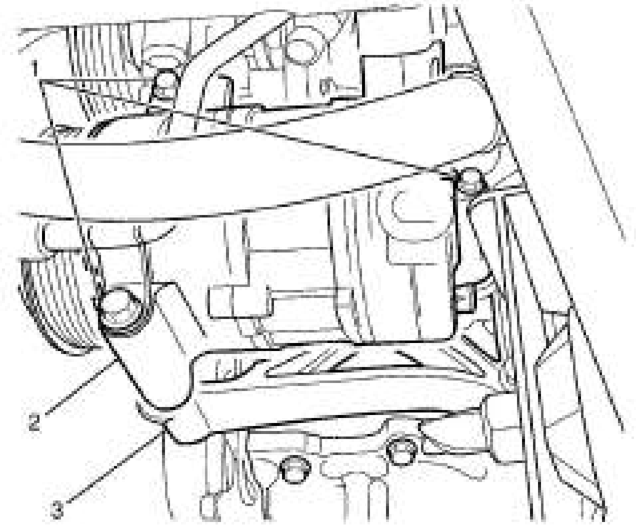
   Discard the sealing washers.

   Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

9. Cap or plug the suction/discharge pipe pad (1) and the ports on the compressor (3).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

10. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



Important: The compressor (2) must be supported before removing the compressor to compressor mounting bracket retaining bolts (1).

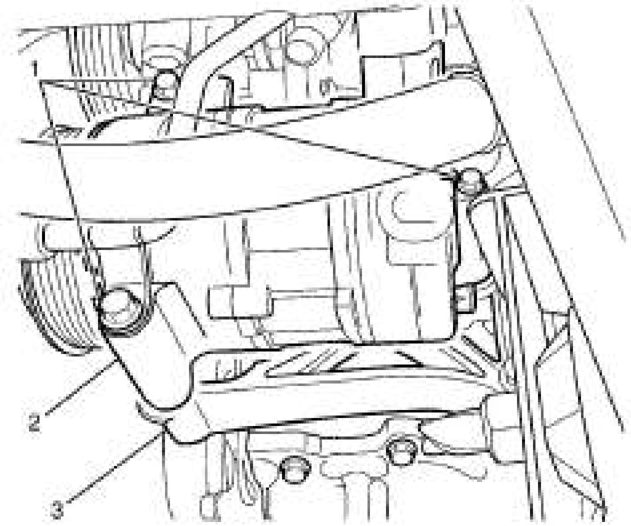
11. Remove the compressor to compressor mounting bracket retaining bolts (1).

Important: Remove the compressor (2) from the compressor mounting bracket (3) by sliding forwards and then upwards out of the engine compartment.

12. Remove the compressor (2) from compressor mounting bracket (3).

Installation Procedure

1. If you are replacing the compressor, balance the compressor oil. Refer to Air Conditioning Compressor Oil Balancing .



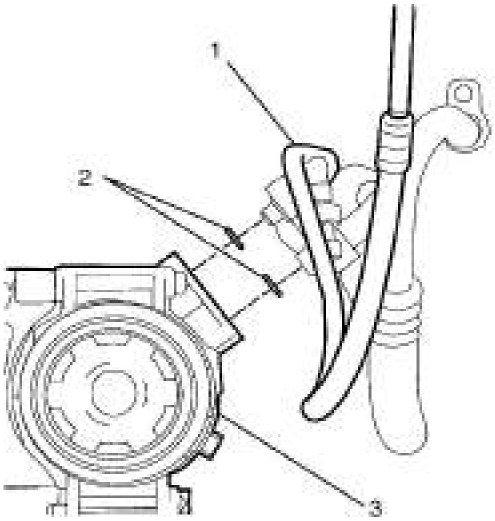
2. Install the compressor (2) to the compressor mounting bracket (3).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the compressor to compressor mounting bracket retaining bolts (1).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).

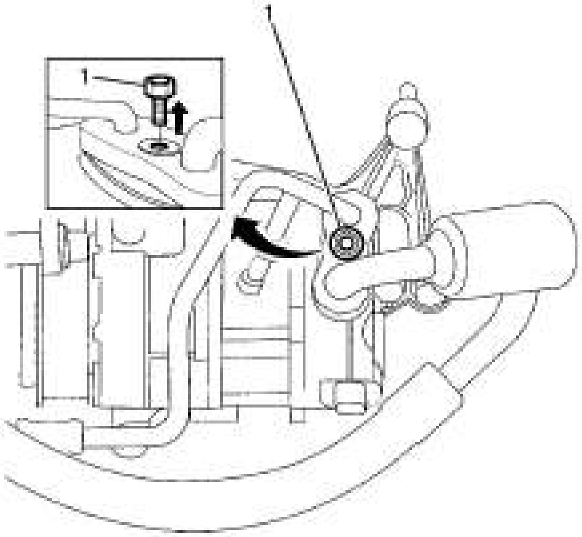
4. Lower the vehicle.



5. Remove the plugs or caps from the suction/discharge pipe pad (1) and the ports on the compressor (3).

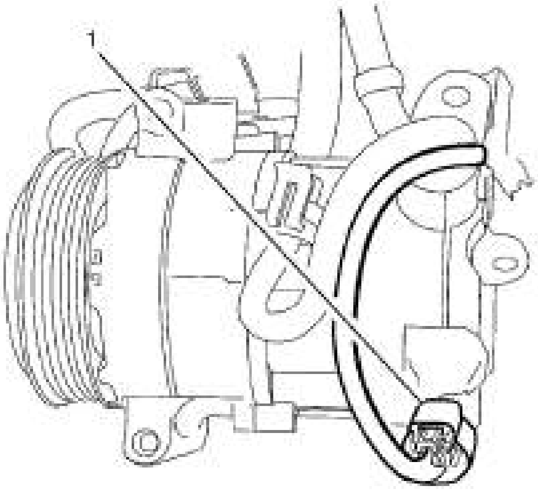
Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

6. Install two NEW sealing washers (2). Refer to Sealing Washer Replacement .
7. Connect the suction/discharge pipes (1) to the compressor (3).



8. Install the suction/discharge pipe pad to compressor retaining bolt (1).

Tighten
Tighten the bolt to 22 N·m (16 lb ft).



9. Install the compressor electrical connector (1).

10. Install the accessory drive belt or air conditioning drive belt. Refer to Drive Belt Replacement .
11. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement .
12. Evacuate and recharge the refrigerant system. Refer to Refrigerant Recovery and Recharging .
13. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection l.
14. Leak test the fitting of the repaired or reinstalled component using the J 39400 .

Air Conditioning Compressor Replacement (6.0L Engine)

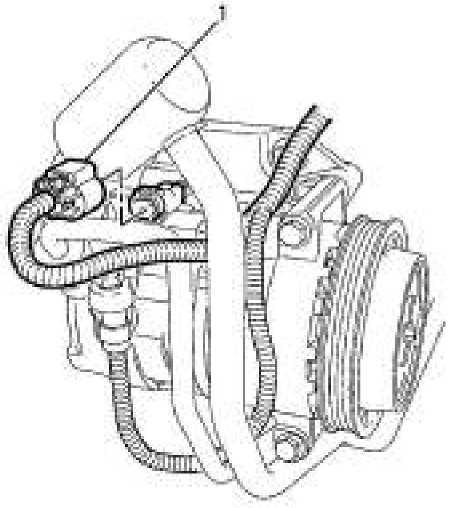
Tools Required

J 39400 Halogen Leak Tester

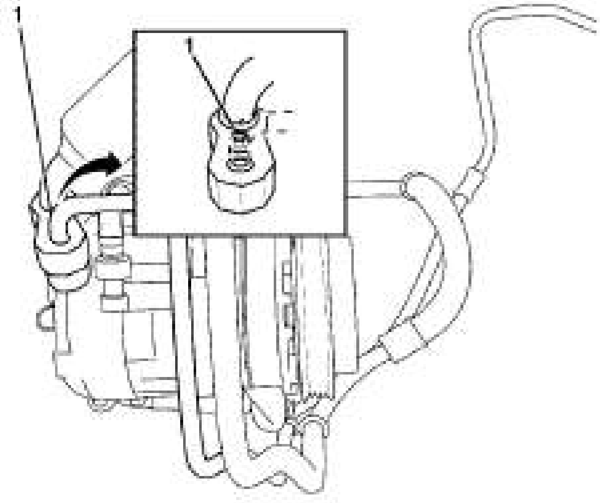
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

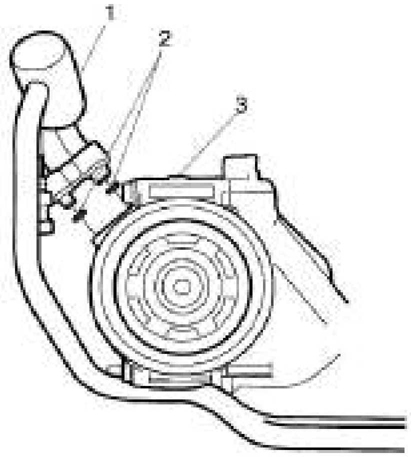
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.
3. Remove the radiator air deflector. Refer to Cooling Fan and Shroud Replacement.
4. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement.
5. Remove the A/C drive belt. Refer to Air Conditioning Compressor Belt Replacement.



6. Disconnect the compressor electrical connector (1).



7. Remove the suction/discharge pipes pad to compressor retaining bolt (1).



8. Disconnect the suction/discharge pipes (1) from the compressor (3).

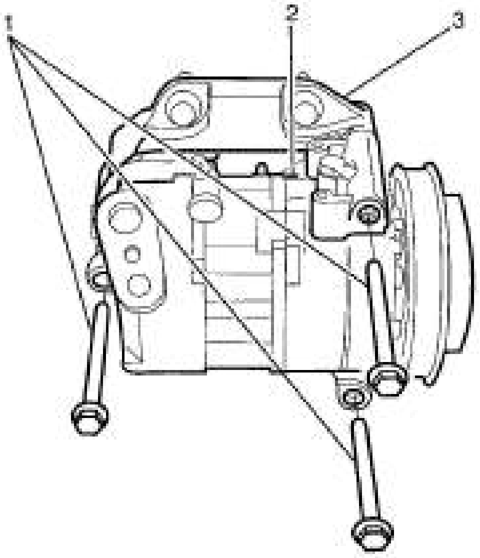
Important: The sealing washers (2) are a single use item and must be discarded after use.

9. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

   Discard the sealing washers

   Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

10. Cap or plug the suction/discharge pipes (1) and the ports on the compressor (3).



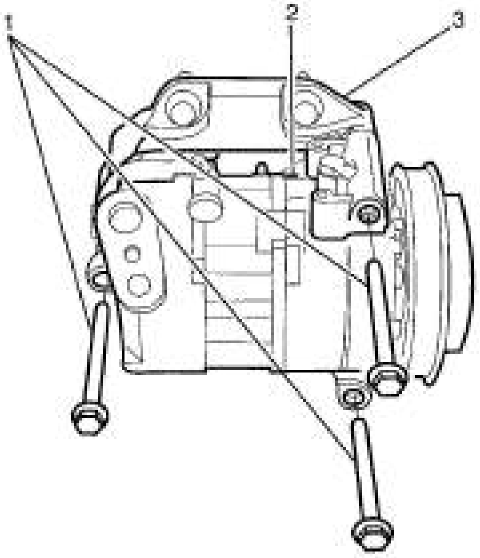
11. Remove the compressor to compressor bracket retaining bolts (1).

    Important: Remove the compressor (2) from the compressor mounting bracket (3) by sliding forwards and than tilting upwards out of the engine compartment.

12. Remove the compressor (2) from the compressor bracket (3).

Installation Procedure

1. If you are replacing the compressor, balance the compressor oil. Refer to Air Conditioning Compressor Oil Balancing.

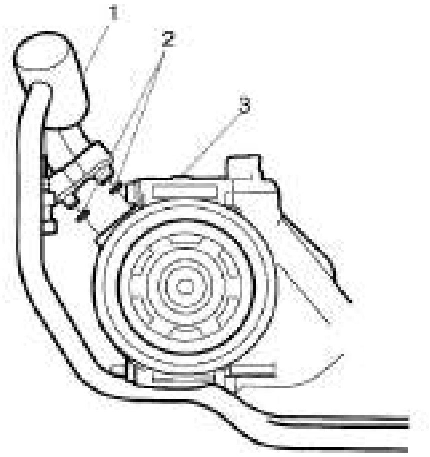


2. Install the compressor (2) to the compressor mounting bracket (3).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the compressor to compressor mounting bracket retaining bolts (1).

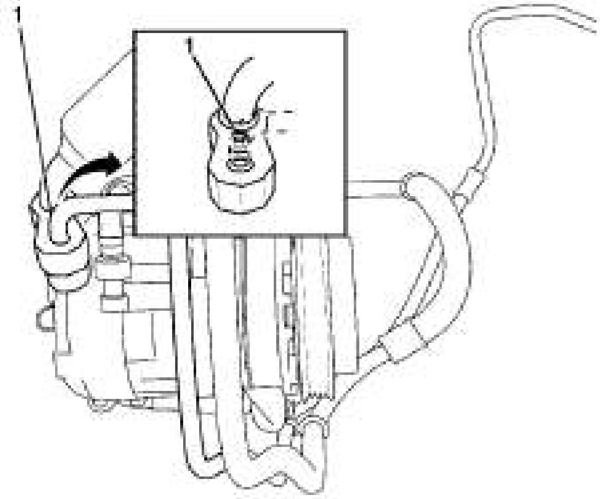
   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).



4. Remove the plugs or caps from the suction/discharge pipes (1) and the ports on the compressor (3).

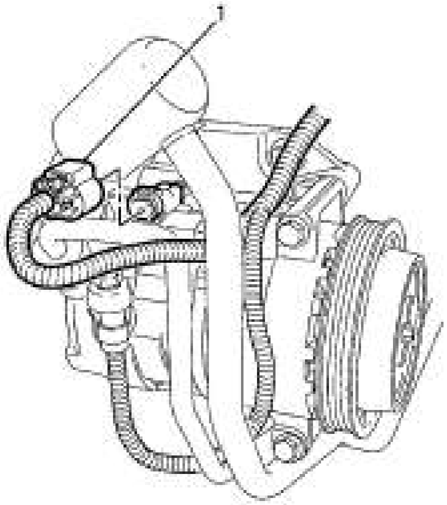
   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

5. Install two NEW sealing washers (2). Refer to Sealing Washer Replacement.
6. Connect the suction/discharge pipes (1) to the compressor (3)



7. Install the suction/discharge pipes pad to compressor retaining bolt (1).

   Tighten
   Tighten the bolt to 22 N·m (16 lb ft).



8. Connect the compressor electrical connector (1).
9. Install the drive belt, Refer to Air Conditioning Compressor Belt Replacement.
10. Install the radiator air deflector. Refer to Cooling Fan and Shroud Replacement.
11. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement.
12. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
13. Evacuate and recharge the refrigerant system. Refer to Refrigerant Recovery and

Recharging.

14. Leak test the fitting of the repaired or reinstalled component using the J 39400 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2035174**

Air Conditioning Condenser Replacement

Tools Required

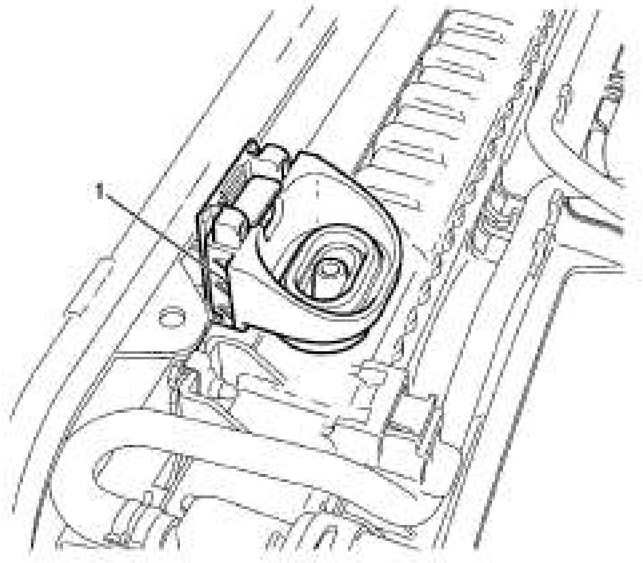
J 39400 Halogen Leak Detector

Removal Procedure

1. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.
2. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement

   Caution: Refer to Safety Glasses Caution in the Preface section.

3. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .

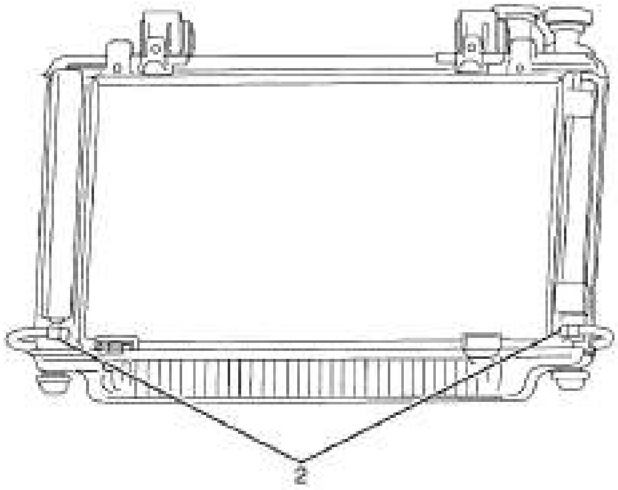


Important: Remove the upper radiator support brackets by raising the securing lock upwards 10mm and slide the bracket out of the radiator slide pin.

4. Remove the upper radiator support brackets (1).

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

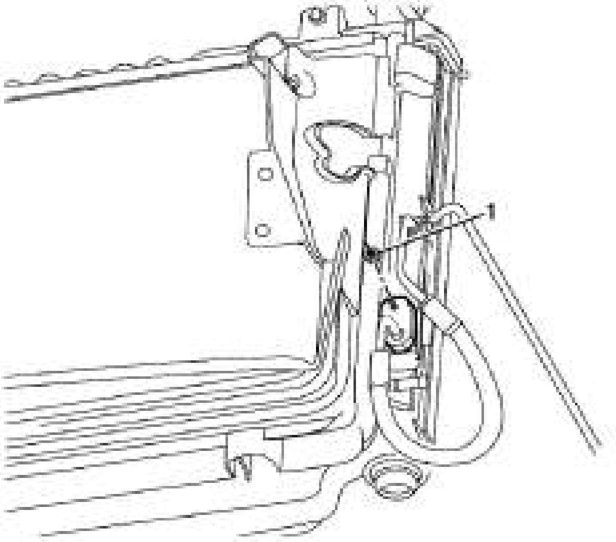
5. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
6. Remove the air deflector front. Refer to Front Air Deflector Replacement.
7. Place a large suitable container under the condenser.



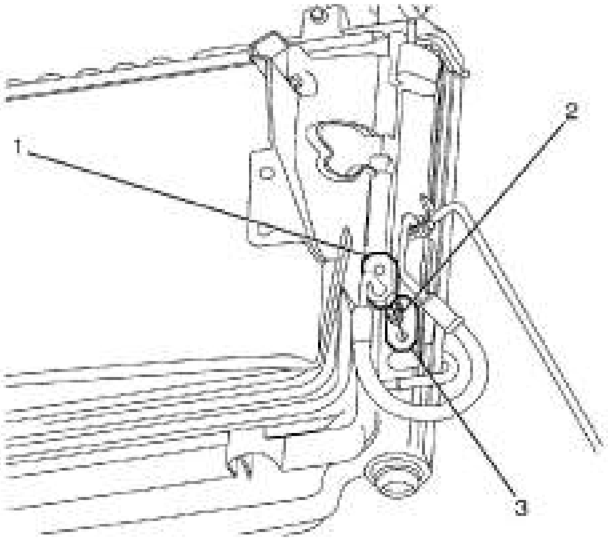
8. Disconnect the power steering cooler hoses (1).

Important: Plug or cap the power steering cooler hose (1) ends to prevent leaks and/or contamination.

9. Plug or cap the power steering cooler hose (1) ends.



10. Remove the liquid pipe to the condenser port retaining nut (1).
11. Lower the vehicle.



12. Disconnect the liquid pipe (1) from the condenser port (3).

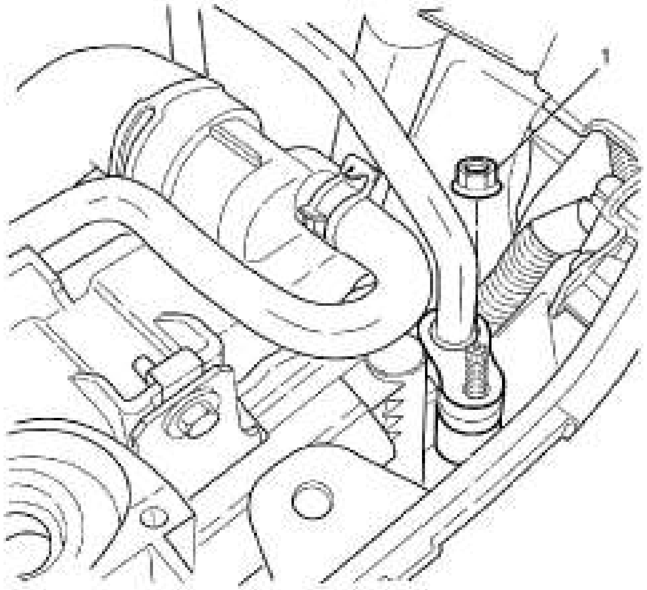
    Important: The sealing washer (2) is a single use item and must be discarded after use.

13. Remove the sealing washer (2). Refer to Sealing Washer Replacement.

    Discard the sealing washer

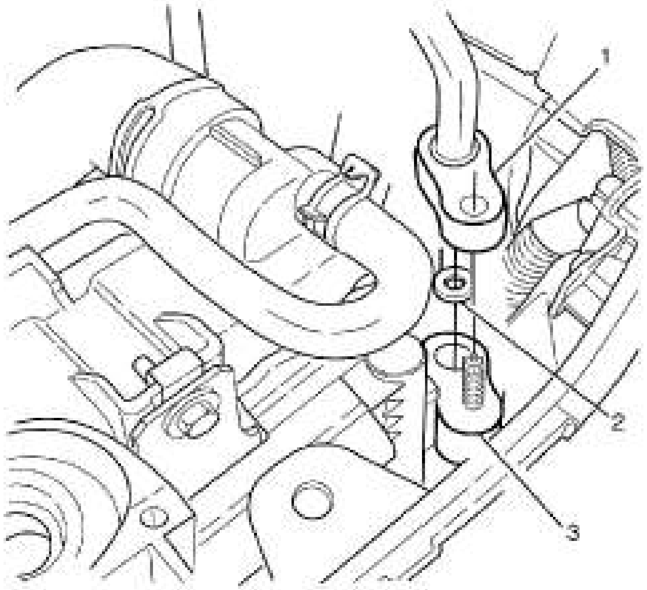
    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

14. Cap or plug the liquid pipe (1) and the condenser port (3).
15. Lower the vehicle.



Important: Gently push the radiator and condenser towards the engine to allow removal of the discharge pipe to condenser retaining nut (1).

16. Remove the discharge pipe to condenser retaining nut (1).

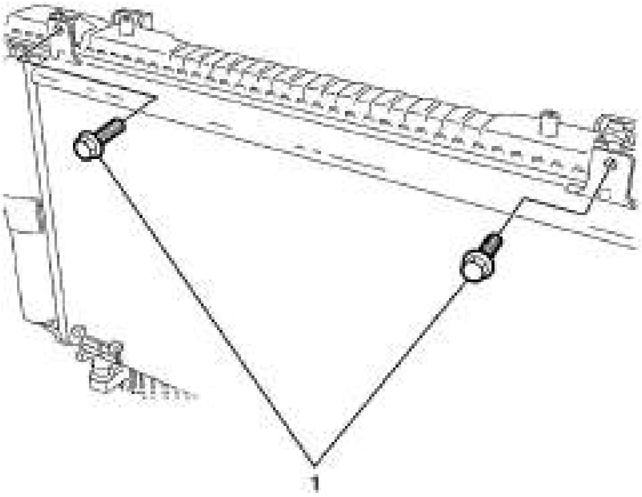


17. Disconnect the discharge pipe (1) from condenser (3) and position aside.
18. Remove the sealing washer (2). Refer to Sealing Washer Replacement.

Discard the sealing washer.

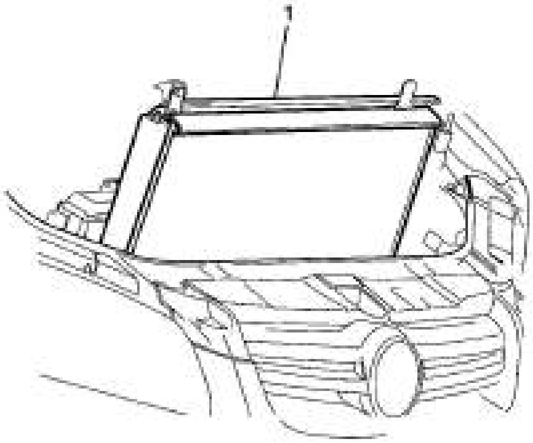
Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

19. Cap or plug the discharge pipe (1) and the condenser (3).



Important: Gently push the radiator and condenser towards the engine to allow removal of the condenser to radiator retaining bolts (1).

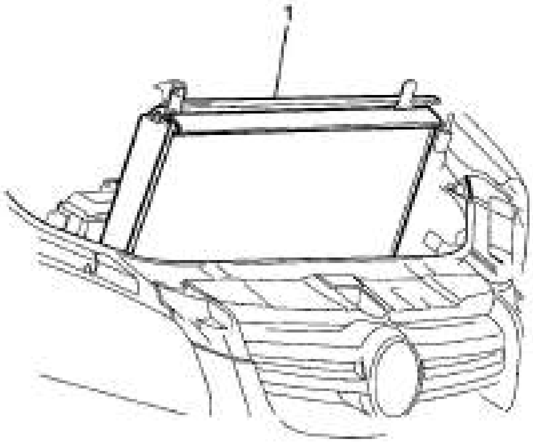
20. Remove the condenser to radiator retaining bolts (1).



Important: Remove the condenser (1) by lifting it up between the radiator and radiator support.

21. Remove the condenser (1) from the engine compartment.

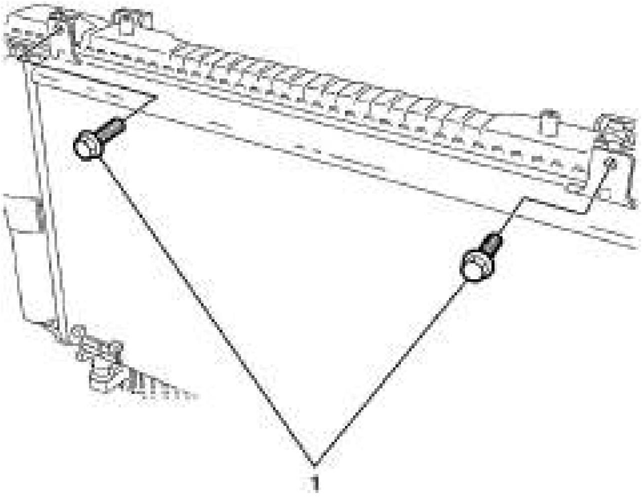
Installation Procedure



Important: Install the condenser (1) by lowering down between the radiator and radiator support.

1. Install the condenser (1) to the engine compartment.

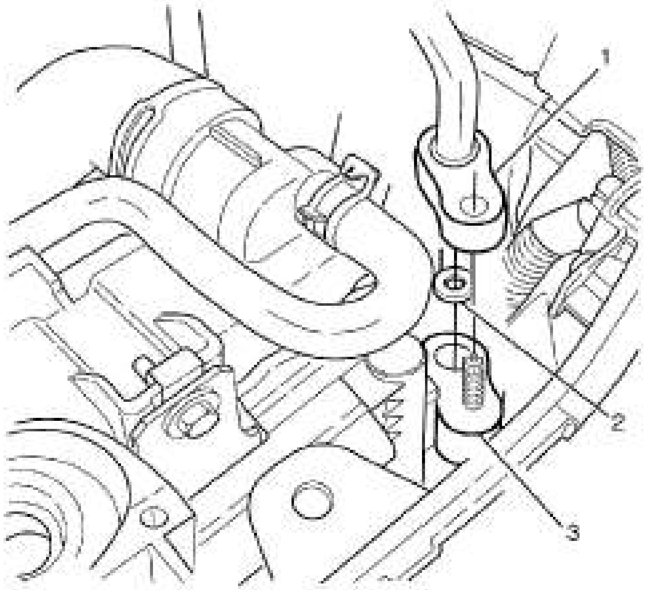
   Notice: Refer to Fastener Notice in the Preface section.



Important: Gently push the radiator and condenser towards the engine to allow installation of the condenser to radiator retaining bolts (1).

2. Install the condenser to radiator retaining bolts (1).

   Tighten
   Tighten the bolts to 11 N·m (97 lb in).

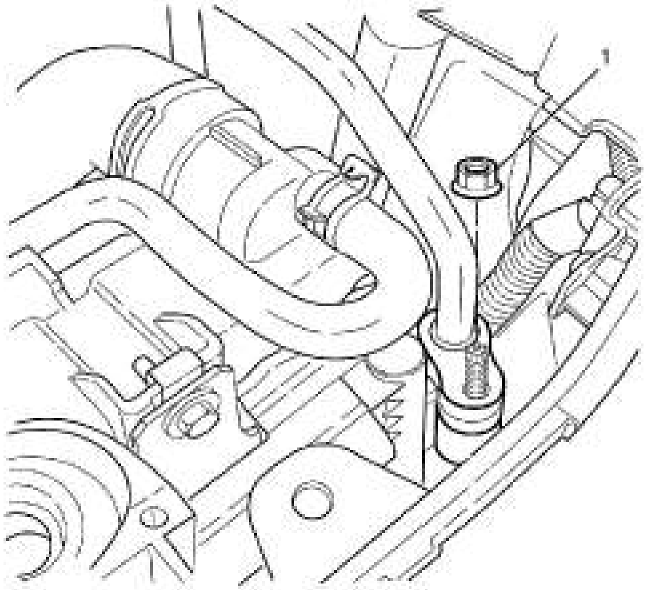


3. Remove the plugs or caps from the discharge pipe (1) and the condenser (3).

   Important: DO NOT coat the NEW sealing washer (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (2) useless, as the sealing washer (2) WILL swell causing refrigerant to leak out.

4. Install a NEW sealing washer (2). Refer to Sealing Washer Replacement.
5. Install the discharge pipe (1) to condenser (3).

   Notice: Refer to Fastener Notice in the Preface section.

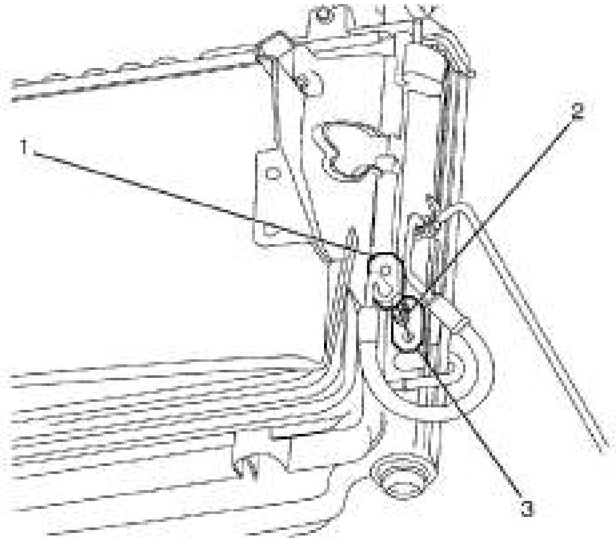


Important: Gently push the radiator and condenser towards the engine to allow installation of the discharge pipe to condenser retaining nut (1).

6. Install the discharge pipe to condenser retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).

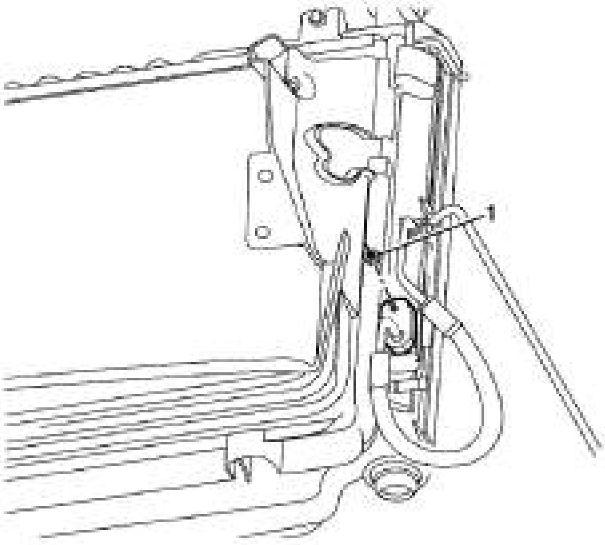
7. Raise the vehicle.



8. Remove the plugs or caps from the suction pipe liquid pipe (1) and the condenser port (3).

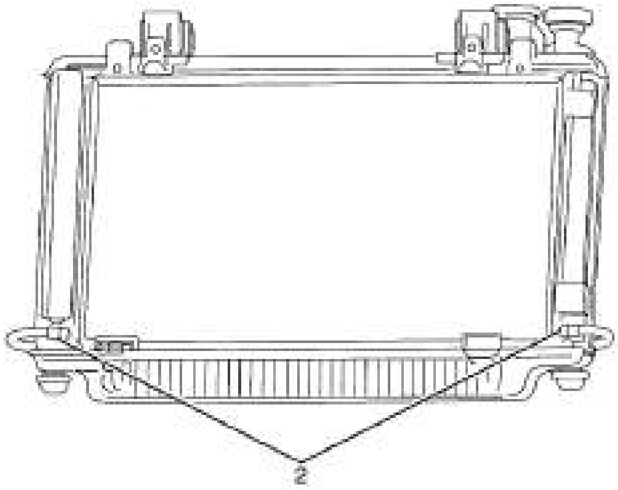
   Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

9. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.
10. Connect the liquid pipe (1) to the condenser port (3).

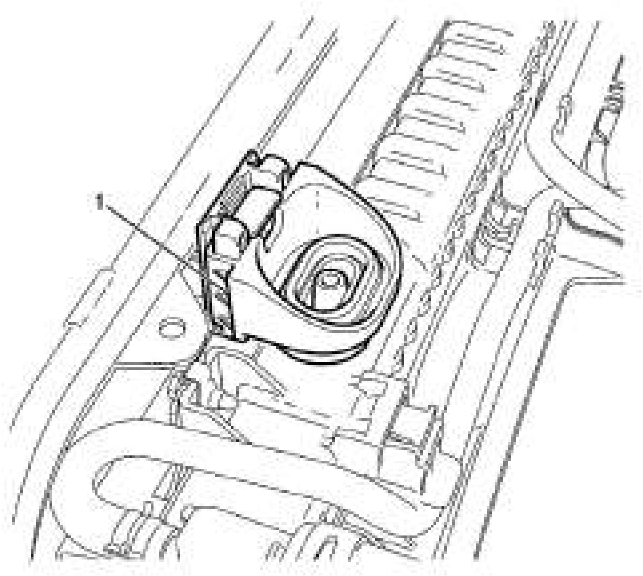


11. Install the liquid pipe to condenser port retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



12. Remove the plug or cap at the power steering cooler hose (1) ends.
13. Connect the power steering cooler hoses (1).
14. Install the air deflector front. Refer to Front Air Deflector Replacement.
15. Lower the vehicle.



16. Install radiator upper retaining brackets (1).
17. Fill the power steering fluid reservoir as necessary. Refer to Checking and Adding Power Steering Fluid.
18. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging.
19. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.
20. Leak test the fittings of the component using J 39400 .
21. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.

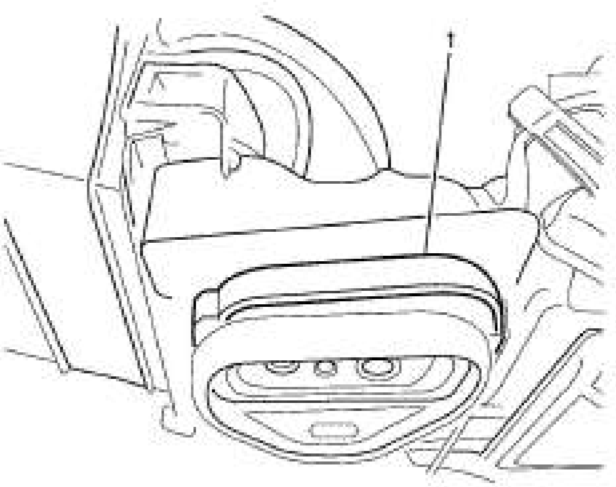
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 1976125

Air Conditioning Evaporator Core Replacement (RHD)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

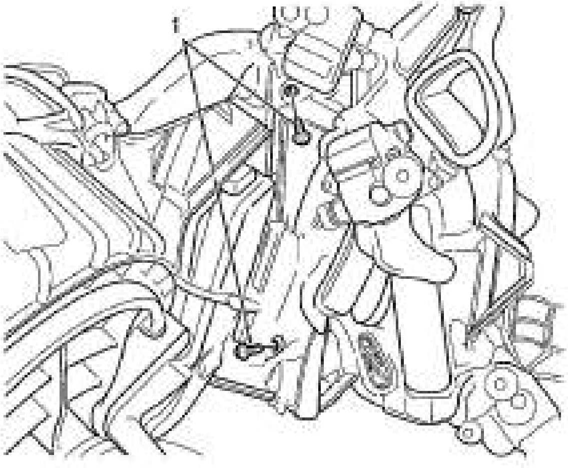
1. Remove the HVAC module assembly. Refer to HVAC Module Assembly Replacement.



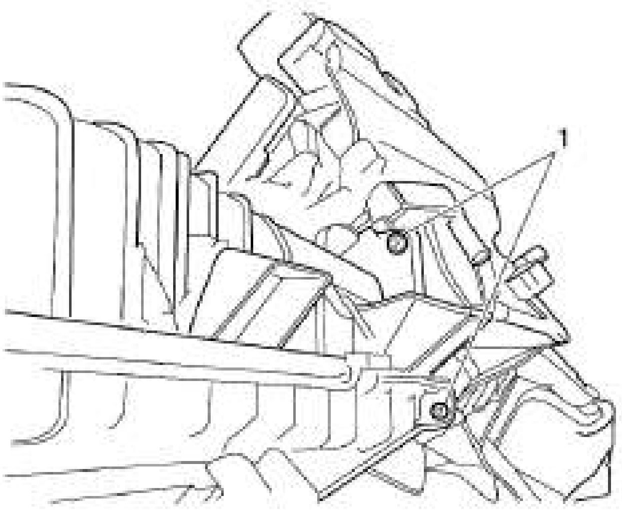
2. With the HVAC module assembly on a bench locate the thermal expansion (TX) valve retaining upper plastic cover (1).

   Important: Unclip the TX valve retaining upper plastic cover (1) and remove by lifting upwards.

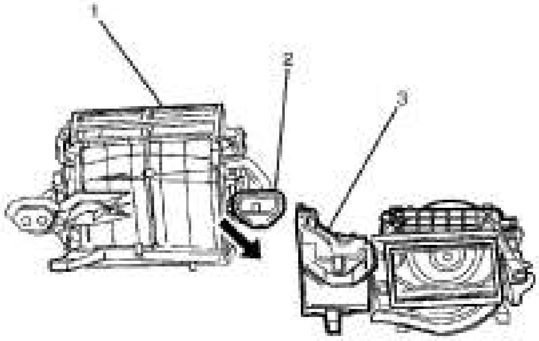
3. Remove the TX valve retaining upper plastic cover (1).



4. Remove the air inlet assembly to HVAC module assembly retaining screws (1).

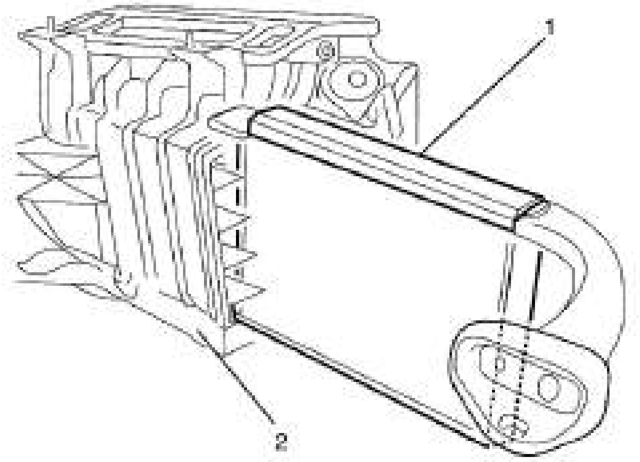


5. Remove the air inlet assembly to HVAC module assembly retaining screws (1).



Important: Unclip the air inlet assembly (3) and carefully tilt downwards past the TX valve (2)

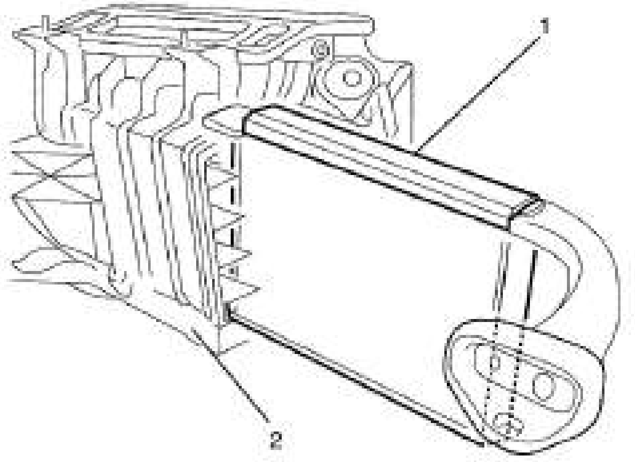
6. Remove the air inlet assembly (3) from the HVAC module assembly (1).



Important: Gently grasp the evaporator (1) pipes and slowly withdraw the evaporator from the HVAC module assembly (2).

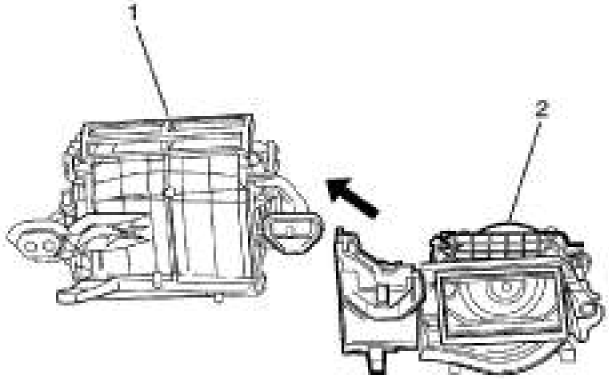
7. Remove the evaporator (1) from the HVAC module assembly (2).
8. While the evaporator (1) is out of the HVAC module assembly (2), remove any contaminates from the housing such as hair, leaves or dust with a moist rag.

Installation Procedure



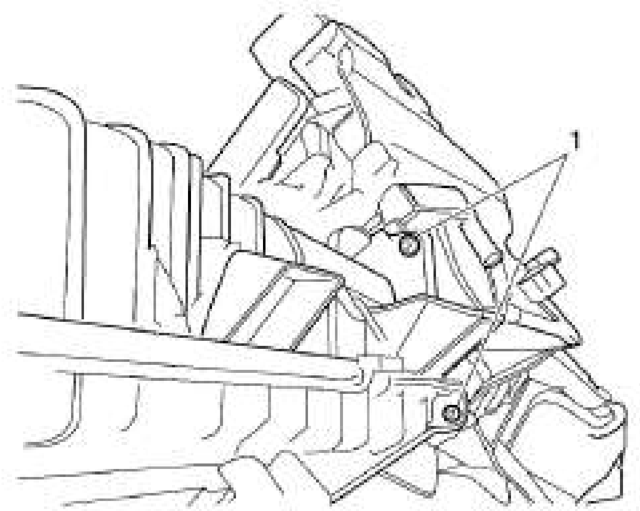
Important: Install the evaporator core (1) by gently sliding into HVAC module assembly housing (2).

1. Install the evaporator core (1) to the HVAC module assembly housing (2).



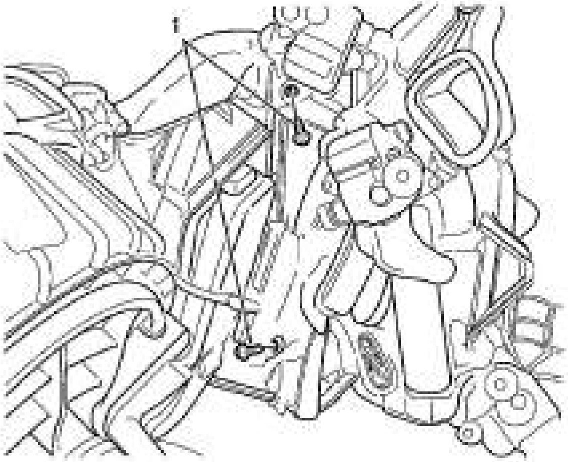
2. Install the air inlet assembly (2) to the HVAC module assembly (1).

   Notice: Refer to Fastener Notice in the Preface section.



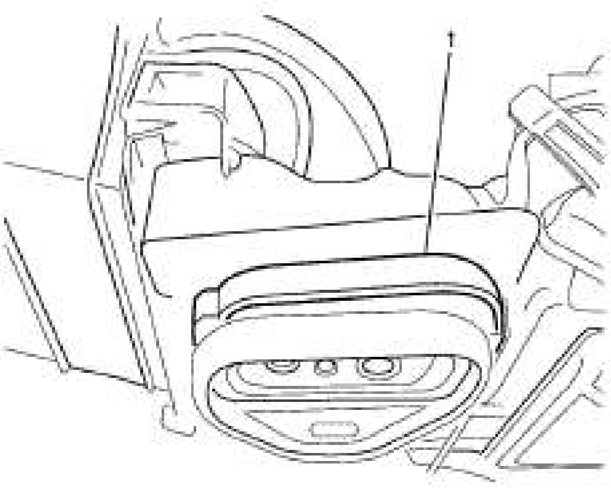
3. Install the air inlet assembly to HVAC module assembly retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (8 lb in.)



4. Install the air inlet assembly to HVAC module assembly retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (8 lb in.)



Important: Make sure all the clips on the thermal expansion (TX) valve retaining upper plastic cover (1) are engaged to avoid an induced rattle condition.

5. Install the TX valve retaining upper plastic cover (1).
6. Install the HVAC module assembly. Refer to HVAC Module Assembly Replacement.

Air Conditioning Evaporator Thermal Expansion Valve Replacement (RHD)

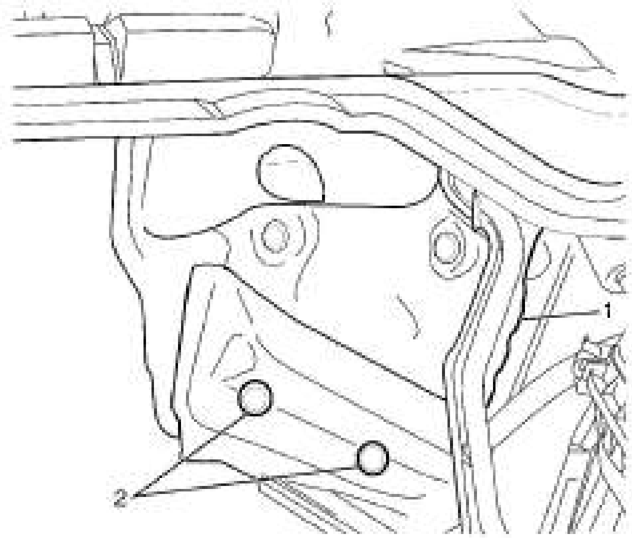
Tools Required

J 39400 Halogen Leak Detector

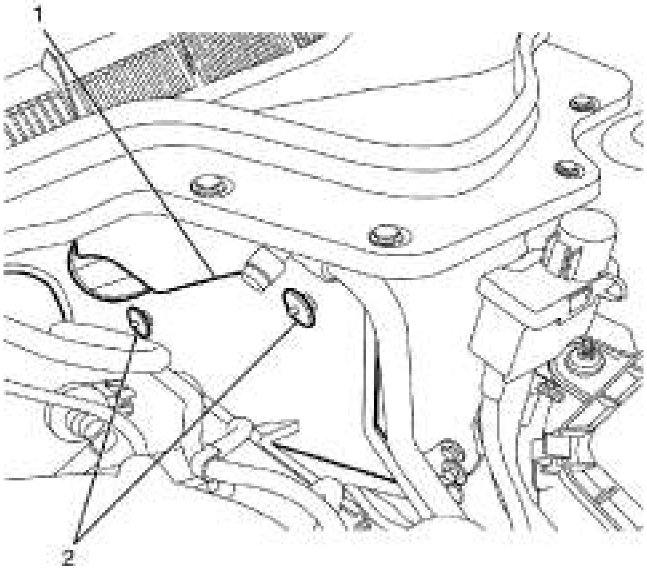
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

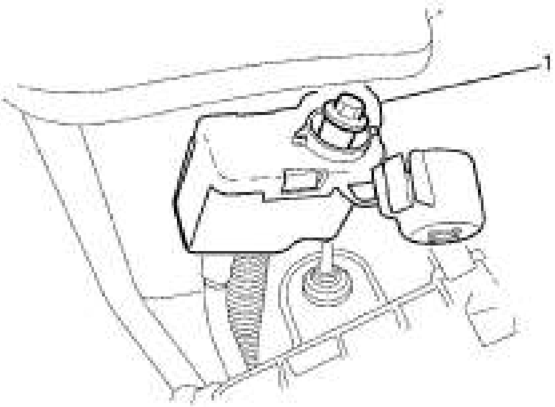
1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
2. Remove the engine cover. Refer to Engine Cover Replacement for 3.6L engine, or Engine Cover Replacement for 6.0L engine.
3. Recover the refrigerant Refer to Refrigerant Recovery and Recharging.
4. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
5. Remove windscreen wiper arms. Refer to Windshield Wiper Arm Replacement.
6. Remove the air inlet grill panel. Refer to Air Inlet Grille Panel Replacement.
7. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.



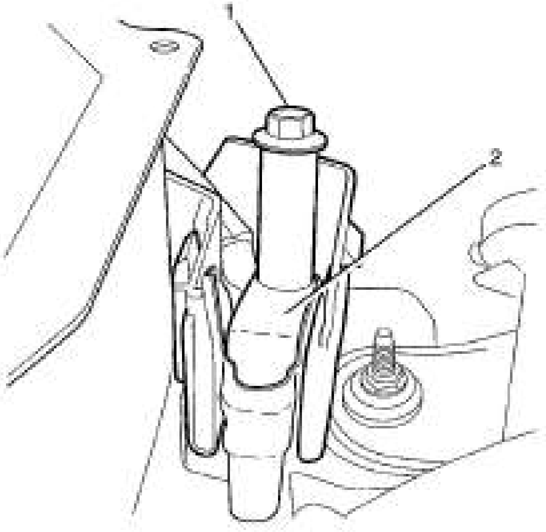
8. Remove the exhaust manifold heat shield to air box retaining clips (2).
9. Remove the exhaust manifold heat shield (1).



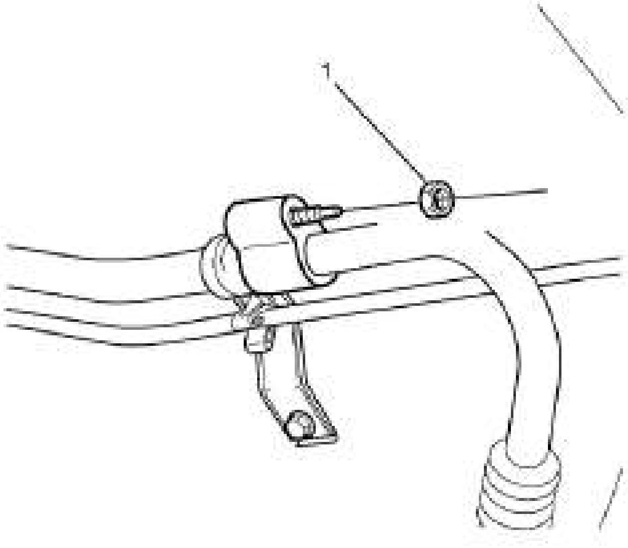
10. Remove the insulation panel to air box retaining clips (2).
11. Remove the insulation panel (1) from the engine compartment.



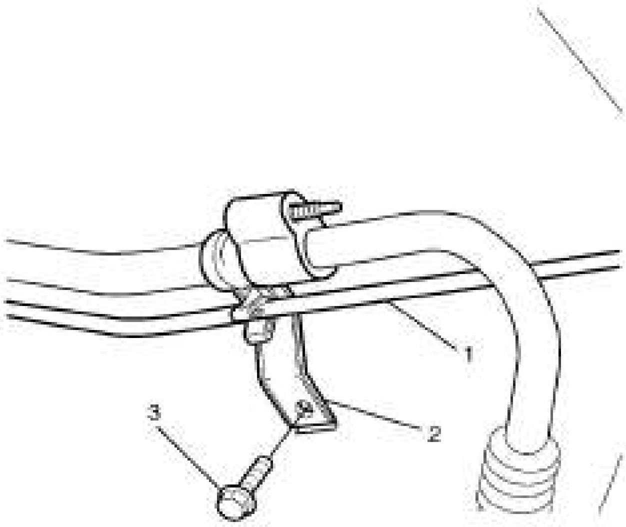
12. Remove the remote battery positive post cover (1).



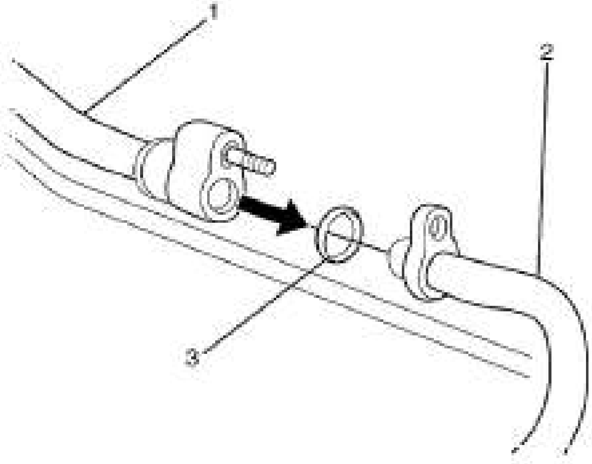
13. Remove the remote battery positive post to wiring harness retaining bolt (1).
14. Remove the starter motor power cable (2) and position aside.



15. Remove the suction pipe upper to suction pipe lower retaining nut (1).



16. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
17. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



18. Disconnect the suction pipe upper (1) from suction pipe lower (2).

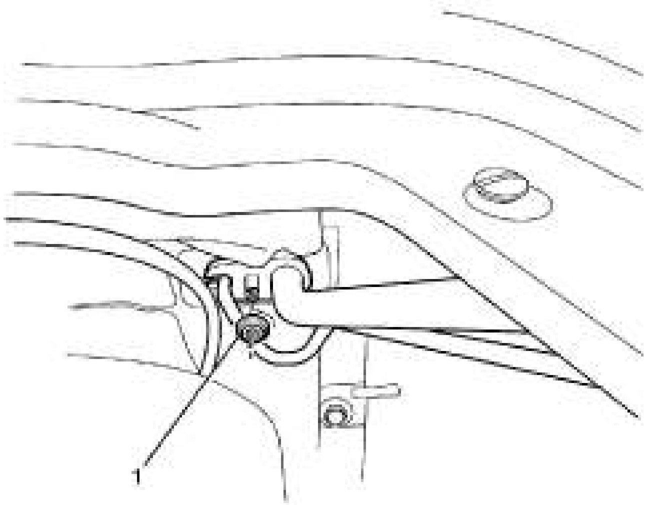
Important: The sealing washer (3) is a single use item and must be discarded after use.

19. Remove the sealing washer (3). Refer to Sealing Washer Replacement .

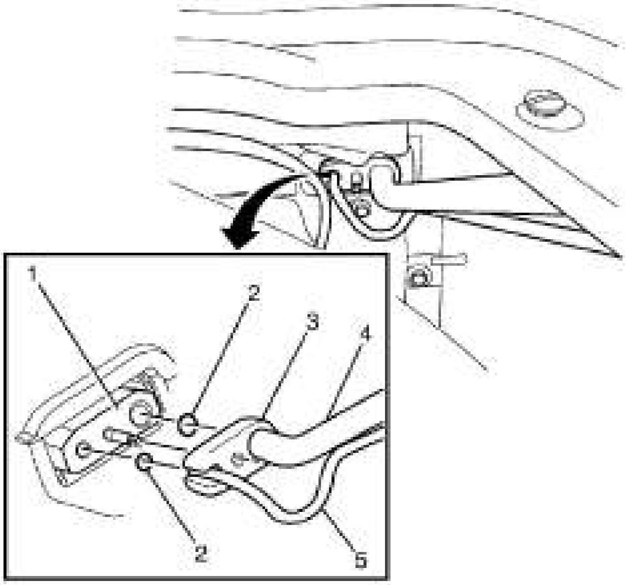
Discard the sealing washer

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

20. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



21. Remove the suction pipe/liquid pipe pad to thermal expansion (TX) valve retaining nut (1).



22. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

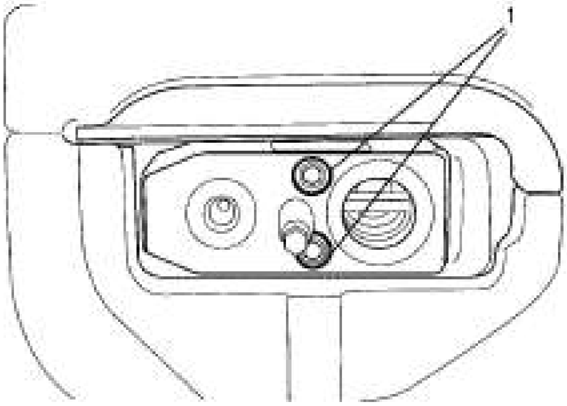
Important: The sealing washers (2) are a single use item and must be discarded after use.

23. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

Discard the sealing washers

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

24. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).

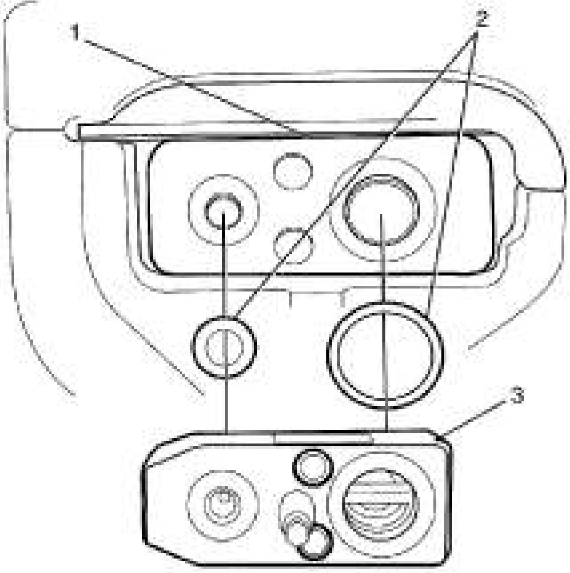


Important: Using a suitable tool, unscrew the TX valve to evaporator pad retaining hex screws (1).

25. Remove the TX valve to evaporator pad retaining screws (1).

Important: Reinstall the suction pipe/liquid pipe to TX valve retaining nut to assist in the removal of the TX valve.

26. Reinstall the suction pipe/liquid pipe to TX valve retaining nut (2).



Important: Place the TX Valve in a plastic bag to avoid any contamination from air born dirt or moisture.

27. Remove the TX valve (3) from the evaporator pad (1).

    Important: The sealing washers (2) are a single use item and must be discarded after use.

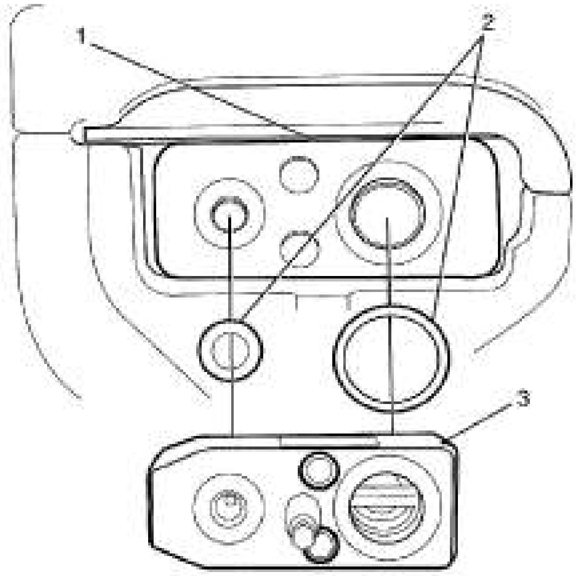
28. Remove the sealing washers (2) from the evaporator pad (1). Refer to Sealing Washer Replacement .

    Discard the sealing washers

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

29. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).

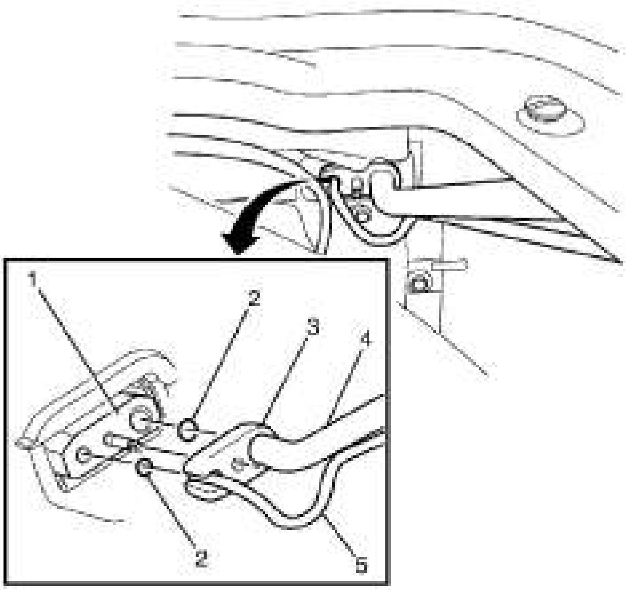
Installation Procedure



1. Remove the plugs or caps from the thermal expansion (TX) valve (3) and the evaporator pad (1).

   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

2. Install NEW sealing washers (2) to the evaporator pad (1). Refer to Sealing Washer Replacement .
3. Connect the TX valve (3) to the evaporator pad (1).

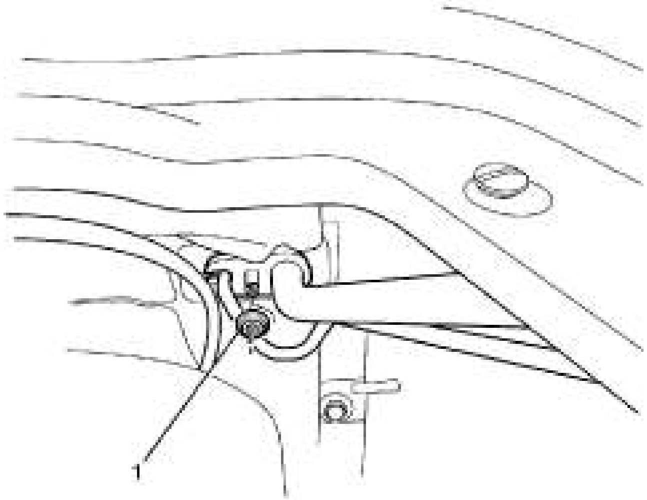


4. Remove the plugs or caps from the suction pipe (4), liquid pipe (5) and the TX valve (1).

   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

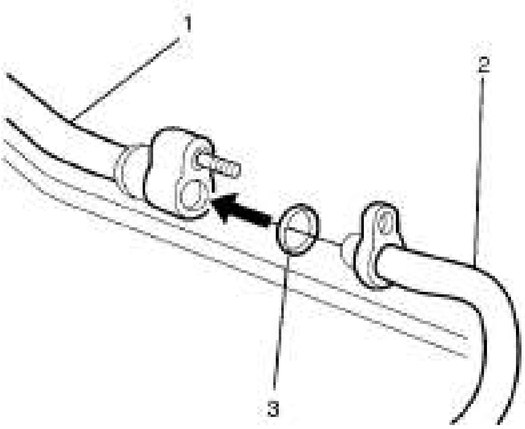
5. Install NEW sealing washers (2). Refer to Sealing Washer Replacement .
6. Connect the suction pipe/liquid pipe pad (3) to the TX Valve (1).

   Notice: Refer to Fastener Notice in the Preface section.



7. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

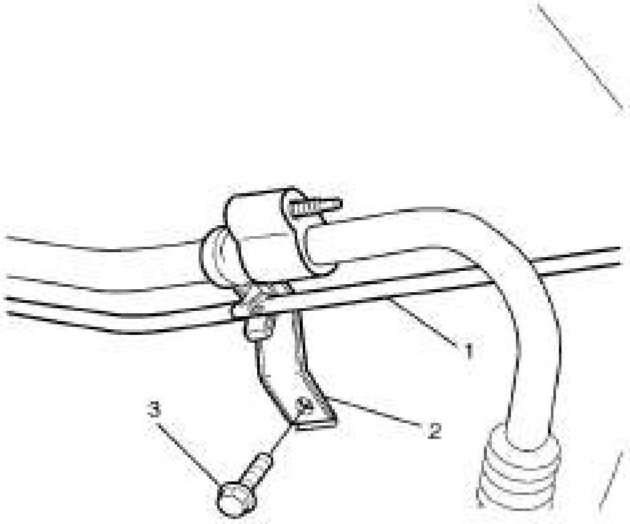
Tighten
Tighten the nut to 22 N·m(16 lb ft).



8. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

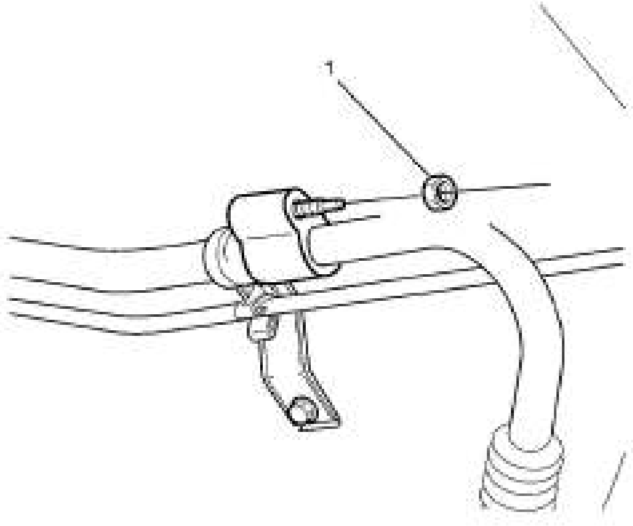
   Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

9. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement .
10. Install the suction pipe upper (1) to the suction pipe lower (2).



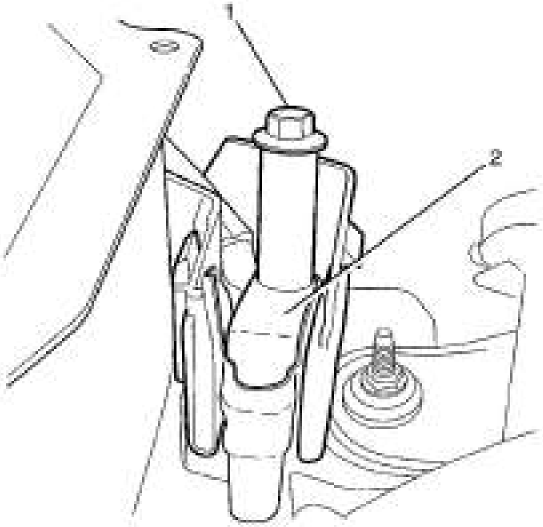
11. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).

12. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).



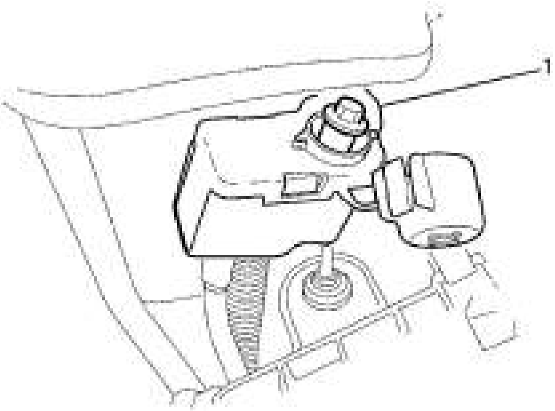
13. Install the suction pipe upper to suction pipe lower retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



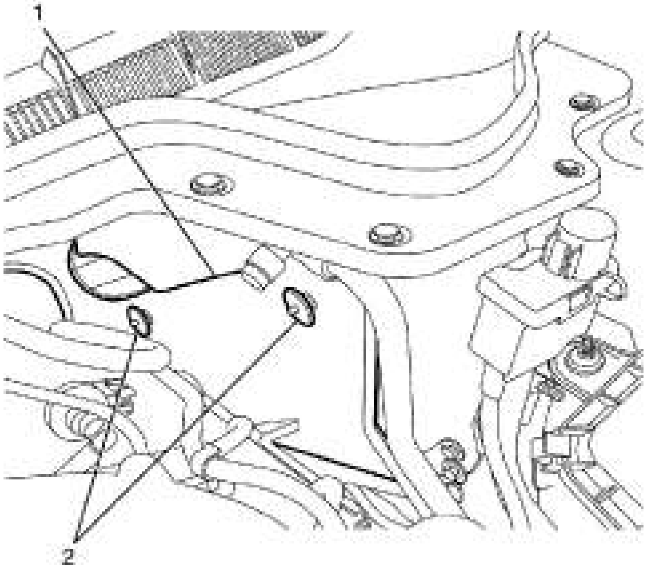
14. Install the starter motor positive cable (2) to the remote battery positive post.
15. Install the remote battery positive post to wiring harness retaining bolt (1).

Tighten
Tighten the bolt to 15 N·m (11 lb ft).

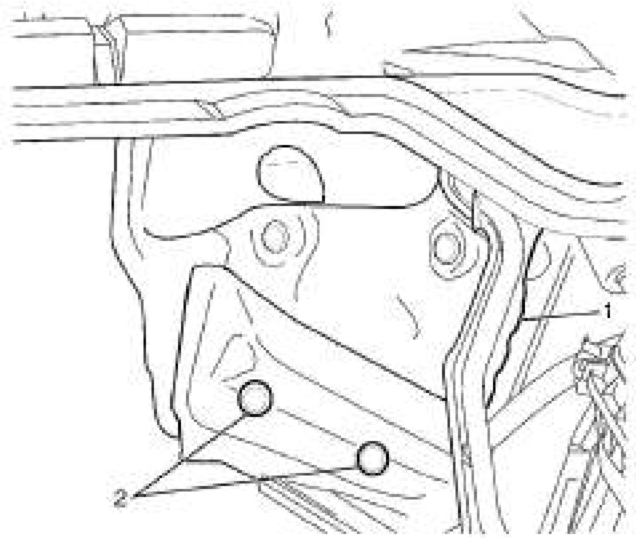


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

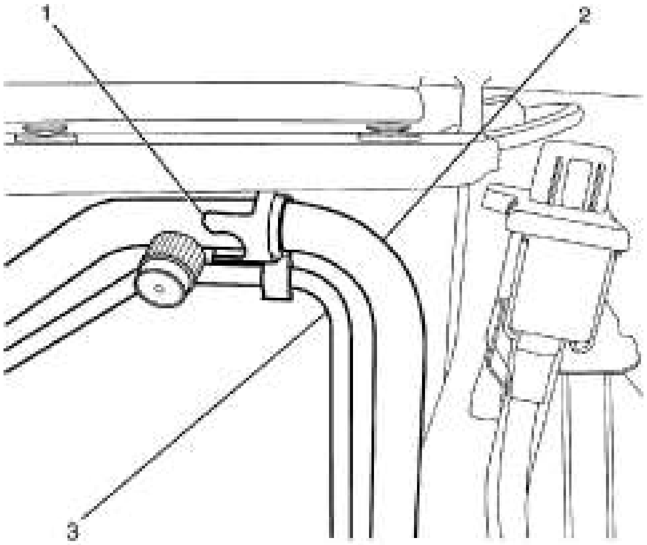
16. Install the remote battery positive post cover (1) to the remote battery positive post.



17. Install the insulation panel (1) to the left rear side engine compartment.
18. Install the insulation panel to air box retaining clips (2).



19. Install the exhaust manifold heat shield (1).
20. Install the exhaust manifold heat shield to air box retaining clips (2).



21. Attach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).
22. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging.
23. Install the radiator air baffle and deflector. . Refer to Radiator Air Upper Baffle and Deflector Replacement.
24. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.
25. Install the engine cover. Refer to Engine Cover Replacement for 3.6L engine, or Engine Cover Replacement for 6.0L engine.
26. Install the plenum chamber cover panel. Refer to Air Inlet Grille Panel Replacement.
27. Install the windscreen wiper arms. Refer to Windshield Wiper Arm Replacement.
28. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and

Connection.

29. Leak test the fittings of the component using J 39400 .

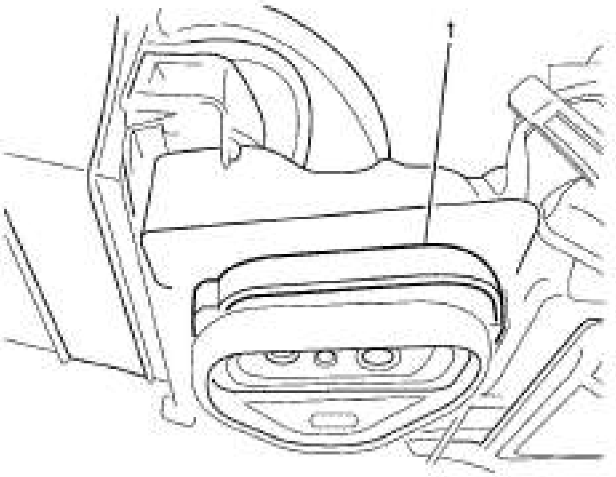
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1993816**

Air Inlet Assembly Replacement (RHD)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

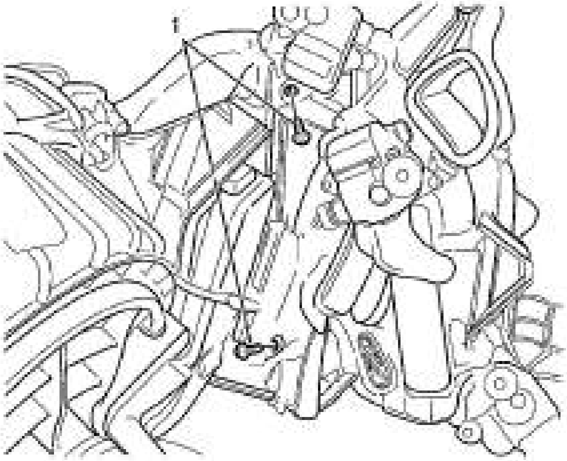
1. Remove the instrument panel (I/P). Refer to Instrument Panel Center Trim Panel Replacement .
2. Remove the thermal expansion (TX) valve. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement
3. Remove the HVAC module assembly. Refer to HVAC Module Assembly Replacement .



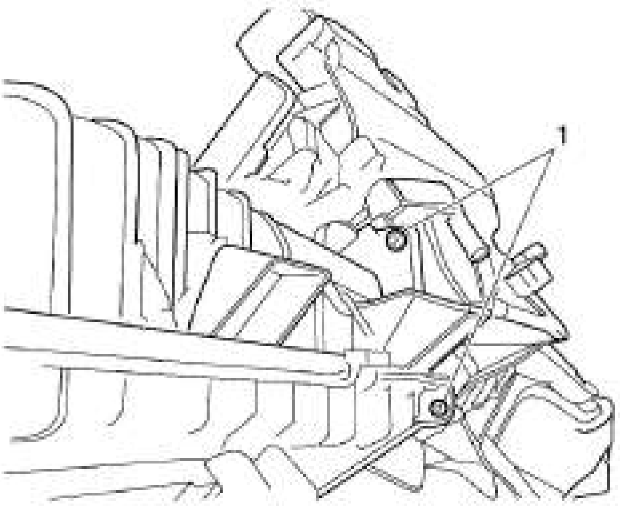
4. With the HVAC module assembly on a bench locate the TX valve retaining upper plastic cover (1).

Important: Unclip the TX valve retaining upper plastic cover (1) and remove by lifting upwards.

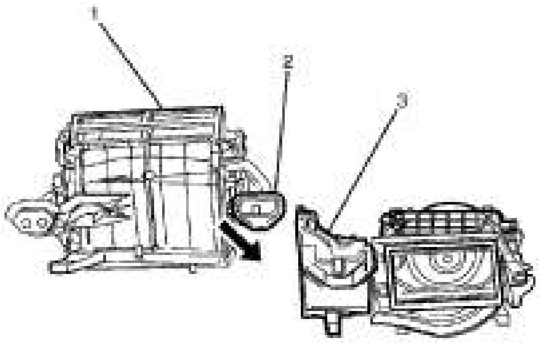
5. Remove the TX valve retaining upper plastic cover (1).



6. Remove the air inlet assembly to HVAC module assembly retaining screws (1).



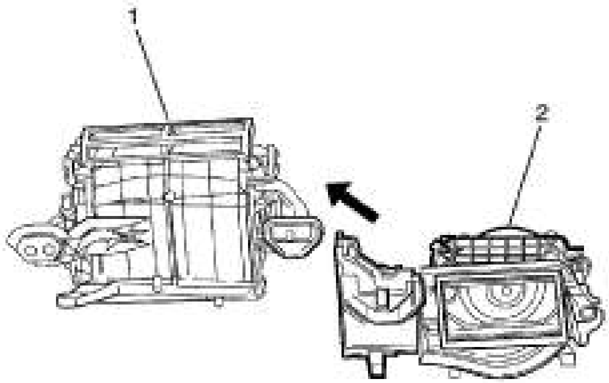
7. Remove the air inlet assembly to HVAC module assembly retaining screws (1).



Important: Unclip the air inlet assembly (3) and carefully tilt downwards past the TX valve (2)

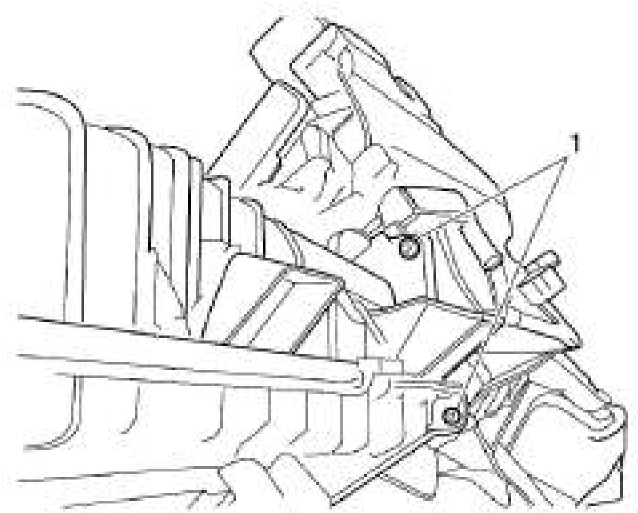
8. Remove the air inlet assembly (3) from the HVAC module assembly (1).

Installation Procedure



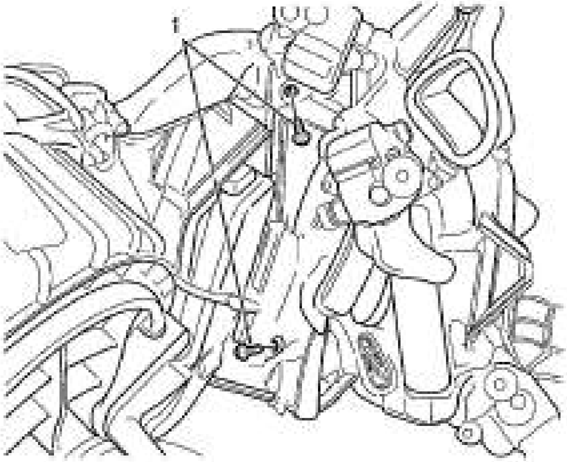
1. Install the air inlet assembly (2) to the HVAC module assembly (1).

   Notice: Refer to Fastener Notice in the Preface section.



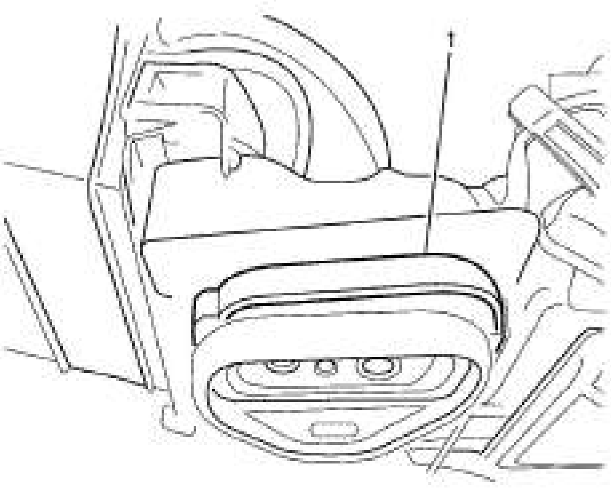
2. Install the air inlet assembly to HVAC module assembly retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (8 lb in.)



3. Install the air inlet assembly to HVAC module assembly retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (8 lb in.)



Important: Make sure all the clips on the thermal expansion (TX) valve retaining upper plastic cover (1) are engaged to avoid an induced rattle condition.

4. Install the TX valve retaining upper plastic cover (1).
5. Install the HVAC module assembly. Refer to HVAC Module Assembly Replacement .
6. Install the TX valve. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement
7. Install the instrument panel (I/P). Refer to Instrument Panel Center Trim Panel Replacement .

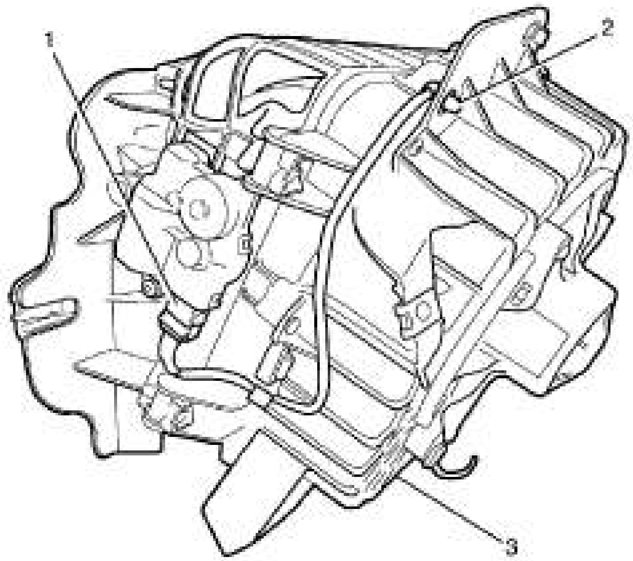
Air Valve Actuator Control Module Harness Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Important: The evaporator temperature sensor is part of the wiring harness.

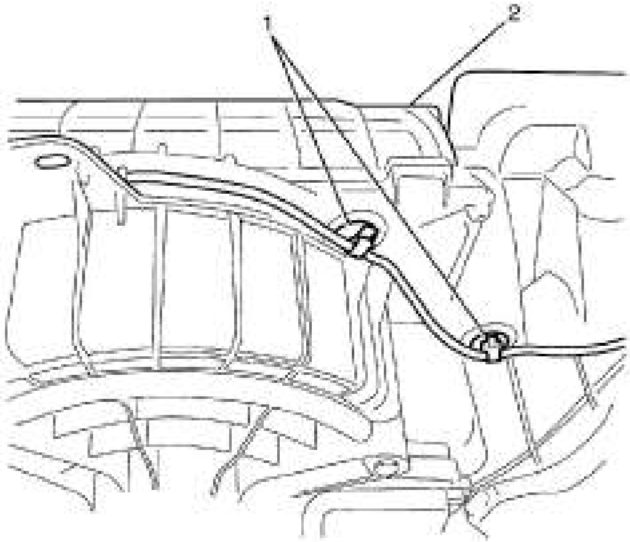
1. Remove the HVAC module assembly. Refer to HVAC Module Assembly Replacement.



2. Disconnect the air intake fresh/recirculation actuator electrical connector (1).

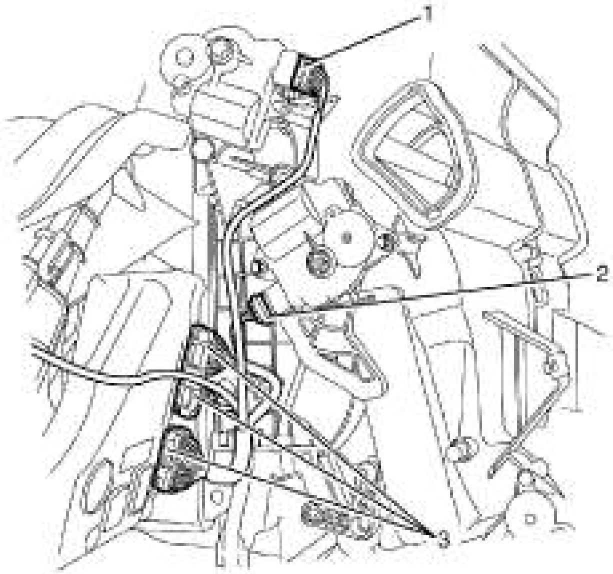
Important: Use a pair of long nose pliers to close the wiring harness retaining clip (2) ends to remove the wiring harness retaining clips (2) from the HVAC module assembly (3)

3. Detach the wiring harness retaining clips (2) from the HVAC module assembly (3).



Important: Use a pair of long nose pliers to close the wiring harness retaining clip (1) ends to remove the wiring harness retaining clips (1) from the HVAC module assembly (2)

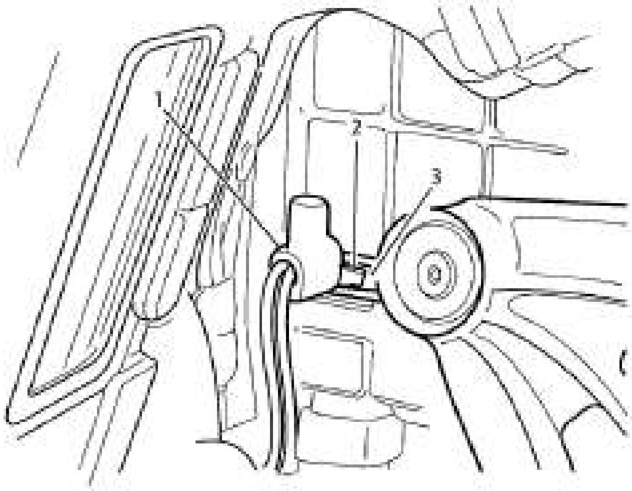
4. Detach the wiring harness retaining clips (1) from the HVAC module assembly (2).



5. Disconnect the defrost actuator air intake fresh/recirculation electrical connector (1).
6. Disconnect the air mix actuator electrical connector (2).

Important: The single zone HVAC module only has the one 22 pin connector. The dual zone HVAC module has a 22 pin connector and a 7 pin connector. The tri zone HVAC module has a 22 pin connector, a 7 pin connector and a 10 pin connector.

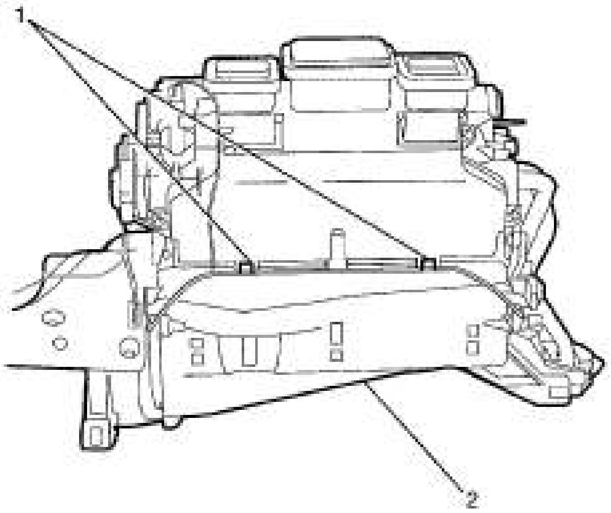
7. Disconnect the HVAC module electrical connectors (3) as required.



Important: The evaporator temperature sensor is part of the wiring harness.

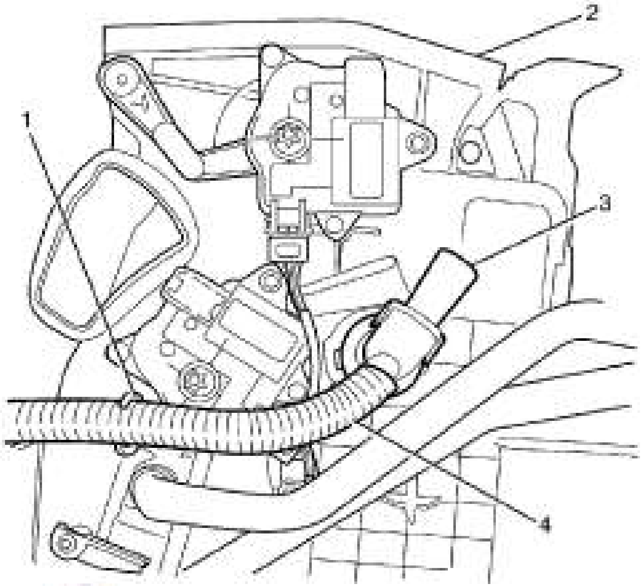
Important: Using a suitable tool, raise the evaporator temperature sensor locating clip (2) to clear the locking recess in the HVAC module assembly (3) and turn the evaporator temperature sensor (1) 45 degrees clockwise to remove evaporator temperature sensor (1) from the HVAC module assembly (3).

8. Remove evaporator temperature sensor (1) from the HVAC module assembly (3).



Important: Use a pair of long nose pliers to close the wiring harness retaining clip (1) ends to remove the wiring harness retaining clips (1) from the HVAC module assembly (2)

9. Detach the wiring harness retaining clips (1) from the under side of the HVAC module assembly (2).

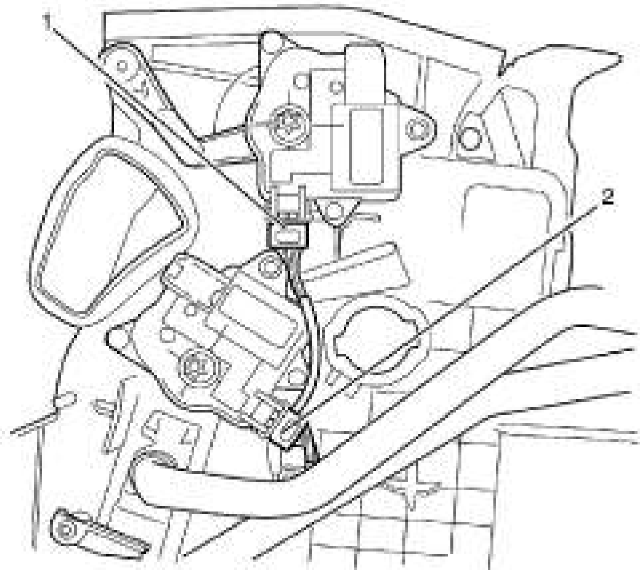


Important: The inside air temperature sensor aspirator venturi is only fitted to dual and tri zone HVAC module assemblies. Ignore steps 11 and 12 if working on a single zone HVAC equipped vehicle.

10. Detach the inside air temperature sensor aspirator venturi tube (4) from the HVAC module assembly retaining clip (1)

Important: Rotate the inside air temperature sensor aspirator venturi (3) clockwise to disengage the inside air temperature sensor aspirator venturi (3) retaining clips from the HVAC module assembly (2).

11. Remove the inside air temperature sensor aspirator venturi (3) and inside air temperature sensor aspirator venturi tube (4) from the HVAC module assembly (2).

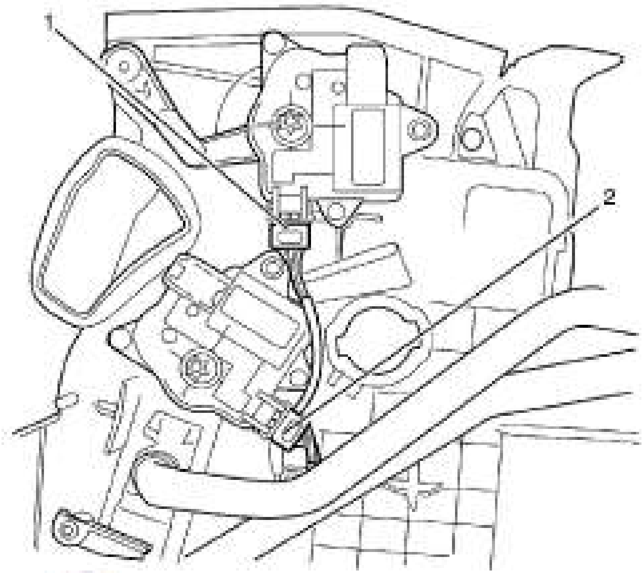


12. Disconnect the face/floor actuator electrical connector (1).

    Important: The drivers side air mix actuator is only fitted to dual and tri zone HVAC module assemblies. Ignore this step if working on a single zone HVAC equipped vehicle.

13. Disconnect the drivers side air mix actuator electrical connector (2) if equipped.

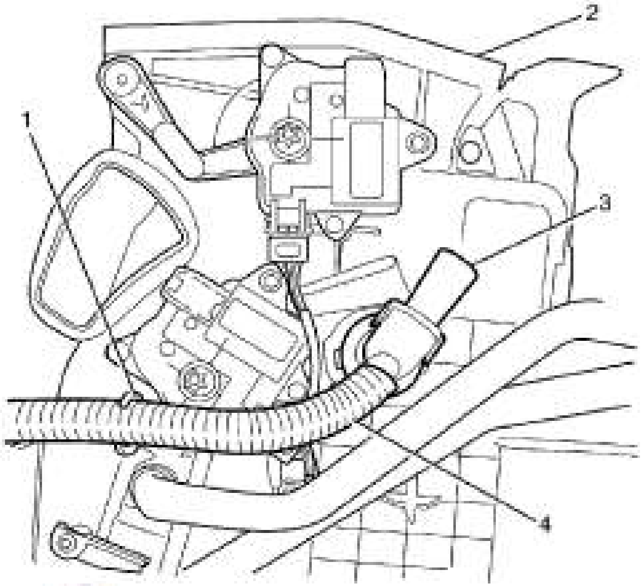
Installation Procedure



1. Connect the face/floor actuator electrical connector (1).

    Important: The drivers side air mix actuator is only fitted to dual and tri zone HVAC module assemblies. Ignore this step if working on a single zone HVAC equipped vehicle.

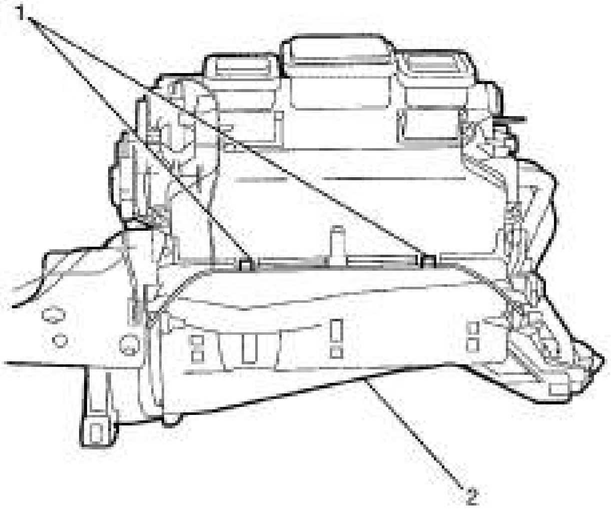
2. Connect the drivers side air mix actuator electrical connector (2) if equipped.



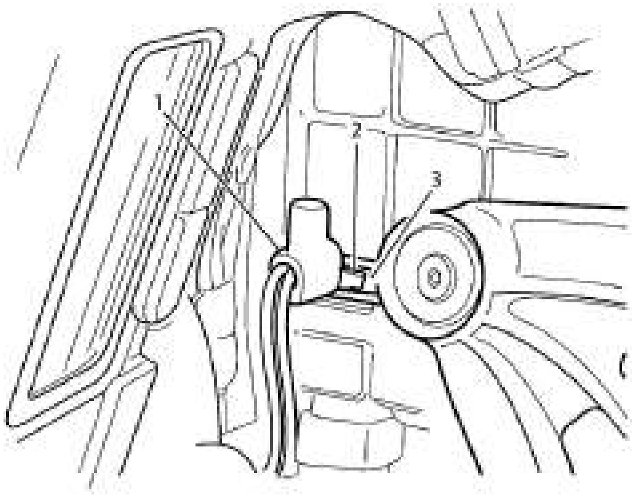
Important: The inside air temperature sensor aspirator venturi is only fitted to dual and tri zone HVAC module assemblies. Ignore steps 3 and 4 if working on a single zone HVAC equipped vehicle.

Important: Rotate the inside air temperature sensor aspirator venturi (3) counterclockwise to engage the inside air temperature sensor aspirator venturi (3) retaining clips.

3. Install the inside air temperature sensor aspirator venturi (3) and inside air temperature sensor aspirator venturi tube (4) to the HVAC module assembly (2).
4. Attach the inside air temperature sensor aspirator venturi tube (4) to the HVAC module assembly retaining clip (1)

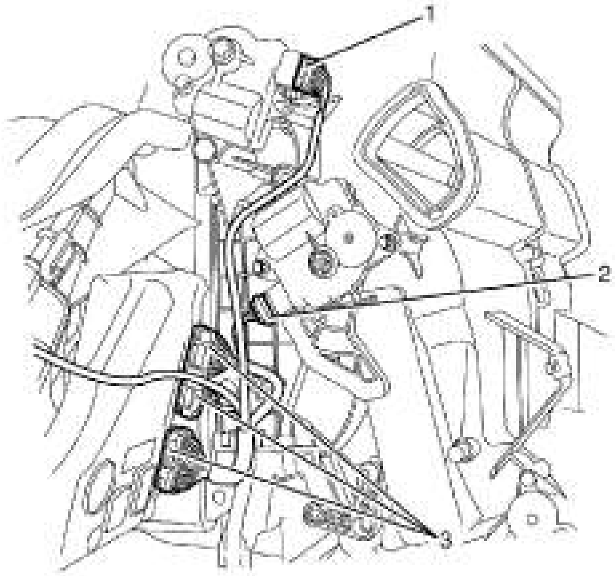


5. Install the clips (1) to the under side of the HVAC module assembly (2).



Important: Install the evaporator temperature sensor (1) to the HVAC module assembly (3) and turn the evaporator temperature sensor (1) 45 degrees counterclockwise to engage the evaporator temperature sensor locating clip (2) in the locking recess in the HVAC module assembly (3).

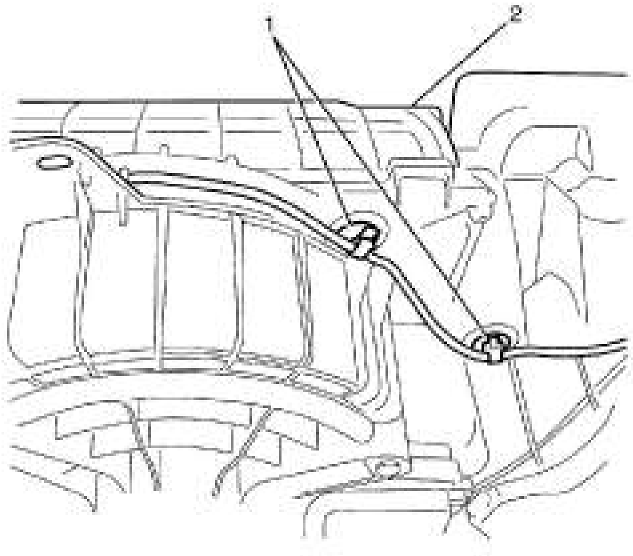
6. Remove evaporator temperature sensor (1) from the HVAC module assembly (3).



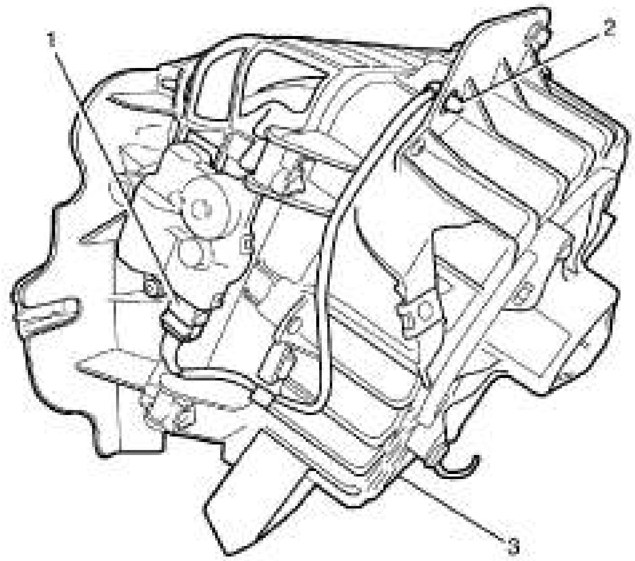
Important: The single zone HVAC module only has the one 22 pin connector. The dual zone HVAC module has a 22 pin connector and a 7 pin connector. The tri zone HVAC module has a 22 pin connector, a 7 pin connector and a 10 pin connector.

7. Connect the HVAC module electrical connectors (3) as required.

8. Connect the air mix actuator electrical connector (2).
9. Connect the defrost actuator air intake fresh/recirculation electrical connector (1).



10. Attach the wiring harness retaining clips (1) from the HVAC module assembly (2).



11. Attach the wiring harness retaining clips (2) from the HVAC module assembly (3).
12. Connect the air intake fresh/recirculation actuator electrical connector (1).
13. Install the HVAC module assembly. Refer to HVAC Module Assembly Replacement.

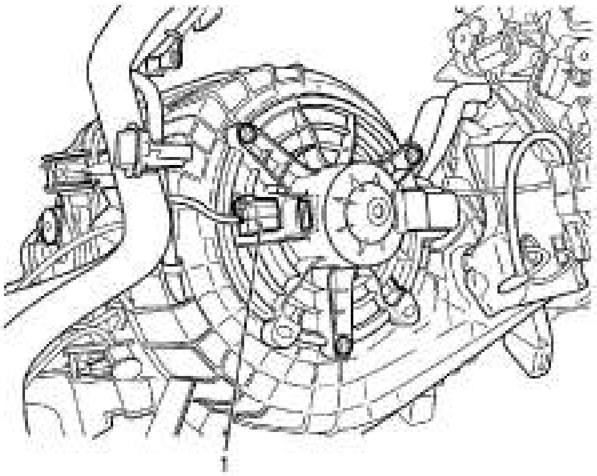
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 1976130

Blower Motor Replacement (RHD)

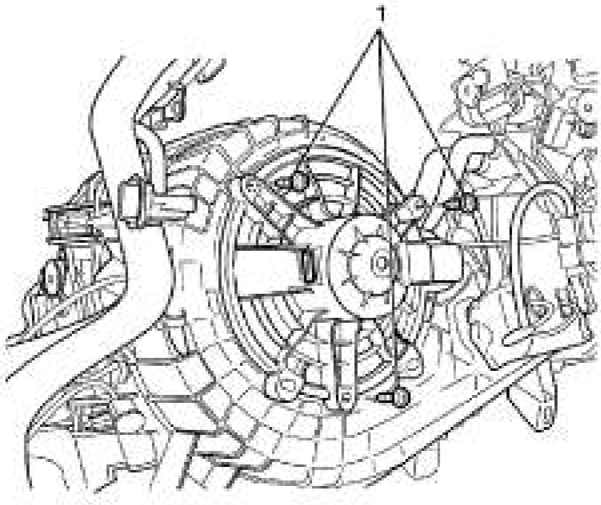
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

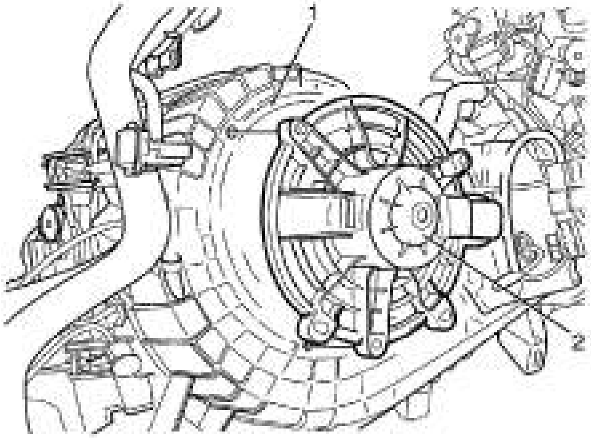
1. Remove the glove box assembly. Refer to Instrument Panel Compartment Replacement .
2. Remove the left floor air outlet duct. Refer to Floor Air Outlet Duct Replacement - Left Side .



3. Disconnect the blower motor electrical connector (1).

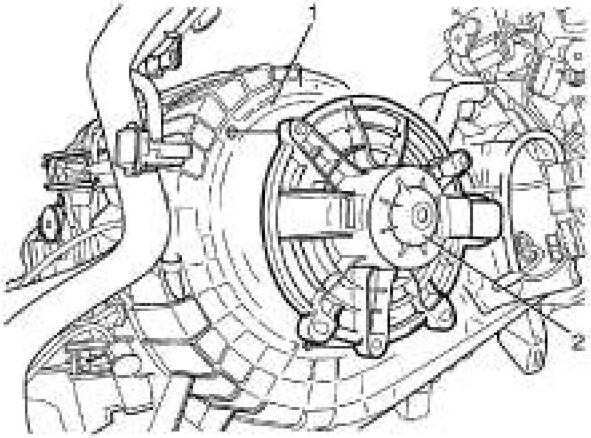


4. Remove the blower motor to blower assembly retaining screws (1).



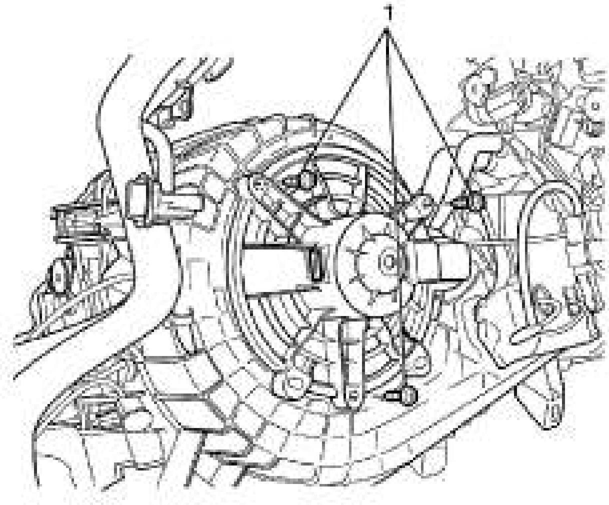
5. Remove the blower motor (2) from the blower assembly (1).

Installation Procedure



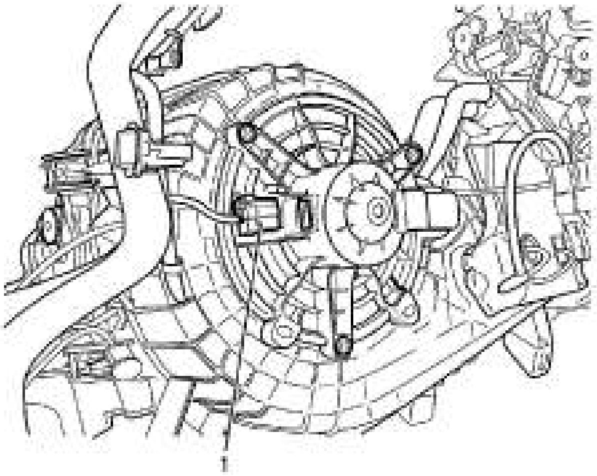
1. Install the blower motor (2) to the blower assembly (1).

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the blower motor to blower assembly retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m(18lb in).



3. Connect the blower motor electrical connector (1).
4. Install the left floor air outlet duct. Refer to Floor Air Outlet Duct Replacement - Left Side .
5. Install the glove box assembly. Refer to Instrument Panel Compartment Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1993735**

Discharge Hose Replacement (3.6L Engine)

Tools Required

J 39400 Halogen Leak Tester

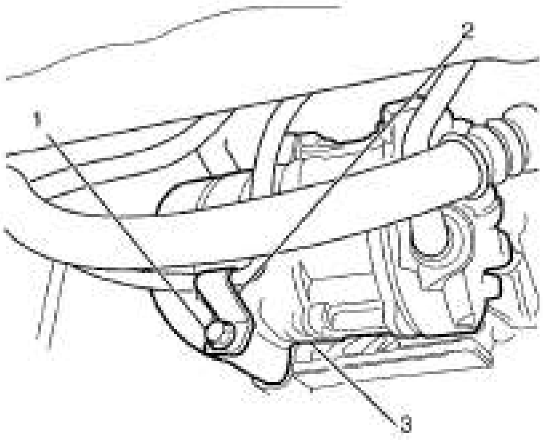
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

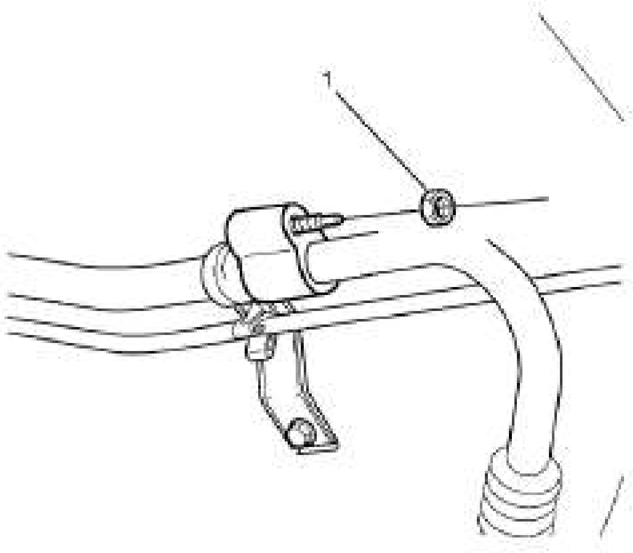
1. Recover the refrigerant Refer to Refrigerant Recovery and Recharging .
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement .
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
5. Remove the passenger side engine cover. Refer to Engine Cover Replacement .

Caution: Refer to Vehicle Lifting Caution in the Preface section.

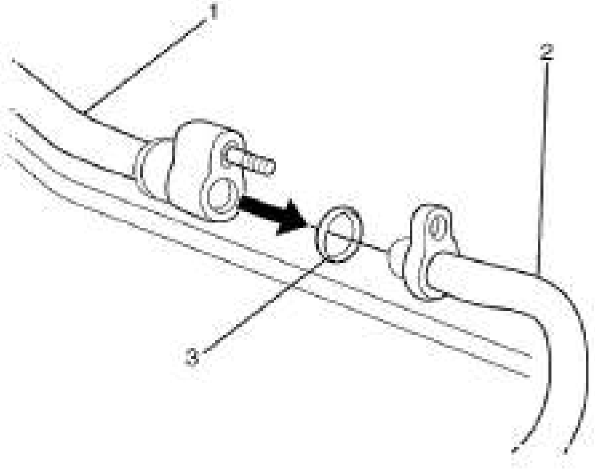
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



7. Remove the compressor to compressor mounting bracket retaining bolt (1).
8. Position the discharge hose retaining bracket (2) away from the compressor (3).
9. Lower the vehicle



10. Remove the suction pipe upper to suction pipe lower retaining nut (1).



11. Disconnect the suction pipe upper (1) from suction pipe lower (2).

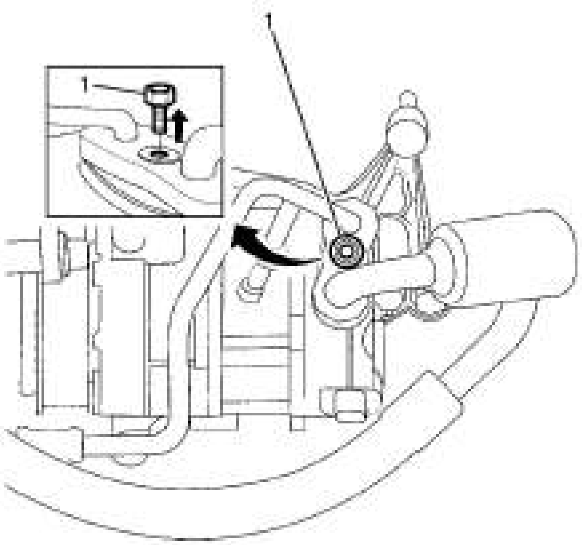
    Important: The sealing washer (3) is a single use item and must be discarded after use.

12. Remove the sealing washer (3). Refer to Sealing Washer Replacement .

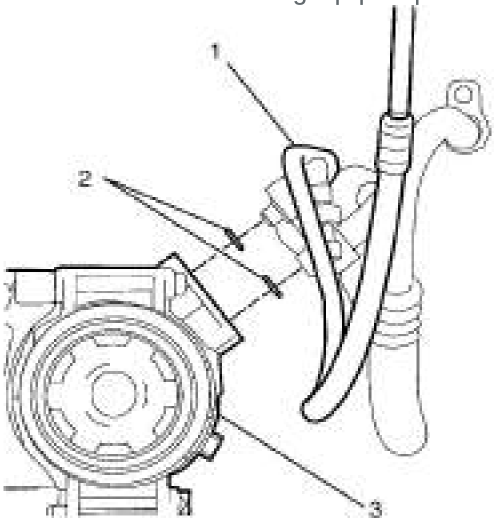
    Discard the sealing washer

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

13. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



14. Remove the suction/discharge pipes pad retaining bolt (1).



15. Disconnect the suction/discharge pipes (1) from the compressor (3).

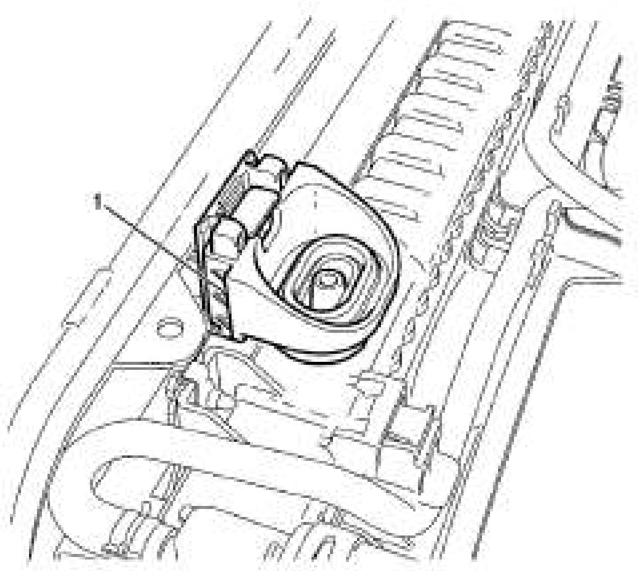
Important: The sealing washers (2) are a single use item and must be discarded after use.

16. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

Discard the sealing washers

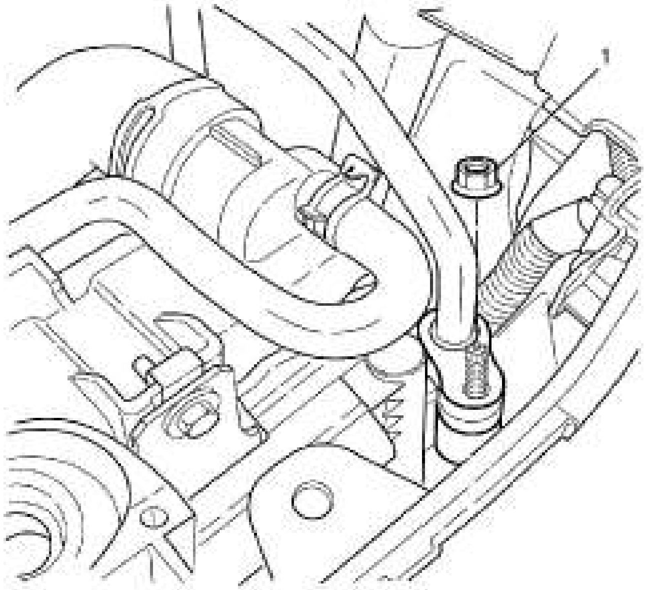
Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

17. Cap or plug the suction/discharge pipes (1) and the ports on the compressor (3).



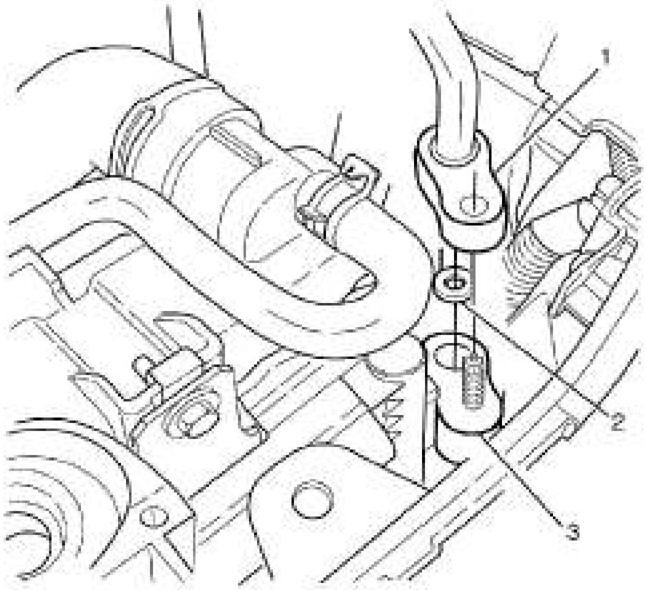
Important: Remove the upper radiator support brackets by raising the securing lock upwards 10mm and slide the bracket of the radiator slide pin.

18. Remove the upper radiator support brackets (1).



Important: Gently push the radiator and condenser towards the engine to allow removal of the discharge pipe to condenser retaining nut (1).

19. Remove the discharge pipe to condenser retaining nut (1).



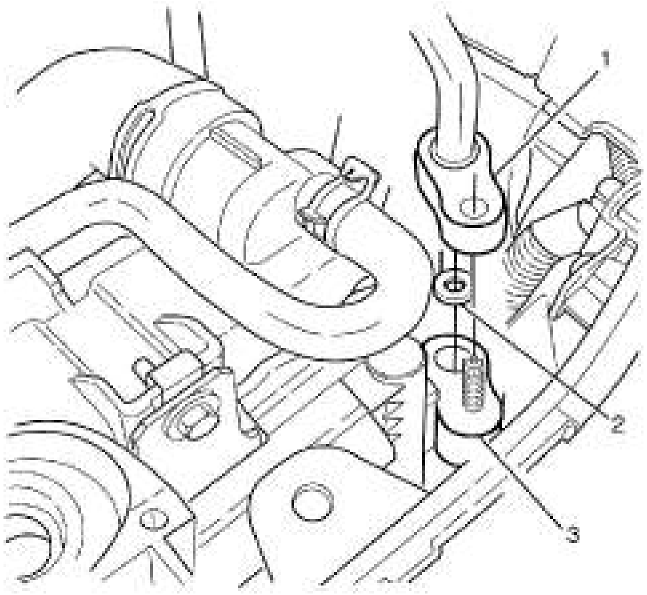
20. Disconnect the discharge pipe (1) from condenser (3).
21. Remove the sealing washer (2). Refer to Sealing Washer Replacement .

    Discard the sealing washer.

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

22. Cap or plug the discharge pipe (1) and the condenser (3).

Installation Procedure

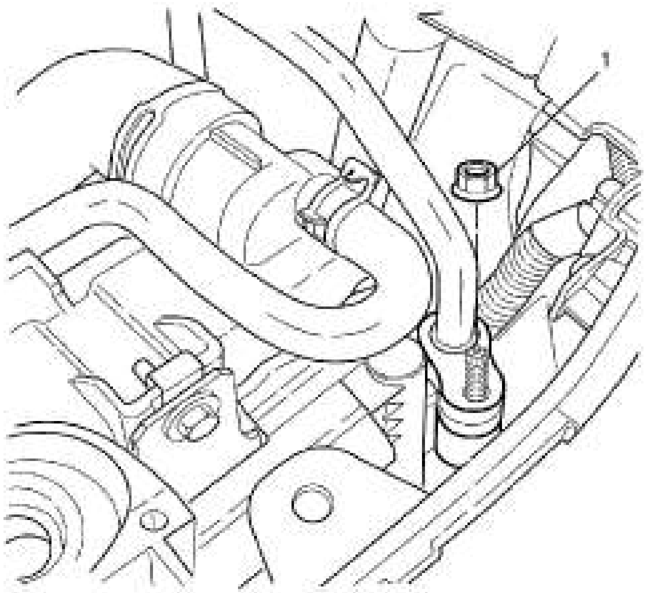


1. Remove the plugs or caps from the discharge pipe (1) and the condenser (3).

   Important: DO NOT coat the NEW sealing washer (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (2) useless, as the sealing washer (2) WILL swell causing refrigerant to leak out.

2. Install a NEW sealing washer (2). Refer to Sealing Washer Replacement .
3. Install the discharge pipe (1) to condenser (3).

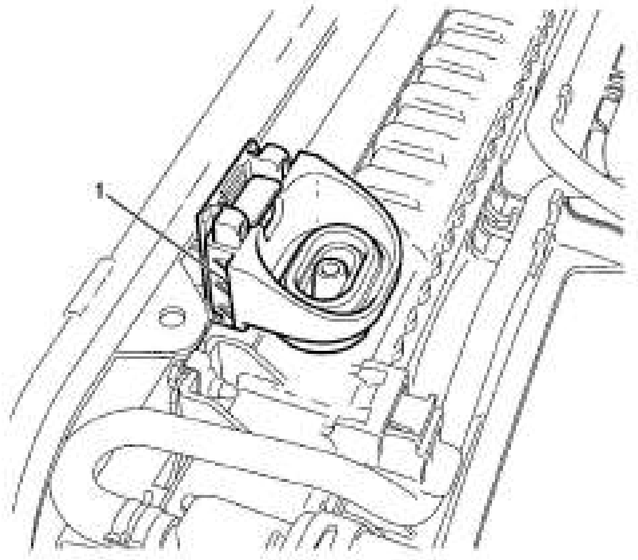
   Notice: Refer to Fastener Notice in the Preface section.



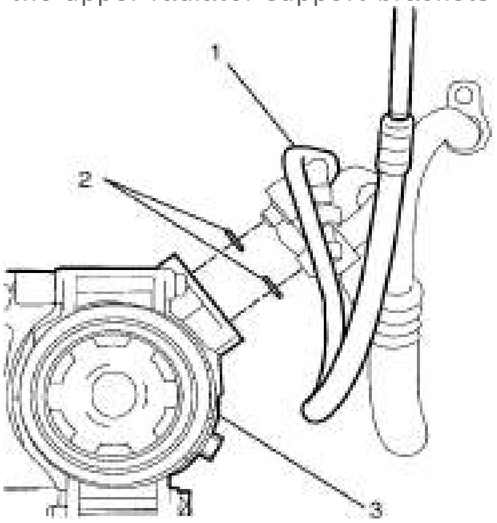
Important: Gently push the radiator and condenser towards the engine to allow installation of the discharge pipe to condenser retaining nut (1).

4. Install the discharge pipe to condenser retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).



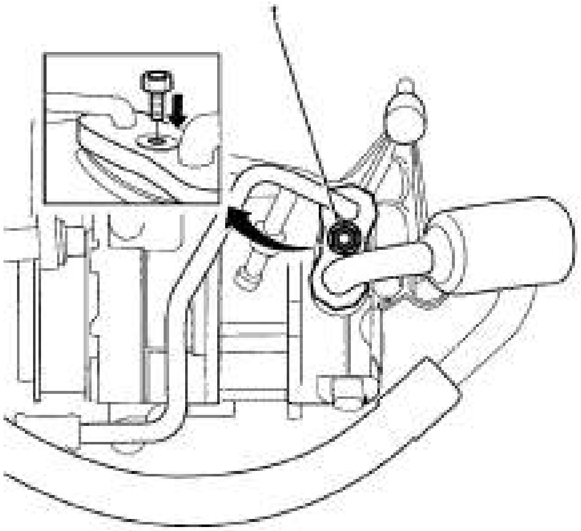
5. Install the upper radiator support brackets (1).



6. Remove the plugs or caps from the suction/discharge pipes (1) and the ports on the compressor (3).

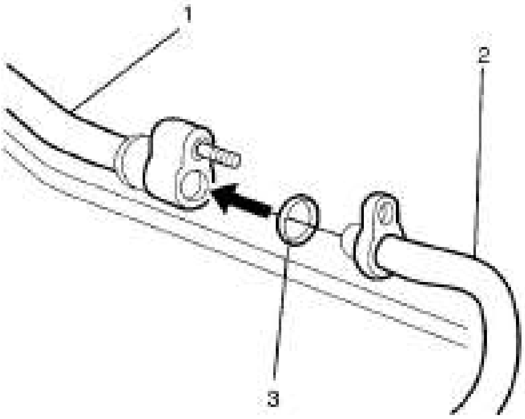
   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

7. Install two NEW sealing washers (2). Refer to Sealing Washer Replacement .
8. Connect the suction/discharge pipes (1) to the compressor (3)



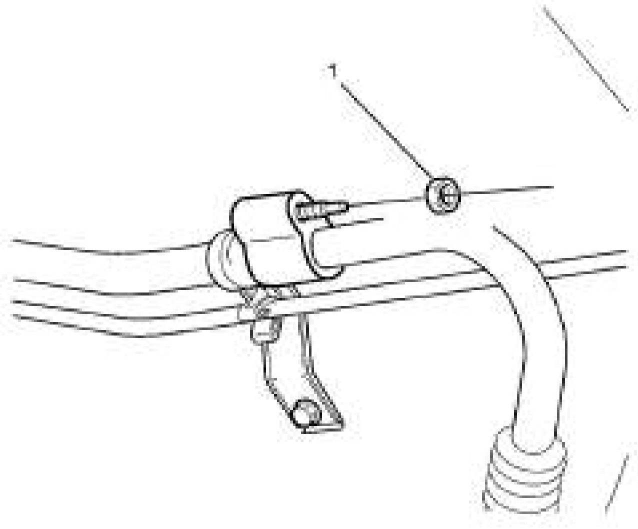
9. Install the suction/discharge pipe to compressor retaining bolt (1).

   Tighten
   Tighten the bolt to 22 N·m(16 lb ft).



Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

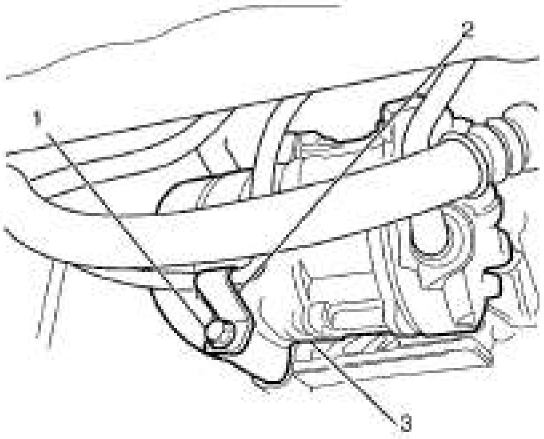
10. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement .
11. Install the suction pipe upper (1) to the suction pipe lower (2).



12. Install the suction pipe upper to suction pipe lower retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m(16 lb ft).

13. Raise the vehicle.



14. Position the discharge hose retaining bracket (2) to the compressor (3).
15. Install the compressor to compressor mounting bracket bolt (1).

    Tighten
    Tighten the bolt to 22 N·m (16 lb ft).

16. Lower the vehicle to the ground.

17. Install the passenger side engine dress cover. Refer to Engine Cover Replacement .
18. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
19. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement .
20. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
21. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging .
22. Leak test the fittings of the component using J 39400 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2038175**

Discharge Hose Replacement (6.0L Engine)

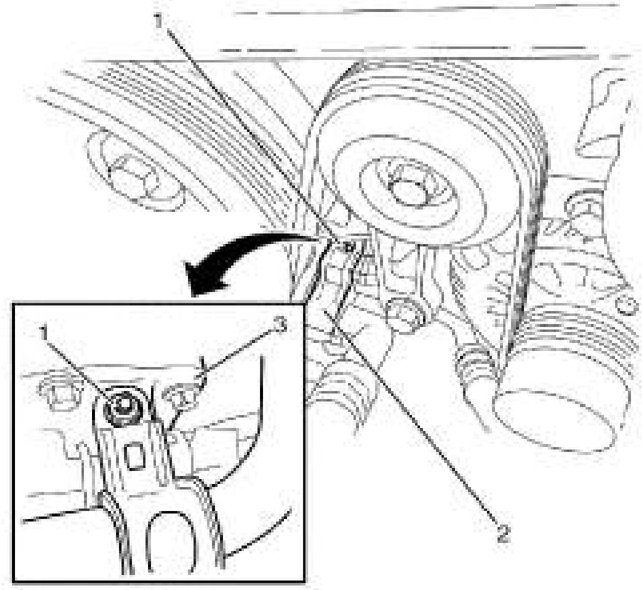
Tools Required

J 39400-A Halogen Leak Tester

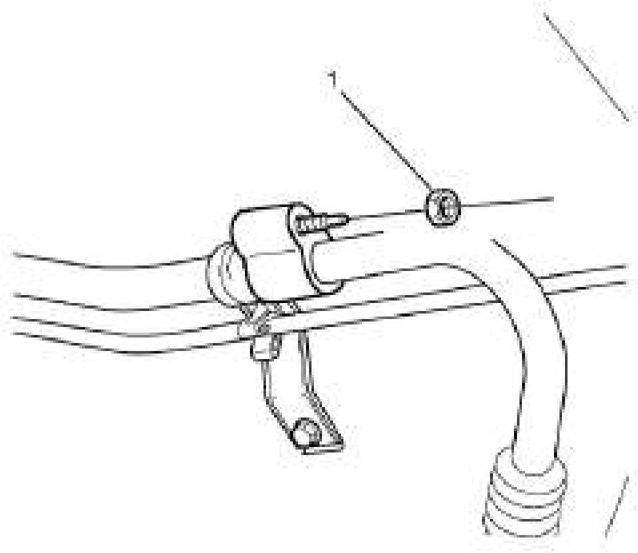
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

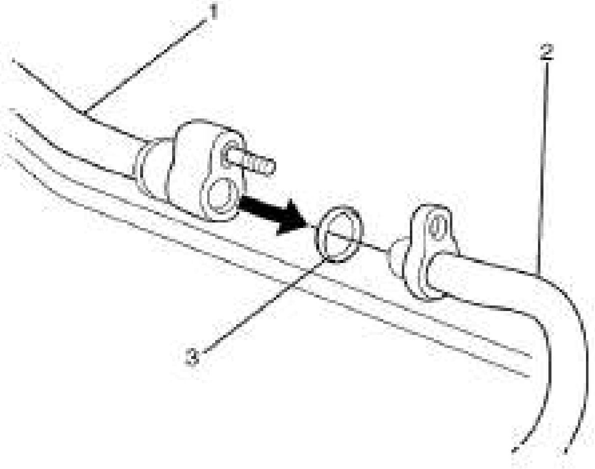
1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.
2. Disconnect battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement.
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
5. Remove the engine cover. Refer to Engine Cover Replacement.



6. Remove the discharge hose retaining bracket to oil pan retaining bolt (1).
7. Position the discharge hose retaining bracket (2) away from the oil pan (3).



8. Remove the suction pipe upper to suction pipe lower retaining nut (1).



9. Disconnect the suction pipe upper (1) from suction pipe lower (2).

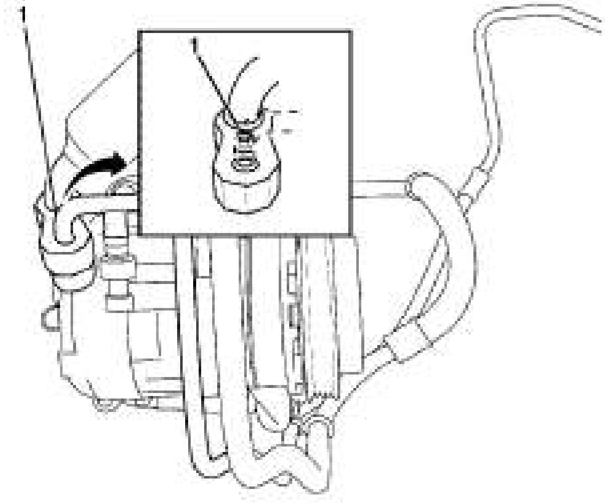
Important: The sealing washer (3) is a single use item and must be discarded after use.

10. Remove the sealing washer (3). Refer to Sealing Washer Replacement.

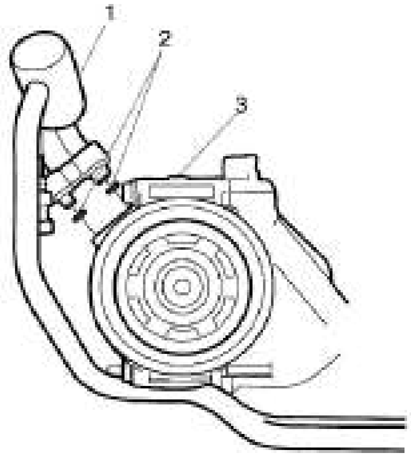
Discard the sealing washer

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

11. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



12. Remove the suction/discharge pipe to compressor retaining bolt (2).



13. Disconnect the suction/discharge pipes (1) from the compressor (3).

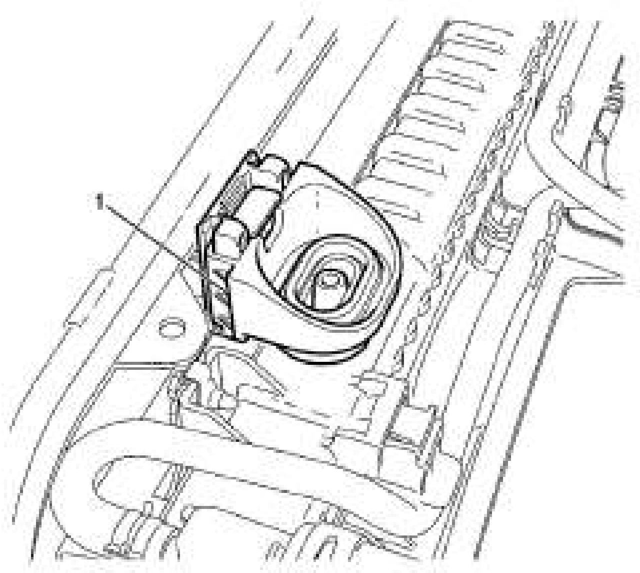
    Important: The sealing washers (2) are a single use item and must be discarded after use.

14. Remove the sealing washers (2). Refer to Sealing Washer Replacement.

    Discard the sealing washers.

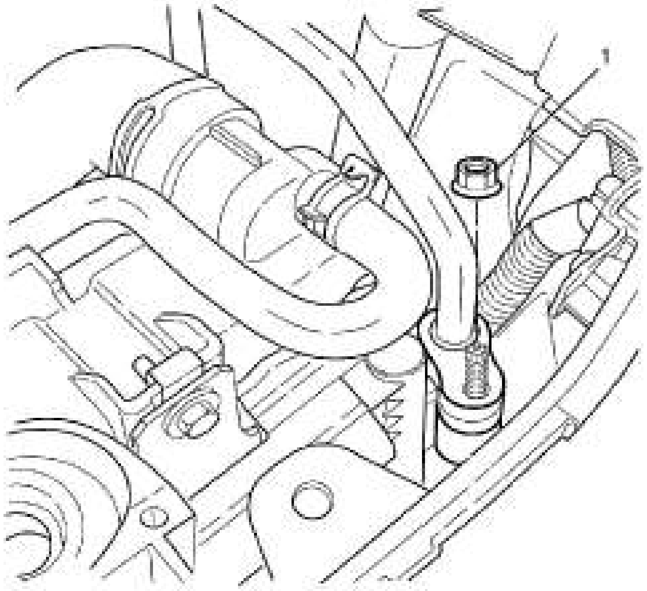
    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

15. Cap or plug the suction/discharge pipes (1) and the ports on the compressor (3).



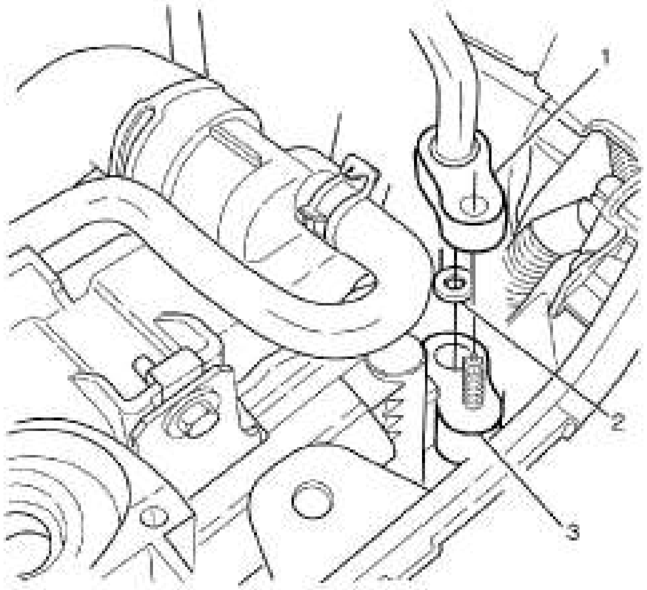
Important: Remove the upper radiator support brackets by raising the securing lock upwards 10mm and slide the bracket of the radiator slide pin.

16. Remove the upper radiator support brackets (1).



Important: Gently push the radiator and condenser towards the engine to allow removal of the discharge pipe to condenser retaining nut (1).

17. Remove the discharge pipe to condenser retaining nut (1).



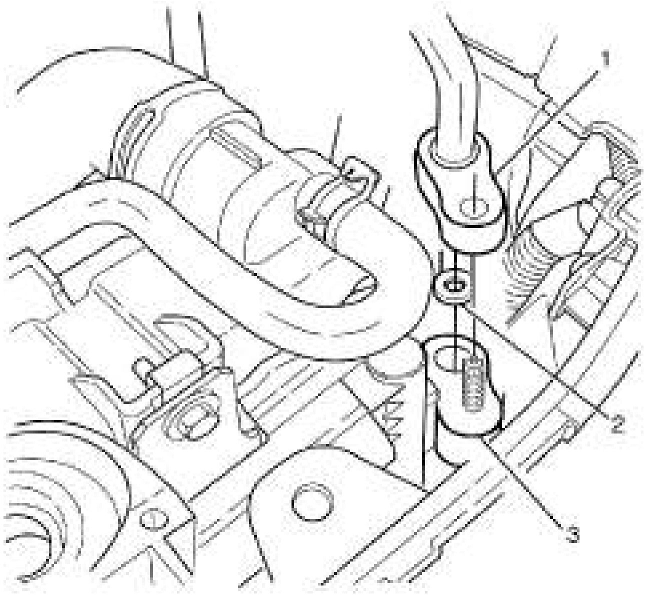
18. Disconnect the discharge pipe (1) from condenser (3).
19. Remove the sealing washer (2). Refer to Sealing Washer Replacement.

    Discard the sealing washer.

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

20. Cap or plug the discharge pipe (1) and the condenser (3).

Installation Procedure



1. Remove the plugs or caps from the discharge pipe (1) and the condenser (3).

   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

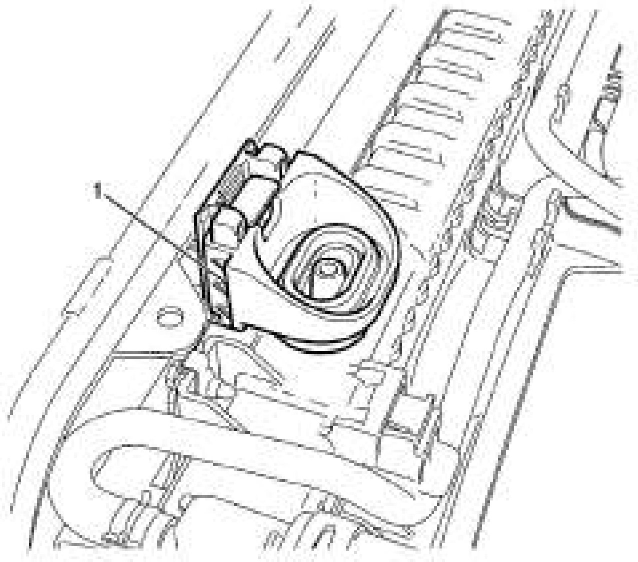
2. Install a NEW sealing washer (2). Refer to Sealing Washer Replacement.
3. Install the discharge pipe (1) to condenser (3).

   Notice: Refer to Fastener Notice in the Preface section.

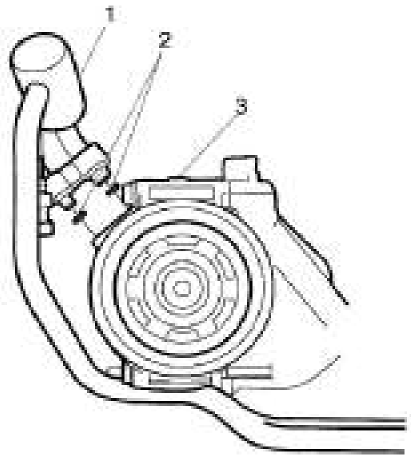
   Important: Gently push the radiator and condenser towards the engine to allow installation of the discharge pipe to condenser retaining nut (1).

4. Install the discharge pipe to condenser retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m (16 lb ft).



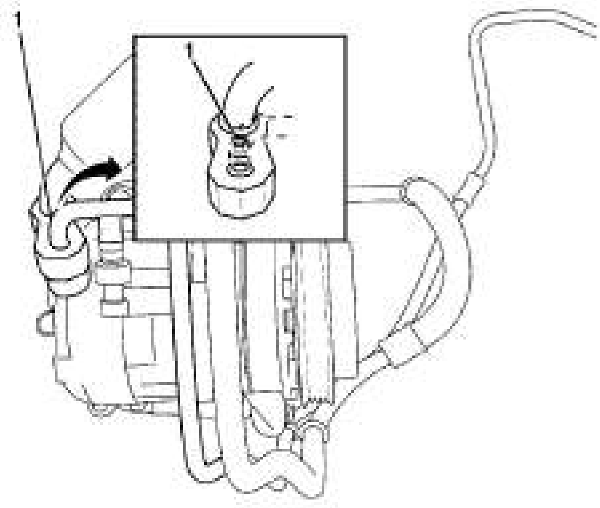
5. Install the upper radiator support brackets (1).



6. Remove the plugs or caps from the suction/discharge pipes (1) and the ports on the compressor (3).

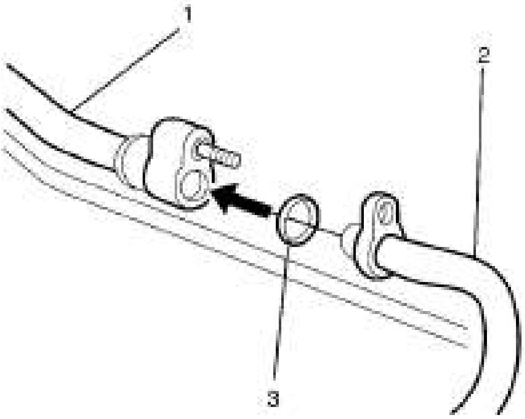
Important: DO NOT coat the sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the washer useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

7. Install two NEW sealing washers (2). Refer to Sealing Washer Replacement.
8. Connect the suction/discharge pipes (1) to the compressor (3).



9. Install the suction/discharge pipe to the compressor retaining bolt (2).

   Tighten
   Tighten the bolt to 22 N·m(16 lb ft).

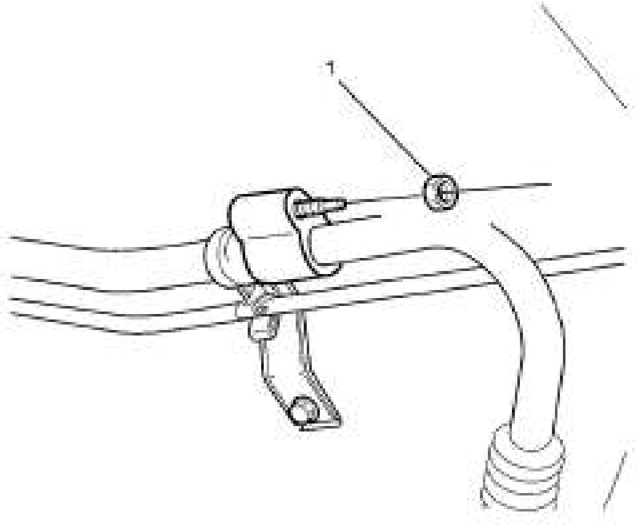


10. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

    Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

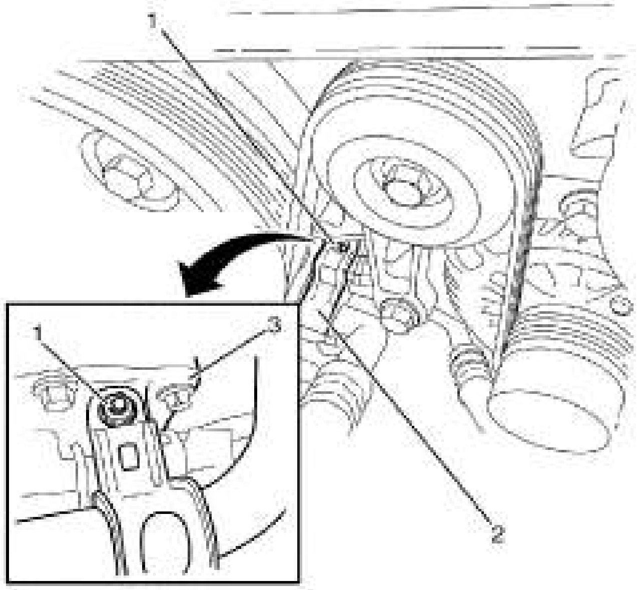
11. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.

12. Install the suction pipe upper (1) to the suction pipe lower (2).



13. Install the suction pipe upper to suction pipe lower retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



14. Position the discharge hose retaining bracket (2) to the oil pan (3).
15. Install the discharge hose retaining bracket to oil pan retaining nut (1).

Tighten
Tighten the nut to 22 N·m (16 lb ft).

16. Install the engine cover. Refer to Engine Cover Replacement.
17. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
18. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement.
19. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
20. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging.
21. Leak test the fittings of the components using J 39400-A .

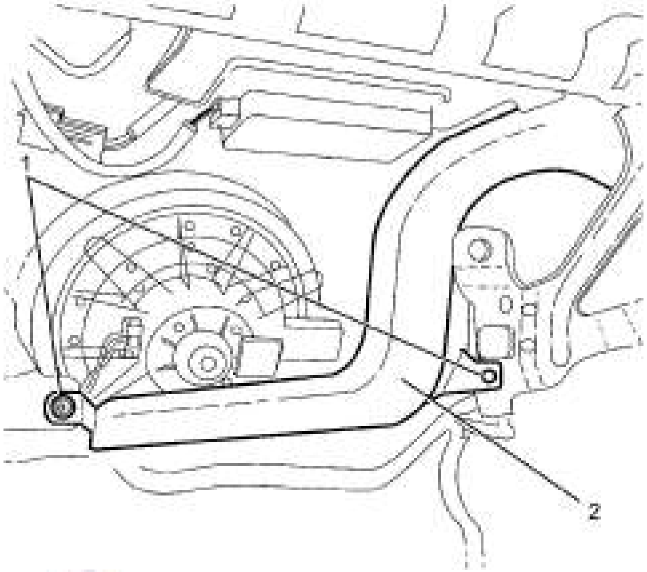
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1994774**

Floor Air Outlet Duct Replacement - Left Side

Removal Procedure

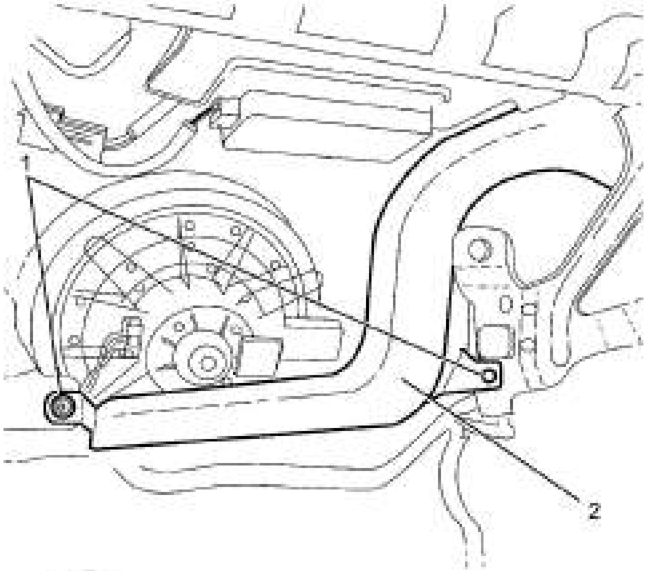
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the glove box assembly. Refer to Instrument Panel Compartment Replacement .



2. Remove the floor air outlet duct to instrument panel (I/P) retaining screws (1).
3. Remove floor air outlet duct (2) from the I/P.

Installation Procedure



1. Install the floor air outlet duct 2 to the instrument panel (I/P).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the floor air outlet duct to I/P retaining screws (1) .

   Tighten
   Tighten the screws to 2 N·m(18lb in).

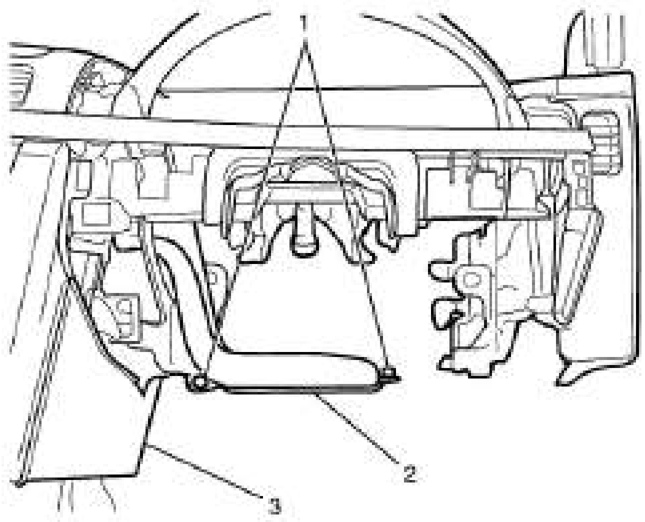
3. Install the glove box assembly. Refer to Instrument Panel Compartment Replacement .

Floor Air Outlet Duct Replacement - Right Side

Removal Procedure

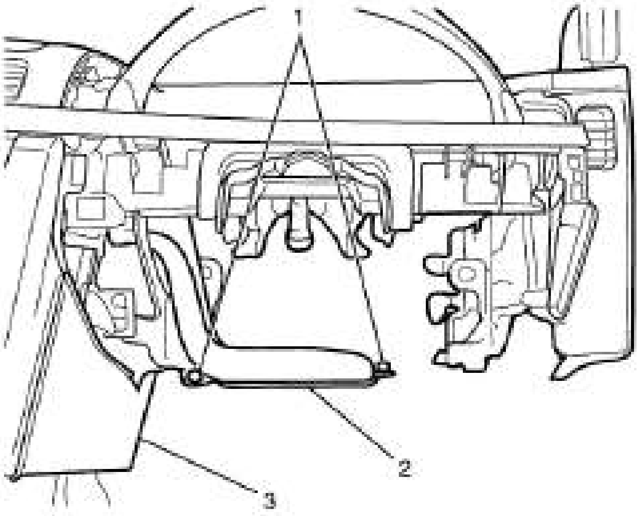
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the knee bolster. Refer to Knee Bolster Replacement .



2. Remove the floor air outlet duct to instrument panel (I/P) retaining screws (1).
3. Remove the floor air outlet duct (3) from the I/P (2).

Installation Procedure



1. Install the floor air outlet duct (3) to the instrument panel (I/P) (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the floor air outlet duct to I/P retaining screws (1)

   Tighten
   Tighten the screws to 2 N·m(18 lb in).

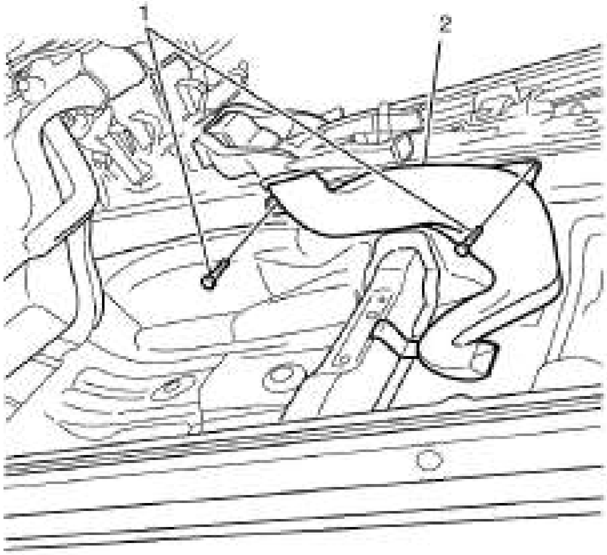
3. Install the knee bolster. Refer to Knee Bolster Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1976161**

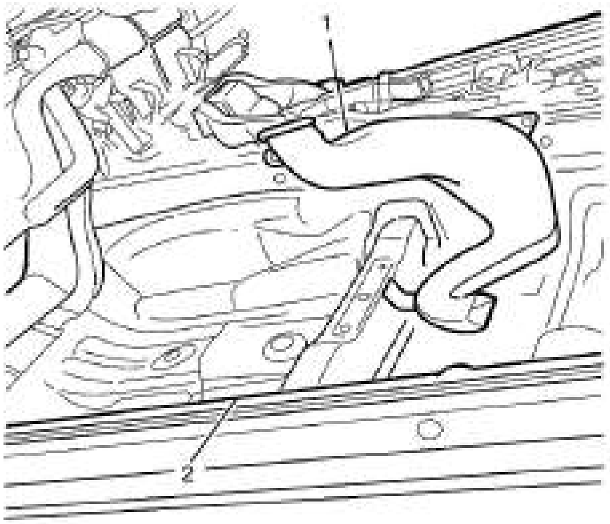
Floor Rear Air Outlet Duct Replacement - Left Side (RHD)

Removal Procedure

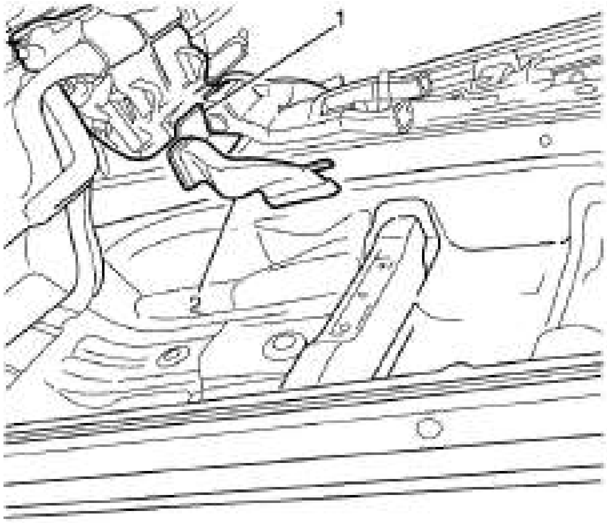
1. Remove the centre console. Refer to Front Floor Console Replacement.
2. Remove the front carpet. Refer to Front Floor Panel Carpet Replacement.



3. Remove the push pin (1) from the rear floor air outlet duct (2).

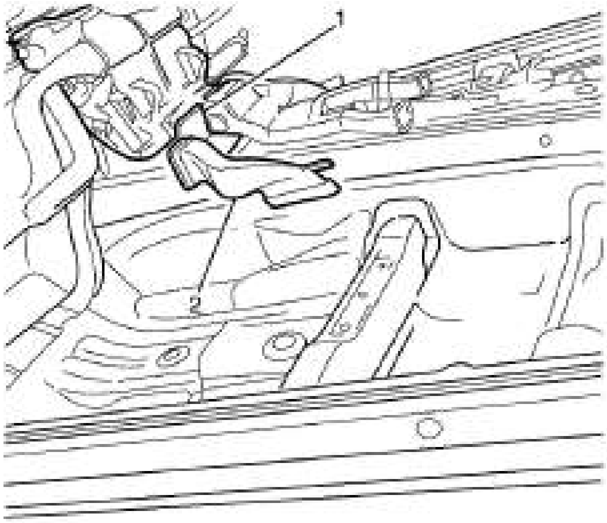


4. Remove the rear floor air outlet duct (1) from the floor (2).

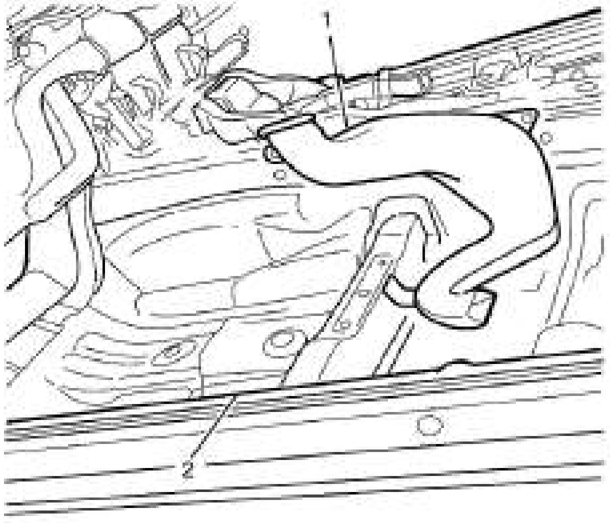


5. Disconnect the rear floor air outlet duct (2) from the HVAC module assembly (1).

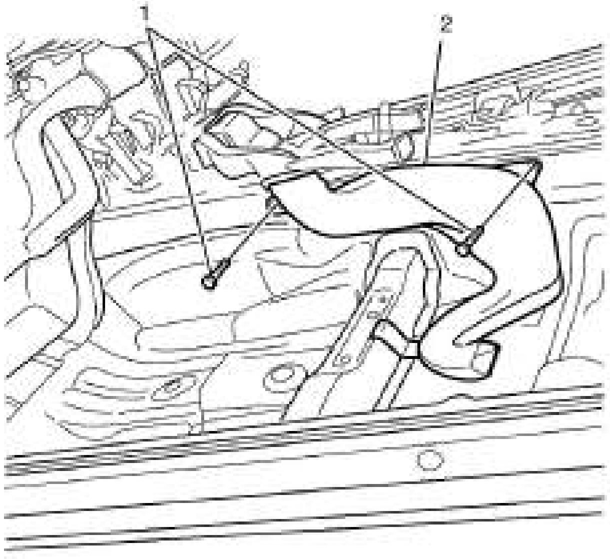
Installation Procedure



1. Install the rear floor air outlet duct (2) to the HVAC module assembly (1).



2. Install the rear floor air outlet duct (1) to the floor (2).



3. Install the push pins (1) to the rear floor air outlet duct (2).
4. Install the centre console. Refer to Front Floor Console Replacement.
5. Install the front carpet. Refer to Front Floor Panel Carpet Replacement.

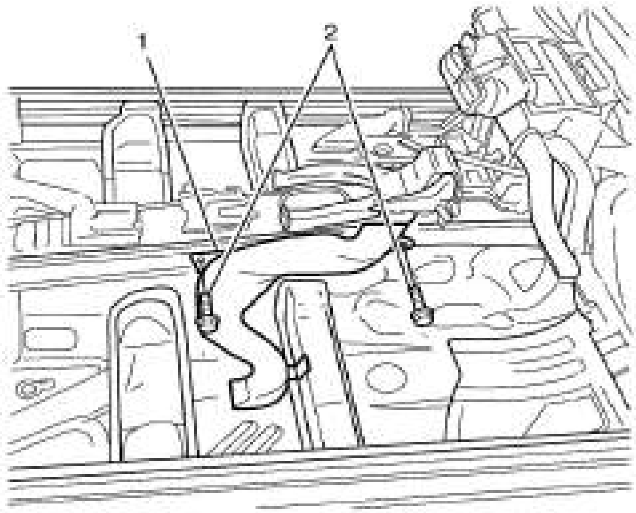
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 1976164

Floor Rear Air Outlet Duct Replacement - Right Side (RHD)

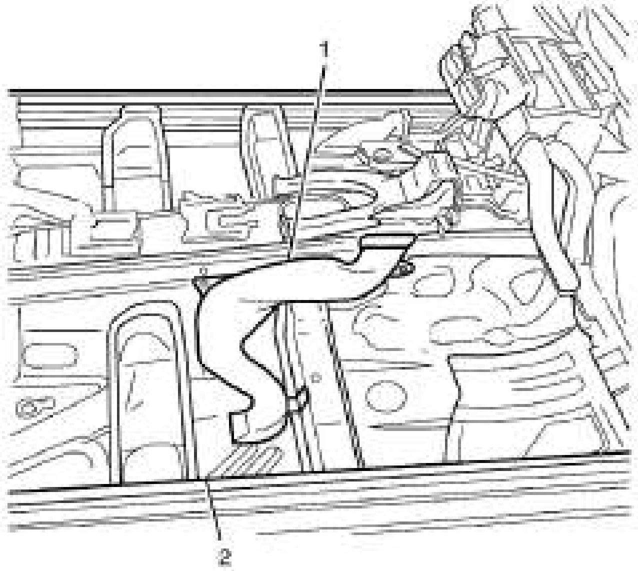
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

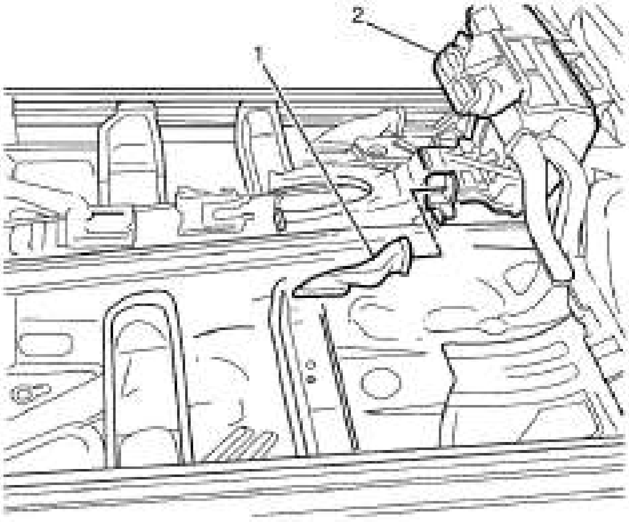
1. Remove the front carpet. Refer to Front Floor Panel Carpet Replacement.
2. Remove the centre console. Refer to Front Floor Console Replacement.



3. Remove the push pins (2) from the rear floor air outlet duct (1).

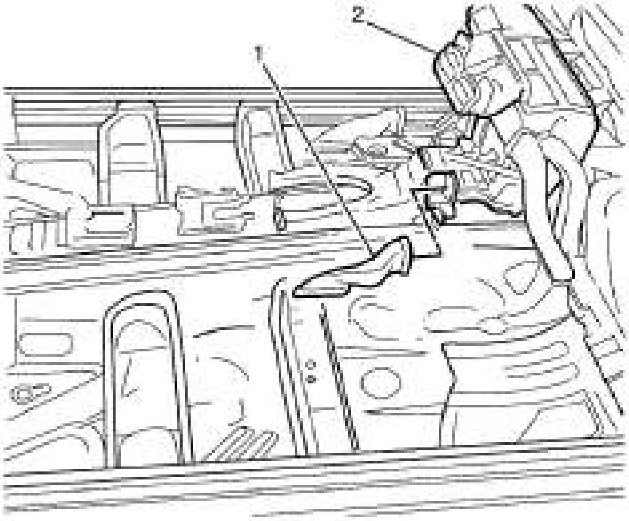


4. Remove the rear floor air outlet duct (1) from the floor (2).

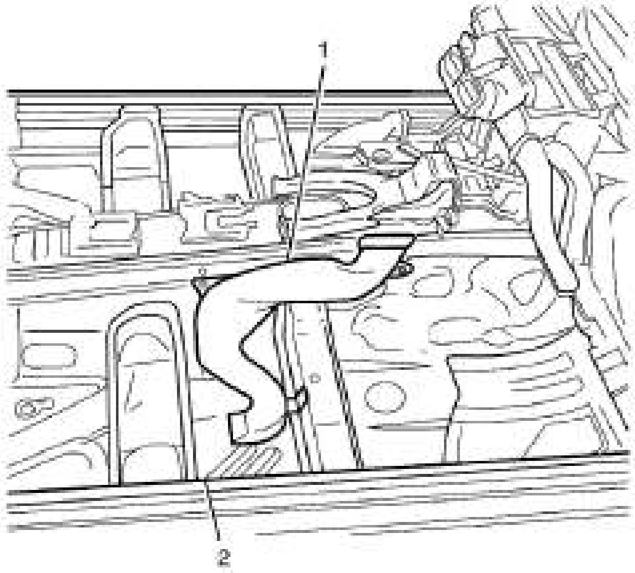


5. Disconnect the rear floor air outlet duct (1) from the HVAC module assembly (2).

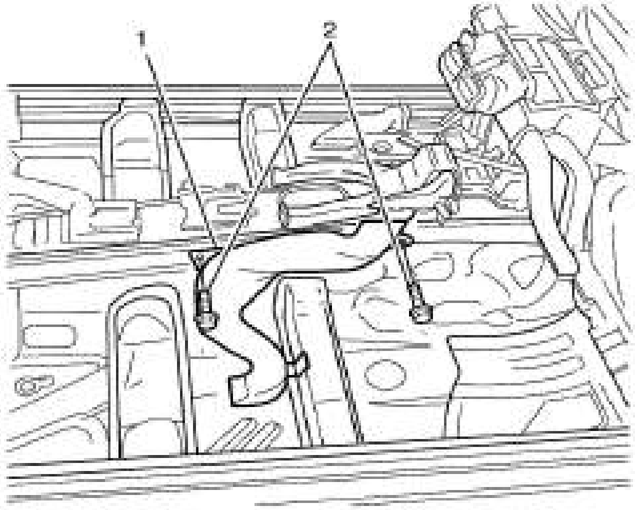
Installation Procedure



1. Install the rear floor air outlet duct (1) to the HVAC module assembly (2).



2. Install the rear floor air outlet duct (1) to the floor (2).



3. Install the push pins (2) to the rear floor air outlet duct (1).
4. Install the centre console. Refer to Front Floor Console Replacement.
5. Install the front carpet. Refer to Front Floor Panel Carpet Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1993710**

Flushing

Tools Required

- R-134a - A/C Tracer Dye Box of 24
- Universal 12 V Leak Detection Lamp
- Air Conditioning Service Centre
- A/C Flush Adapter Kit

The A/C system and in particular the heat exchangers (evaporator and condenser) will need to be flushed (cleaned internally) if the following issues have occurred:

- A/C system "over lubricated". This normally occurs after a compressor has been replaced and the oil balancing procedure has not been carried correctly. This condition shows up as an extremely high high pressure (HP) reading.
- Contamination such as aluminium particles in the A/C system which cause blockages in the condenser, receiver dehydrator and TX valve. The most common component causing contamination through the A/C system is a compressor that has internally collapsed.

Flush Procedure

Important: It is imperative that all safety rules and first aid is followed for the specific flushing solvent being used. Consult with your solvent supplier and ask for an MSDS (Material Safety Data Sheet) which will outline all safety precautions.

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .

Important: The recommended method of flushing is the open loop. Read the instructions regarding health, safety and environmental issues prior to commencing the flushing procedure.

2. Remove the compressor. Refer to Air Conditioning Compressor Replacement .
3. Drain all the oil through the compressor drain plug then through the rear hose pad ports. DO NOT flush through the compressor.

Important: It is important to follow the process found in Receiver Dehydrator Replacement for correct removal of receiver dehydrator

Important: DO NOT reuse the receiver dehydrator after removal.

4. Remove the receiver dehydrator.

Discard the receiver dehydrator

Important: Place the TX valve in a plastic bag to avoid any contamination from air born dirt or moisture.

5. Disconnect all hose/pipe fittings from the TX valve. Refer to Air Conditioning Evaporator

Thermal Expansion Valve Replacement . Refer to Air Conditioning Condenser Replacement .

6. Remove the TX valve. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement .
7. Fill the flushing vessel with solvent. Connect the pressure hose and the flush gun handle to the outlet side of the component being flushed.
8. Connect a clear plastic hose (simply wedge the hose in place or use worm drive clips) to the outlet port for discharging solvent waste to the collection container.
9. Connect the solvent container to a pressure source such as dry workshop compressed air or dry Nitrogen (NO2). This pressure is required to force the solvent through the A/C components.
10. Activate flush gun and force solvent through the component.
11. On the same component being flushed, reverse direction flush.
12. View through the clear plastic discharge hose to see when the liquid become clear, this indicates the level of cleanliness of the component internals. Repeat this operation on the evaporator, condenser, hoses and pipes.
13. After flushing is finished, allow 30 minutes with the system still open to atmosphere, to "boil off" any solvent residue left in the components. Then reconnect all parts using NEW sealing washers.
14. Add the total specified amount of PAG oil (used for the complete system) to the compressor, through the drain plug and by turning the front pulley.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 1976168

Heater Core Replacement (RHD)

Removal Procedure

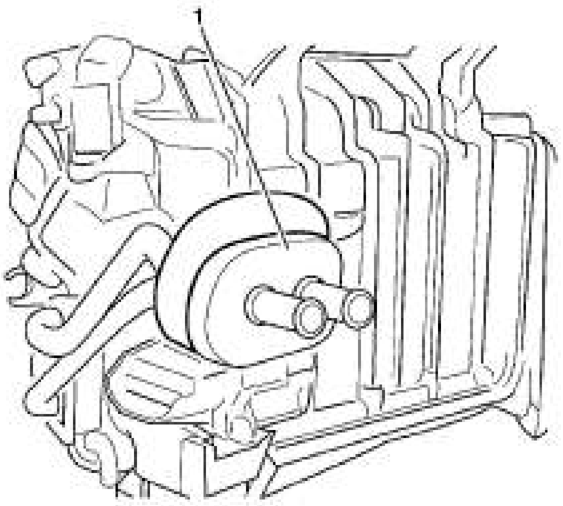
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.

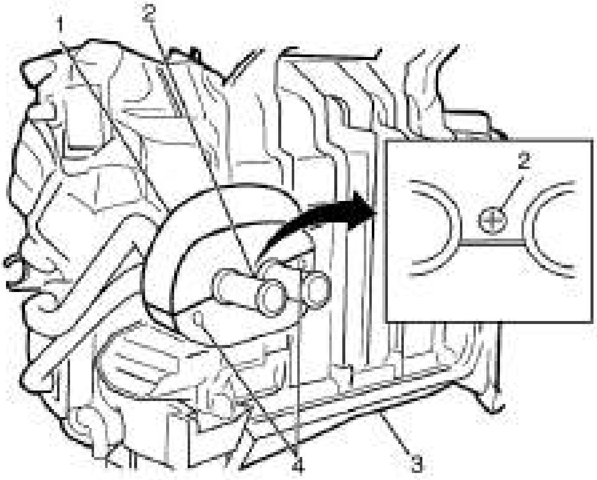
   Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

   Important: Apply tape or blanking plugs to the heater core pipes to contain any coolant left in the heater core, This is to avoid a coolant spill onto the carpet during HVAC removal.

2. Remove the HVAC module assembly. Refer to HVAC Module Assembly Replacement.

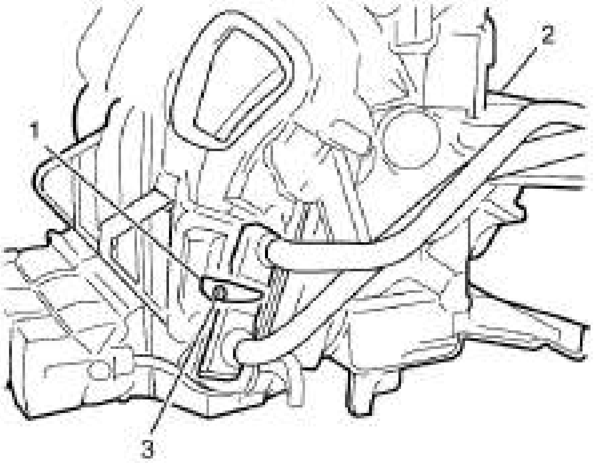


3. Remove the foam seal (1) from the heater core pipes (2).

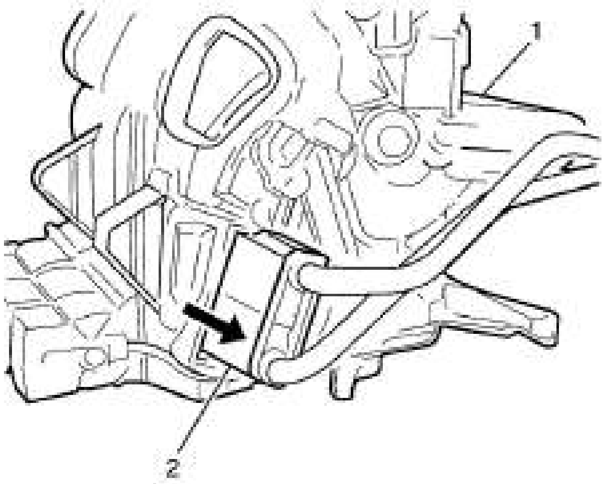


Important: The heater core pipe locating plate (1) incorporates two guide pins (4) to locate the heater core pipe locating plate (1) to the HVAC module assembly (3). Care must be taken not to damage the guide pins (4).

4. Remove the heater core pipe locating plate to HVAC module assembly retaining screw (2).
5. Remove the heater core pipe locating plate (1) from the HVAC module assembly (3).



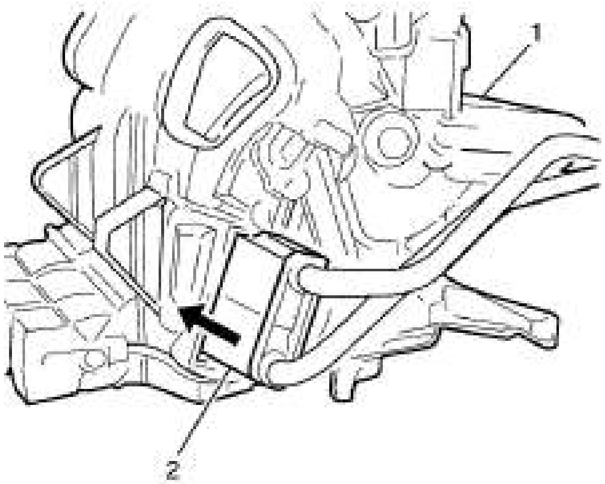
6. Remove the heater core retaining plate to HVAC module assembly retaining screw (3).
7. Remove the heater core retaining plate (1) from the HVAC module assembly (2).



Important: Carefully slide the heater core (2) out of the HVAC module assembly (1).

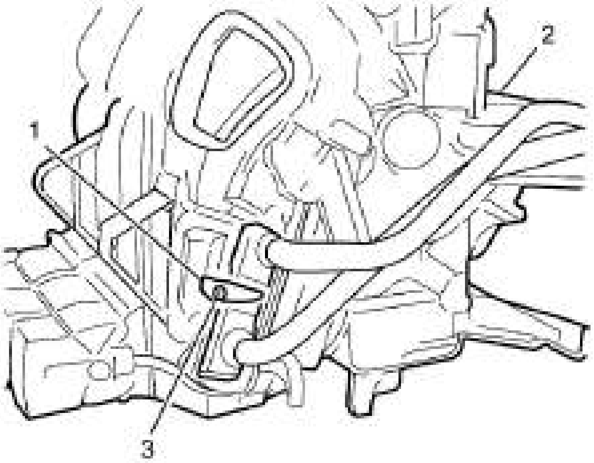
8. Remove the heater core (2) from the HVAC module assembly (1).

Installation Procedure



Important: Make sure that all the foam seals are fitted when installing the heater core (2). If a foam seal is missing do not fit the heater core (2).

1. Install the heater core (2) into the HVAC module assembly (1).

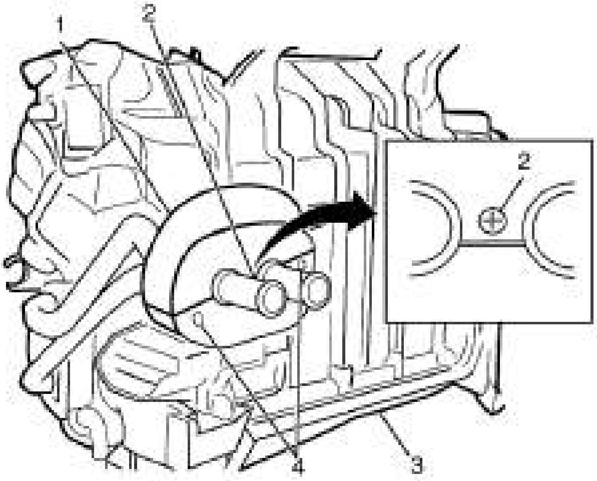


2. Install the heater core retaining plate (1) to the HVAC module assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the heater core retaining plate to HVAC module assembly retaining screw (3).

   Tighten
   Tighten the screw to 1 N·m (9 lb in).



Important: The heater core pipe locating plate (2) incorporates two guide pins (4) to locate the heater core pipe locating plate (2) to the HVAC module assembly (3). Care must be taken not to damage the guide pins (4).

4. Install the heater core pipe locating plate (2) to the HVAC module assembly (3).
5. Install the heater core pipe locating plate to HVAC module assembly retaining screw (1).

   Tighten
   Tighten the screw to 1 N·m (9 lb in).

6. Install the HVAC module assembly. Refer to HVAC Module Assembly Replacement.
7. Refill the coolant system, Refer to Cooling System Draining and Filling.
8. Recharge the refrigerant Refer to Refrigerant Recovery and Recharging.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2038169**

Heater Hose Assembly Replacement (6.0L Engine)

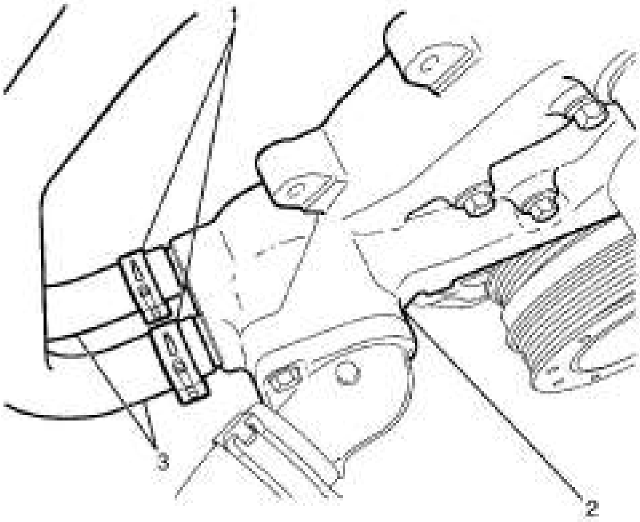
Tools Required

J 38185 Hose Clamp Pliers

Removal Procedure

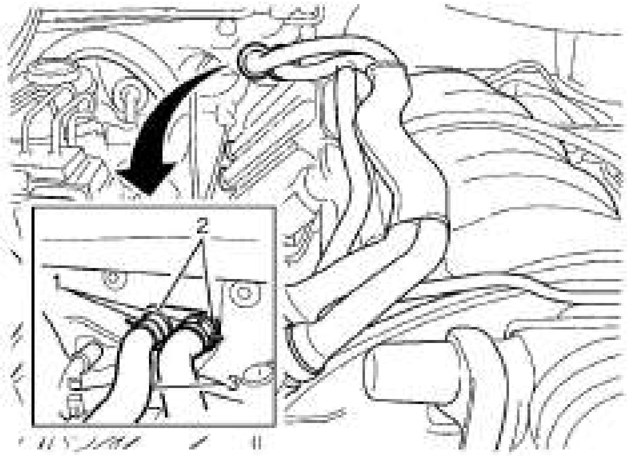
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the engine cover. Refer to Engine Cover Replacement
2. Drain the cooling system. Refer to Cooling System Draining and Filling .



Important: Mark position of heater hoses (3) and heater hose retaining clamps (1) before removal to make sure of correct alignment during assembly.

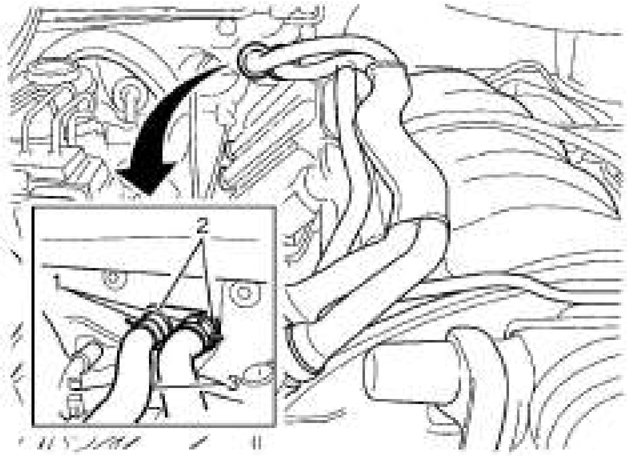
3. Using J 38185 compress the heater hose retaining clamps (1) and slide 50 mm (2 in) along the heater hose (3).
4. Disconnect the heater hoses (3) from the water pump housing (2).



Important: Mark position of heater hoses (3) and heater hose retaining clamps (1) before removal to make sure of correct alignment during assembly.

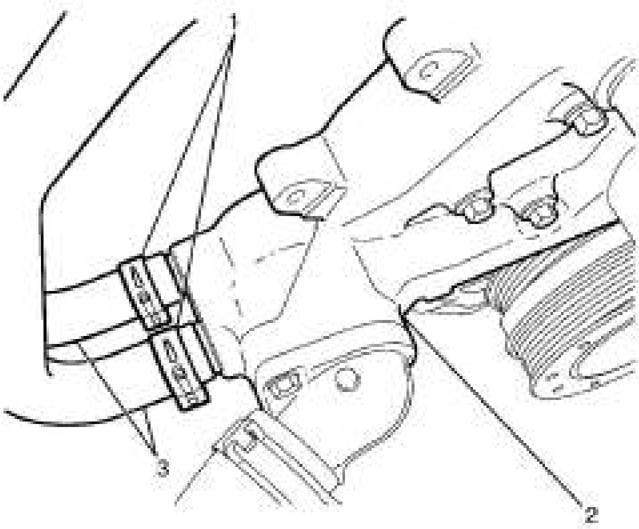
5. Using J 38185 compress the heater hose retaining clamps (1) and slide 50 mm (2 in) along the heater hose (3).
6. Disconnect the heater hoses (3) from the heater core pipes (2).
7. Remove the heater hose assembly.

Installation Procedure



1. Connect the heater hoses (3) to the heater core pipes (2).

2. Using J 38185 slide the heater hose retaining clamps (1) back into the original position on the heater hoses (3).



3. Connect the heater hoses (1) to the water pump housing (2).
4. Using J 38185 slide the heater hose retaining clamps (1) back into the original position on the heater hoses (3).
5. Fill the cooling system. Refer to Cooling System Draining and Filling .
6. Install the engine cover.Refer to Engine Cover Replacement

Heater Inlet Hose Replacement

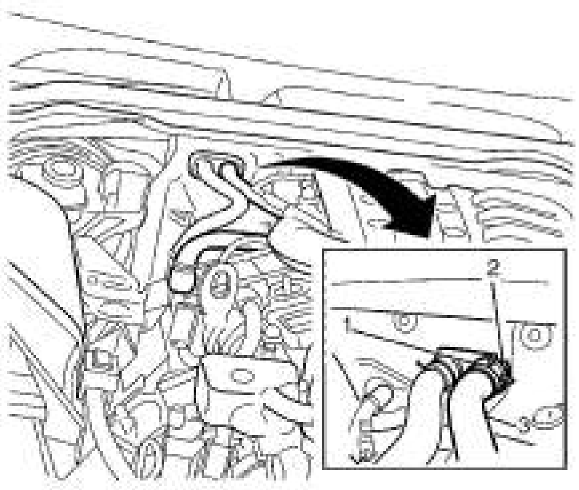
Tools Required

J 38185	Hose Clamp Pliers

Removal Procedure

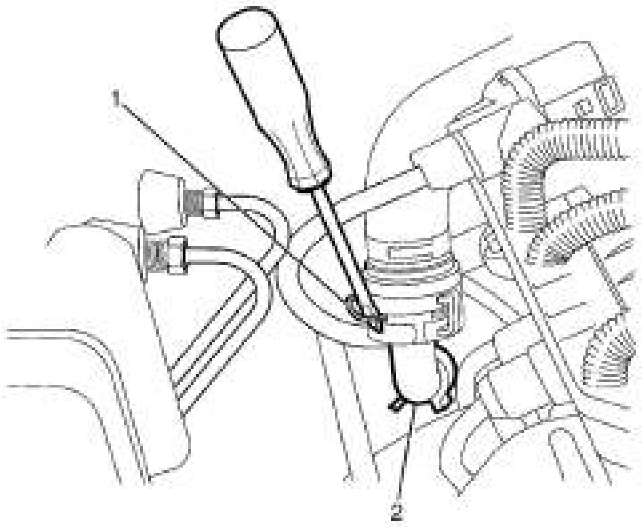
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Drain the cooling system. Refer to Cooling System Draining and Filling .
2. Remove the engine cover. Refer to Engine Cover Replacement

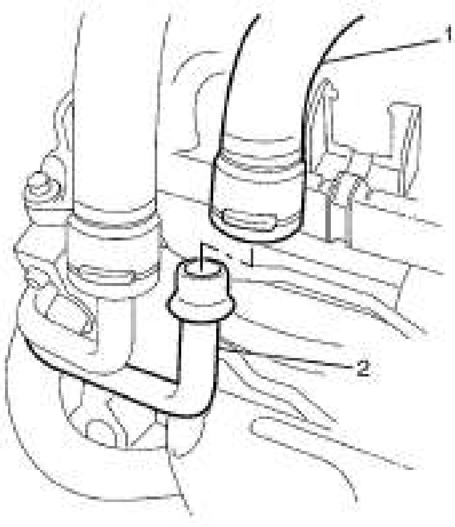


Important: Mark position of the heater inlet hose (3) and the heater inlet hose retaining clamp (1) before removal to make sure of correct alignment during assembly.

3. Using J 38185 slide the heater inlet hose retaining clamp (1) and slide 50 mm (2 in) along the heater inlet hose (3).
4. Disconnect the heater inlet hose (3) from the heater core pipe (2).



5. Detach the heater inlet hose quick connect fitting by releasing the retaining clip (1) with a suitable tool, from the heater pipe (2).

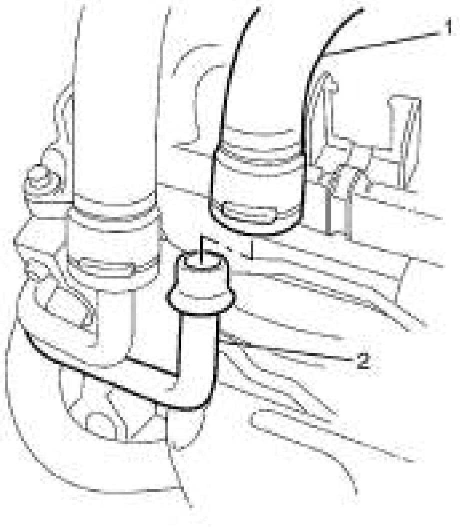


6. Disconnect the heater inlet hose (1) from the heater inlet pipe (2).

Installation Procedure

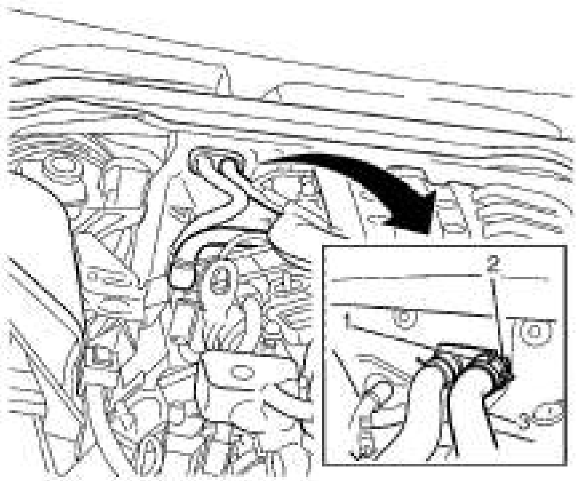
Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

1. Install the heater inlet hose.



Important: Listen for an audible click to confirm fitting.

2. Connect the heater inlet hose (1) to the heater inlet pipe (2).



3. Connect the heater inlet hose (3) to the heater core pipe (2).
4. Using J 38185 slide the heater inlet hose retaining clamp (1) back into the original position on the heater inlet hose (3).
5. Refit the right side engine cover. Refer to Engine Cover Replacement
6. Fill the cooling system. Refer to Cooling System Draining and Filling .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1997274**

Heater Outlet Hose Replacement

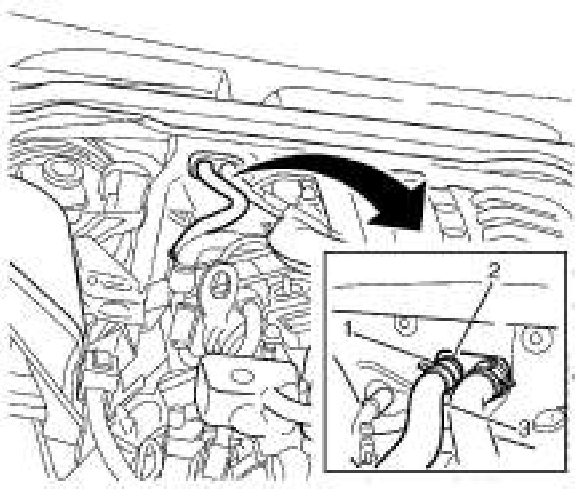
Tools Required

J 38185	Hose Clamp Pliers

Removal Procedure

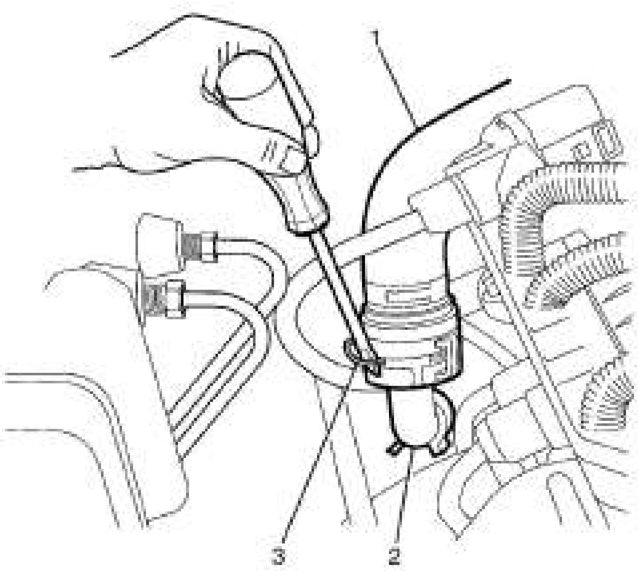
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Drain the cooling system. Refer to Cooling System Draining and Filling .
2. Remove the engine cover. Refer to Engine Cover Replacement

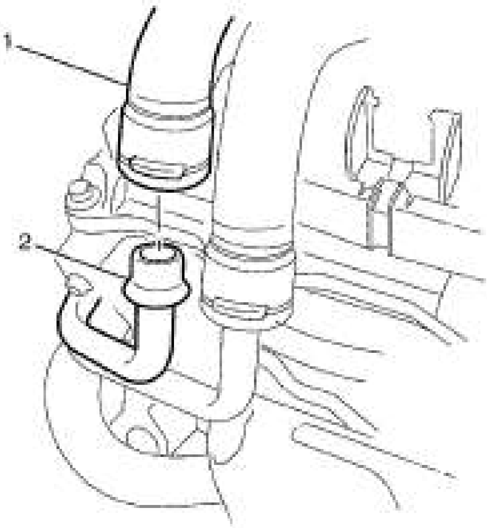


Important: Mark position of the heater outlet hose (3) and the heater outlet hose retaining clamp (1) before removal to make sure of correct alignment during assembly.

3. Using J 38185 compress the heater outlet hose retaining clamp (1) and slide 50 mm (2 in) along the heater outlet hose (3).
4. Disconnect the heater outlet hose (3) from the heater core pipe (2).



5. Detach the heater hose (1) quick connect fitting by releasing the retaining clip (3) with a suitable tool, from the heater pipe (2).

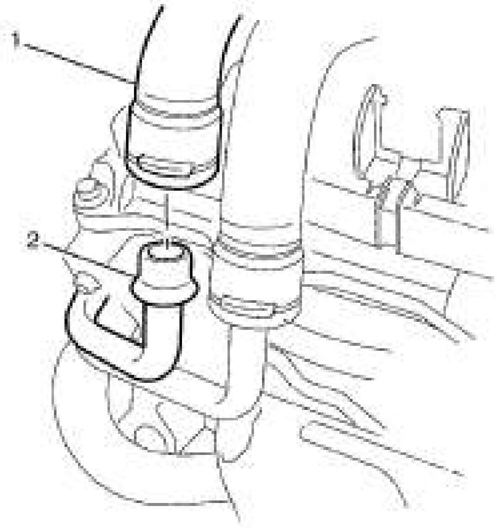


6. Remove the heater outlet hose (1) from the heater outlet pipe (2).

Installation Procedure

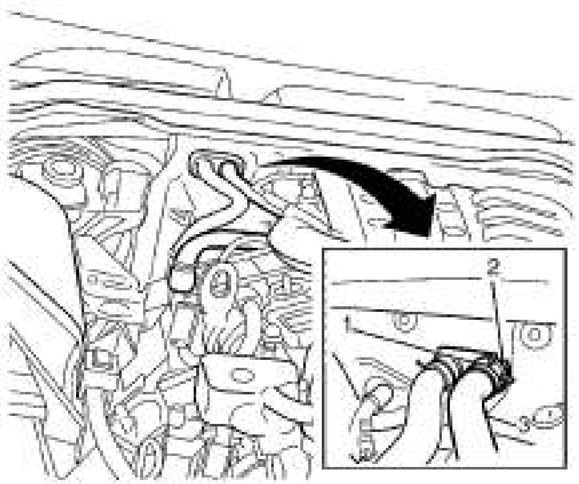
Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

1. Install the heater inlet hose.



Important: Listen for an audible click to confirm fitting.

2. Connect the heater outlet hose (1) to the heater outlet pipe (2).



3. Connect the heater outlet hose (3) to the heater core pipe (2).
4. Using J 38185 slide the heater outlet hose retaining clamp (1) back into the original position on the heater outlet hose (3).
5. Refit the right side engine cover. Refer to Engine Cover Replacement
6. Fill the cooling system. Refer to Cooling System Draining and Filling .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 2038170

HVAC Module Assembly Replacement (RHD)

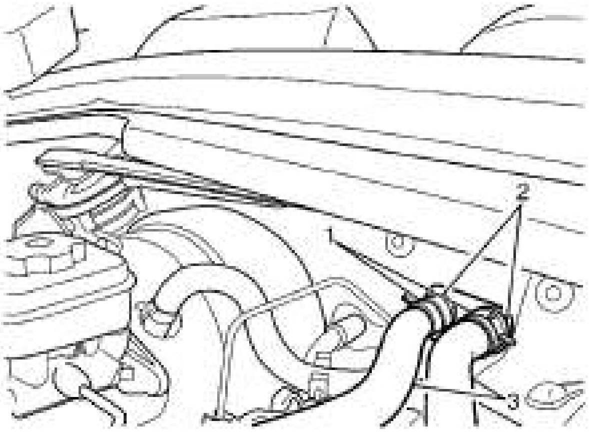
Tools Required

- J 38185 Hose Clamp Pliers
- J 39400 Halogen Leak Detector

Removal Procedure

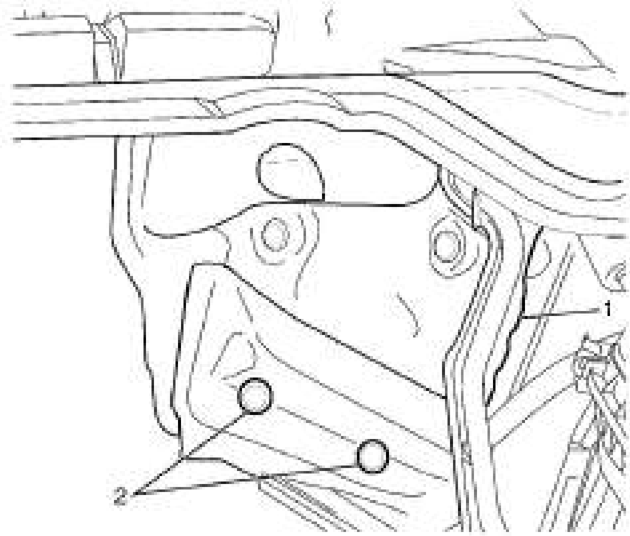
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L or Engine Cover Replacement Engine Mechanical - 6.0L
4. Drain the cooling system. Refer to Cooling System Draining and Filling.

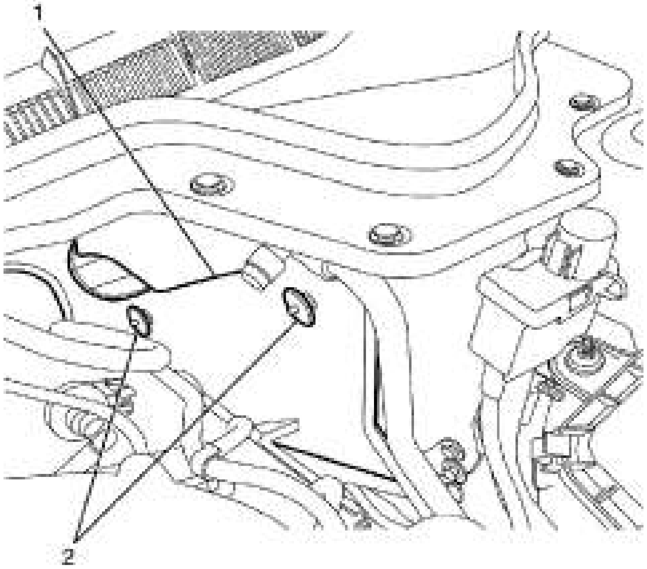


Important: Mark position of heater hoses (3) and heater hose retaining clamps (1) before removal to make sure of correct alignment during assembly.

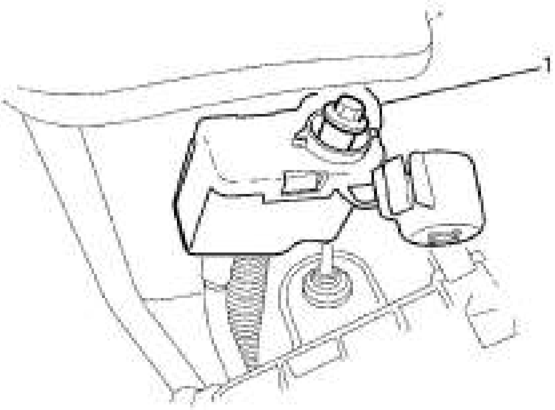
5. Using J 38185 compress the heater hose retaining clamps (1) and slide 50 mm (2 in) along the heater hose (3).
6. Remove the heater hoses (3) from the heater core pipes (2).



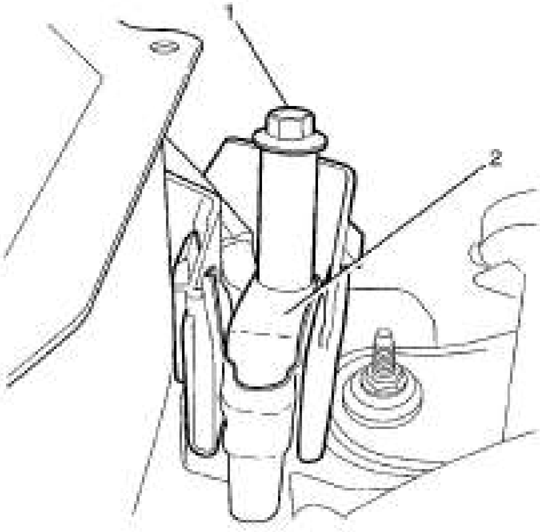
7. Remove the exhaust manifold heat shield to air box retaining clips (2).
8. Remove the exhaust manifold heat shield (1).



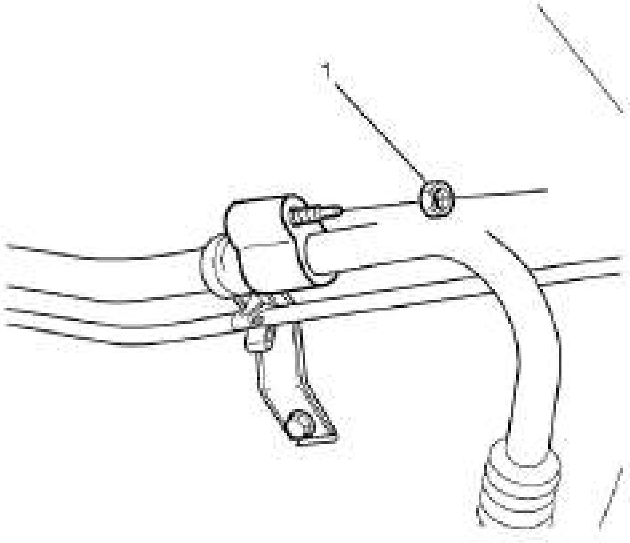
9. Remove the insulation panel to air box retaining clips (2).
10. Remove the insulation panel (1) from the engine compartment.



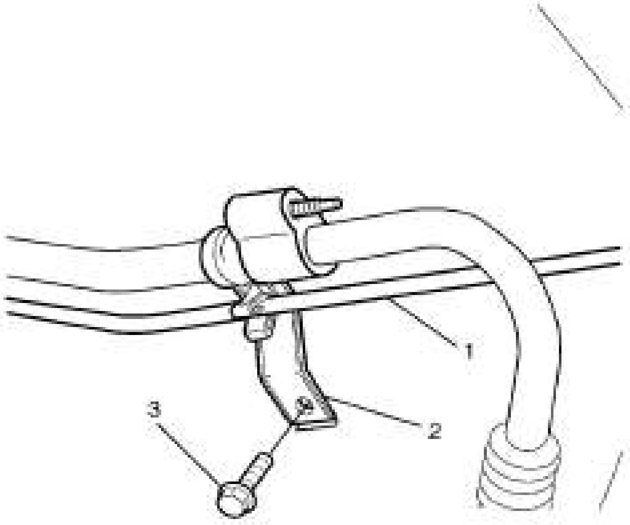
11. Remove the remote battery positive post cover (1).



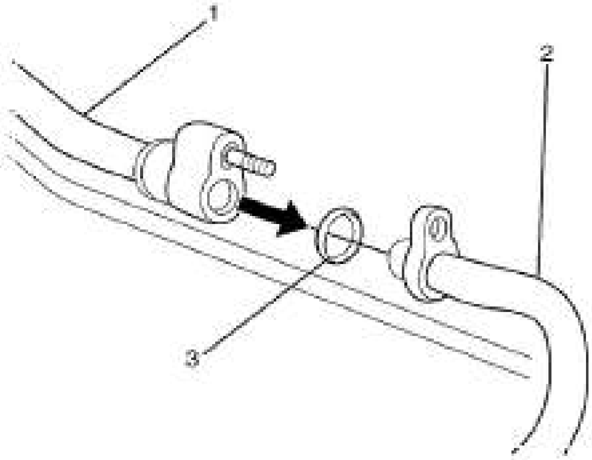
12. Remove the remote battery positive post to wiring harness retaining bolt (1).
13. Remove the starter motor power cable (2) and position aside.



14. Remove the suction pipe upper to suction pipe lower retaining nut (1).



15. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
16. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



17. Disconnect the suction pipe upper (1) from the suction pipe lower (2).

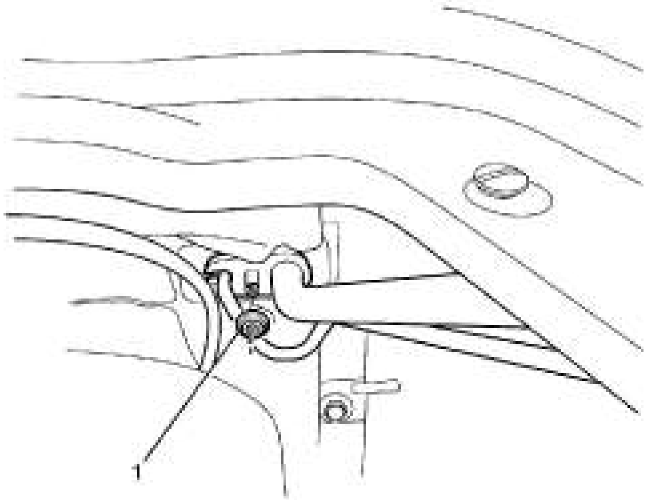
    Important: The sealing washer (3) is a single use item and must be discarded after use.

18. Remove the sealing washer (3). Refer to Sealing Washer Replacement .

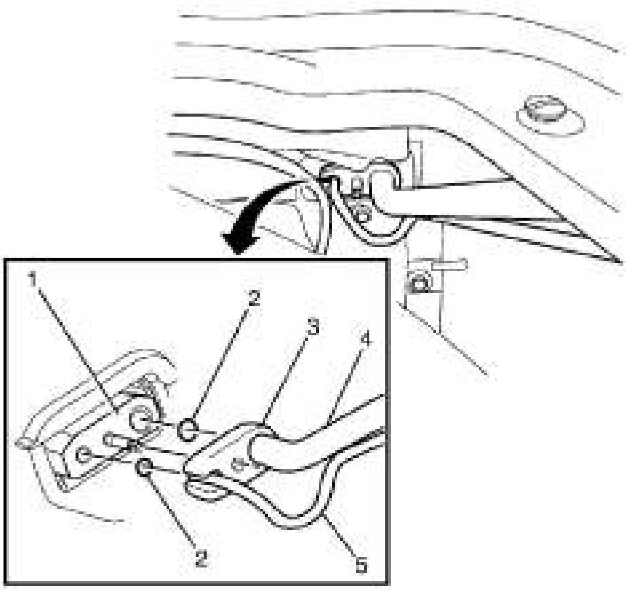
    Discard the sealing washer

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

19. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



20. Remove the suction pipe/liquid pipe pad to thermal expansion (TX) valve retaining nut (1).



21. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

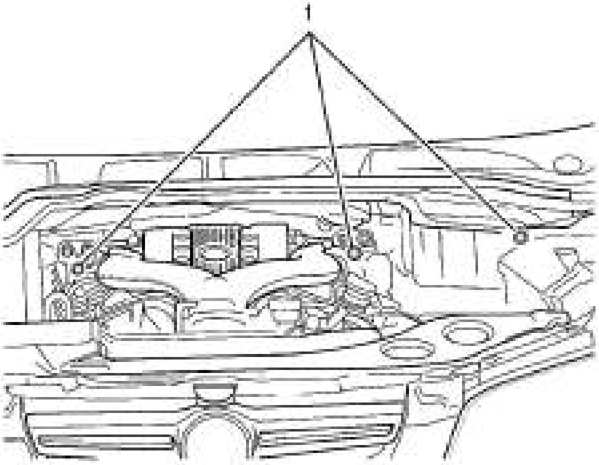
Important: The sealing washers (2) are a single use item and must be discarded after use.

22. Remove the sealing washers (2). Refer to Sealing Washer Replacement.

Discard the sealing washers

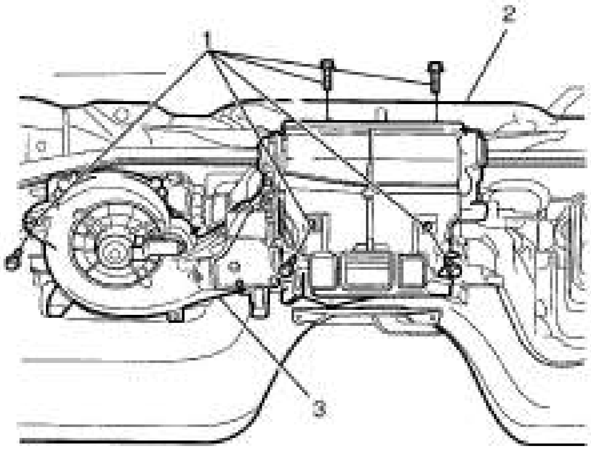
Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

23. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).



24. Remove the HVAC module assembly to bulkhead retaining bolts (1).

25. Remove the I/P centre support bracket. Refer to Instrument Panel Retainer Replacement.
26. Remove the I/P upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.

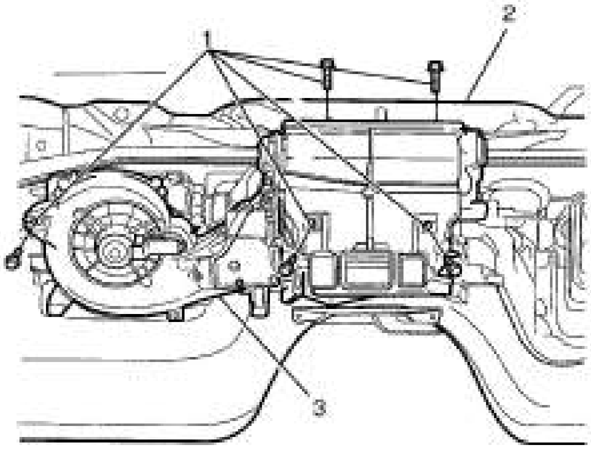


27. Remove the HVAC module assembly to vehicle body retaining screws (1).
28. Remove the I/P carrier. Refer to Instrument Panel Carrier Replacement.

Important: To remove the HVAC module assembly from the vehicle move the HVAC module assembly towards the back of the car off the drain assembly and downwards to clear locating pins from datum bracket.

29. Remove the HVAC module assembly (3) from the vehicle body (2).

Installation Procedure



Important: Make sure the HVAC module assembly (3) fits into the drain assembly

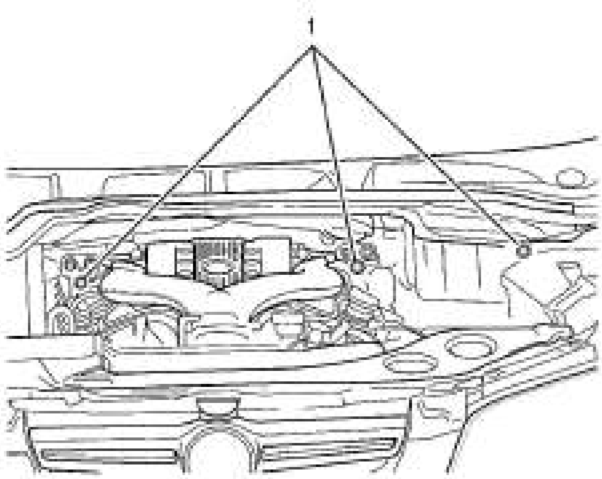
1. Install the HVAC module assembly to the vehicle (2).
2. Install the instrument panel (I/P) carrier. Refer to Instrument Panel Carrier Replacement.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the HVAC module assembly to I/P carrier retaining screws (1).

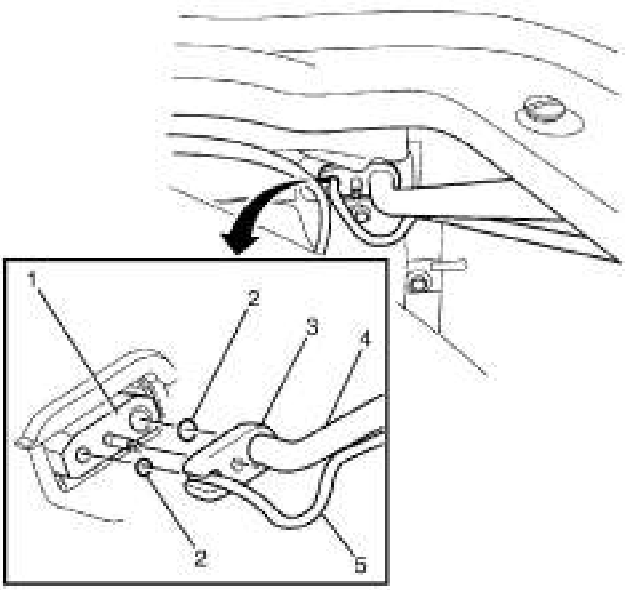
Tighten
Tighten the screws to 9 N·m.80 lb in.

4. Install the I/P upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.
5. Install the I/P retainer bracket. Refer to Instrument Panel Retainer Replacement .



6. Install the HVAC module assembly to bulkhead retaining bolts (1).

Tighten
Tighten the nuts to 7 N·m.62 lb in.

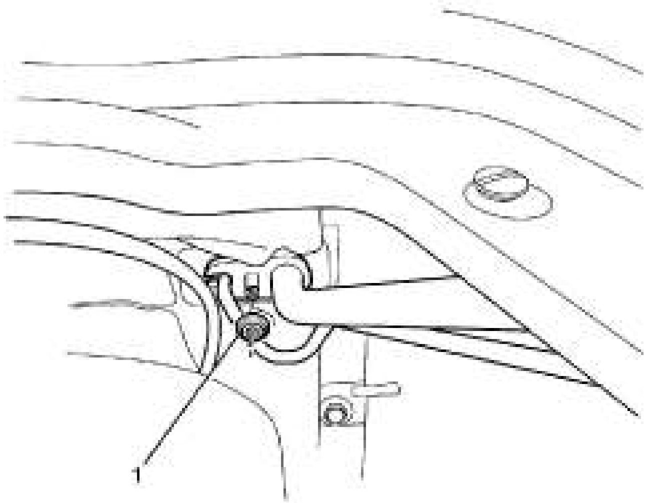


7. Remove the plugs or caps from the suction pipe (4), liquid pipe (5) and the thermal expansion (TX) valve (1).

Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

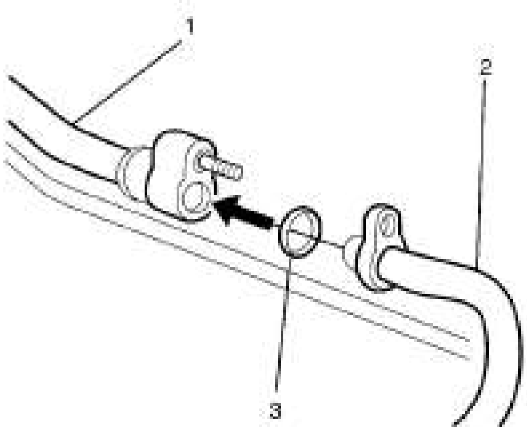
8. Install NEW sealing washers (2). Refer to Sealing Washer Replacement.
9. Connect the suction pipe/liquid pipe pad (3) to the TX Valve (1).

Notice: Refer to Fastener Notice in the Preface section.



10. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

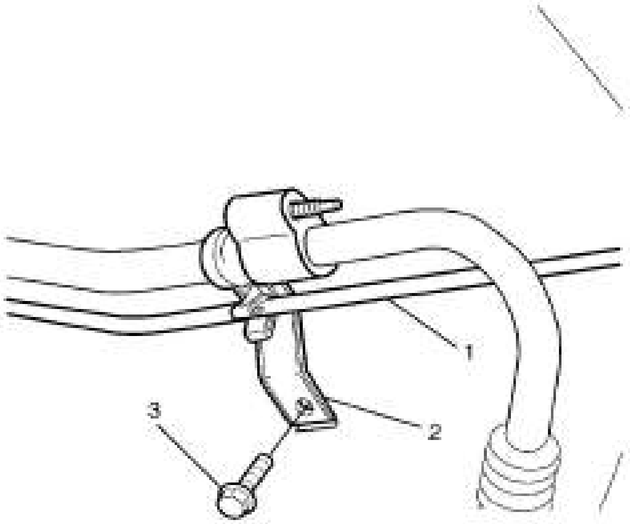
    Tighten
    Tighten the nut to 22 N·m(16 lb ft).



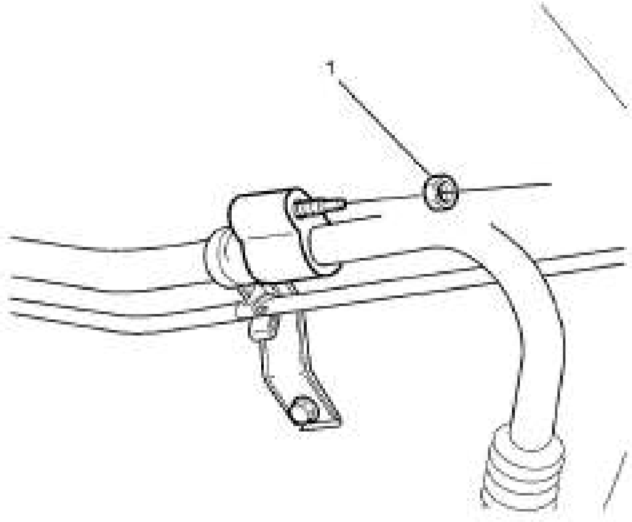
11. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

    Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

12. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.
13. Install the suction pipe upper (1) to the suction pipe lower (2).

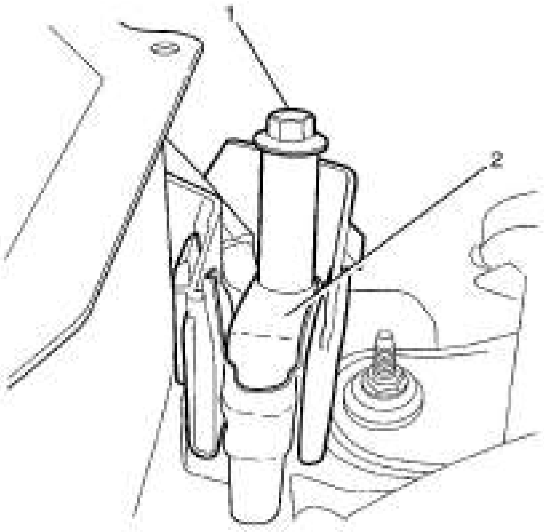


14. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).
15. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).



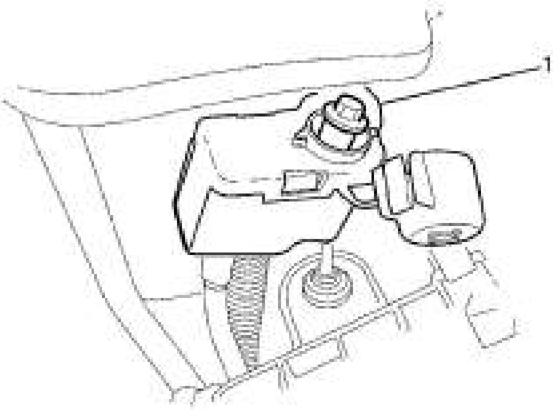
16. Install the suction pipe upper to suction pipe lower retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



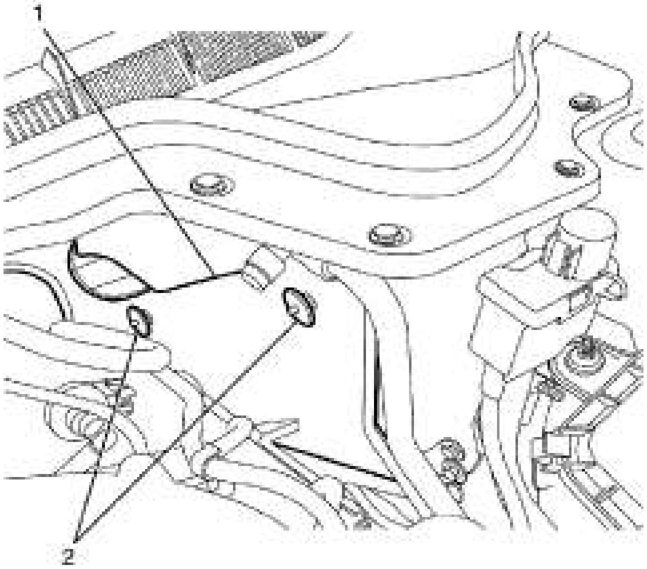
17. Install the starter motor positive cable (2) to the remote battery positive post.
18. Install the remote battery positive post to wiring harness retaining bolt (1).

Tighten
Tighten the bolt to 15 N·m (11 lb ft).

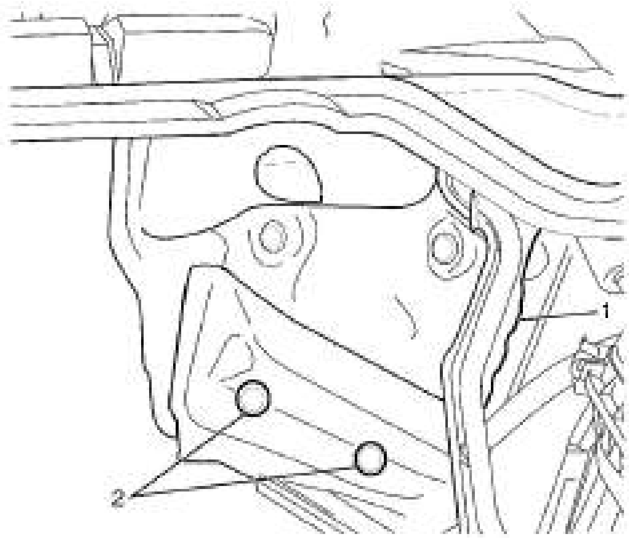


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

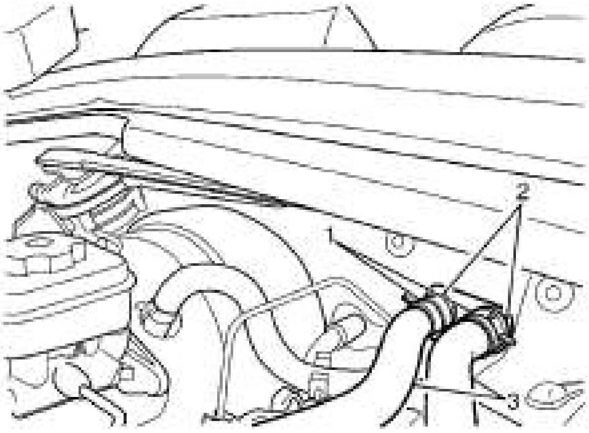
19. Install the remote battery positive post cover (1) to the remote battery positive post.



20. Install the insulation panel (1) to the left rear side engine compartment.
21. Install the insulation panel to air box retaining clips (2).



22. Install the exhaust manifold heat shield (1).
23. Install the exhaust manifold heat shield to air box retaining clips (2).

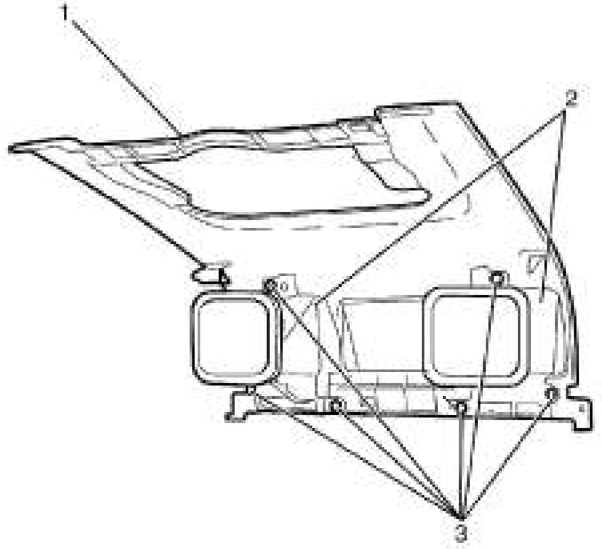


24. Connect the heater hoses (3) to the heater core pipes (2).
25. Using J 38185 , slide the heater hose retaining clamps (1) back into the original position on the heater hoses (3).
26. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
27. Fill the cooling system. Refer to Cooling System Draining and Filling .
28. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging .
29. Leak test the fittings of the component using J 39400 .
30. Install the engine cover. Refer to Engine Cover Replacement for 3.6L engine or Engine Cover Replacement for 6.0L engine.

Instrument Panel Center Air Outlet Deflector Replacement

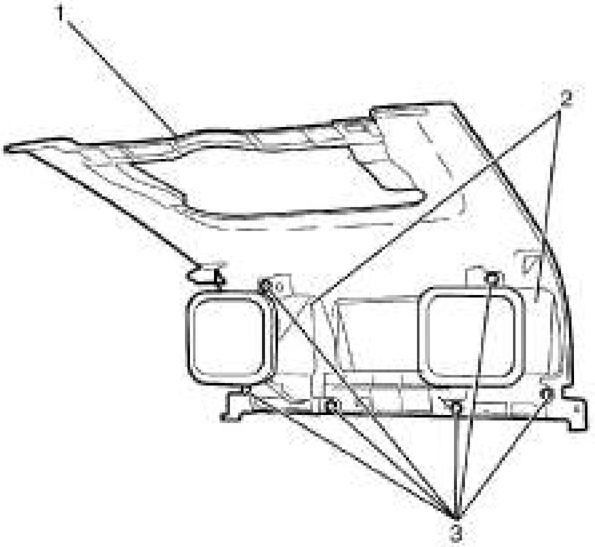
Removal Procedure (Type A)

1. Remove the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .
2. Remove the secondary information centre. Refer to Secondary Driver Information Display Replacement .



3. Remove the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).
4. Remove the I/P center air outlet deflector (2) from the I/P upper trim panel (1).

Installation Procedure (Type A)



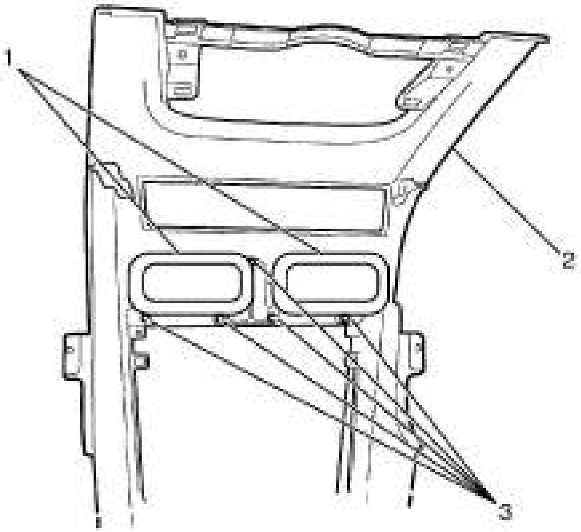
1. Install the I/P center air outlet deflector (2) to the I/P upper trim panel (1).
2. Install the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).

   Tighten
   Tighten the screws to 2 N·m (18 lb in.)

3. Install the secondary information centre. Refer to Secondary Driver Information Display Replacement .
4. Install the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .

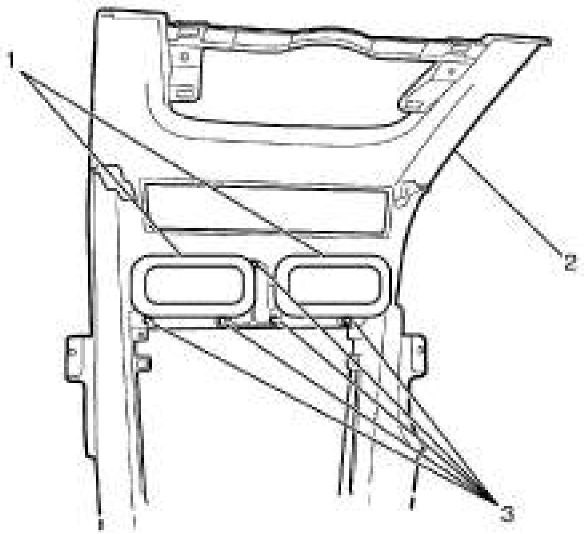
Removal Procedure (Type B)

1. Remove the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .
2. Remove the secondary information centre. Refer to Secondary Driver Information Display Replacement .



3. Remove the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).
4. Remove the I/P center air outlet deflector (1) from the I/P upper trim panel (2).

Installation Procedure (Type B)



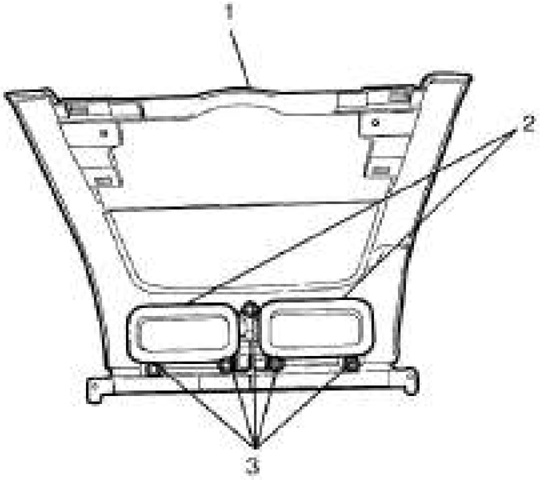
1. Install the I/P center air outlet deflector (1) to the I/P upper trim panel (2).
2. Install the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).

   Tighten
   Tighten the screws to 2 N·m (18 lb in.)

3. Install the secondary information centre. Refer to Secondary Driver Information Display Replacement .
4. Install the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .

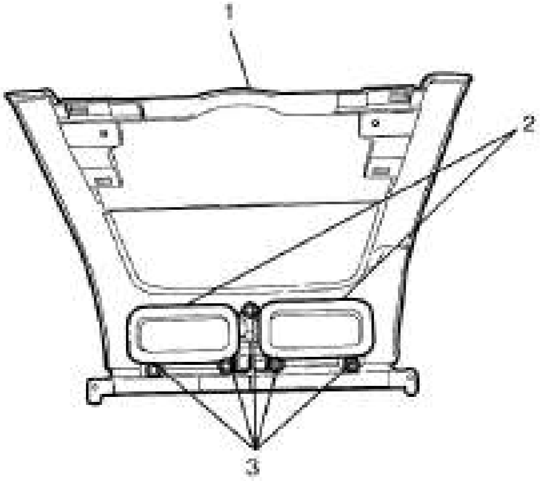
Removal Procedure (Type C)

1. Remove the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .



2. Remove the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).
3. Remove the I/P center air outlet deflector (2) from the I/P upper trim panel (1).

Installation Procedure (Type C)



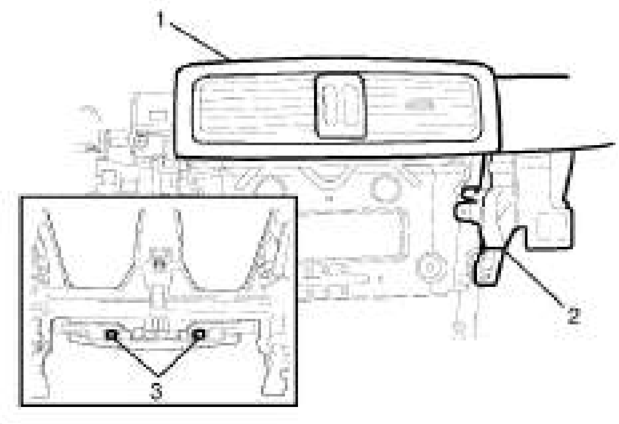
1. Install the I/P center air outlet deflector (2) to the I/P upper trim panel (1).
2. Install the I/P center air outlet deflector to I/P upper trim panel retaining screws (3).

   Tighten
   Tighten the screws to 2 N·m (18 lb in.)

3. Install the I/P upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .

Removal Procedure (Type D)

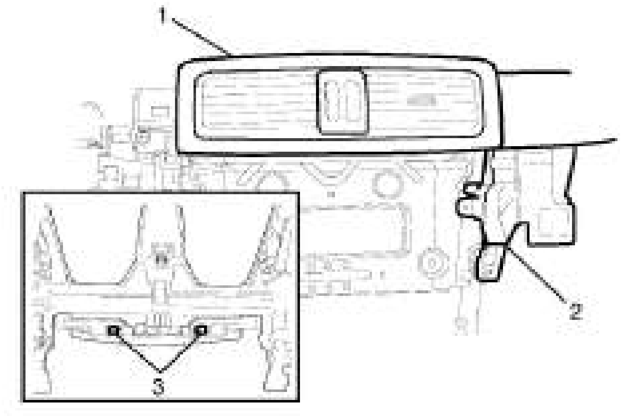
1. Remove the console centre trim plate. Refer to Console Trim Plate Replacement .
2. Remove the instrument panel centre trim plate. Refer to Instrument Panel Center Trim Panel Replacement .
3. Remove the infotainment unit. Refer to Radio Replacement .



Important: Depress the I/P center air outlet deflector to I/P upper trim pad retaining clips (3) to disengage the I/P center air outlet deflector (1) from the I/P upper trim pad (2).

4. Disengage the I/P center air outlet deflector to I/P upper trim pad retaining clips (3).
5. Remove the I/P center air outlet deflector (1) from the I/P upper trim pad (2).

Installation Procedure (Type D)



Important: Make sure the I/P center air outlet deflector to I/P upper trim pad retaining clips (3) are engaged to avoid an induced rattle condition.

1. Install the I/P center air outlet deflector (1) to the I/P upper trim pad (2).
2. Install the infotainment unit. Refer to Radio Replacement .
3. Install the instrument panel centre trim plate. Refer to Instrument Panel Center Trim Panel Replacement .
4. Install the console centre trim plate. Refer to Console Trim Plate Replacement .

Instrument Panel Outer Air Outlet Deflector Replacement - Left Side

Removal Procedure

Important: The deflector vent is part of the door trim, if it requires replacement the whole door trim is to be replaced.

Refer to Front Side Door Trim Panel Replacement.

Instrument Panel Outer Air Outlet Deflector Replacement - Right Side

Removal Procedure

Important: The deflector vent is part of the door trim, if it requires replacement the whole door trim is to be replaced.

Refer to Front Side Door Trim Panel Replacement.

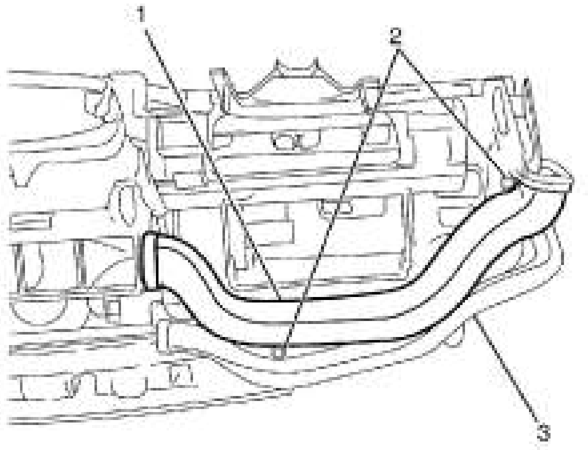
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | Document ID: 1994739

Instrument Panel Outer Air Outlet Upper Duct Replacement - Left Side

Removal Procedure

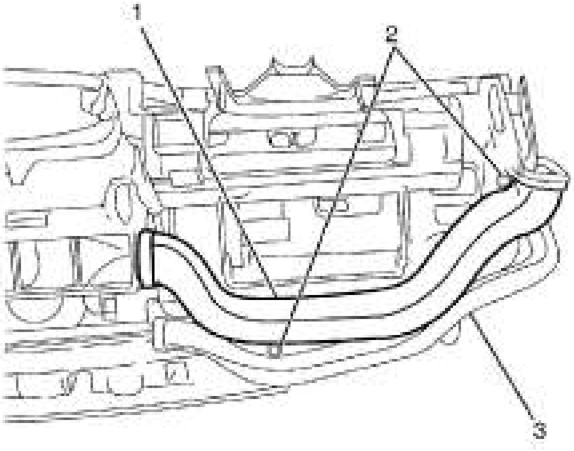
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the instrument panel (I/P) upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.



2. Remove the air outlet duct to I/P upper trim pad retaining screws (2).
3. Remove the air outlet duct (1) from the I/P upper trim pad (3).

Installation Procedure



1. Install the air outlet duct (1) to the instrument panel (I/P) upper trim pad (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the air outlet duct to I/P upper trim pad retaining screws (2).

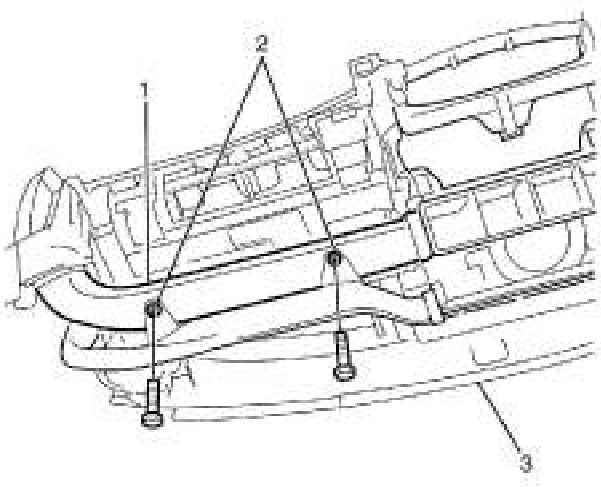
   Tighten
   Tighten the screws to 2 N·m(18 lb in).

3. Install the I/P upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.

Instrument Panel Outer Air Outlet Upper Duct Replacement - Right Side

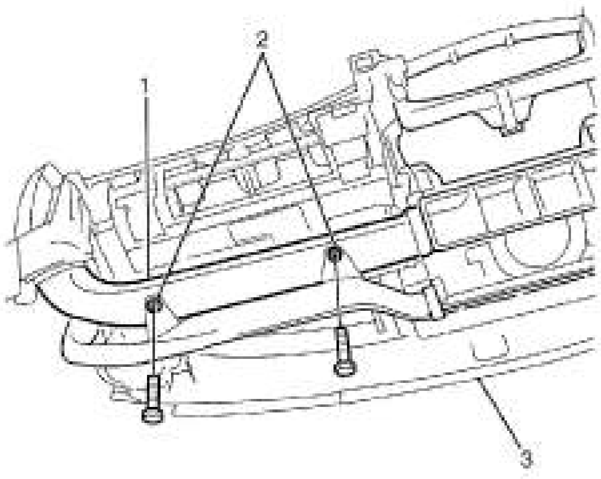
Removal Procedure

1. Remove the instrument panel (I/P) upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.



2. Remove the air outlet duct to I/P upper trim pad retaining screws (2).
3. Remove the air outlet duct (1) from the I/P upper trim pad (3).

Installation Procedure



1. Install the air outlet duct (1) to the instrument panel (I/P) upper trim pad (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the air outlet duct to I/P upper trim pad retaining screws (2).

   Tighten
   Tighten the screws to 2 N·m(18lb in).

3. Install the I/P upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement.

Liquid Line Replacement (3.6L Engine)

Tools Required

J 39400 Halogen Leak Detector

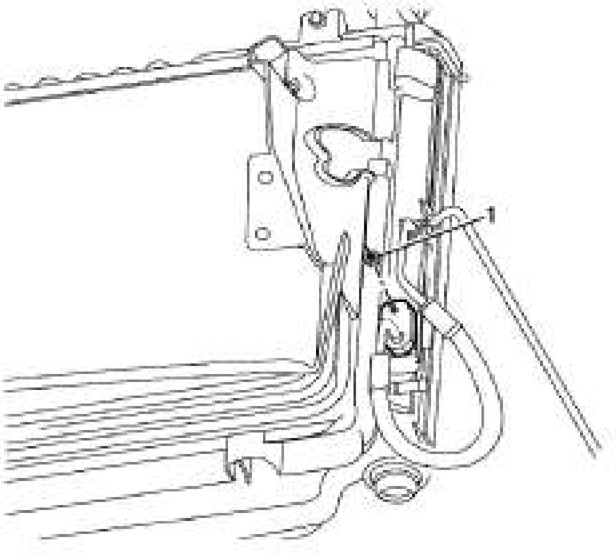
Removal Procedure

1. Recover the refrigerant Refer to Refrigerant Recovery and Recharging .
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove windscreen wiper arms. Refer to Windshield Wiper Arm Replacement .
4. Remove the air inlet grill panel. Refer to Air Inlet Grille Panel Replacement .
5. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement .
6. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement

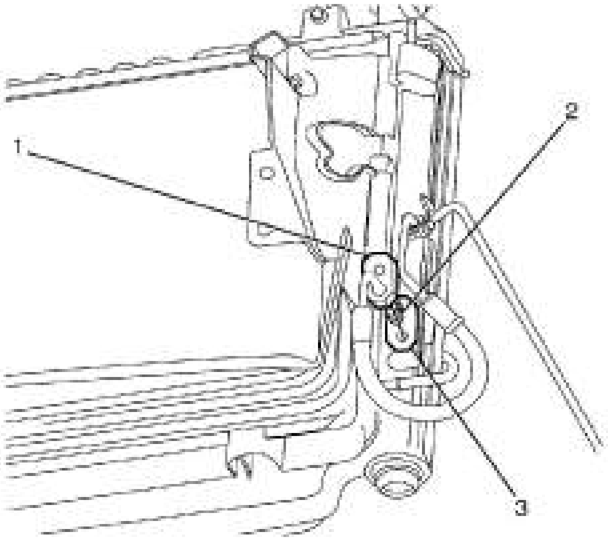
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

7. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
8. Remove the front air deflector. Refer to Front Air Deflector Replacement .



9. Remove the liquid pipe to the condenser port retaining nut (1).
10. Lower the vehicle.



11. Disconnect the liquid pipe (1) from the condenser port (3).

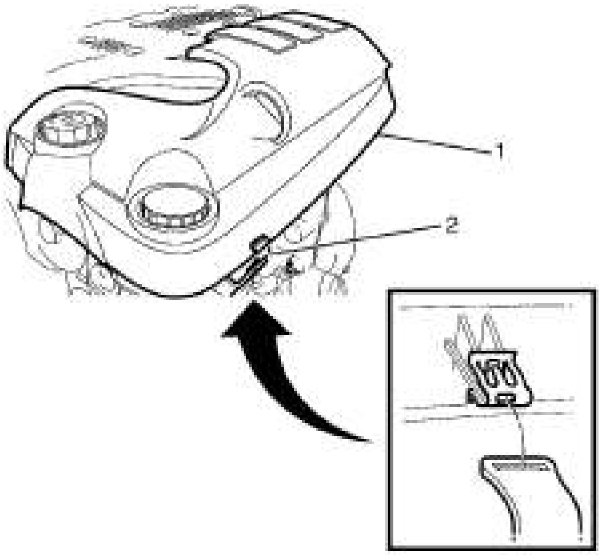
    Important: The sealing washer (2) is a single use item and must be discarded after use.

12. Remove the sealing washer (2). Refer to Sealing Washer Replacement .

    Discard the sealing washer

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

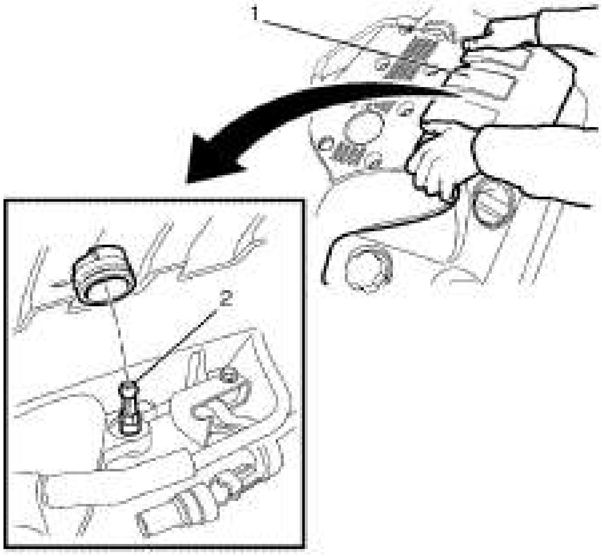
13. Cap or plug the liquid pipe (1) and the condenser port (3).
14. Remove the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement



Important: The left engine cover has one front and one rear outer retaining clip.

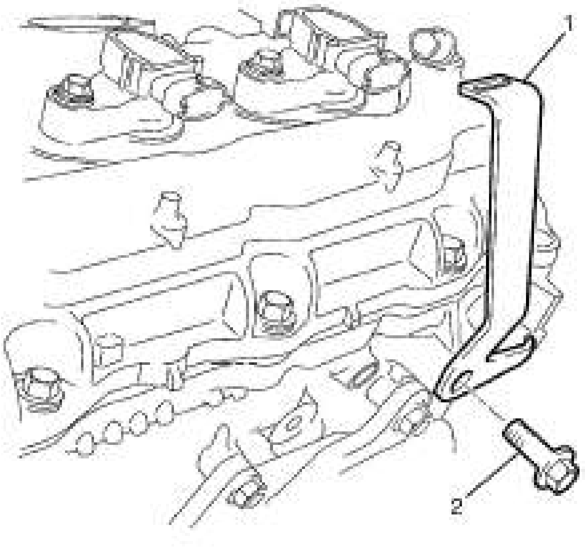
Important: Grasp and pry the left engine cover (1) upwards to detach the left engine cover (1) from the outer retaining clip (2).

15. Detach the left engine cover (1) from the outer retaining clip (2).

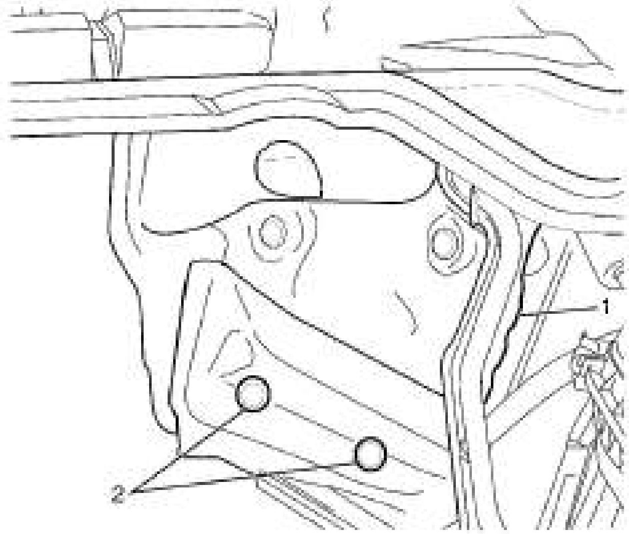


Important: Disengage the left engine cover (1) from the ball stud (2) by pulling up firmly on the rear and front of the left engine cover (1).

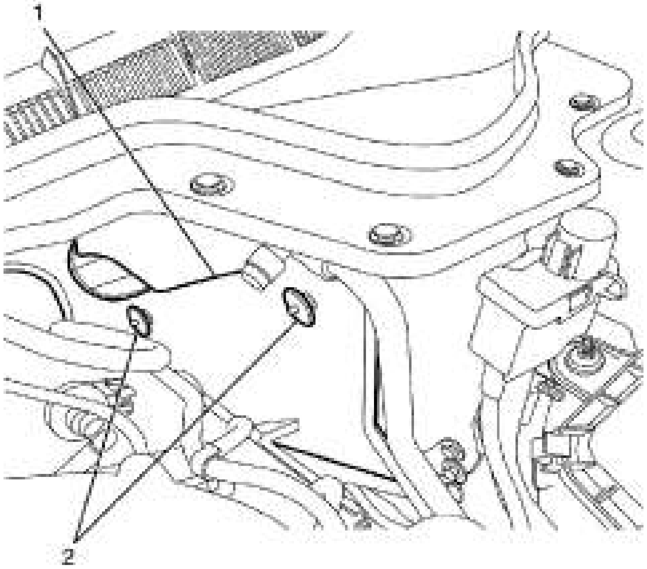
16. Detach the left engine cover (1) from the ball stud (2).
17. Remove the left engine cover (1).



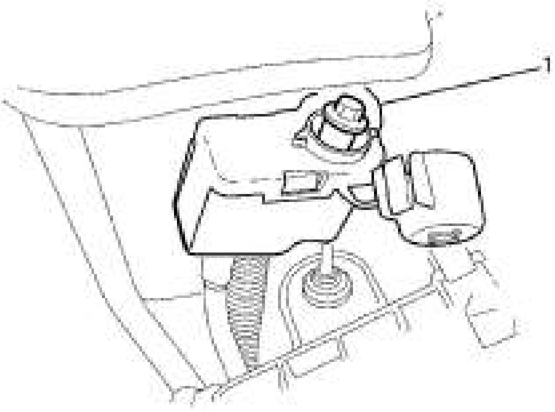
18. Remove the left engine cover mounting bracket to cylinder head retaining bolt (2).
19. Remove the left engine cover mounting bracket (1) from the cylinder head.



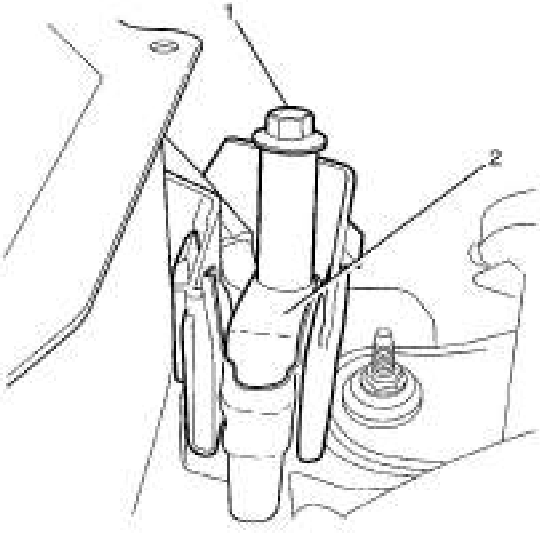
20. Remove the exhaust manifold heat shield to air box retaining clips (2).
21. Remove the exhaust manifold heat shield (1).



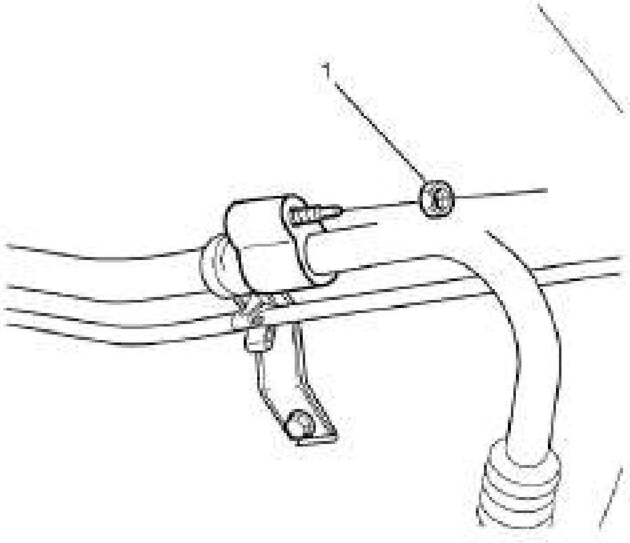
22. Remove the insulation panel to air box retaining clips (2).
23. Remove the insulation panel (1) from the engine compartment.



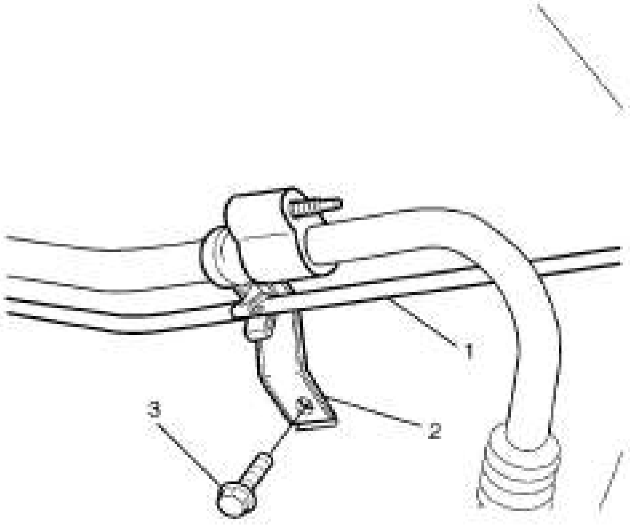
24. Remove the remote battery positive post cover (1).



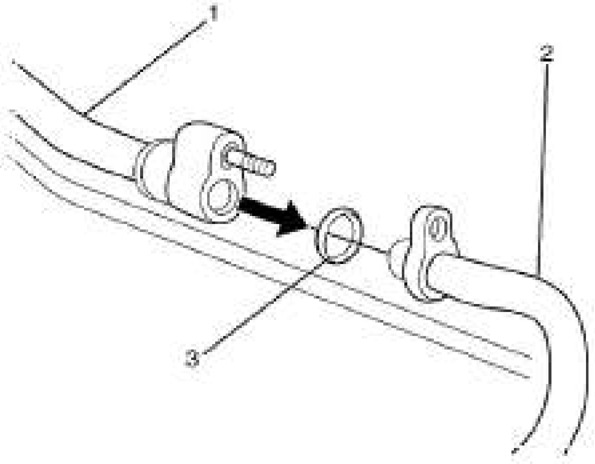
25. Remove the remote battery positive post to wiring harness retaining bolt (1).
26. Remove the starter motor power cable (2) and position aside.



27. Remove the suction pipe upper to suction pipe lower retaining nut (1).



28. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
29. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



30. Disconnect the suction pipe upper (1) from suction pipe lower (2).

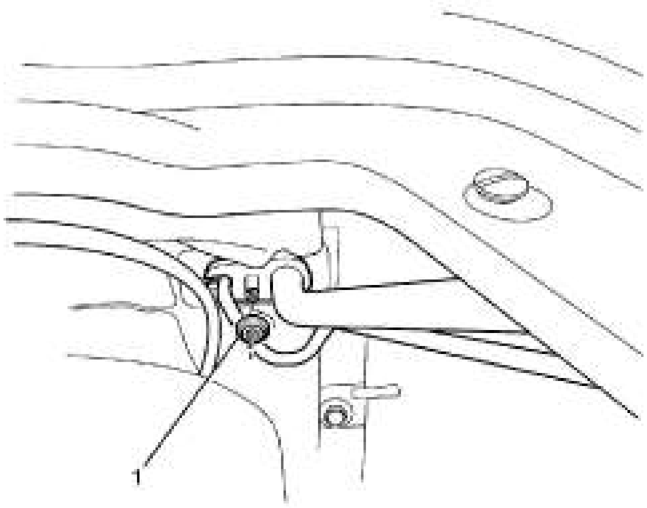
    Important: The sealing washer (3) is a single use item and must be discarded after use.

31. Remove the sealing washer (3). Refer to Sealing Washer Replacement .

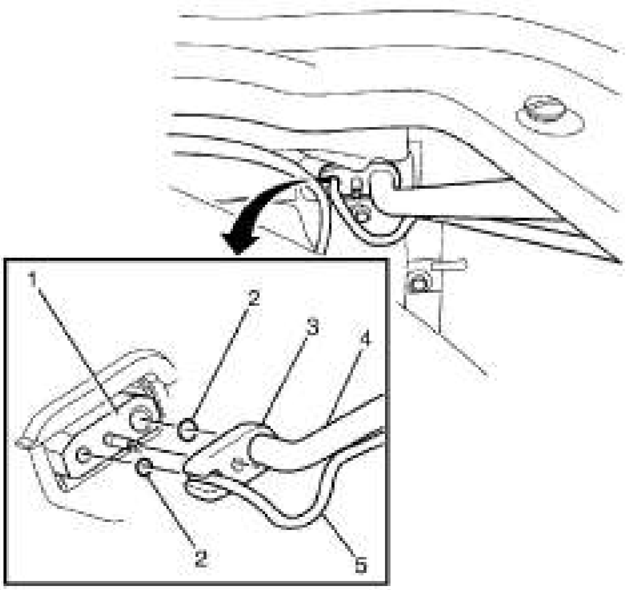
    Discard the sealing washer

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

32. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



33. Remove the suction pipe/liquid pipe pad to TX valve retaining nut (1).



34. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

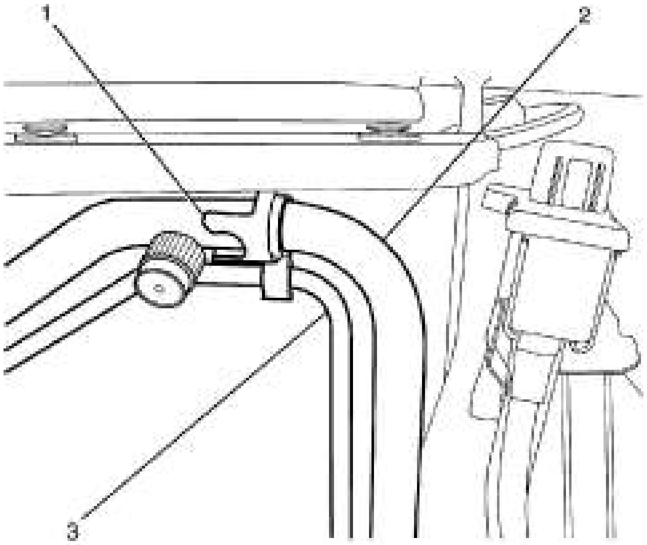
    Important: The sealing washers (2) are a single use item and must be discarded after use.

35. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

    Discard the sealing washers

    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

36. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).
37. Remove the liquid pipe (5) from the suction pipe/liquid pipe pad (3).

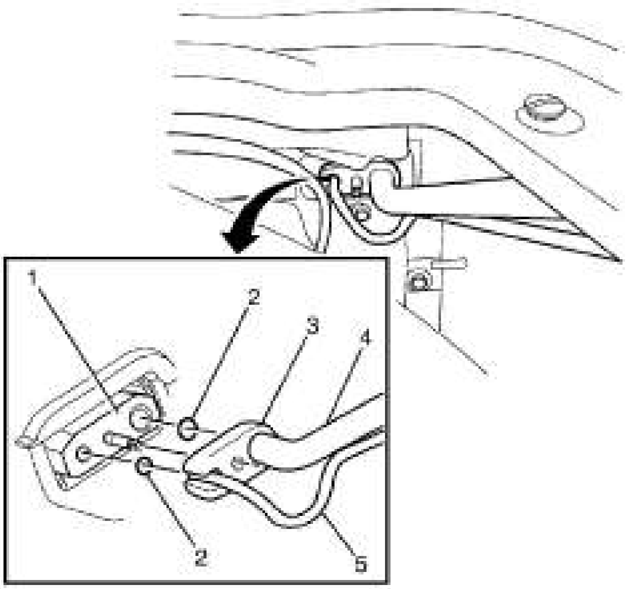


38. Detach the liquid pipe (3) and the suction pipe (2) from the suction pipe/liquid pipe retaining clip (1).

    Important: Have an assistant ensure that the liquid tube flexible hose at the condenser end clears all the vehicle body work and condenser on removal from the engine compartment.

39. Remove the liquid pipe (3) from the engine compartment.

Installation Procedure

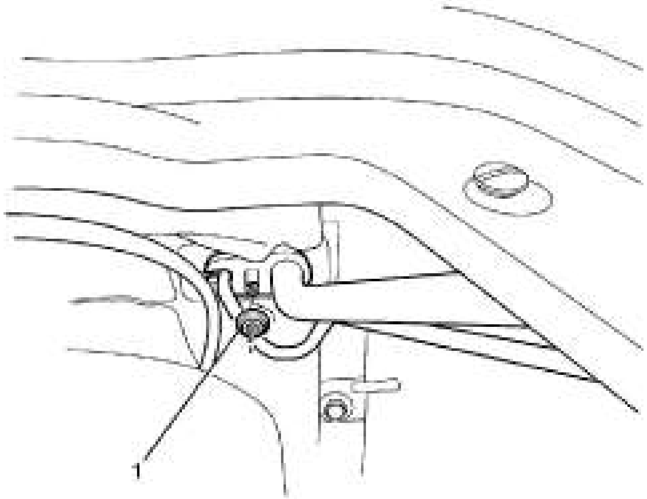


1. Install the liquid pipe (5) to the suction pipe/liquid pipe pad (3).
2. Remove the plugs or caps from the suction pipe (4), liquid pipe (5) and the TX valve (1).

    Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

3. Install NEW sealing washers (2). Refer to Sealing Washer Replacement .
4. Position the suction pipe/liquid pipe pad (3) to the TX Valve (1).

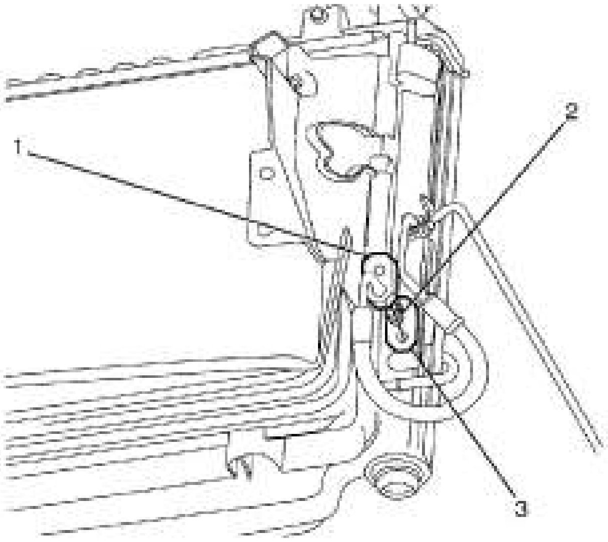
    Notice: Refer to Fastener Notice in the Preface section.



5. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).

6. Raise the vehicle.

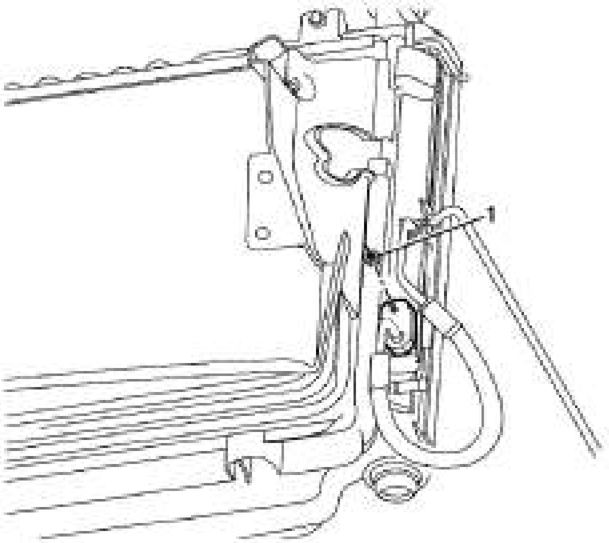


7. Remove the plugs or caps from the suction pipe liquid pipe (1) and the condenser port (3).

   Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

8. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement .

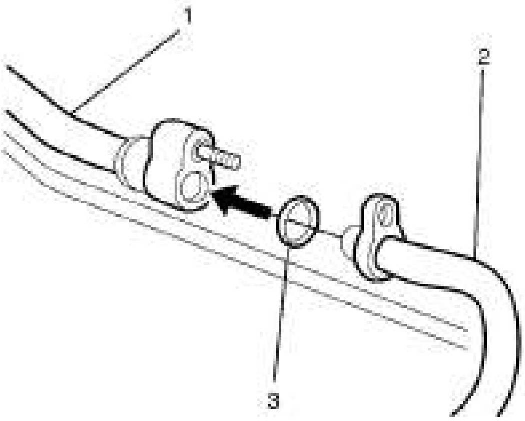
9. Connect the liquid pipe (1) to the condenser port (3).



10. Install the liquid pipe to condenser port retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m(16 lb ft).

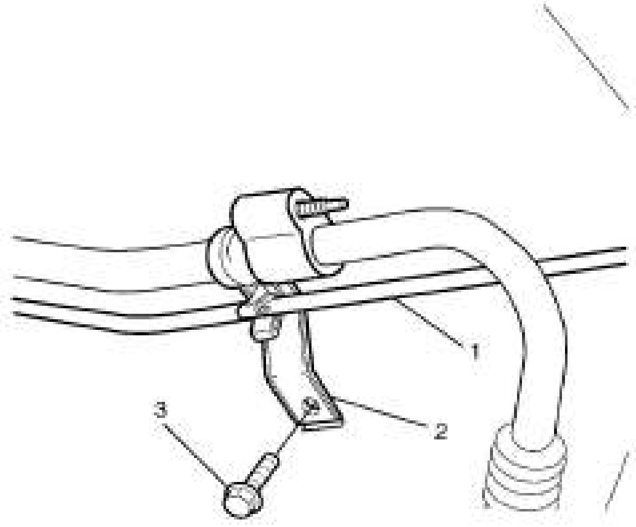
11. Install the air deflector front. Refer to Front Air Deflector Replacement .



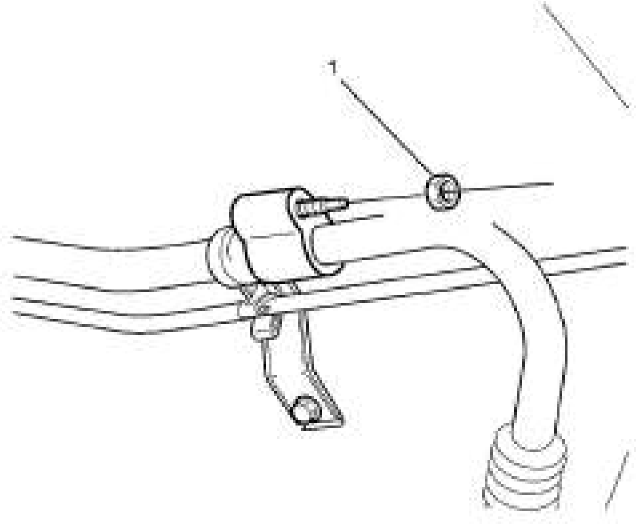
12. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

    Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

13. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement .
14. Install the suction pipe upper (1) to the suction pipe lower (2).

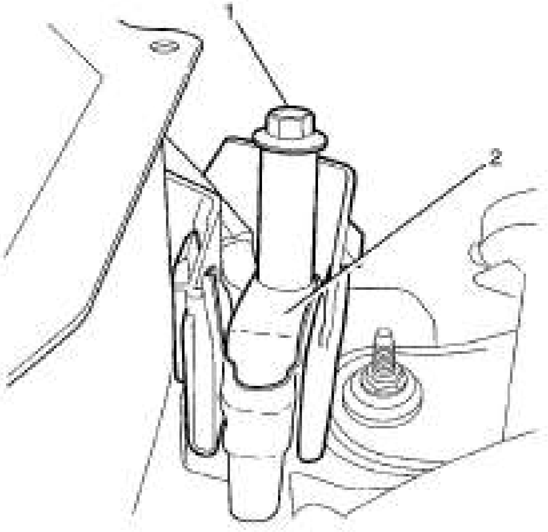


15. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).
16. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).



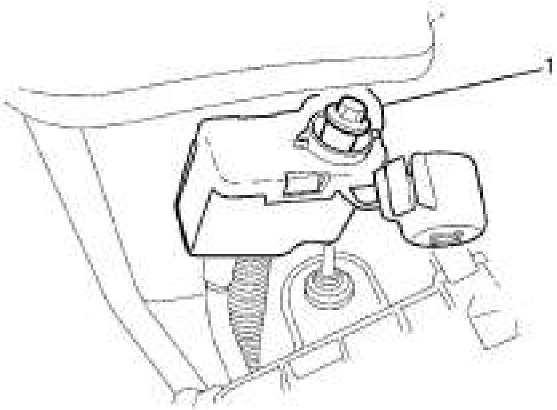
17. Install the suction pipe upper to suction pipe lower retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).



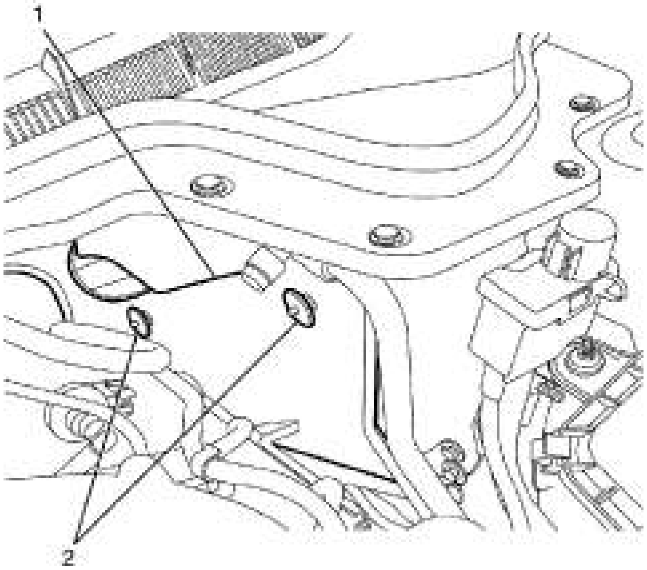
18. Install the starter motor positive cable (2) to the remote battery positive post.
19. Install the remote battery positive post to wiring harness retaining bolt (1).

    Tighten
    Tighten the bolt to 15 N·m (11 lb ft).

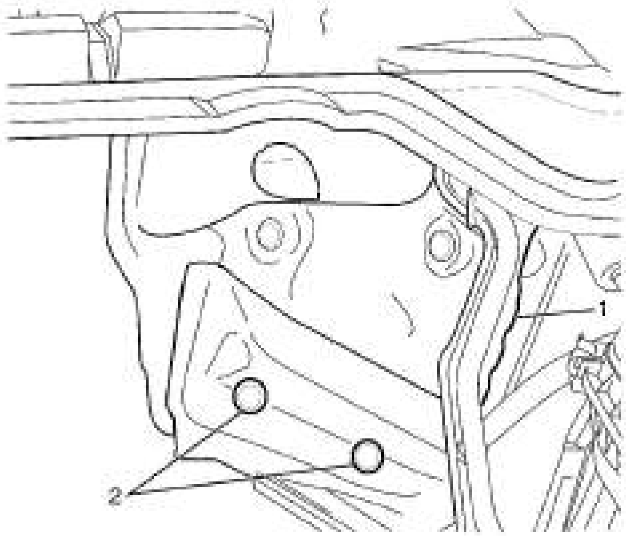


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

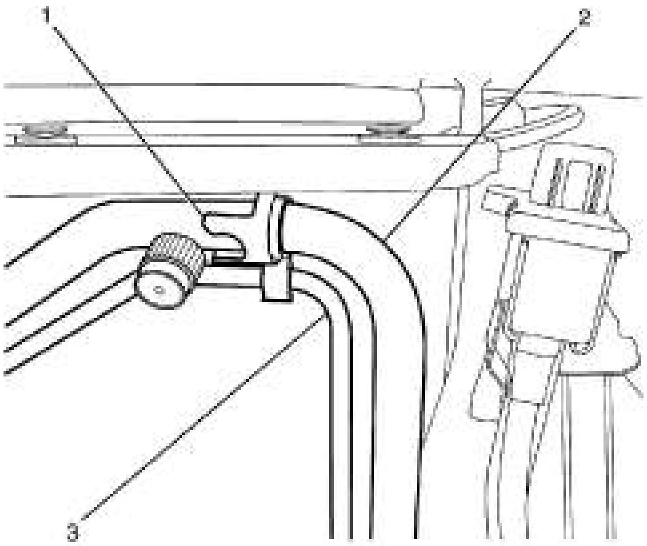
20. Install the remote battery positive post cover (1) to the remote battery positive post.



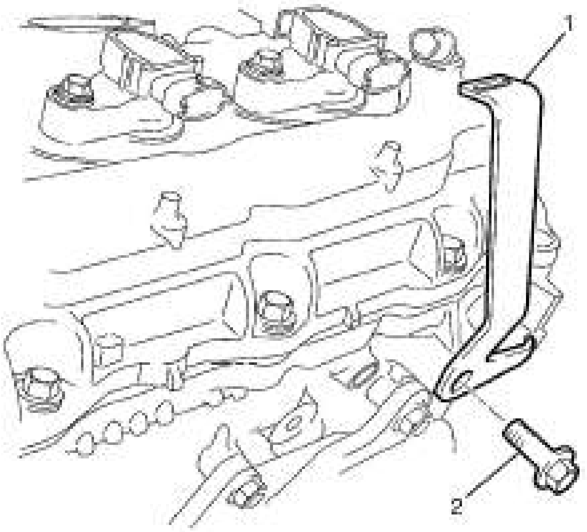
21. Install the insulation panel (1) to the left rear side engine compartment.
22. Install the insulation panel to air box retaining clips (2).



23. Install the exhaust manifold heat shield (1).
24. Install the exhaust manifold heat shield to air box retaining clips (2).

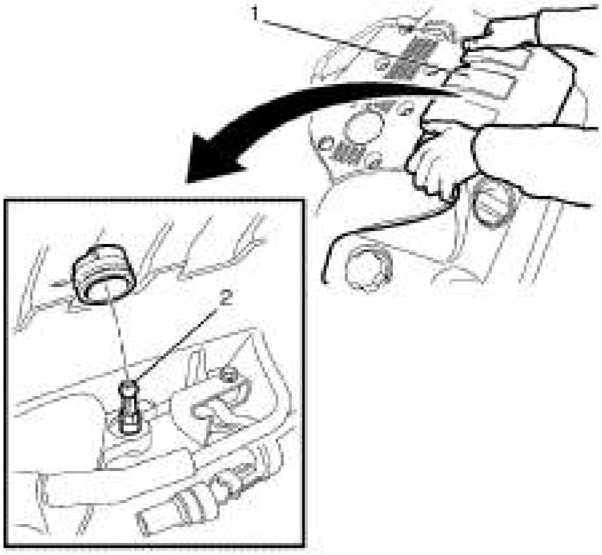


25. Attach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).



26. Install the left engine cover mounting bracket (1)
27. Install the left engine cover mounting bracket to cylinder head retaining bolt (2).

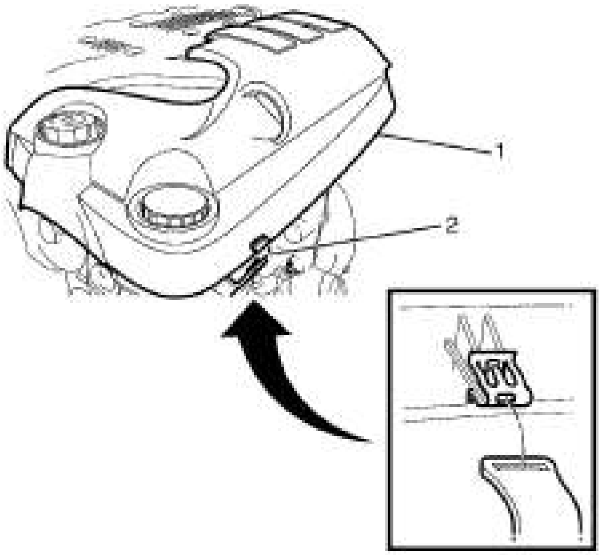
Tighten
Tighten the bolt to 35 N·m (26 lb in).



28. Position the left engine cover (1) over the intake manifold so the grommet is aligned with the ball stud (2).

Important: Press the left engine cover (1) down firmly near the ball stud to attach the left engine cover (1) to the ball stud (2).

29. Attach the left engine cover (1) to the ball stud (2).



Important: The left engine cover has one front and one rear outer retaining clip.

Important: Press the left engine cover (1) down firmly near the outer retaining clips to attach the left engine cover (1) to the outer retaining clip (2).

30. Attach the left engine cover (1) to the outer retaining clip (2).
31. Install the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement
32. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement .
33. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
34. Install the plenum chamber cover panel. Refer to Air Inlet Grille Panel Replacement .
35. Install the windscreen wiper arms. Refer to Windshield Wiper Arm Replacement .
36. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
37. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging .
38. Leak test the fittings of the component using J 39400 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2038172**

Liquid Line Replacement (6.0L Engine)

Tools Required

J 39400 Halogen Leak Detector

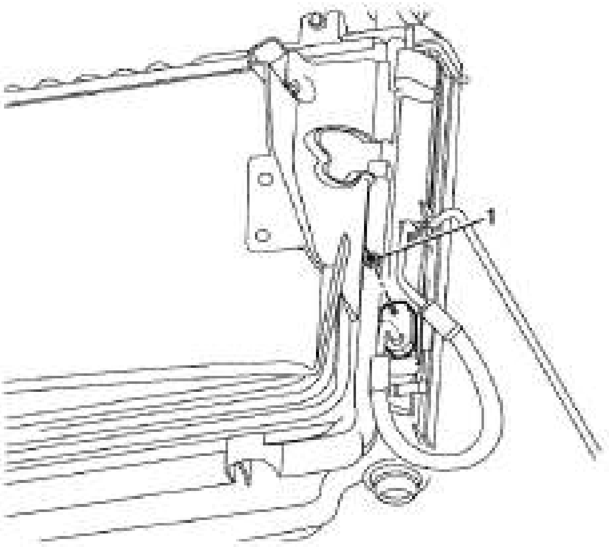
Removal Procedure

1. Recover the refrigerant Refer to Refrigerant Recovery and Recharging.
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove windscreen wiper arms. Refer to Windshield Wiper Arm Replacement.
4. Remove the air inlet grill panel. Refer to Air Inlet Grille Panel Replacement.
5. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement.
6. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
7. Remove the engine cover. Refer to Engine Cover Replacement.

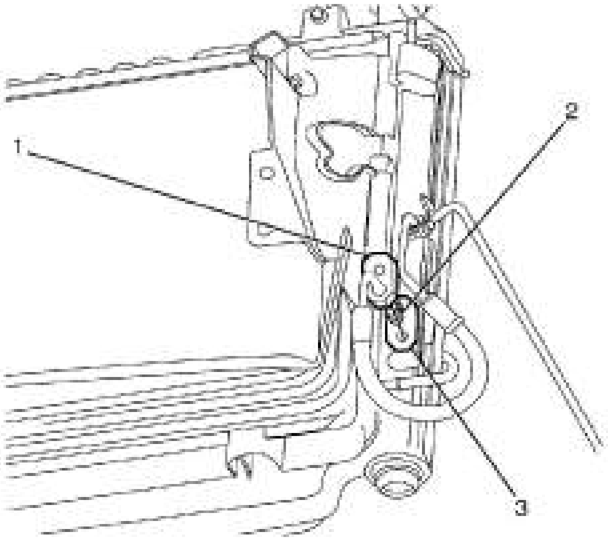
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

8. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
9. Remove the front air deflector. Refer to Front Air Deflector Replacement.



10. Remove the liquid pipe to the condenser port retaining nut (1).
11. Lower the vehicle.



12. Disconnect the liquid pipe (1) from the condenser port (3).

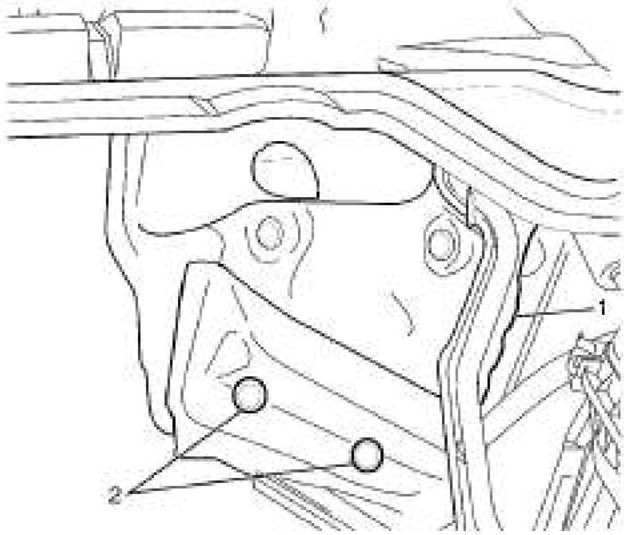
    Important: The sealing washer (2) is a single use item and must be discarded after use.

13. Remove the sealing washer (2). Refer to Sealing Washer Replacement.

    Discard the sealing washer

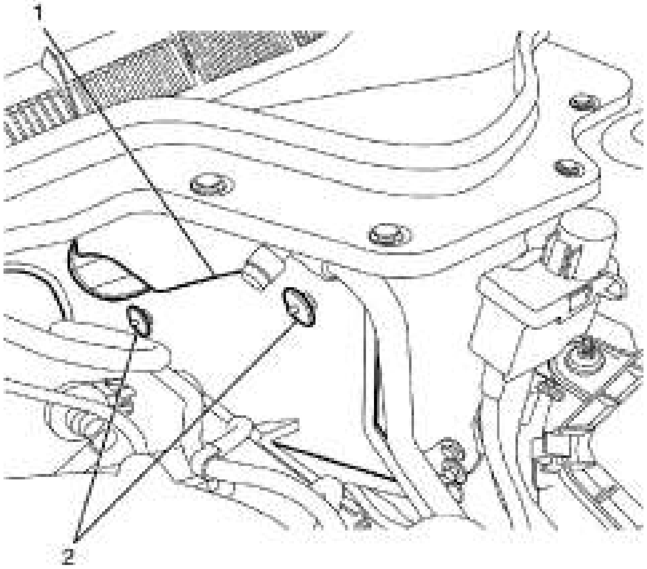
    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

14. Cap or plug the liquid pipe (1) and the condenser port (3).

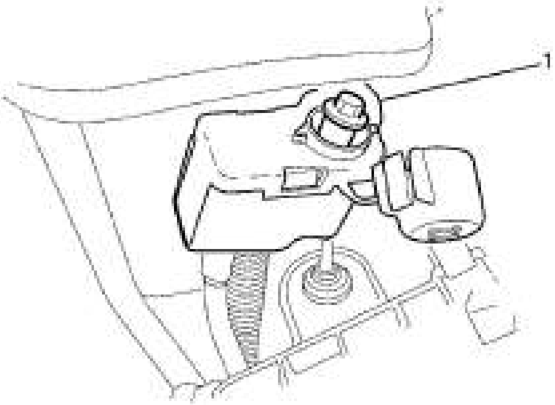


15. Remove the exhaust manifold heat shield to air box retaining clips (2).

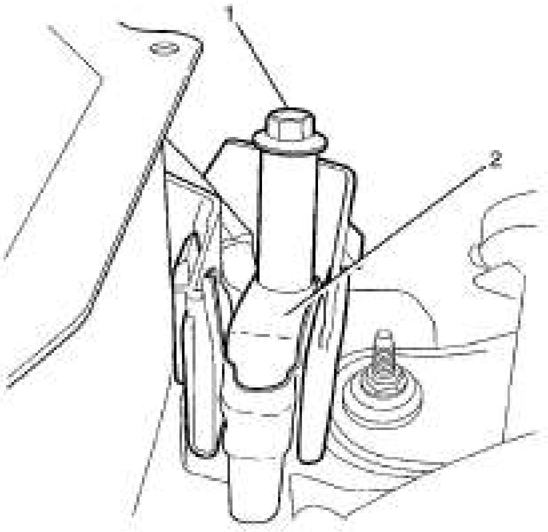
16. Remove the exhaust manifold heat shield (1).



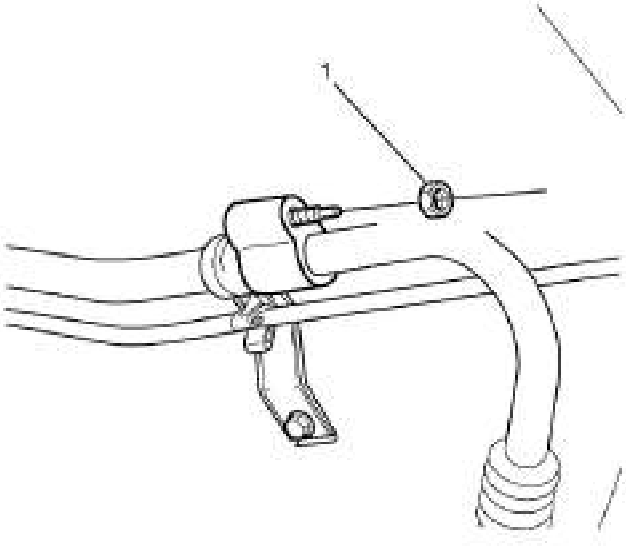
17. Remove the insulation panel to air box retaining clips (2).
18. Remove the insulation panel (1) from the engine compartment.



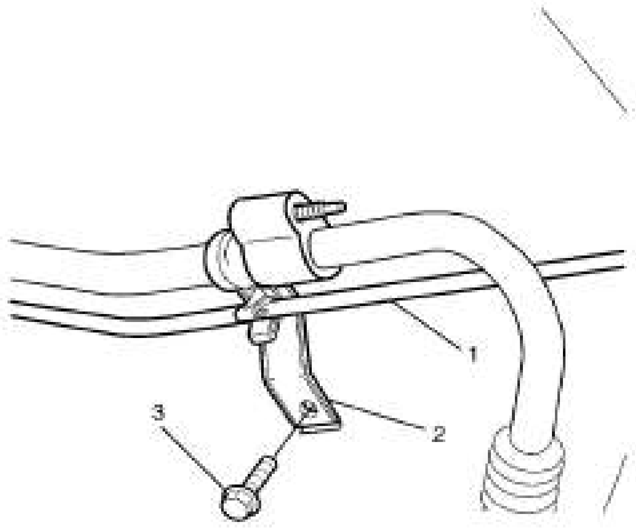
19. Remove the remote battery positive post cover (1).



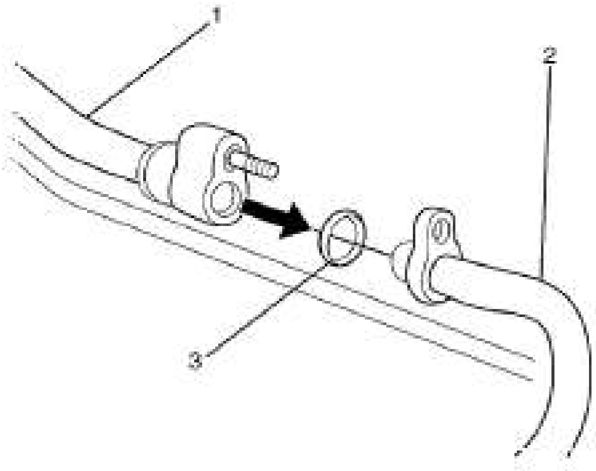
20. Remove the remote battery positive post to wiring harness retaining bolt (1).
21. Remove the starter motor power cable (2) and position aside.



22. Remove the suction pipe upper to suction pipe lower retaining nut (1).



23. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
24. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



25. Disconnect the suction pipe upper (1) from suction pipe lower (2).

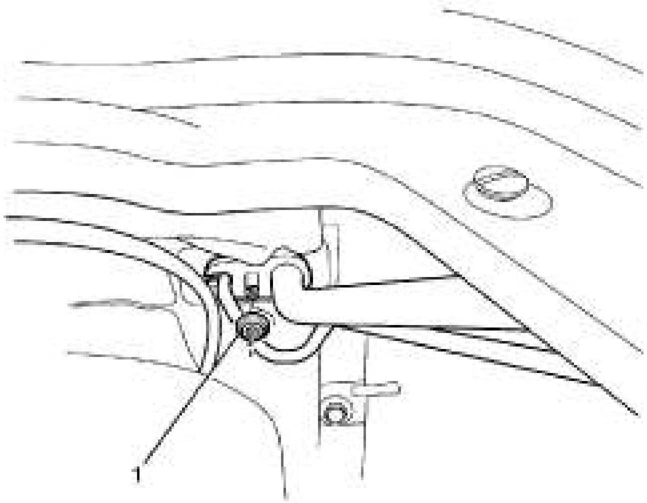
Important: The sealing washer (3) is a single use item and must be discarded after use.

26. Remove the sealing washer (3). Refer to Sealing Washer Replacement.

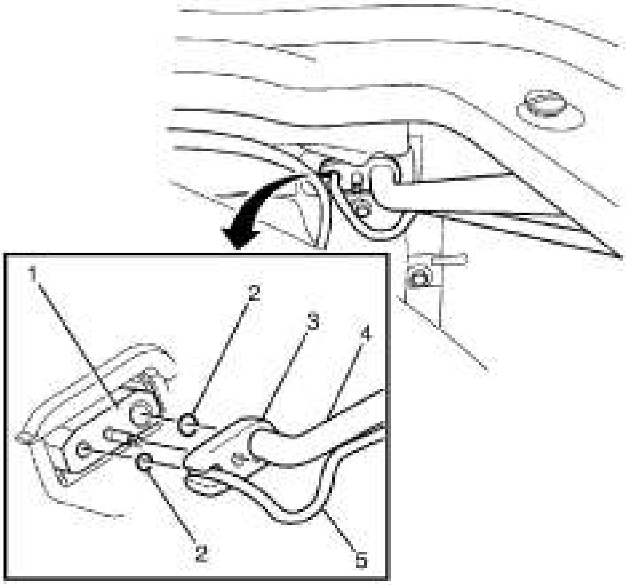
Discard the sealing washer

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

27. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



28. Remove the suction pipe/liquid pipe pad to thermal expansion (TX) valve retaining nut (1).



29. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

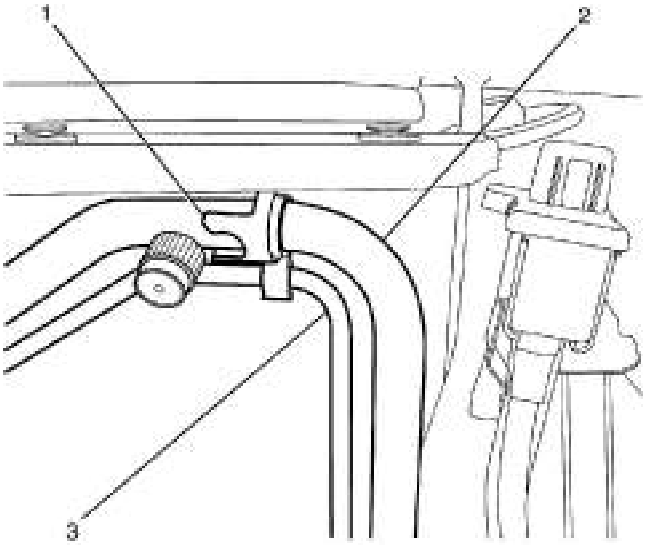
Important: The sealing washers (2) are a single use item and must be discarded after use.

30. Remove the sealing washers (2). Refer to Sealing Washer Replacement.

Discard the sealing washers

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

31. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).
32. Remove the liquid pipe (5) from the suction pipe/liquid pipe pad (3).

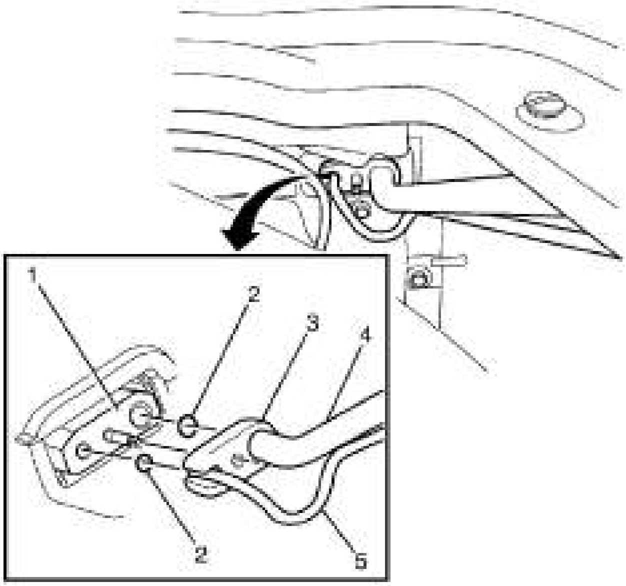


33. Detach the liquid pipe (3) and the suction pipe (2) from the suction pipe/liquid pipe retaining clip (1).

Important: Have an assistant ensure that the liquid tube flexible hose at the condenser end clears all the vehicle body work and condenser on removal from the engine compartment.

34. Remove the liquid pipe (3) from the engine compartment.

Installation Procedure

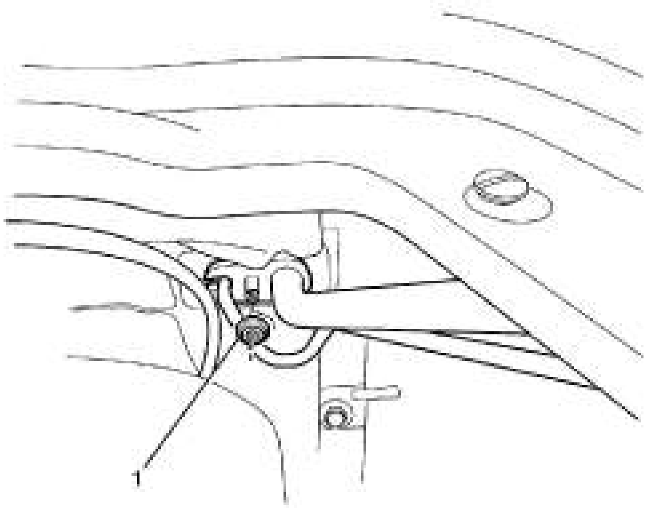


1. Install the liquid pipe (5) to the suction pipe/liquid pipe pad (3).
2. Remove the plugs or caps from the suction pipe (4), liquid pipe (5) and the thermal expansion (TX) valve (1).

   Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

3. Install NEW sealing washers (2). Refer to Sealing Washer Replacement.
4. Position the suction pipe/liquid pipe pad (3) to the TX valve (1).

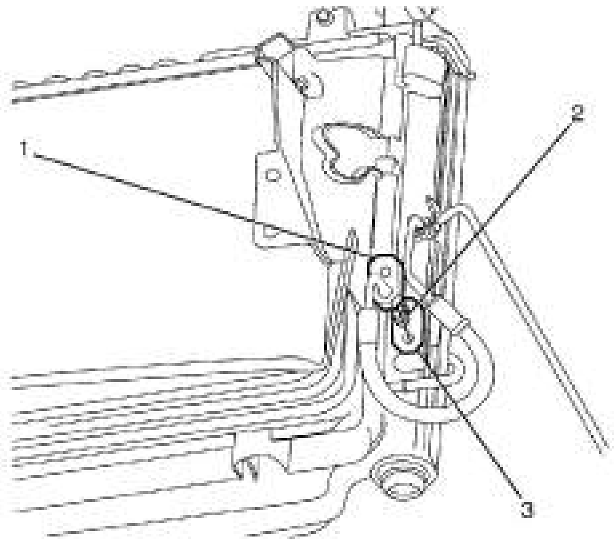
   Notice: Refer to Fastener Notice in the Preface section.



5. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).

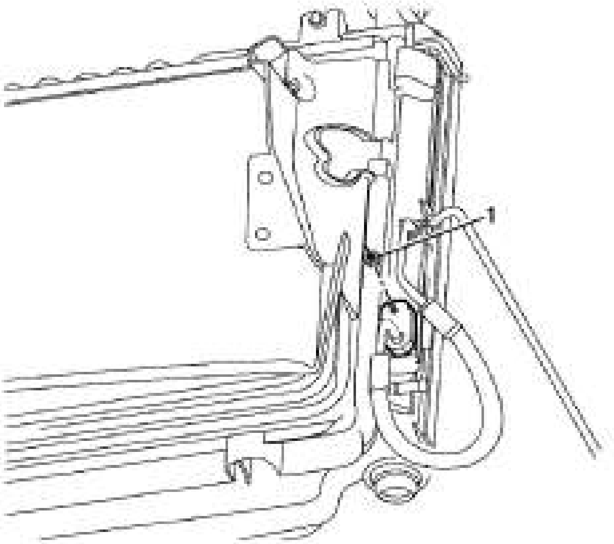
6. Raise the vehicle.



7. Remove the plugs or caps from the suction pipe liquid pipe (1) and the condenser port (3).

   Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

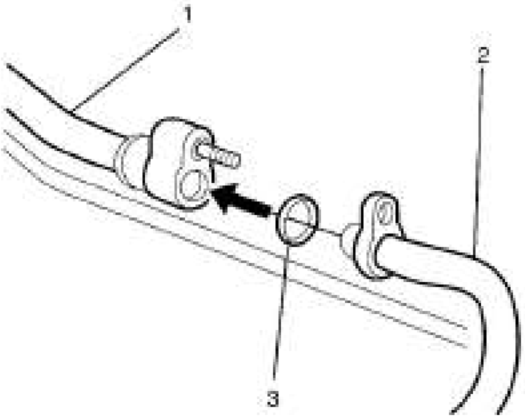
8. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.
9. Connect the liquid pipe (1) to the condenser port (3).



10. Install the liquid pipe to condenser port retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m(16 lb ft).

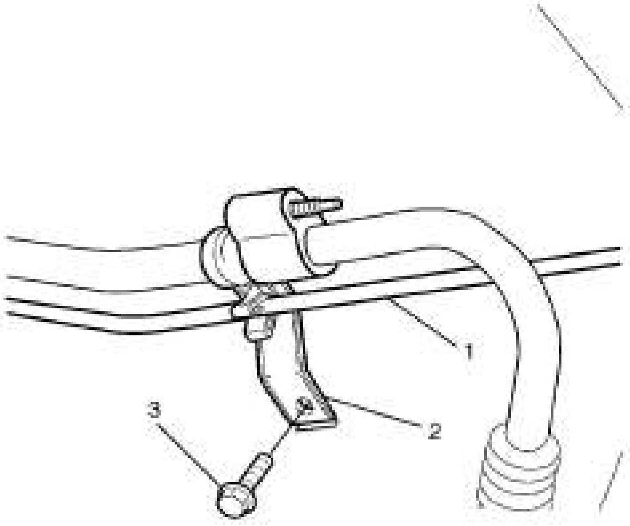
11. Install the air deflector front. Refer to Front Air Deflector Replacement .



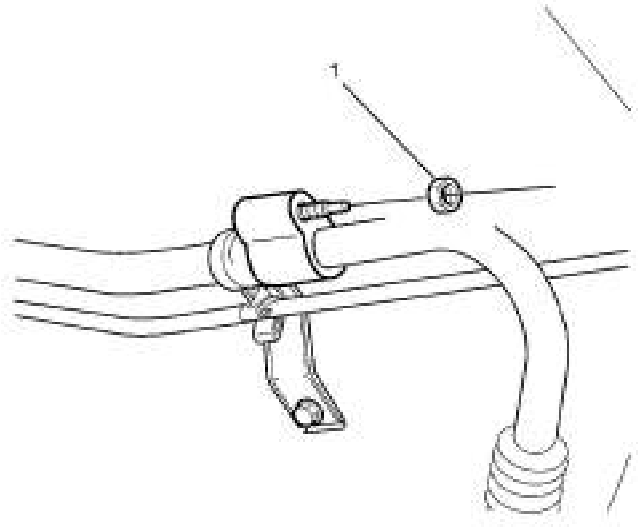
12. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

13. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.
14. Install the suction pipe upper (1) to the suction pipe lower (2).

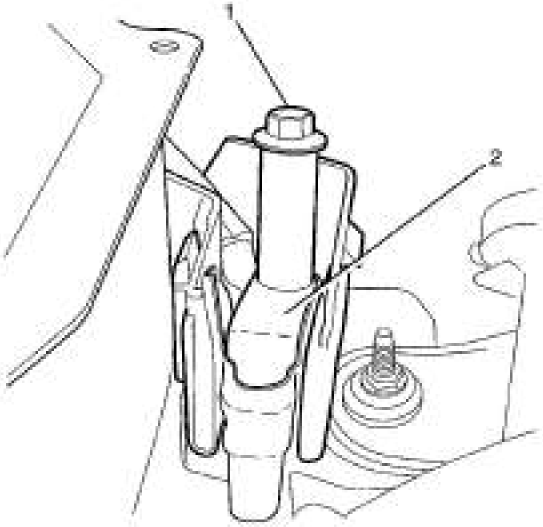


15. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).
16. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).



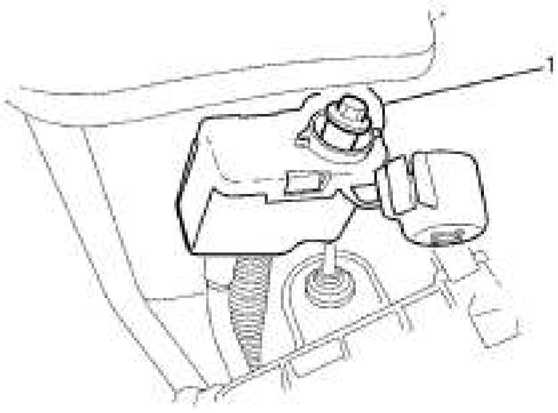
17. Install the suction pipe upper to suction pipe lower retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m(16 lb ft).



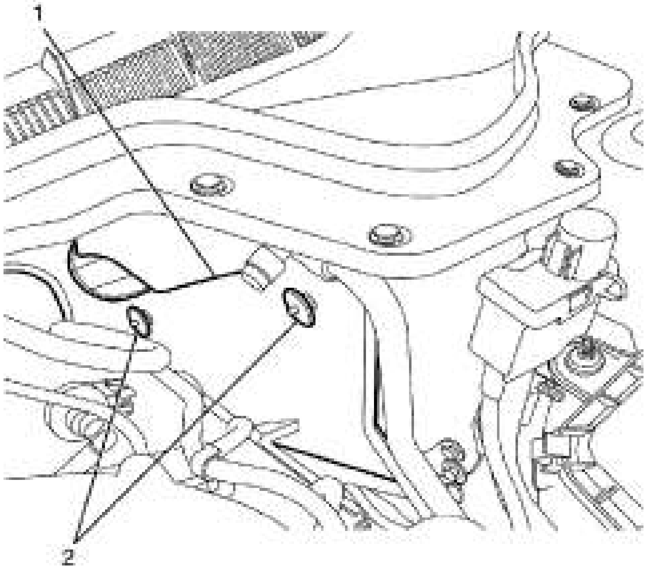
18. Install the starter motor positive cable (2) to the remote battery positive post.
19. Install the remote battery positive post to wiring harness retaining bolt (1).

    Tighten
    Tighten the bolt to 15 N·m (11 lb ft).

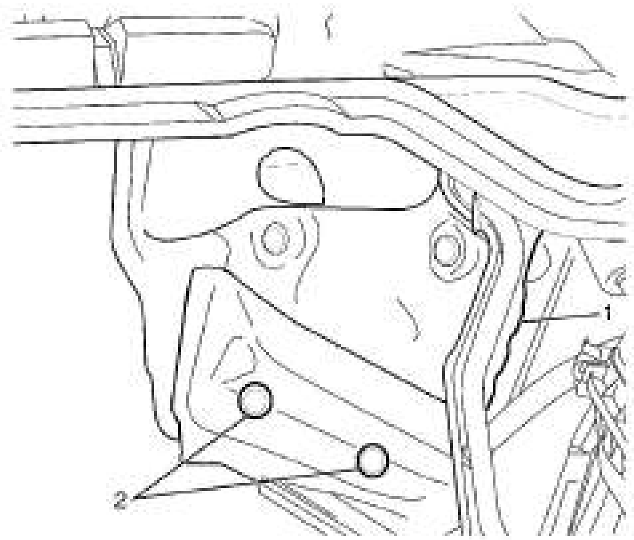


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

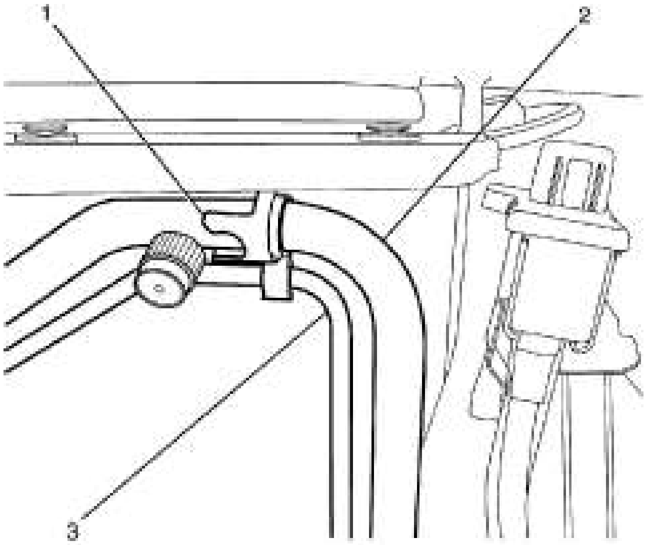
20. Install the remote battery positive post cover (1) to the remote battery positive post.



21. Install the insulation panel (1) to the left rear side engine compartment.
22. Install the insulation panel to air box retaining clips (2).



23. Install the exhaust manifold heat shield (1).
24. Install the exhaust manifold heat shield to air box retaining clips (2).



25. Attach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).
26. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
27. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement.
28. Install the engine cover. Refer to Engine Cover Replacement.
29. Install the plenum chamber cover panel. Refer to Air Inlet Grille Panel Replacement.
30. Install the windscreen wiper arms. Refer to Windshield Wiper Arm Replacement.
31. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
32. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging.
33. Leak test the fittings of the component using J 39400 .

Odor Correction

Eliminating Air Conditioning Odour

1. Odours may be emitted from the air conditioning system primarily at start up in hot, humid climates. The following conditions may cause the odour:
   - Debris is present in the HVAC module assembly.
   - Microbial growth on the evaporator core.
2. When the blower motor fan is turned on, the microbial growth may release an unpleasant musty odour into the passenger compartment. To remove odours of this type, the microbial growth must be addressed. Perform the following procedure:
   - Remove evaporator core. Refer to Air Conditioning Evaporator Core Replacement.
   - Clean evaporator core with a solution of 40% vinegar and 60% water.
   - Refit evaporator core. Refer to Air Conditioning Evaporator Core Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1976240**

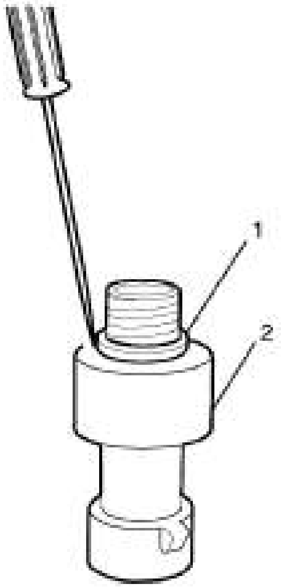
O-Ring Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Important: This procedure applies to all 'O-ring throughout the A/C system.

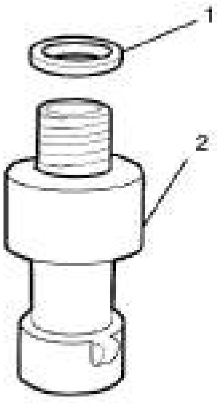
1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure.



Important: The O-ring seal (1) is a single use item and must be discarded after use.

Important: Using a suitable tool, gently insert the end of the tool under the O-ring seal (1) and lift O-ring seal (1), evenly all the way around, off the A/C refrigerant component (2).

2. Remove the O-ring seal (1) from the A/C refrigerant component (2).

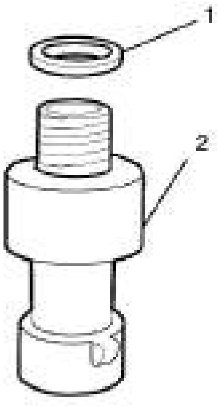


3. Inspect the O-ring seal (1) for signs of damage.
4. Inspect the A/C refrigerant component (2) for damage or burrs. Repair if necessary.

   Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

5. Cap or tape the A/C refrigerant component (2).
6. Discard the O-ring seal.

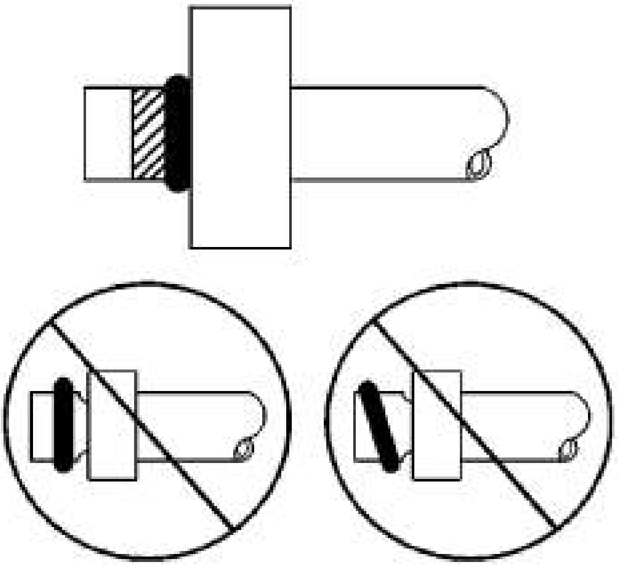
Installation Procedure



1. Inspect the NEW O-ring seal (1) for any sign or cracks, cuts, or damage. Replace if

necessary.

2. Remove the cap or tape from the A/C refrigerant component (2).
3. Using a lint-free clean, dry cloth, carefully clean the sealing surfaces of the A/C refrigerant component (2).
4. Coat the NEW O-ring (1) with refrigerant oil.
5. Carefully slide the NEW O-ring seal (1) onto the A/C refrigerant component.



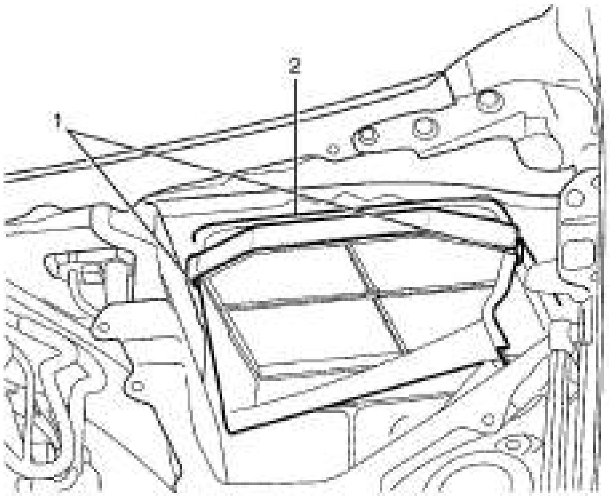
6. The O-ring seal must be fully seated.
7. Assemble the A/C components. Refer to the appropriate repair procedure.

Passenger Compartment Air Filter Housing Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

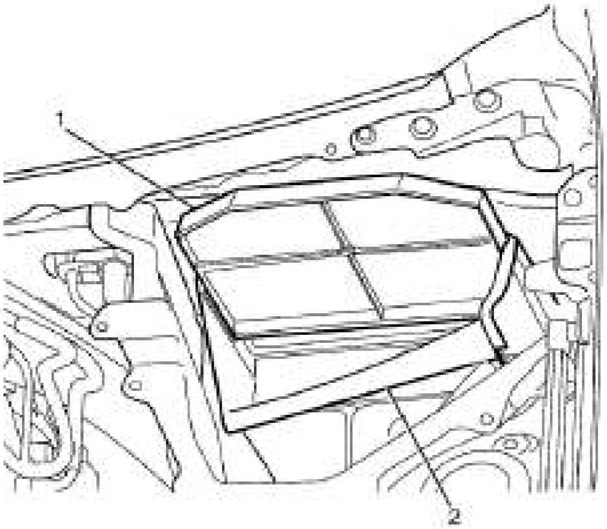
1. Remove the plenum chamber cover panel. Refer to Air Inlet Grille Panel Replacement.



2. Detach the leaf screen housing retainer (1) from the leaf screen housing (2).

   Important: Remove the leaf screen housing retainer (1) from the leaf screen housing (2), by lifting the leaf screen housing retainer (1) upwards.

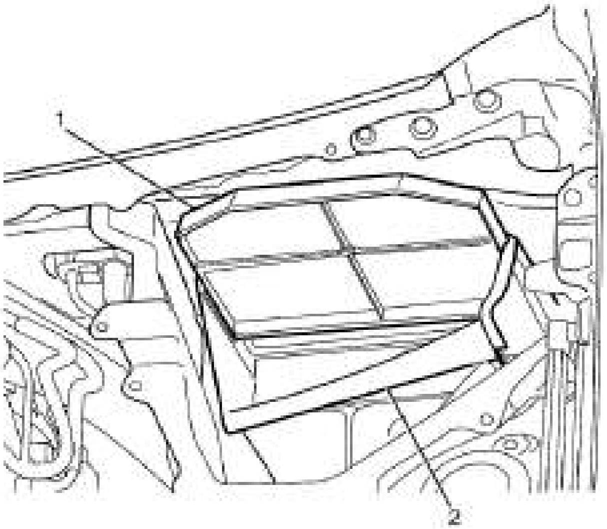
3. Remove the leaf screen housing retainer (1).



Important: Remove the leaf screen (1) from the leaf screen housing (2), by lifting the leaf screen (1) upwards.

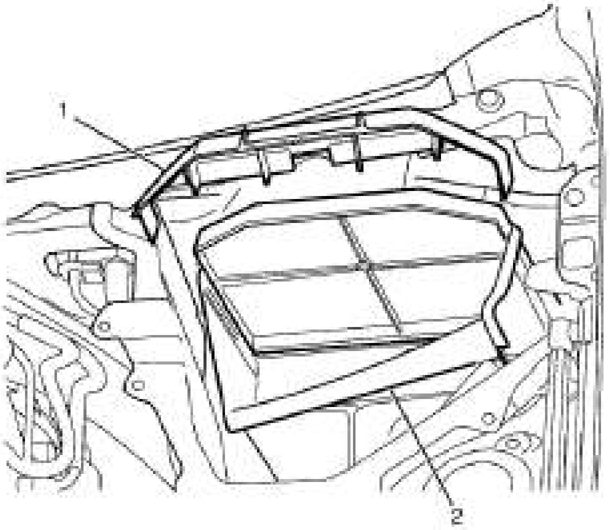
4. Remove the leaf screen (1) from the leaf screen housing (2).

Installation Procedure



Important: To install the leaf screen (1), slide the leaf screen (1) downwards into the leaf screen housing (2).

1. Install the leaf screen (1) into the leaf screen housing (2).



Important: Make sure that the rear tang on the leaf screen housing retainer (1) is correctly positioned in the leaf screen housing (2) and the leaf screen housing retainer (1) is correctly attached to the leaf screen housing (2) to avoid an induced rattle condition.

2. Install the leaf screen housing retainer (1) to the leaf screen housing (2).
3. Install the plenum chamber cover panel. Refer to Air Inlet Grille Panel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2035173**

Receiver and Dehydrator Replacement

Tools Required

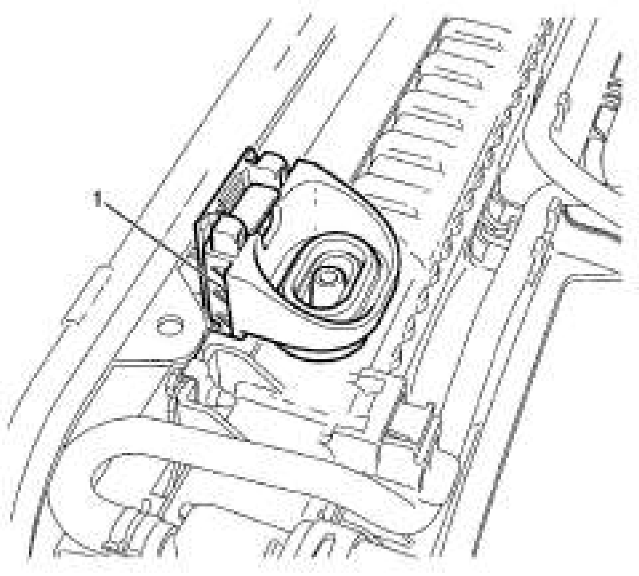
J 39400 Halogen Leak Detector

Removal Procedure

1. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.
2. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement

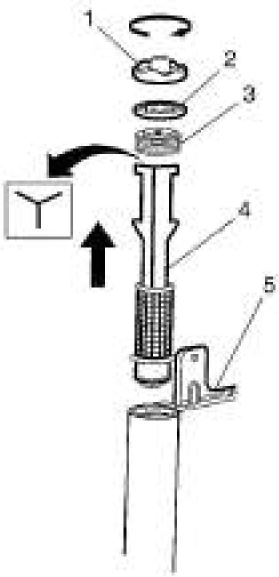
Caution: Refer to Safety Glasses Caution in the Preface section.

3. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .



Important: Remove the upper radiator support brackets by raising the securing lock upwards 10mm and slide the bracket out of the radiator slide pin.

4. Remove the upper radiator support brackets (1).



Important: Gently push the radiator and condenser towards the engine to allow removal of the plastic screw cap (1) on the right side of the condenser (5).

5. Remove the receiver dehydrator plastic screw cap (1) from the condenser (5).

Important: The circlip (2) cannot be removed if any gas pressure is present in A/C system.

Important: To gain adequate clearance for removal of the circlip (2), use a suitable tool to gently tap the receiver dehydrator bottle plug (3) downwards.

6. Remove the circlip (2).

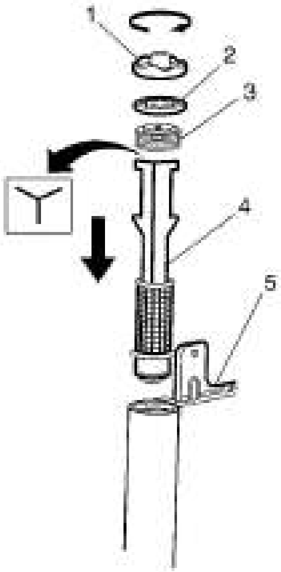
Important: Screw a suitable bolt into the threaded hole in the receiver dehydrator bottle plug (3). Pull upwards on the bolt to remove the receiver dehydrator bottle plug (3) from the condenser (5).

7. Remove the receiver dehydrator bottle plug (3) from the condenser (5).

Important: Using a suitable tool, grip the lower lip on the receiver dehydrator cartridge (4) and pull upwards to remove the receiver dehydrator cartridge (4) from the condenser (5).

8. Remove the receiver dehydrator cartridge (4) from the condenser (5).

Installation Procedure



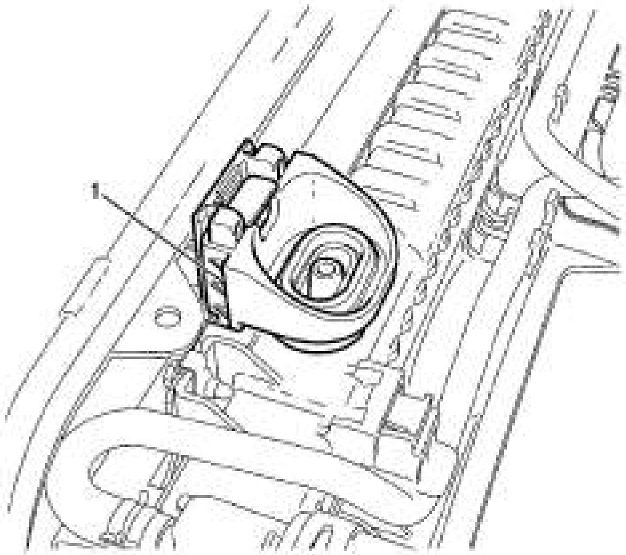
1. Install the receiver dehydrator cartridge (4) into the condenser (5).

   Important: Make sure the receiver dehydrator bottle plug (3) is fitted below the circlip groove

2. Install the receiver dehydrator bottle plug (3).

   Important: Make sure the circlip (2) is fitted correctly seated in the circlip groove.

3. Install the circlip (2).
4. Install the receiver dehydrator plastic screw cap (1) to the condenser (5).



5. Install the upper radiator support brackets (1).
6. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or

Air Cleaner Assembly Replacement for 6.0L engine

7. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging .
8. Leak test the fittings of the component using J 39400
9. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement

Refrigerant Recovery and Recharging

Tools Required

Air Conditioning Service Centre.

Caution: Avoid breathing the A/C Refrigerant 134a (R-134a) and the lubricant vapor or the mist. Exposure may irritate the eyes, nose, and throat. Work in a well ventilated area. In order to remove R-134a from the A/C system, use service equipment that is certified to meet the requirements of SAE J 2210 (R-134a recycling equipment). If an accidental system discharge occurs, ventilate the work area before continuing service. Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

Caution: For personal protection, goggles and lint-free gloves should be worn and a clean cloth wrapped around fittings, valves, and connections when doing work that includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

Notice: R-134a is the only approved refrigerant for use in this vehicle. The use of any other refrigerant may result in poor system performance or component failure.

Notice: To avoid system damage use only R-134a dedicated tools when servicing the A/C system.

Notice: Use only Polyalkylene Glycol Synthetic Refrigerant Oil (PAG) for internal circulation through the R-134a A/C system and only 525 viscosity mineral oil on fitting threads and O-rings. If lubricants other than those specified are used, compressor failure and/or fitting seizure may result.

Notice: R-12 refrigerant and R-134a refrigerant must never be mixed, even in the smallest of amounts, as they are incompatible with each other. If the refrigerants are mixed, compressor failure is likely to occur. Refer to the manufacturer instructions included with the service equipment before servicing.

Important: As of December 2006 only personnel holding the federal government refrigerant handling licence are to carry out repairs to the A/C system and handle refrigerant HFC R134a, unlicensed personnel may be subject to a fine from a government appointed body.

Preliminary A/C Service Centre Inspection Before Commencing

1. Make sure that the A/C Service Centre refrigerant storage container has sufficient refrigerant for charging the A/C system.
2. Drain the oil collection reservoir.
3. Turn both high pressure (HP) and low pressure (LP) hand valves to the OFF or closed direction.
4. Connect the HP (Red) and LP (Blue) hoses from the A/C Service Centre to the vehicles A/C system charging ports, using the shut off valves fitted to the end of the hoses. Turn the shut off valve taps to the open position to depress the charge port schrader valves.

Refrigerant Recovery

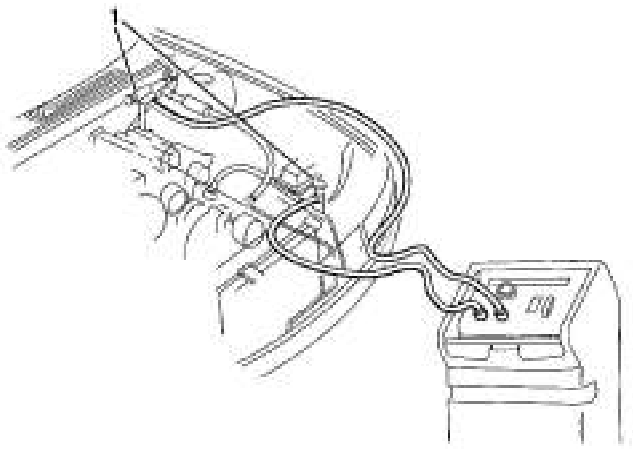
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the A/C Service Centre to the ON position.
2. Select the refrigerant recovery program at the control panel.
3. Open both the HP and LP hand valves on the device.
4. The A/C Service Centre will now start to recover both the refrigerant and lubricating oil from the A/C system. The refrigerant will go to the storage bottle and the oil will be separated into a removable oil reservoir.

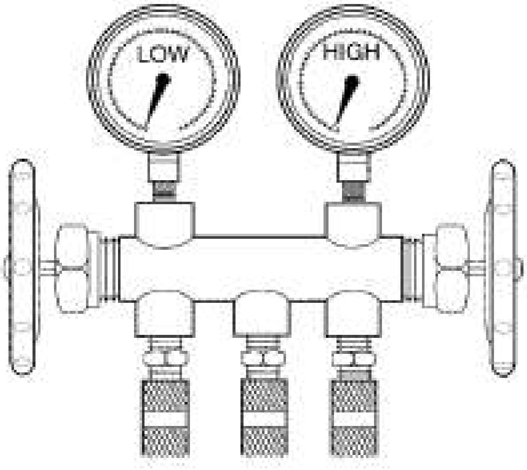
   Important: Although the A/C system does pull into a partial vacuum, this is only to aid in refrigerant recovery. The A/C will still have to be evacuated for the specified duration of time.

5. The A/C Service Centre will remove all the refrigerant from the A/C system then pull into a partial vacuum around 34 kPa (10 inhg).
6. Once the partial vacuum is reached it is advisable to turn the A/C Service Centre OFF and close both the hand valves, take note of the pressure readings. If after 2 minutes the vacuum readings rise to a positive pressure that indicates that refrigerant (boiling off) still remains in the receiver dehydrator, if so continue the recovery process until no rise to positive pressure is evident.
7. Inspect the recovered oil reservoir and take a note of the quantity removed as you will need to add the same quantity back into the A/C system later.

Evacuation

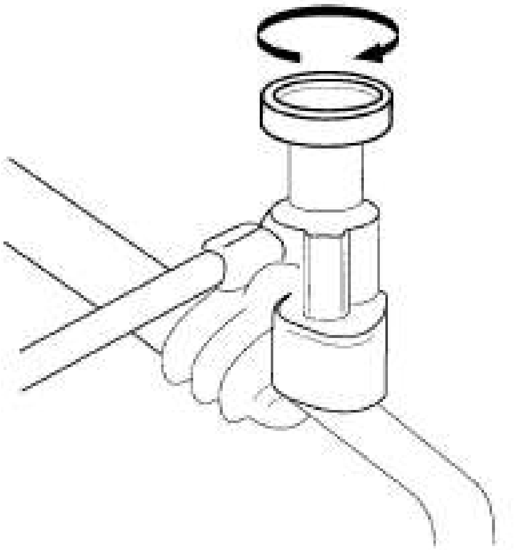


1. Connect the HP (Red) and LP (Blue) hoses from the A/C Service Centre to the vehicles A/C system charging ports (1), using the shut off valves fitted to the end of the hoses. Turn the shut off valve taps open to depress the charge port Schrader valves.
2. Turn the A/C Service Centre to the ON position.
3. Select the A/C system evacuation program at the control panel.
4. Select the duration time for evacuation. The recommendation is 30 minutes and longer for high temperature and humidity states.
5. Open both the HP and LP hand valves on the A/C Service Centre.



6. Note both the HP and LP negative pressure readings.
7. After waiting 5 minutes, check the LP reading for a rise in pressure. If the pressure has risen this indicates a leak is present in the system. Carry out leak test and repair leakage point. If no pressure rise has taken place the A/C system is correctly evacuated and no leak is present.

Refrigerant Recharging



1. Make sure that the HP and LP hand valves are in the OFF position.
2. Turn the A/C Service Centre to the ON position.
3. Connect the HP (Red) and LP (Blue) hoses from the A/C Service Centre to the vehicles A/C system charging ports, using the shut off valves fitted to the end of the hoses. Turn the shut

off valve taps open to depress the charge port Schrader valves.

4. Select the A/C refrigerant charging program at the control panel and set the specified charge quantity of 580 grams (20.5 oz).

   Important: DO NOT Start the engine as all automated A/C Service Centres have a pump that will force the refrigerant into the A/C system.

   Important: If you have to start the engine to complete the charging through the low side, make sure that you do not exceed 275 kPa this is to make sure that the refrigerant, entering the compressor is vaporised.

   Important: If the ambient temperature is low you may also have to hold the engine RPM at 2000 to assist in filling the remaining refrigerant.

5. Open both the HP and LP hand valves on the A/C Service Centre. The A/C Service Centre will now start filling the A/C system with refrigerant. If the total specified quantity cannot be filled into the A/C system (especially in cooler weather), CLOSE the HP hand valve, leave the LP hand valve OPEN, start the engine and engage the A/C. The action of the "suction" side of the compressor will draw the remaining refrigerant into the A/C system.

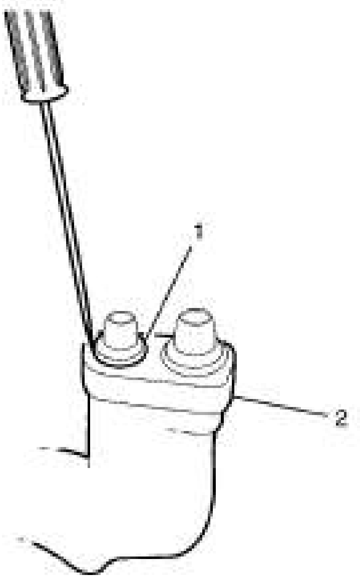
Sealing Washer Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Important: This procedure applies to all sealing washers throughout the A/C system

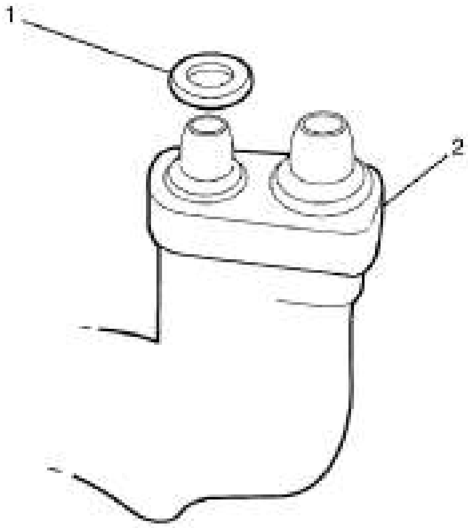
1. Disassemble the appropriate A/C refrigerant components. Refer to the appropriate repair procedure.



Important: The sealing washers (1) are a single use item and must be discarded after use.

Important: Using a suitable tool, gently insert the end of the tool under the sealing washer (1) and lift sealing washer (1), evenly all the way around, off the A/C refrigerant component (2).

2. Remove the sealing washer (1) from the A/C refrigerant component (2).

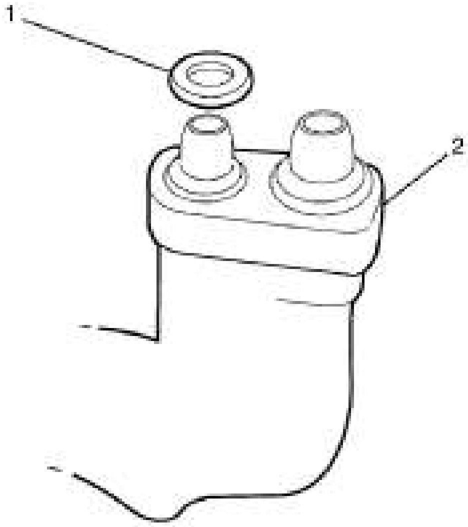


3. Inspect the sealing washer (1) for signs of damage.
4. Inspect the A/C refrigerant component (2) for damage or burrs. Repair if necessary.

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

5. Cap or tape the A/C refrigerant component (2).
6. Discard the sealing washer (1).

Installation Procedure



Important: DO NOT coat the NEW sealing washer (1) with oil, they must be fitted dry. The use of mineral oil will render the washer useless, as the sealing washer (1) will swell causing refrigerant to leak out.

1. Inspect the NEW sealing washer (1) for any sign or cracks, cuts, or damage. Replace if necessary.
2. Remove the cap or tape from the A/C refrigerant component (2).
3. Using a lint-free clean, dry cloth, carefully clean the sealing surfaces of the A/C refrigerant component (2).
4. Carefully slide the NEW sealing washer (1) onto the A/C refrigerant component (2).
5. The sealing washer (1) must be fully seated.
6. Assemble the A/C components. Refer to the appropriate repair procedure.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 1993761**

Suction Hose Replacement (3.6L Engine)

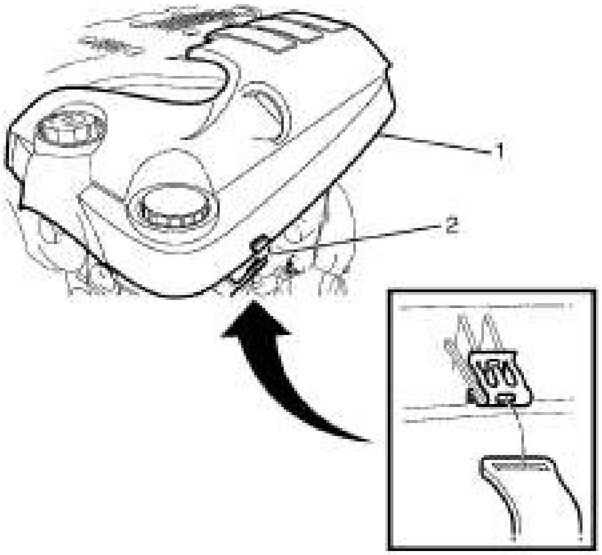
Tools Required

J 39400 Halogen Leak Detector

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

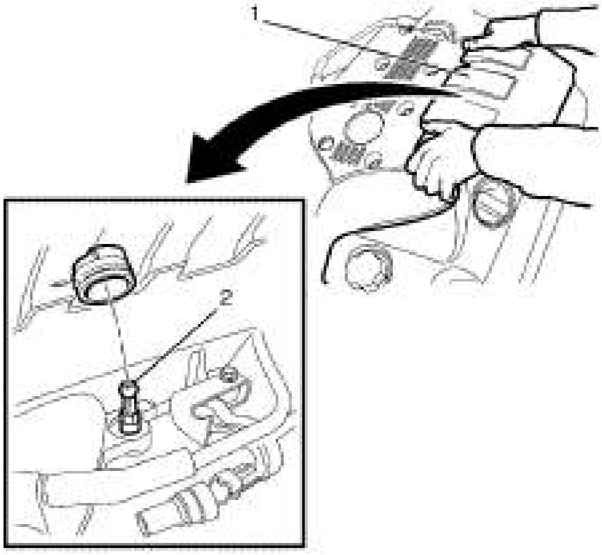
1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection I.
3. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement .
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
5. Remove the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement



Important: The left engine cover has one front and one rear outer retaining clip.

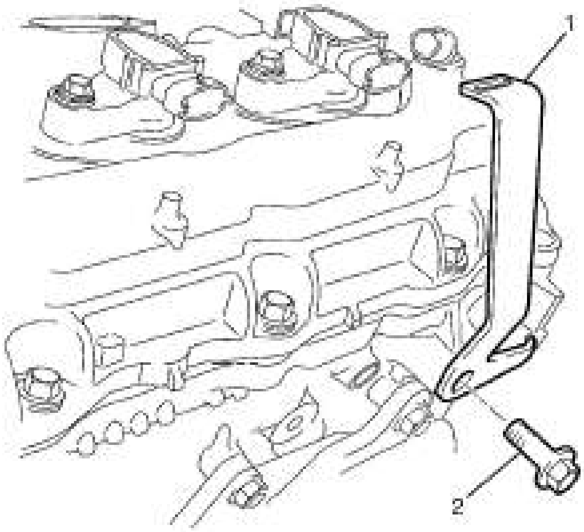
Important: Grasp and pry the left engine cover (1) upwards to detach the left engine cover (1) from the outer retaining clip (2).

6. Detach the left engine cover (1) from the outer retaining clip (2).

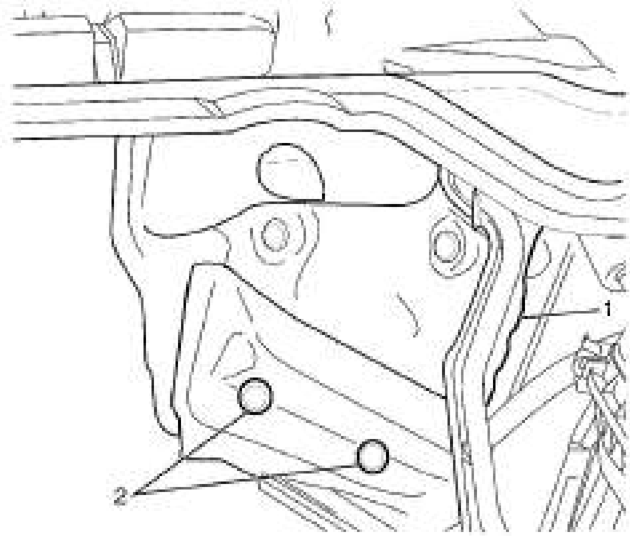


Important: Disengage the left engine cover (1) from the ball stud (2) by pulling up firmly on the rear and front of the left engine cover (1).

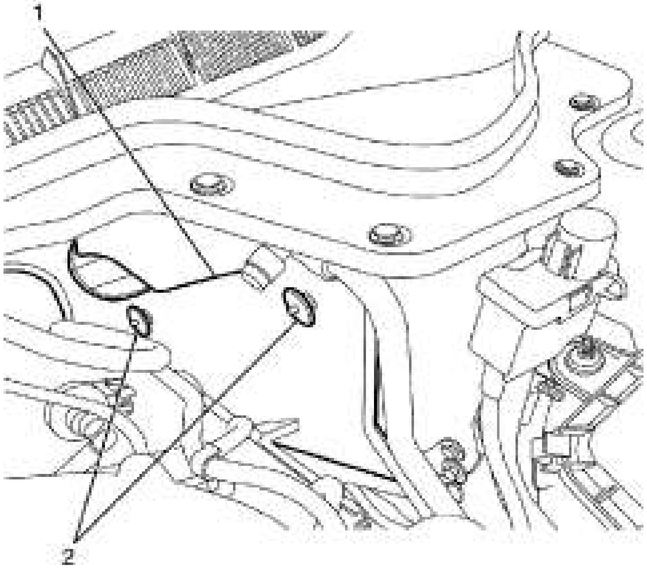
7. Detach the left engine cover (1) from the ball stud (2).
8. Remove the left engine cover (1).



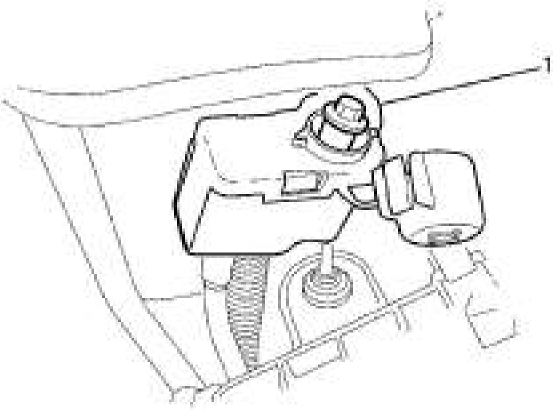
9. Remove the left engine cover mounting bracket to cylinder head retaining bolt (2).
10. Remove the left engine cover mounting bracket (1) from the cylinder head.



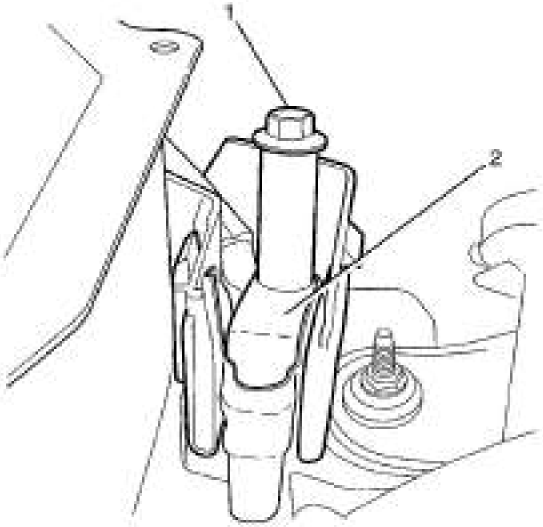
11. Remove the exhaust manifold heat shield to air box retaining clips (2).
12. Remove the exhaust manifold heat shield (1).



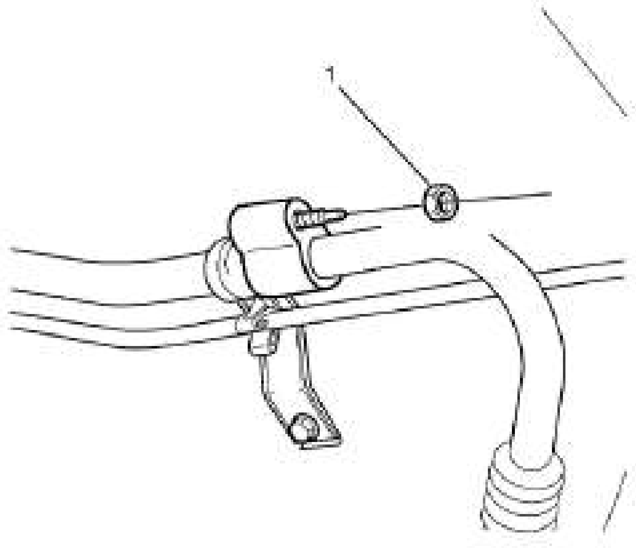
13. Remove the insulation panel to air box retaining clips (2).
14. Remove the insulation panel (1) from the engine compartment.



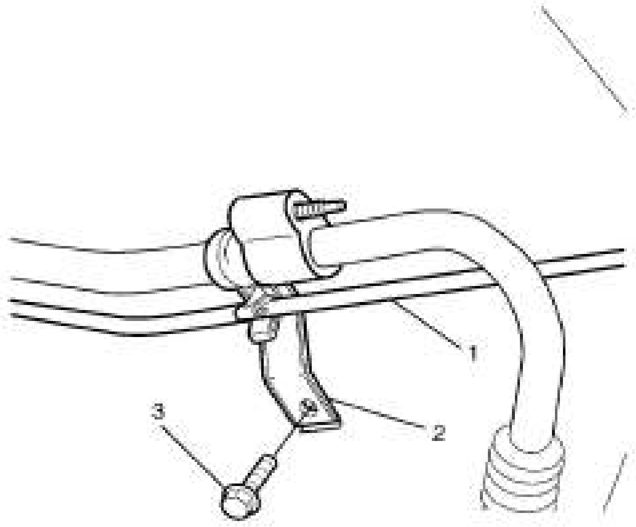
15. Remove the remote battery positive post cover (1).



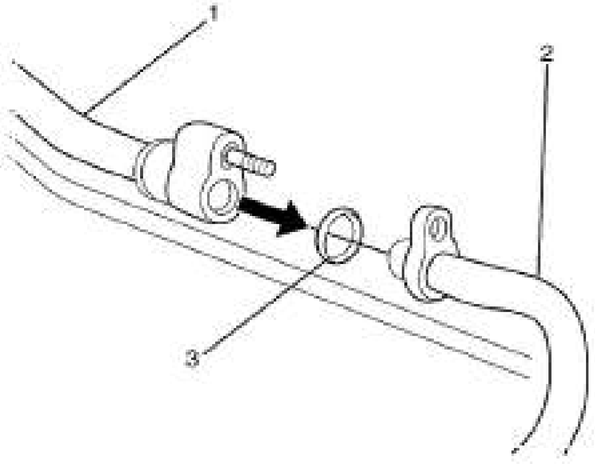
16. Remove the remote battery positive post to wiring harness retaining bolt (1).
17. Remove the starter motor power cable (2) and position aside.



18. Remove the suction pipe upper to suction pipe lower retaining nut (1).



19. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
20. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



21. Disconnect the suction pipe upper (1) from the suction pipe lower (2).

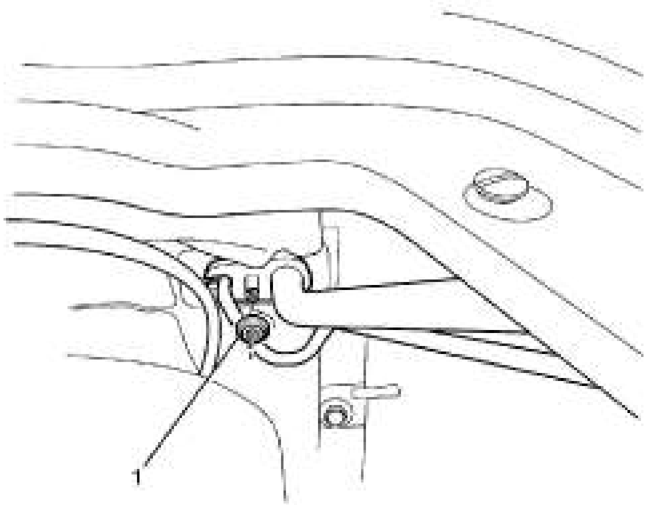
Important: The sealing washer (3) is a single use item and must be discarded after use.

22. Remove the sealing washer (3). Refer to Sealing Washer Replacement .

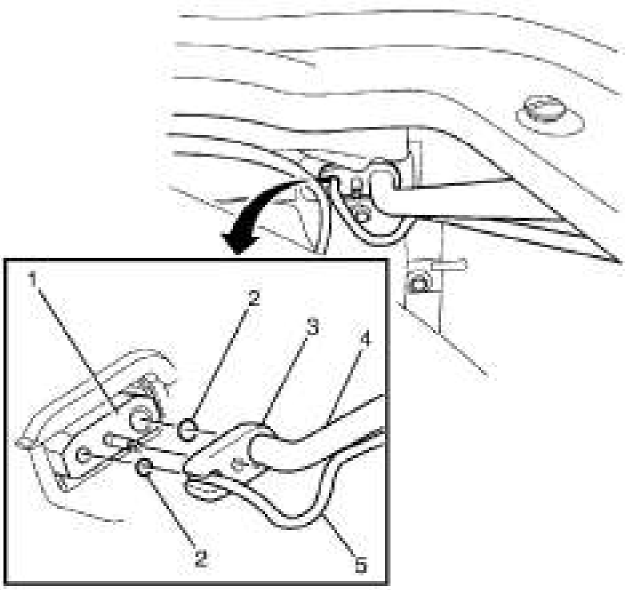
Discard the sealing washer

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

23. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



24. Remove the suction pipe/liquid pipe pad to TX valve retaining nut (1).



25. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

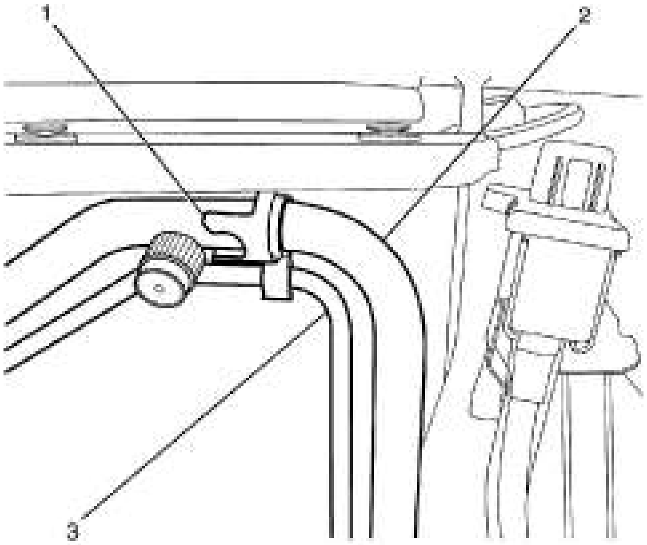
    Important: The sealing washers (2) are a single use item and must be discarded after use.

26. Remove the sealing washers (2). Refer to Sealing Washer Replacement .

    Discard the sealing washers

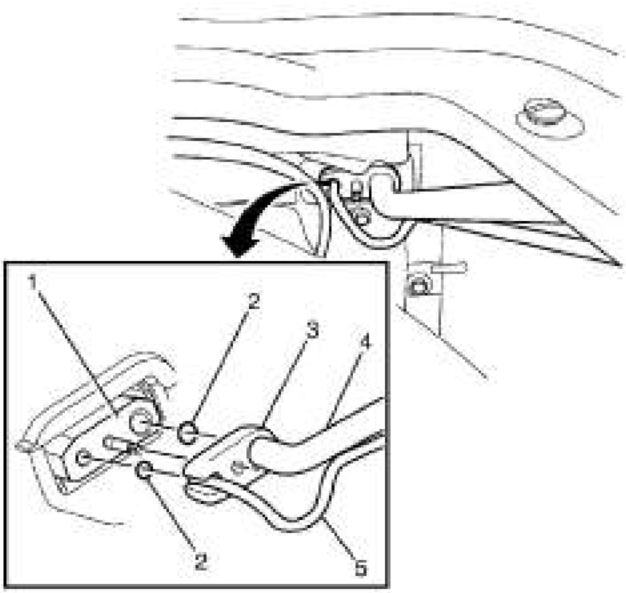
    Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

27. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).
28. Remove the liquid pipe (5) from the suction pipe/liquid pipe pad (3).



29. Detach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).
30. Remove the suction pipe (2) from the engine compartment.

Installation Procedure

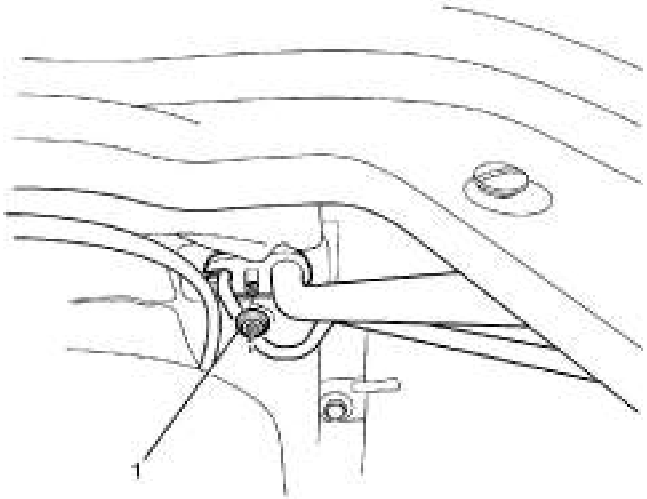


1. Install the liquid pipe (5) to the suction pipe/liquid pipe pad (3).
2. Remove the plugs or caps from the suction pipe (4), liquid pipe (5) and the TX valve (1).

Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

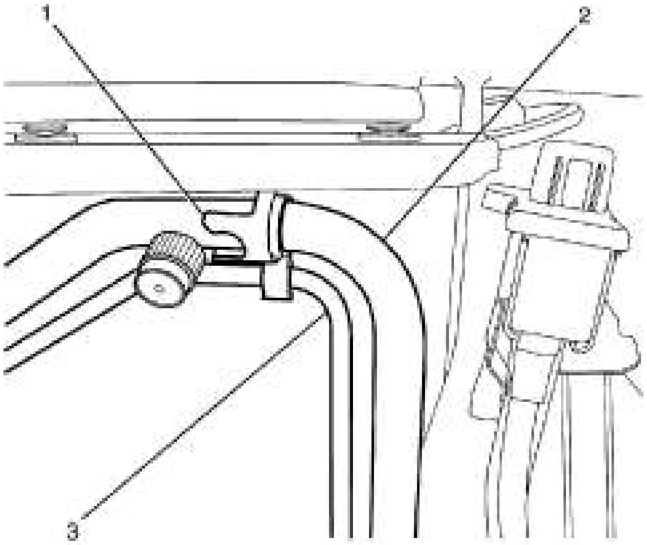
3. Install NEW sealing washers (2). Refer to Sealing Washer Replacement .
4. Position the suction pipe/liquid pipe pad (3) to the TX Valve (1).

Notice: Refer to Fastener Notice in the Preface section.

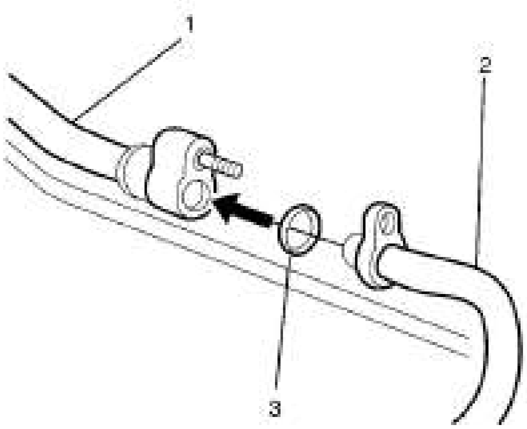


5. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).



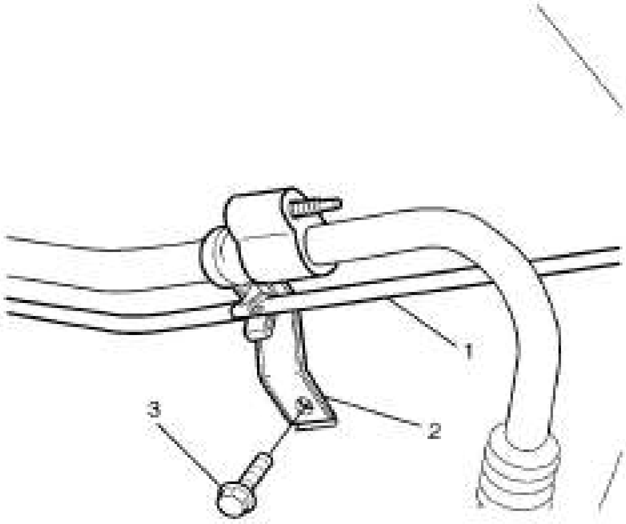
6. Attach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).



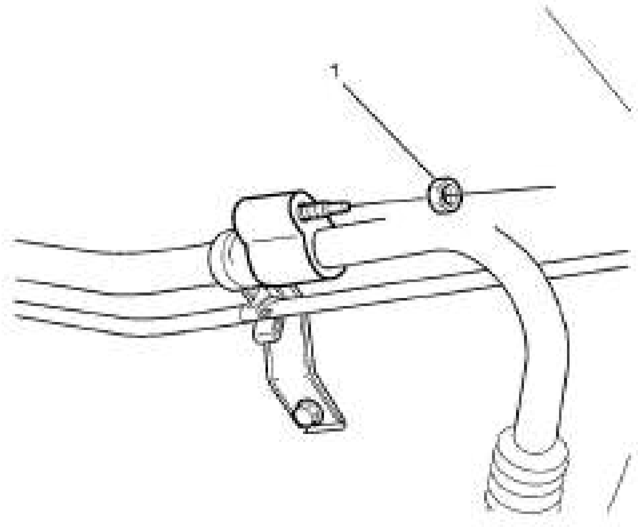
7. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

8. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement .
9. Install the suction pipe upper (1) to the suction pipe lower (2).

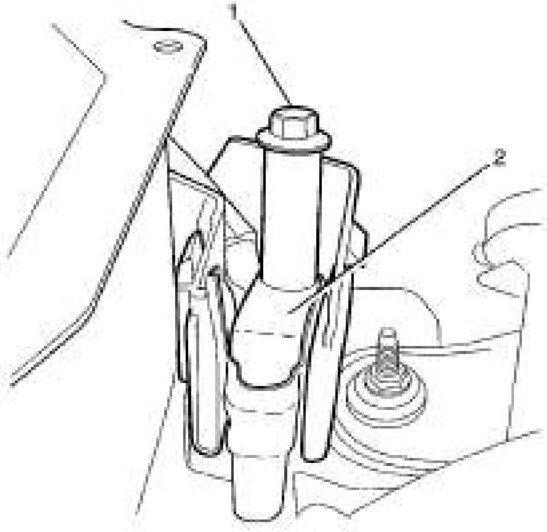


10. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).
11. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).



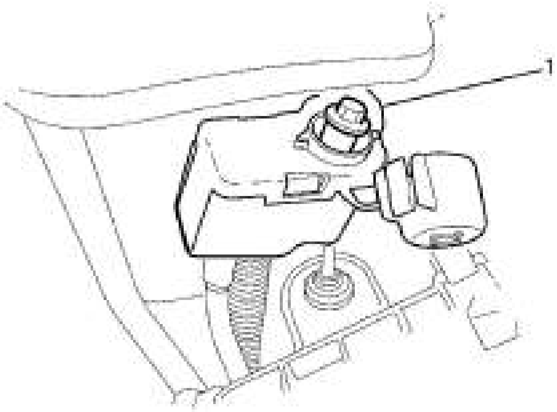
12. Install the suction pipe upper to suction pipe lower retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m(16 lb ft).



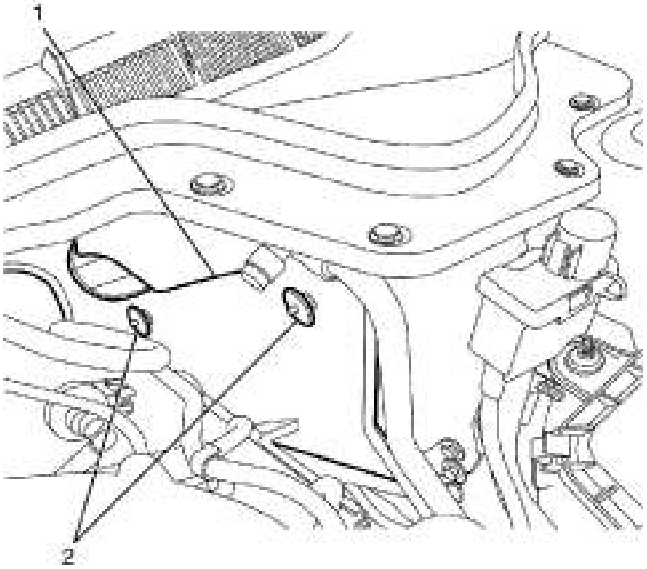
13. Install the starter motor positive cable (2) to the remote battery positive post.
14. Install the remote battery positive post to wiring harness retaining bolt (1).

    Tighten
    Tighten the bolt to 15 N·m (11 lb ft).

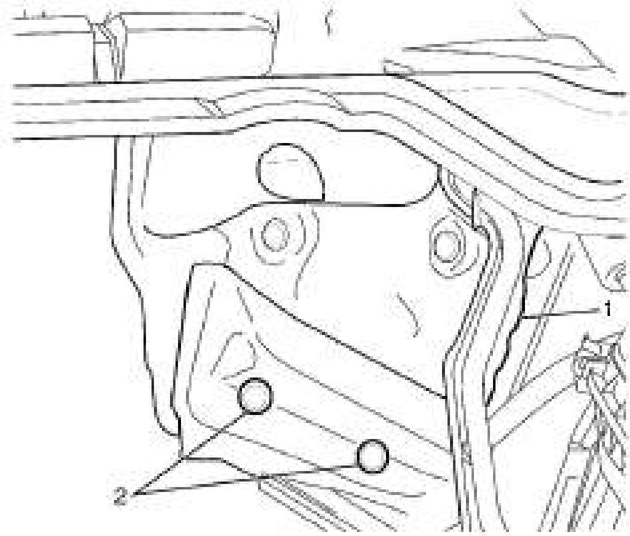


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

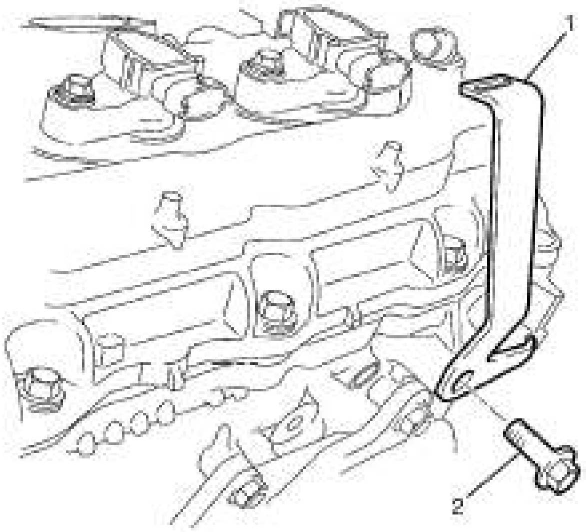
15. Install the remote battery positive post cover (1) to the remote battery positive post.



16. Install the insulation panel (1) to the left rear side engine compartment.
17. Install the insulation panel to air box retaining clips (2).

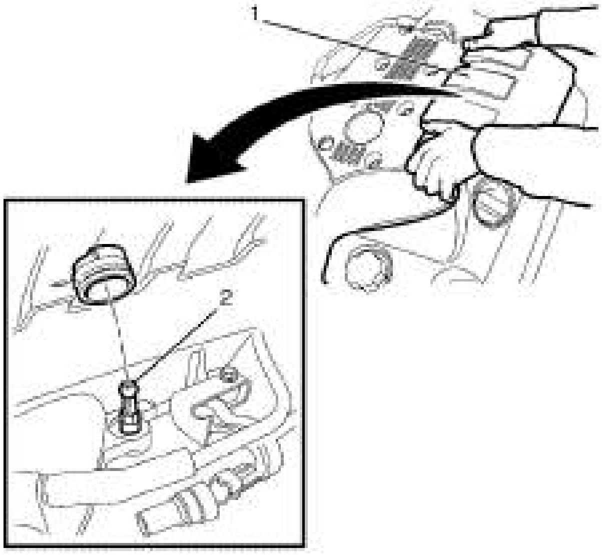


18. Install the exhaust manifold heat shield (1).
19. Install the exhaust manifold heat shield to air box retaining clips (2).



20. Install the left engine cover mounting bracket (1)
21. Install the left engine cover mounting bracket to cylinder head retaining bolt (2).

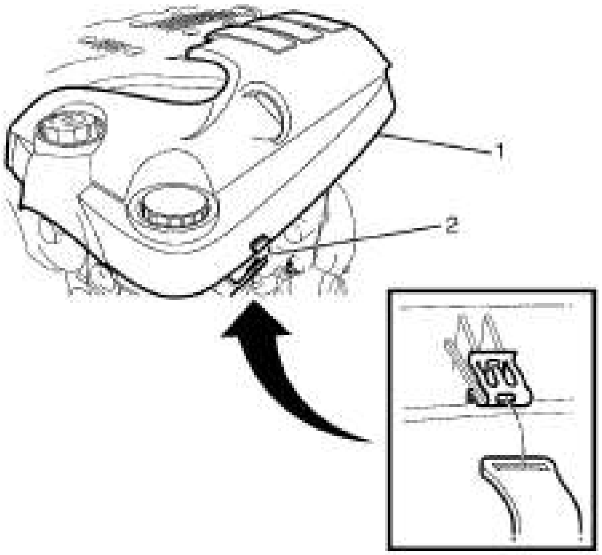
Tighten
Tighten the bolt to 35 N·m (26 lb in).



22. Position the left engine cover (1) over the intake manifold so the grommet is aligned with the ball stud (2).

    Important: Press the left engine cover (1) down firmly near the ball stud to attach the left engine cover (1) to the ball stud (2).

23. Attach the left engine cover (1) to the ball stud (2).



Important: The left engine cover has one front and one rear outer retaining clip.

Important: Press the left engine cover (1) down firmly near the outer retaining clips to attach the left engine cover (1) to the outer retaining clip (2).

24. Attach the left engine cover (1) to the outer retaining clip (2).
25. Install the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement
26. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
27. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement .
28. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
29. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging .
30. Leak test the fittings of the component using electronic leak detector.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | Heating, Ventilation, and Air Conditioning | Repair Instructions | **Document ID: 2038171**

Suction Hose Replacement (6.0L Engine)

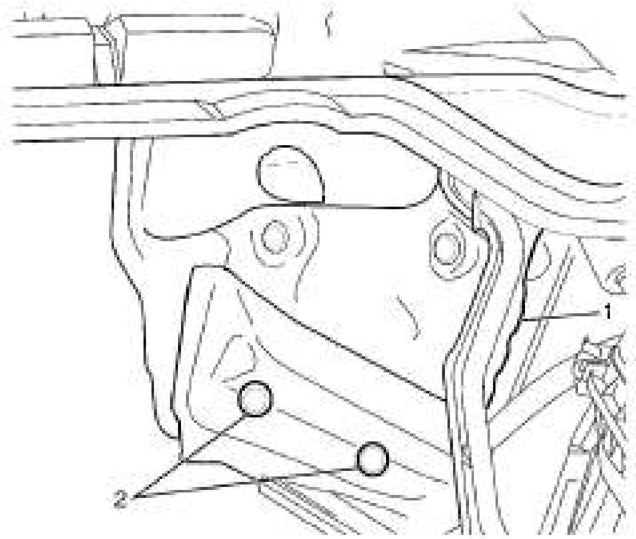
Tools Required

J 39400 Halogen Leak Detector

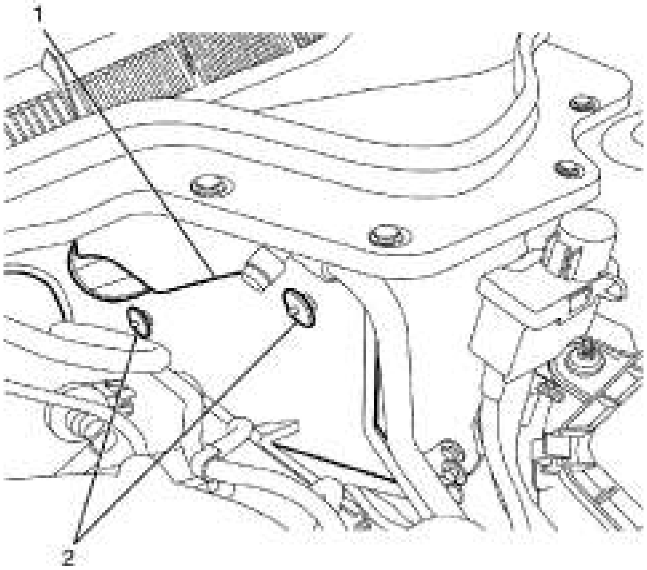
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

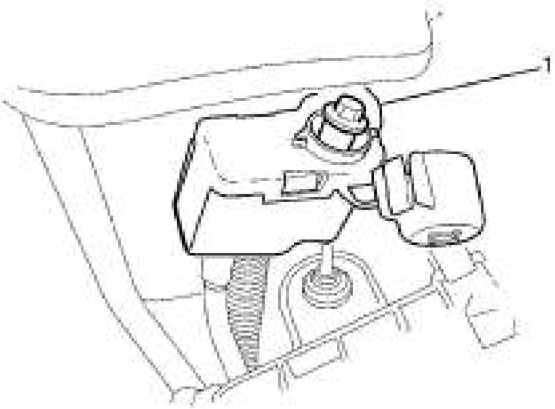
1. Recover the refrigerant Refer to Refrigerant Recovery and Recharging.
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the air filter assembly. Refer to Air Cleaner Assembly Replacement.
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
5. Remove the engine cover. Refer to Engine Cover Replacement.



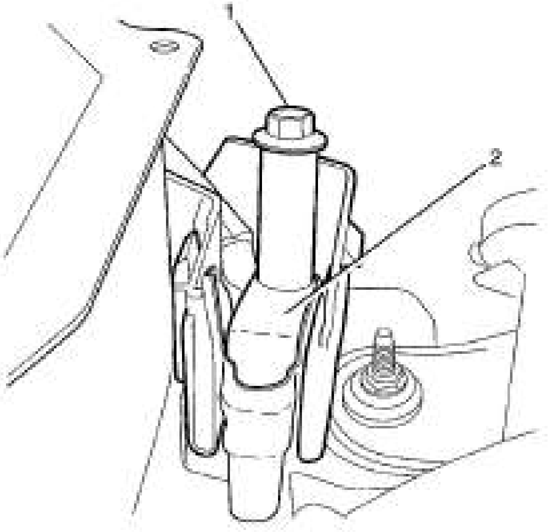
6. Remove the exhaust manifold heat shield to air box retaining clips (2).
7. Remove the exhaust manifold heat shield (1).



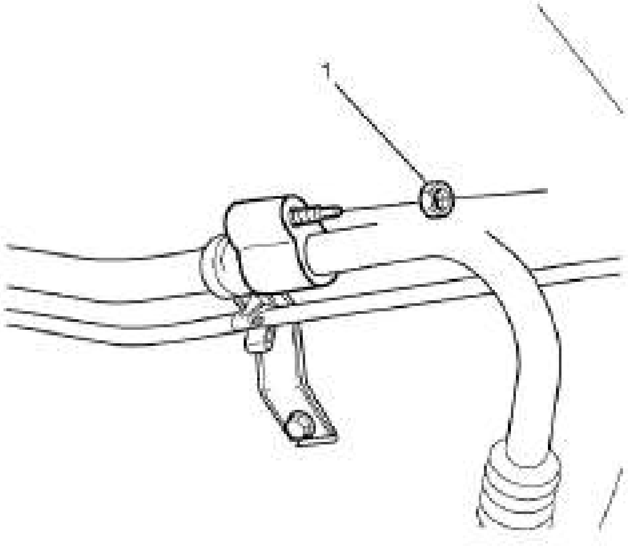
8. Remove the insulation panel to air box retaining clips (2).
9. Remove the insulation panel (1) from the engine compartment.



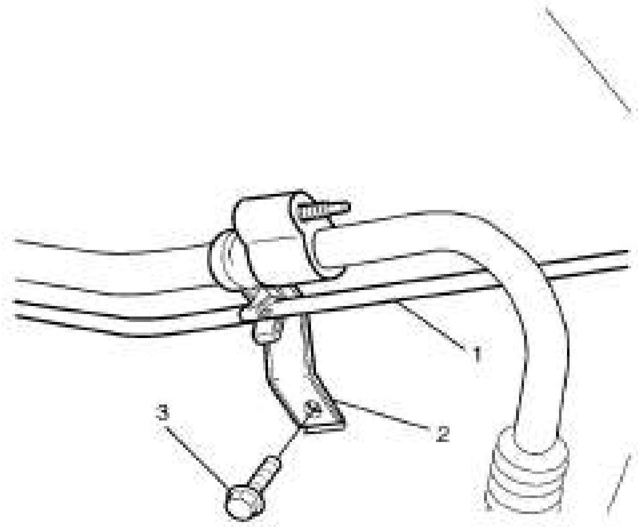
10. Remove the remote battery positive post cover (1).



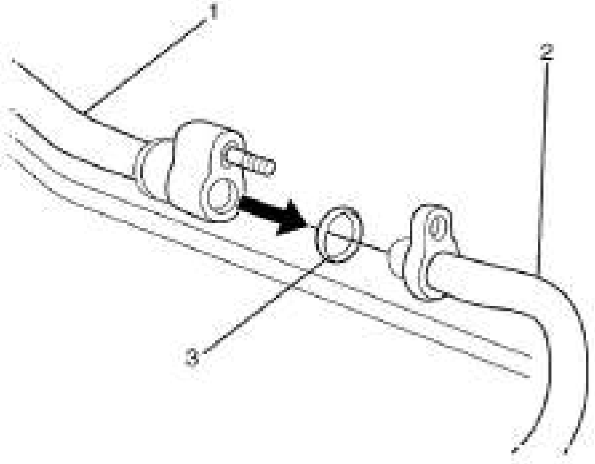
11. Remove the remote battery positive post to wiring harness retaining bolt (1).
12. Remove the starter motor power cable (2) and position aside.



13. Remove the suction pipe upper to suction pipe lower retaining nut (1).



14. Remove the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).
15. Detach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).



16. Disconnect the suction pipe upper (1) from suction pipe lower (2).

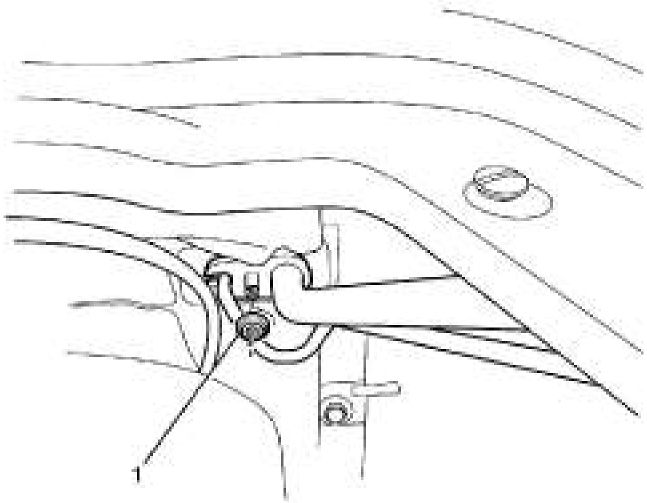
Important: The sealing washer (3) is a single use item and must be discarded after use.

17. Remove the sealing washer (3). Refer to Sealing Washer Replacement.

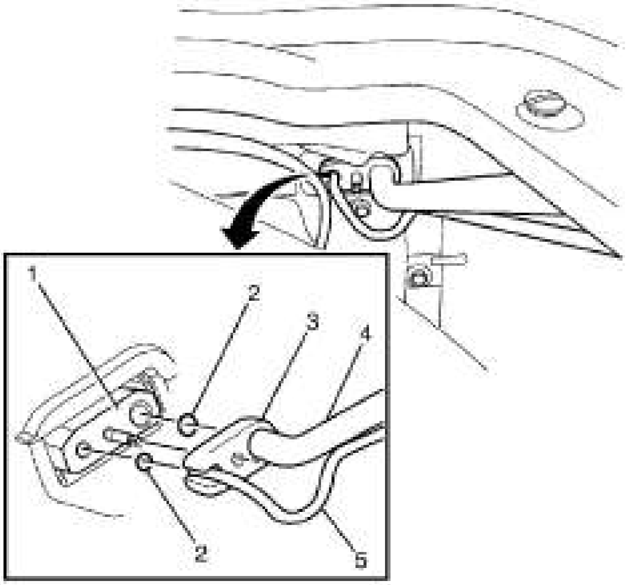
Discard the sealing washer

Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

18. Cap or plug the suction pipe upper (1) and the suction pipe lower (2).



19. Remove the suction pipe/liquid pipe pad to TX Valve retaining nut (1).



20. Disconnect the suction pipe/liquid pipe pad (3) from the TX valve (1).

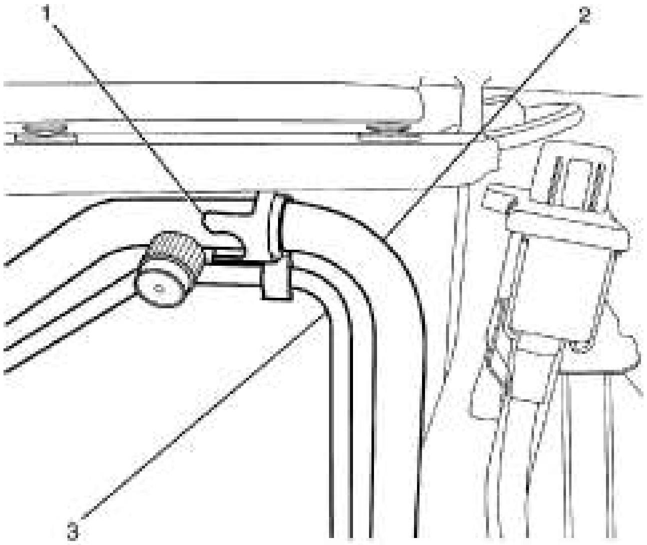
Important: The sealing washers (2) are a single use item and must be discarded after use.

21. Remove the sealing washers (2). Refer to Sealing Washer Replacement.

Discard the sealing washers

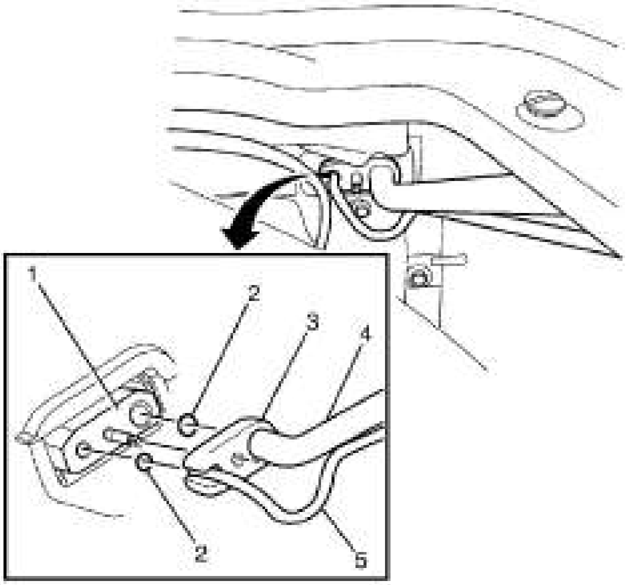
Important: Cover any opening of the A/C system with a suitable cap or tape immediately, to prevent absorption of moisture from the atmosphere.

22. Cap or plug the suction pipe (4), liquid pipe (5) and the TX valve (1).
23. Remove the liquid pipe (5) from the suction pipe/liquid pipe pad (3).



24. Detach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).
25. Remove the suction pipe (2) from the engine compartment

Installation Procedure

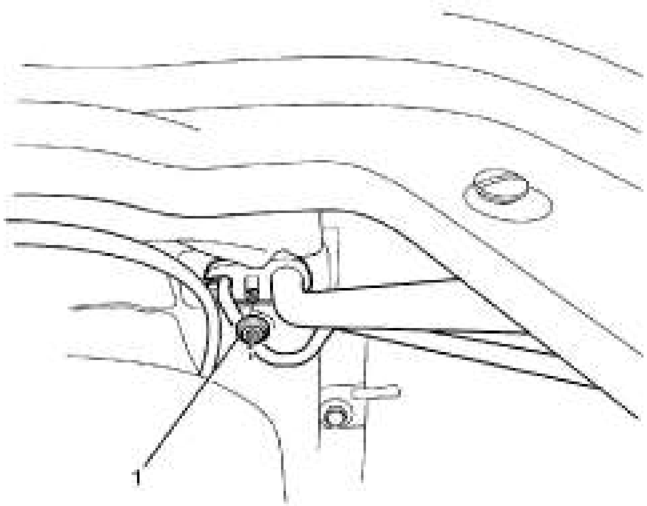


1. Install the liquid pipe (5) to the suction pipe/liquid pipe pad (3).
2. Remove the plugs or caps from the suction pipe (4), liquid pipes (5) and the TX valve (1).

Important: DO NOT coat the NEW sealing washers (2) with oil, they must be fitted dry. The use of mineral oil will render the sealing washers (2) useless, as the sealing washers (2) WILL swell causing refrigerant to leak out.

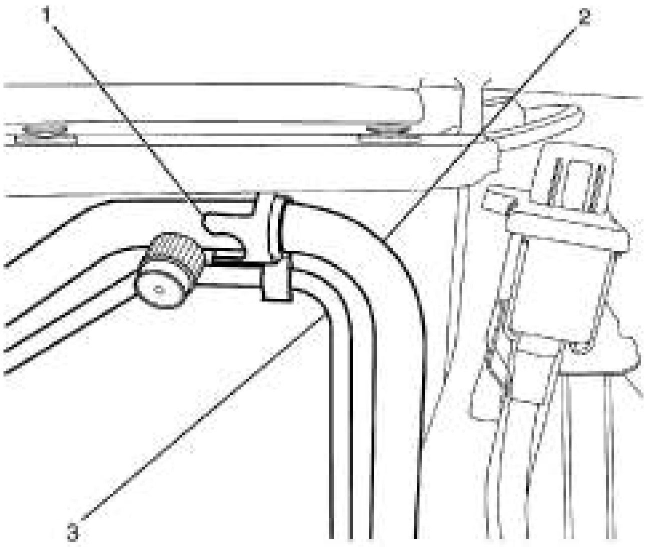
3. Install NEW sealing washers (2). Refer to Sealing Washer Replacement.
4. Position the suction pipe/liquid pipe pad (3) to the TX Valve (1).

   Notice: Refer to Fastener Notice in the Preface section.

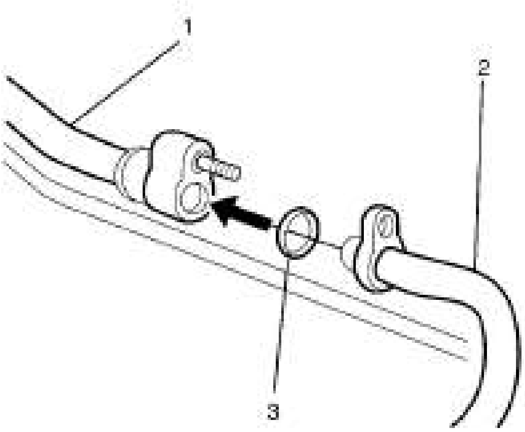


5. Install the suction pipe/liquid pipe pad to TX valve retaining nut (1).

   Tighten
   Tighten the nut to 22 N·m(16 lb ft).



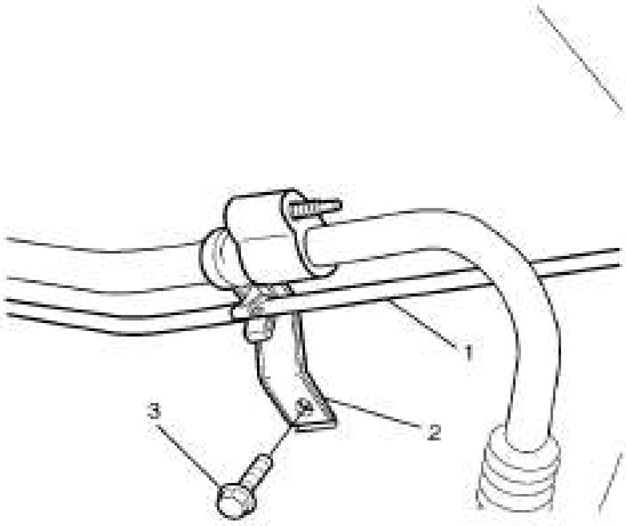
6. Attach the suction pipe (2) and the liquid pipe (3) from the suction pipe/liquid pipe retaining clip (1).



7. Remove the plugs or caps from the suction pipe upper (1) and the suction pipe lower (2).

Important: DO NOT coat the NEW sealing washer (3) with oil, they must be fitted dry. The use of mineral oil will render the sealing washer (3) useless, as the sealing washer (3) WILL swell causing refrigerant to leak out.

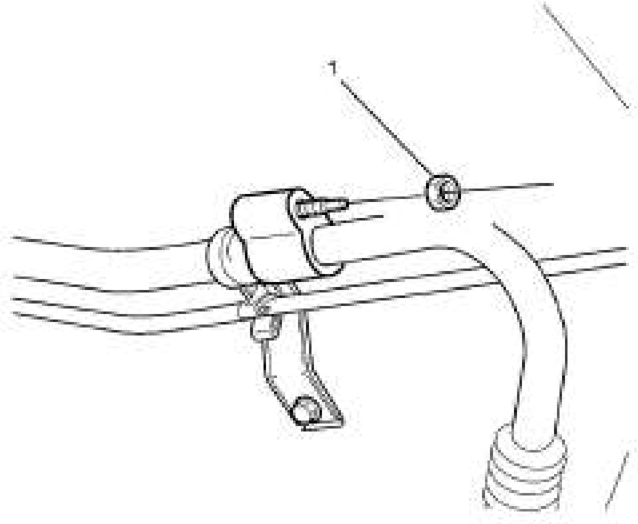
8. Install a NEW sealing washer (3). Refer to Sealing Washer Replacement.
9. Install the suction pipe upper (1) to the suction pipe lower (2).



10. Attach the liquid pipe (1) from the suction pipe/liquid pipe retaining clip (2).

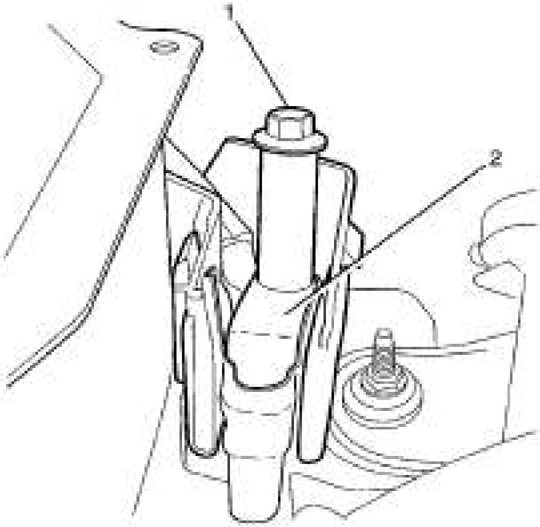
11. Install the suction pipe/liquid pipe retaining clip to left front chassis rail retaining bolt (3).

    Tighten
    Tighten the bolt to 22 N·m(16 lb ft).



12. Install the suction pipe upper to suction pipe lower retaining nut (1).

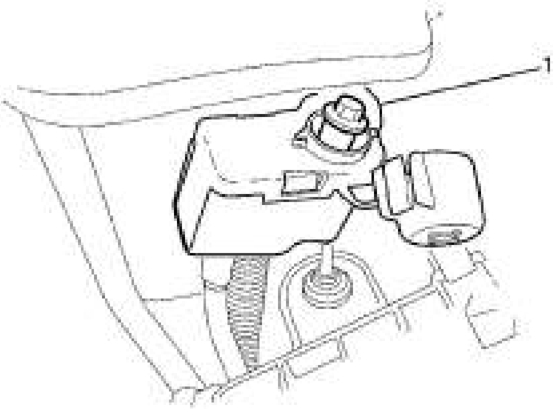
    Tighten
    Tighten the nut to 22 N·m(16 lb ft).



13. Install the starter motor positive cable (2) to the remote battery positive post.

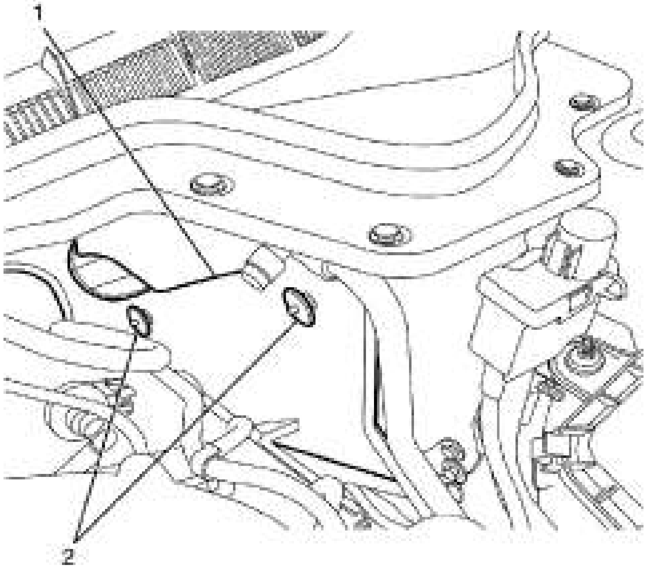
14. Install the remote battery positive post to wiring harness retaining bolt (1).

Tighten
Tighten the bolt to 15 N·m (11 lb ft).

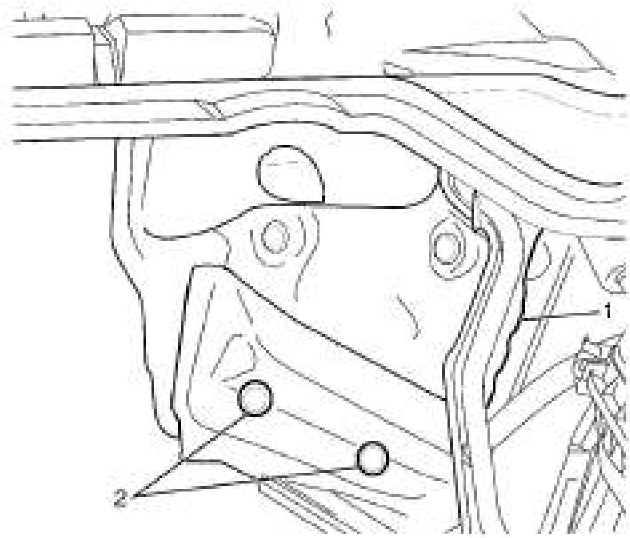


Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

15. Install the remote battery positive post cover (1) to the remote battery positive post.



16. Install the insulation panel (1) to the left rear side engine compartment.
17. Install the insulation panel to air box retaining clips (2).



18. Install the exhaust manifold heat shield (1).
19. Install the exhaust manifold heat shield to air box retaining clips (2).
20. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
21. Install the air filter assembly. Refer to Air Cleaner Assembly Replacement.
22. Install the engine cover. Refer to Engine Cover Replacement.
23. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
24. Evacuate and recharge the A/C system. Refer to Refrigerant Recovery and Recharging.
25. Leak test the fittings of the component using electronic leak detector.

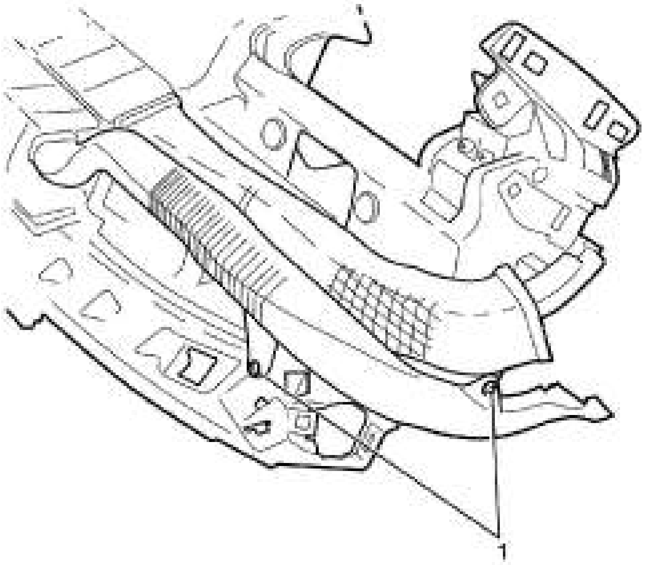
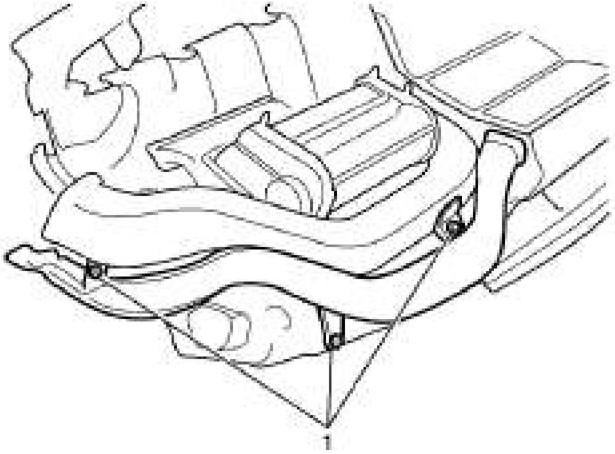
Windshield Defroster Duct Replacement

Removal Procedure

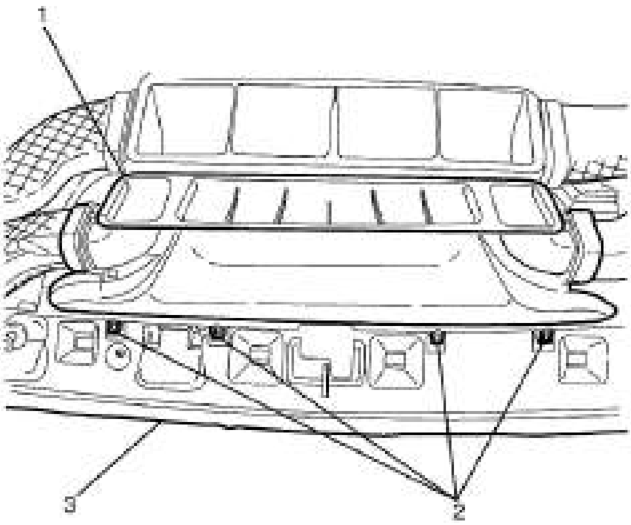
1. Remove the instrument panel (I/P) upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement .



2. Remove the air outlet duct to I/P upper trim pad retaining screws (1).

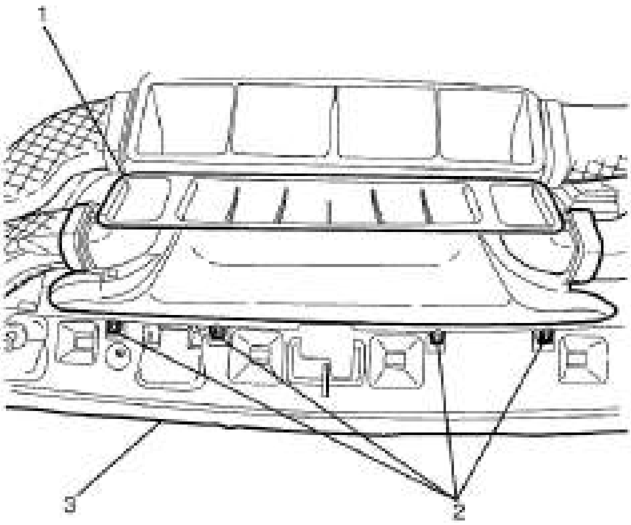


3. Remove the air outlet duct to I/P upper trim pad retaining screws (1).



4. Disengage the defroster duct to instrument panel (I/P) upper trim pad retaining clips (2)
5. Remove the defroster duct assembly (1) from the I/P upper trim pad (3).

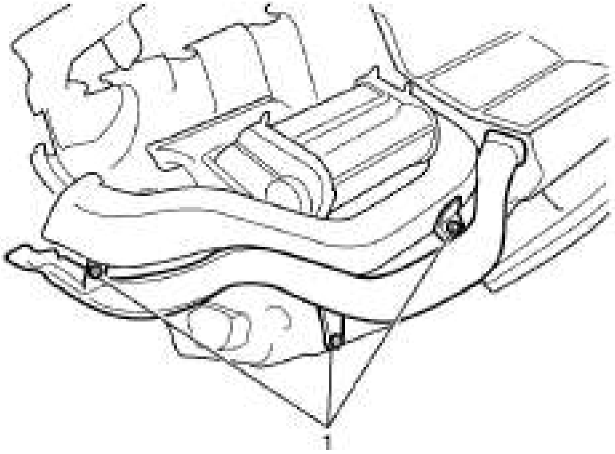
Installation Procedure



Important: Make sure the defroster duct to instrument panel (I/P) upper trim pad retaining clips (2) are engaged to avoid an induced rattle condition.

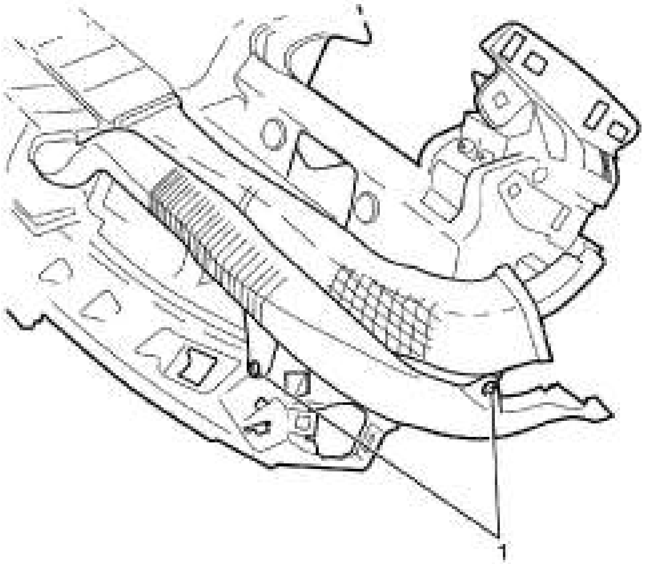
1. Install the defroster duct assembly (1) to the instrument panel (I/P) upper trim pad (3).

Notice: Refer to Fastener Notice in the Preface section.



2. Install the air outlet duct to I/P upper trim pad retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m(18lb in).



3. Install the air outlet duct to I/P upper trim pad retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m(18lb in).

4. Install the I/P upper trim pad. Refer to Instrument Panel Upper Trim Pad Replacement .

Heating and Air Conditioning System Description and Operation

The air temperature controls are divided into 4 areas:

- HVAC Control Components
- Heating and A/C Operation
- Engine Coolant
- A/C Cycle

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The HVAC module assembly is operated manually by a combination of electrical and mechanical components. The case is of a 3-piece, plastic construction. The left and right cases are assembled with a centre divider that houses the doors and are secured together with screws. The case sump is secured to the upper case assembly with screws. The blower resistor is integrated into the HVAC control module which is screwed to the HVAC blower motor fan assembly, which in turn is secured to the HVAC unit with a combination of pivot pins and screws.

A/C Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5-volt reference, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0-5 volts. When the A/C refrigerant pressure is low, the signal value is near 0 volts. When the A/C refrigerant pressure is high, the signal value is near 5 volts. The engine control module (ECM) converts the voltage signal to a pressure value.

It provides a 0-5 volt output and requires a 5-volt regulated power supply. In operation, the transducer senses applied pressure via the deflection of a 2 piece ceramic diaphragm with one half being a parallel plate capacitor. Changes in capacitance influenced by the refrigerant pressure under the ceramic diaphragm are converted to an analogue output by the transducers integral signal electronics. The pressure transducer's electronics are on a flexible circuit board contained in the upper section of the transducer. They provide linear calibration of the capacitance signal from the ceramic sensing diaphragm. Benefits of using the pressure transducer over a normal type pressure switch is that the transducer is constantly monitoring pressures and sending signals to the ECM. The normal type pressure switch only has an upper and lower cut out point. The ECM will disengage the A/C compressor at low or high refrigerant pressures and electronic diagnostic equipment can be used to extract system pressure information making it easier when diagnosing concerns. As well as acting as an input to the ECM for A/C operation, the ECM also uses the information provided by the pressure transducer to determine when to turn ON and OFF the 2nd Stage cooling fan operation.

A/C Pressure Sensor Operation

Low Pressure Cut Out 180 kPa (26 psi)
Low Pressure Cut In 240 kPa (35 psi)
High Pressure Cut Out 2900 kPa (420 psi)
High Pressure Cut In 2000 kPa (290 psi)
1st Stage Fan Operation On 1517 kPa (220 psi)
1st Stage Fan Operation Off 1214 kPa (176 psi)
2nd Stage Fan Operation On 1758 kPa (255 psi)
2nd Stage Fan Operation Off 1517 kPa (220 psi)

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windshield fogging. The vehicle operator can determine the compartment temperature by adjusting the air temperature switch. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Recirculation actuator setting.
- Difference between inside and desired temperature.
- Difference between ambient and desired temperature.
- Blower motor speed setting.
- Mode setting.

The A/C system can be engaged by pressing the A/C switch. The A/C switch will illuminate when the A/C switch is pressed to the ON position. Pressing the A/C switch, the IRC (Radio) sends switch information via GMLAN to the HVAC. The HVAC unit then requests permission to engage the compressor from the ECM. Upon receiving permission from the ECM, the HVAC then engages the compressor.

- A/C Pressure is between 196 kPa (28 psi) and 3250 kPa (470 psi).
- Engine coolant temperature (ECT) is less than 119°C (250°F)..
- Engine RPM is more than 400 RPM.
- The A/C request signal is set to engage.

Once engaged, the compressor will be disengaged for the following conditions:

- A/C Pressure is more than 3250kPa (470 psi)..
- A/C Pressure is less than 196 kPa (28 psi).
- ECT is more than 119°C (246°F).
- Throttle position is over 95 percent.
- Transmission shift
- ECM detects higher than predicted torque load.
- ECM detects insufficient idle quality.
- ECM detects a hard launch condition.

A/C Request Signal and A/C Control

The compressor is an externally controlled variable displacement (ECVD) compressor. The HVAC controls the compressor displacement with a pulse width modulated (PWM) signal. When the A/C switch is pressed, the HVAC requests permission to engage the compressor from the ECM. The ECM must grant this permission before the HVAC can engage the compressor. The BCM acts as a gateway to pass these messages on GMLAN between the HVAC (LS bus) and ECM (HS bus). If the conditions listed above are not met, the engine will not grant this permission and A/C will remain at approximately 4 cc (OFF). The A/C indication (LED/Icon) will remain ON. If A/C pressure is below 196 kPa the A/C will be reduced back to approximately 4 cc (turned OFF) and the A/C indication (LED/Icon) will turn OFF. This is a normal condition in very cold ambient temperatures. While the compressor is running the HVAC transmits a Normalised Load value (representing compressor torque) to the ECM. The ECM uses this value to manage engine torque requirements and maintain idle stability. The A/C will be reduced back to approximately 4 cc (turned OFF) if the HVAC fan is turned to zero (OFF).

Heater Core

The heater core is located within the HVAC case. The engine coolant flows through the heater core providing heat to warm the vehicle interior and to provide windscreen defogging. The heater core is of a tube and fin design and is constructed of aluminium. It is fitted with a detachable inlet and outlet pipe assembly. Each pipe is attached and sealed to the heater core. Sealing foam is bonded to the sides and around the top of the heater core to prevent air leakage from the HVAC case and to make sure that all air passes through the heater core in the full hot mode.

Radiator

The radiator is a heat exchanger. It consists of a core and 2 tanks. The aluminium core is a down flow tube and fin design. This is a series of tubes that extend vertically down from the inlet tank to the outlet tank. Fins are placed around the outside of the tubes to increase heat transfer from the coolant to the atmosphere. The inlet and outlet tanks are moulded with a high temperature, nylon reinforced plastic. A high temperature rubber gasket seals the tank flange edge. The tanks are clamped to the core with clinch tabs. The tabs are part of the aluminium header at each end of the core.

The radiator removes heat from the coolant passing through it. The fins on the core absorb heat from the coolant passing through the tubes. As air passes between the fins, it absorbs heat and cools the coolant.

During vehicle use, the coolant heats and expands. The coolant that is displaced by this expansion flows into the recovery reservoir bottle. As the coolant circulates, air is allowed to exit. This is an advantage to the cooling system. Coolant without bubbles absorbs heat much better than coolant with bubbles.

Evaporator

The evaporator is located inside the vehicle housed behind the instrument panel fascia in the HVAC case. It is constructed of aluminium and is of a plate and fin design. The evaporator core is the actual cooling unit of the A/C system. As the low pressure, low temperature refrigerant enters the evaporator, it begins to boil and evaporate. This evaporation process absorbs heat from the air being circulated through the evaporator core by the blower fan. Due to the evaporator being so cold, condensation forms on the surface. This condensation is moisture taken from the air (humidity). Also any dust particles in the air passing through the evaporator become lodged in the condensate water droplets, thus filtering the air from contaminants. The evaporator is constructed of aluminium and is fitted with a detachable inlet and outlet pipe assembly. It is attached and sealed to the evaporator by a single bolt and sealing washers.

Condenser

The purpose of the condenser is the opposite of the evaporator. The condenser receives high pressure, high temperature refrigerant vapour from the compressor. It is exposed to a flow of ram air from the movement of the vehicle and as the high pressure high temperature vapour flows inside the condenser tubes, heat is given off to the cooler ambient air flowing past the condenser core. The vapour then condenses into a high pressure, high temperature liquid. Two cooling fans fitted to the rear of the radiator, are activated when required to assist in drawing cool air through the condenser.

Receiver Dehydrator

The receiver dehydrator acts as a particle filter, refrigerant storage container and most importantly, a moisture absorber. Moisture, temperature and R-134a causes hydrofluoric and hydrochloric acid. The silica gel beads (desiccant) located in the filter drier receiver absorb small quantities of moisture thus preventing acid establishment.

Thermal Expansion Valve (TXV)

The thermal expansion valve (TXV) controls refrigerant gas flow to the evaporator and make sure that complete evaporation takes place. It has 2 refrigerant passages. One is in the refrigerant line from the condenser to the evaporator and contains a ball and spring valve. The other passage is in the refrigerant line from the evaporator to the compressor and contains the temperature sensing element.

TXV Opening

As the non-cooled refrigerant from the evaporator core flows through the TXV outlet (suction), it makes contact with the underside of the thin metallic diaphragm and reacts on the refrigerant contained above that diaphragm. This refrigerant then expands, forcing the pin downwards and moving the ball off its seat, then compressing the spring and allowing more refrigerant to enter the evaporator.

TXV Closing

Operation is similar to opening but now the refrigerant from the evaporator is cold. The refrigerant contained above the diaphragm now contracts. The ball moves towards the seat aided by the compressed spring, reducing refrigerant flow. Low pressure liquid R-134a passing through the evaporator should be completely vaporized by the time it reaches the TXV outlet side. The TXV is installed in the engine bay to the right side of the instrument panel.

Compressor

The Denso compressor can match the air conditioning demand under all conditions without cycling. The basic compressor mechanism is a variable angle swash-plate with 6 axially oriented cylinders. The compressor has a pumping capacity of 160 cc.

The electronic control valve is installed in the compressor rear head. The swash-plate angle of the compressor and the resultant compressor displacement, are determined by the compressor crankcase to suction pressure differential which is governed by the control valve.

When the A/C capacity demand is low, the crankcase pressure behind the pistons is equal to the pressure in front of the pistons. This forces the swash plate to change its angle to towards vertical which reduces the stroke of the pistons and reduces the output of the compressor to approximately 4 cc. The evaporator cooling load is reduced, ambient temperature or blower fan speed is reduced and therefore, the suction pressure is reduced until it reaches the control point. To reach the control point, the electronic control valve assembly allows discharge pressure to bleed past the control valve ball valve seat and into the compressor crankcase. This crankcase pressure acts as an opposing force behind the compressor pistons to cause the swash plate to change its angle towards vertical and therefore, reduce piston stroke.

When the A/C capacity demand is high, the crankcase pressure behind the pistons is less than the pressure in front of the pistons. This forces the swash plate to change its angle away from vertical which increase the stroke of the pistons. The compressor will then have a corresponding increase in its displacement.

Engine Coolant

The engine coolant is a solution made up of a 50-50 mixture of DEX-COOL and clean fresh water. The coolant solution carries excess heat away from the engine to the radiator, where the heat is dissipated to the atmosphere.

Cooling Fan Operation

The cooling fans operate in two stages; in both stages both fans run. In stage 1 the two fan motors are connected in series so both fans run at low speed. In stage 2 each fan motor is connected to battery voltage so both fans run at high speed. Cooling fan operation is controlled by the engine control module (ECM) based on inputs from the following:

- The A/C request signal
- The vehicle speed sensor (VSS)
- The A/C refrigerant pressure sensor
- The engine coolant temperature (ECT) sensor

Stage One - Both Fans Operate at Low Speed

When the conditions for Stage 1 operation are met the ECM provides a ground to the coil of engine cooling fan relay 1, causing it to operate (turn ON). The fan current path is then from the battery via the large radiator fan fuse, through the large fan motor, cooling fan relay 2, the small fan motor and cooling fan relay 1 to ground.

The conditions for Stage 1 operation are:

- There is an A/C request and:
- Vehicle speed is less than 30 km/h (19 mph)
- A/C refrigerant pressure is greater than 1517 kPa (220 psi).
- ECT is greater than 98°C (208°F).

- ECT is greater than 113°C (235°F) when the engine is switched off (in this case stage 1 will operate for approximately four minutes - this is referred to as low fan run-on).
- An ECT sensor fault is detected and a DTC is set.

Stage 1 operation will cease when:

- There is no A/C request and the ECT is less than 95°C (203°F).
- There is an A/C request and the vehicle speed is greater than 50 km/h (31 mph) and the A/C pressure is less than 1214 kPa (176 psi) and the ECT is less than 95°C (203°F).
- The vehicle speed is greater than 104 km/h (65 mph).

Stage Two - Both Fans Operate at High Speed

When the conditions for Stage 2 operation are met the ECM provides - in addition to that already provided for the coil of engine cooling fan relay 1 - a ground to the coils of engine cooling fan relays 2 and 3, causing them to operate (turn ON). For the large fan, the current path is then from the battery via the large radiator fan fuse, through the large fan motor and engine cooling fan relay 2 to ground. For the small fan, the current path is from the battery via the small radiator fan fuse, through engine cooling fan relay 3, through the small fan motor and engine cooling fan relay 1 to ground. The conditions for Stage 2 operation are:

- The A/C refrigerant pressure is greater than 1758 kPa (255 psi).
- The ECT is greater than 108°C (226°F).
- An ECT sensor fault is detected and a DTC is set.

If stage 1 operation is off when the conditions for stage 2 operation are met, stage 2 operation will be initiated five seconds after initiation of Stage 1 operation.

Stage 2 operation will cease and revert to Stage 1 operation when:

- The ECT is less than 102°C (216°F).
- There is no A/C request.
- There is an A/C request and the A/C refrigerant pressure is less than 1517 kPa (220 psi).
- The vehicle speed is greater than 104 km/h (65 mph).

A/C Cycle

Refrigerant is the key element in an air conditioning system. R-134a is a very low temperature gas that can transfer the undesirable heat and moisture from the passenger compartment to the outside air.

The A/C system used on this vehicle is a non-cycling system. Non-cycling A/C systems use a high pressure switch to protect the A/C system from a predetermined pressure. The high pressure switch will OPEN the electrical signal to the compressor if the refrigerant pressure becomes higher than required. After the high and the low sides of the A/C system pressure equalise, the high pressure switch will CLOSE. This completes the electrical circuit to the compressor . The A/C system is also mechanically protected with the use of a high pressure relief valve. If the high pressure switch were to fail or if the refrigerant system becomes restricted and refrigerant pressure continues to rise, the high pressure relief will pop open and release refrigerant from the system.

The A/C compressor is belt driven . The compressor builds pressure on the vapour refrigerant. Compressing the refrigerant also adds heat. The refrigerant is discharged from the compressor through the discharge hose, and forced through the condenser and then through the balance of the A/C system.

Compressed refrigerant enters the condenser at a high-temperature, high-pressure vapour state. As the refrigerant flows through the condenser, the heat is transferred to the ambient air passing through the condenser. Cooling causes the refrigerant to condense and change from a vapour to a liquid state.

The condenser is located in front of the radiator for maximum heat transfer. The condenser is made of aluminium tubing and aluminium cooling fins, which allows rapid heat transfer for the refrigerant. The semi-cooled liquid refrigerant exits the condenser and flows through the liquid line to the thermal expansion valve (TXV).

The TXV is located at the evaporator inlet. The TXV is the dividing point for the high and the low pressure sides of the A/C system. As the refrigerant passes through the TXV, the pressure on the refrigerant is lowered, causing the refrigerant to vaporise at the TXV. The TXV also measures the amount of liquid refrigerant that can flow into the evaporator.

Refrigerant exiting the TXV flows into the evaporator core in a low-pressure, liquid state. Ambient air is drawn through the HVAC module and passes through the evaporator core. Warm and moist air will cause the liquid refrigerant to boil inside the evaporator core. The boiling refrigerant absorbs heat from the ambient air and draws moisture onto the evaporator. The refrigerant exits the evaporator through the suction line and flows back to the compressor in a vapour state, completing the A/C cycle of heat removal. At the compressor, the refrigerant is compressed again and the cycle of heat removal is repeated.

The conditioned air is distributed through the HVAC module for passenger comfort. The heat and moisture removed from the passenger compartment condenses, and discharges from the HVAC module as water.

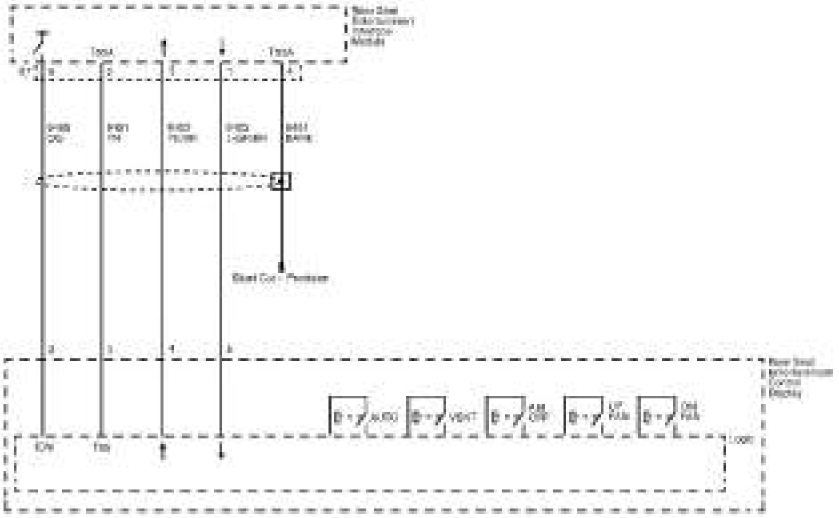
Rear Seat Controls



Diagnostic System Check - HVAC Systems - Automatic

Perform the Diagnostic System Check - Vehicle , prior to using this diagnostic procedure.

Important: The following steps must be completed before using the symptom tables.

1. Confirm the customer concern.
   - Review the service/repair history of the HVAC for prior work carried out.
   - Note the positions of the HVAC control settings.
   - Does the concern happen at certain speeds, rpm or length of driving?
2. Carry out Visual Inspection.
   - Broken, jammed or disconnected HVAC levers or gears.
   - HVAC case damage.
   - A/C system oil stains.
   - Noisy operating components.
   - Accessories blocking airflow.
   - Evidence of vehicle/component abuse.
   - Contamination, such as leaves in blower.
3. Check the battery voltage with a multimeter as the minimum voltage for the HVAC Control Module (HCM) operation is 9 volts and the maximum is 16 volts.
4. Take A/C System Pressure and Face Vent Temperature Readings.
   - Information to be used when diagnosing poor outlet temperature, either hot or cold.
   - A/C performance - Take readings at idle and at 2,000 rpm. Compressor High side pressure should increase at higher rpm.
5. Connect the Scan Tool.
   - Select appropriate vehicle and HVAC level.
   - Check that the HVAC is configured correctly for the vehicle. Refer to Instrument Cluster Programming and Setup .
6. Go to Function 1: Normal Mode - F1, F2, F3, F4. Check and Note any DTC's both current and history for all modules.

   Important: The HVAC control module receives and uses information from the other modules within the vehicle. This information is communicated via GMLAN. Poor performance of the GMLAN or another module can affect the function of the HVAC control module.

7. Go to F4: Miscellaneous Tests - F1 Switch Data. Carry out component activation via scan tool.

   Important: This test will activate the component or function directly from the scan tool and if the component will activate during this test, but not by using the Infotainment facia. This will indicate a faulty Infotainment facia , GMLAN error, sub system module or wiring fault.

DTC B013B

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B013B 00: Coil Compressor Stroke Control Circuit

Circuit / System Description

The A/C system uses a clutchless variable stroke compressor with an electrical control valve which is used to alter the displacement of the compressor, this process is known as electronic control valve displacement (ECVD). ECVD at the compressor is controlled by pulse width modulated (PWM) signal supplied by the HVAC control module via the A/C compressor supply voltage circuit. When the A/C button is pressed, the HVAC control module grounds the A/C compressor low reference circuit completing the circuit and in turn allowing the compressor to operate. The signal returned to the HVAC control module via the A/C low reference circuit is also used in comparison to the supplied signal to confirm correct compressor operation and ECVD positioning.

Conditions for Running the DTC

- System voltage is between 9 - 16 Volts.
- Ignition switch is in the ON position.

Conditions for Setting the DTC

The DTC will set when the A/C compressor is operating and the evaporator temperature fails to drops 5 degrees or more within a 30 second time period.

Action Taken When the DTC Sets

The A/C compressor circuits are deactivated.

Conditions for Clearing the DTC

- The DTC becomes history after the condition for setting the DTC is no longer present.
- The history DTC clears after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Scan Tool Reference

Control Module References

Circuit/System Verification

Ignition ON, A/C ON, blower speed HIGH, temperature set to COLD, mode set to PANEL. Using a scan tool, observe that the evaporator temperature drops by more than 5° C over a 1 minute period. Useing the scan tool command the ECVD compressor ON it will engage at maximum displacement - this should register on the scan tool display as a PWM of approximately 82%, after 6 seconds the ECVD compressor will automatically disengage and PWM will return to 0%.

Circuit/System Testing

1. Disconnect the HVAC control module X1 electrical connector.
2. Test the A/C compressor clutch low reference circuit terminal 6 for a short to ground, voltage or an open/high resistance.
3. Test the A/C compressor clutch supply voltage circuit terminal 7 for a short to ground, voltage or an open/high resistance.

   If all circuits test normal, replace the HVAC control module.

Component Testing

Ignition OFF, disconnect the ECVD compressor harness connector and measure the component resistance. Verify that 8.5Ω - 15.7Ω is displayed. If outside of the specified range, replace the ECVD compressor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Air Conditioning Compressor Replacement
- Control Module References for HVAC control module replacement, setup, and programming.

DTC B0158 or B0168 (Current)

Diagnostic Instructions

DTC Descriptors

DTC B0158 03: Outside Air Temperature Sensor Circuit Voltage Below Threshold

DTC B0158 07: Outside Air Temperature Sensor Circuit Voltage Above Threshold

DTC B0168 03: Passenger Compartment Temperature Sensor Voltage Below Threshold

DTC B0168 07: Passenger Compartment Temperature Sensor Voltage Above Threshold

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ambient Air Temperature Sensor Circuit	B0158 03	B0158 07	B0158 07	--
Inside Air Temperature Sensor Circuit	B0168 03	B0168 07	B0158 07	--

Circuit Description

The HVAC control module monitors the air temperature sensors with a low reference circuit and 5-volt signal circuit. The HVAC control module monitors the voltage drop across the sensor. When the ambient air temperatures are cold, the resistance of the sensor is high and the voltage signals are high. When the ambient air temperatures are hot, the resistance of the sensors is low and the voltage signals are low.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

- The HVAC control module detects the sensor signal circuit is less than -35°C (-39°F).
- The HVAC control module detects the sensor signal circuit is greater than 85°C (185°F).

Action Taken When the DTC Sets

B0158

- The DIC display will display "-" for outside air temperature.
- The system operates using a default value.
- A warning will display on the Driver Information Center (DIC) "Service Air Conditioning System ".

B0168

- The system operates using a default value.
- A warning will display on the Driver Information Center (DIC) "Service Air Conditioning System ".

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The HVAC control module automatically clears the history DTC when a current DTC is not detected in 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Scan Tool Reference

Control Module References

Circuit/System Verification

Ignition ON, observe the appropriate scan tool Air Temp Sensor parameter. The reading should be between -35°C (-39°F) and 85°C (185°F) and change with air temperature changes.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate air temperature sensor.
2. Ignition OFF, test for less than 10 ohms between the following low reference circuit terminal and ground.
   - Outside air temperature sensor terminal A
   - Inside air temperature sensor terminal B

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the HVAC control module.
3. Ignition ON, verify the appropriate scan tool Air Temp Sensor parameter is less than -35°C (-39°F).

   If greater than the specified range, test the following signal circuit terminal for a short to ground. If the circuit tests normal, replace the HVAC control module.
   - Outside air temperature sensor terminal B
   - Inside air temperature sensor terminal A
4. Install a 3A fused jumper wire between the following signal circuit terminal and the low reference circuit terminal. Verify the scan tool Air Temp Sensor parameter is greater than 85° C (185°F).
   - Inside air temperature sensor terminal Aand B.
   - Ambient temperature sensor terminal B and A.

   If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
5. If all circuits test normal, test or replace the air temperature sensor.

Component Testing

Ignition OFF, remove the appropriate temperature sensor and perform a resistance test across the sensor terminals. Verify that the resistance readings correspond with those in the sensor resistance tables. If outside of the specified range, replace the appropriate sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Ambient Air Temperature Sensor Replacement
- Inside Air Temperature Sensor Replacement

DTC B0183 or B0188

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B0183 03: Left Solar Load Sensor 1 Circuit Voltage Below Threshold

DTC B0183 07: Left Solar Load Sensor 1 Circuit Voltage Above Threshold

DTC B0188 03: Right Solar Load Sensor 2 Circuit Voltage Below Threshold

DTC B0188 07: Right Solar Load Sensor 2 Circuit Voltage Above Threshold

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Solar Load Sensor 1 Circuit	B0183 03	B0183 07	B0183 07	--
Right Solar Load Sensor 2 Circuit	B0188 03	B0188 07	B0188 07	--

Circuit Description

The sunload sensor is a photo diode. The vehicle uses left and right sunload sensors. The two sensors are integrated into the sunload sensor assembly along with the ambient light sensor. Ground and signal circuits enable the sensors to operate. As the sunload increases, the sensor signal decreases. The sensor signal varies between 0 and 5 volts. The HVAC control module converts the signal to a range between 0 and 3906.6 W/m². The sunload sensor provides the HVAC control module with a measurement of the amount of light shining on the vehicle. Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle. The following DTCs are for the left and right sunload sensors.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The HVAC control module detects the signal circuit is less than 0 W/m² or greater than 3900

W/m².

Action Taken When the DTC Sets

- If the DTC is set the system will act as if no sunload condition exists.
- A warning will display on the Driver Information Center (DIC) "Service Air Conditioning System"

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the sunload sensor.
2. Ignition OFF, test for less than 10 ohms between the low reference circuit terminal C and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the HVAC control module.
3. Ignition ON, verify the scan tool Sun Load Sensor parameter is greater than 3900.0 W/m².

   If less than the specified range, test the signal circuit terminal listed below for a short to ground. If the circuit tests normal, replace the HVAC control module.

   - Left solar load sensor circuit terminal A.

  - Right solar load sensor circuit terminal B.
4. Install a 3A fused jumper wire between the signal circuit terminal A or B and the low reference circuit terminal C. Verify the scan tool Sun Load Sensor Parameter is less than 1 W/m².

   If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
5. If all circuits test normal, test or replace the sunload sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Sunload and Twilight Sentinel Sensor Replacement
- Control Module References for HVAC control module replacement, setup, and programming.

DTC B0193

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B0193 06: Blower Motor not Operating, Short to Ground or Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Blower Motor control	B0193 06	B0193 06	--	--

Circuit Description

The blower motor speed control, battery positive and ground circuits enable the control module to operate. The HVAC control module provides a pulse width modulation signal to the blower motor in order to command the blower motor speed.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is between 9-16 volts.
- The HVAC module is ON.

Conditions for Setting the DTC

The blower motor draws more amperage than the HVAC control module is calibrated for.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Circuit / System Description

The actuators operate using 5 circuits. A 12-volt reference, low reference, signal circuit and two bi-directional 0 or 12 volt control circuits. The HVAC control module supplies a low reference and 12-volt reference to the potentiometer. The HVAC control module monitors the voltage drop across the potentiometer on the door position signal circuit. As the actuator door changes position the door position signal circuit voltage also changes. The two bi-directional control circuits enable the actuator to operate. Both circuits are set to 0 volts when the HVAC control module detects, from the feedback potentiometer, that the actuator is in the desired position. In order to move the actuator, the HVAC control module switches the appropriate control circuit to 12 volts.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is between 9-16 volts.
- The HVAC module is ON.

Conditions for Setting the DTC

Sub Code: 29

- The HVAC control module detects the door position signal circuit is supplying too few pulses.
- Door position signal circuit has an open/high resistance.
- Actuator door control lever is jammed.

Sub Code: 2A

- The HVAC control module detects the door position signal circuit is supplying too many pulses.
- Actuator door control lever is disconnected.

Sub Code: 61

- The HVAC control module fails to detect any signal from the door position signal circuit.
- Door position signal circuit has an open/high resistance.
- Actuator position sensor failure.
- Actuator door control lever is jammed.

Action Taken When the DTC Sets

- The actuator driver circuits are deactivated.
- The HVAC control module will set the appropriate code.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared with a scan tool.

Scan Tool Reference

Control Module References

Circuit/System Verification

- Access the appropriate actuator door and visually inspect movement when requested from the infotainment fascia.
- Using a scan tool, select actuator testing and visually inspect actuator door movement.
- Visually inspect actuator door pivots for evidence of breakage or damage.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate actuator.
2. Ignition OFF, test for less than 10 ohms between the low reference circuit terminal 3 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the HVAC control module.
3. Ignition ON, test for 11.5-13.5 volts between the 12-volt reference circuit terminal 5 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the HVAC control module.

   If greater than the specified range, test the 12-volt reference circuit for a short to voltage.

If the circuit tests normal, replace the HVAC control module.

4. Verify the scan tool Door Position parameter is greater than 250 counts.

   If less than the specified range, test the signal circuit terminal 4 for a short to ground. If the circuit tests normal, replace the HVAC control module.

5. Install a 3A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 3. Verify the scan tool Door Position parameter is less than 3 counts.

   If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the HVAC control module.

6. Ignition OFF, test for less than 10 ohms between the control circuit terminal 1 and ground.

   If greater than the specified range, test the control circuit for a short to voltage or an open/high resistance. If circuit tests normal, replace the HVAC control module.

7. Ignition OFF, test for less than 10 ohms between the control circuit terminal 2 and ground.

   If greater than the specified range, test the control circuit for a short to voltage or an open/high resistance. If circuit tests normal, replace the HVAC control module.

8. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2.
9. Ignition ON, command the appropriate actuator door in both directions with a scan tool. The test lamp should turn ON and OFF when commanded in both directions.

   If the test lamp remains OFF during either of the commands, test for a short to ground on either control circuit. If the circuits test normal, replace the HVAC control module.

10. If both circuits test normal, test or replace the actuator.

Repair Instructions

Important: Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- HVAC Control Module Programming and Setup
- Recirculation Actuator Replacement
- Temperature Valve Actuator Replacement - Left Side
- Temperature Valve Actuator Replacement - Right Side
- Auxiliary Temperature Valve Actuator Replacement
- Defroster Valve Actuator Replacement
- Floor Air Valve Actuator Replacement

DTC B1325

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1325: Device Power Circuit

Circuit/System Description

With the ignition in either the ACC or ON positions, the HVAC control module should receive a 12V power supply. DTC B1325 will set to indicate the B+ positive supplied to the AHLL control module is below the threshold.

Conditions for Setting the DTCs

This DTC runs continuously once the following condition is met:

The supplied power to the HVAC control module is between 9 - 16V.

Action Taken When the DTC Sets

A warning lamp will illuminate.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Circuit/System Testing

1. Ignition OFF, wait for 30 seconds.
2. Ignition ON, using the scan tool, select the DTC display function. Verify that DTC B1325 is set to current.
3. Ignition OFF, disconnect the HVAC control module harness connector.
4. Ignition ON, test for B+ between the battery positive voltage circuit at the HVAC control module harness connector and a known ground.

   If not within specified range, test the battery positive voltage circuit for an open/high resistance. If the circuit tests normal replace the HVAC control module.

Repair Instructions

Perform the Diagnostic Repair Verification , after completing the diagnostic procedure.

HVAC Control Module Replacement

DTC B3933

DTC Descriptors

DTC B3933 03: Evaporator Temperature Sensor Voltage Below Threshold

DTC B3933 07: Evaporator Temperature Sensor Voltage Above Threshold

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle , prior to using this diagnostic procedure.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Evaporator Temperature Sensor Signal	B0183 03	B0183 03	B0183 07	--
Low Reference	--	B0183 07	B0183 07	--

Circuit Description

The HVAC control module monitors the evaporator temperature via the evaporator temperature sensor. When the air is cold, the sensor resistance and signal voltage are high. When the air is warm, the sensor resistance and signal voltage are low.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The HVAC control module detects the evaporator temperature sensor signal circuit is less than 0.09 volt (5 counts) or greater than 4.90 volts (250 counts).

Action Taken When the DTC Sets

- A warning will display on the Driver Information Centre (DIC) "SERVICE A/C SYSTEM"
- The A/C compressor will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared with a scan tool.

Circuit/System Verification

Ignition ON, using a scan tool, observe the evaporator temperature sensor parameter. The scan tool should display between 0.09 and 4.90 volts.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the evaporator air temperature sensor.
2. Ignition OFF, test for less than 10 ohms between the low reference circuit terminal A and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the HVAC control module.
3. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal A and low reference circuit terminal B.

   If less than the specified range, test the signal circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the HVAC control module.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the HVAC control module.
4. If all circuits test normal, test or replace the evaporator air temperature sensor.

Repair Instructions

Important: Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- HVAC Control Module Programming and Setup
- Air Valve Actuator Control Module Harness Replacement

DTC P0532 or P0533

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0532: Air Conditioning A/C Refrigerant Pressure Sensor Circuit Low Voltage

DTC P0533: Air Conditioning A/C Refrigerant Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference	P0532	P0532	P0533	--
A/C Refrigerant Pressure Sensor Signal	P0532	P0533	P0533	--
Low Reference	--	P0532	P0533	--

Circuit/System Description

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5-volt reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the ECM to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. When pressure is high, the ECM commands the cooling fans on. When pressure is too high or too low, the ECM will not allow the A/C compressor clutch to engage.

Conditions for Running the DTC

- Engine is running.
- Any of the conditions for setting the DTC are met for 15 seconds.
- Battery voltage is between 11-18 volts.

Conditions for Setting the DTC

- The ECM detects that the A/C pressure is less than 1 psi (0.01 volt).
- The ECM detects that the A/C pressure is more than 428 psi (4.92 volts).

Action Taken when the DTC Sets

DTCs P0532 or P0533 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0532 or P0533 are type B DTCs.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Description and Operation

Automatic HVAC Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References

Circuit/System Verification

Ignition ON, observe the scan tool A/C High Side Pressure Sensor parameter. The reading should be between 1 psi and 428 psi.

Circuit/System Testing

1. Ignition OFF, disconnect the A/C pressure sensor harness connector.
2. Ignition OFF, test for less than 1 ohm of resistance between the low reference circuit terminal and ground.

   If greater than 1 ohm, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal and ground.

   If less than 4.8 volts, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than 5.2 volts, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.

4. Verify the scan tool A/C High Side Pressure Sensor parameter is less than 428 psi.

   If greater than 428 psi, test the signal circuit terminal for a short to voltage. If the circuit tests normal, replace the ECM.

5. Install a 3-A fusible link wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the scan tool A/C High Side Pressure Sensor parameter is greater than 428 psi.

   If less than 428 psi, test the signal circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

6. If all circuits test normal, test or replace the A/C Pressure Sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement
- Control Module References

Air Delivery Improper

Step	Action	Yes	No
Schematic Reference: HVAC Schematics . DEFINITION: Air does not flow correctly from the air distribution outlets.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	Did you read Air Delivery Description and Operation?	Go to Step 3	Go to Air Delivery Description and Operation Manual or Air Delivery Description and Operation Automatic.
3	1. Start the engine. 2. Place the mode switch in the OFF position. Is the blower motor OFF?	Go to Step 4	Go to Blower Motor Always On .
4	Check for a jammed or broken actuator Is a door broken or jammed	Go to HVAC Module Assembly Replacement .	Go to Step 5
5	1. Place the mode switch in the vent position. 2. Place the blower motor switch in each speed position. Does the blower motor operate in any of the speed positions?	Go to Step 6	Go to Blower Motor Inoperative .
6	Does the blower motor operate at the desired speed?	Go to Testing for Intermittent Conditions and Poor Connections .	Go to Blower Motor Malfunction .

Air Recirculation Malfunction

Diagnostic Aid

- If the control A circuit of the recirculation actuator is shorted to ground, the following conditions will occur.
  - The recirculation actuator will operate properly when recirculation is requested.
  - The recirculation actuator will continually modulate between the outside air and recirculation positions when outside air is requested.
- If the control B circuit of the recirculation actuator is shorted to ground, the following conditions will occur.
  - The recirculation actuator will operate properly when outside air is requested.
  - The recirculation actuator will continually modulate between the outside air and recirculation positions when recirculation is requested.
- The condition may be intermittent. Refer to Testing for Intermittent Conditions and Poor Connections .
- Inspect the recirculation door and the recirculation actuator for the following conditions:
  - A misaligned recirculation actuator.
  - Refer to Recirculation Actuator Replacement .
  - Broken or binding linkages.
  - A broken or binding recirculation door.
  - An obstruction that prevents the recirculation door from operating within its full range of motion.
  - Missing seals to the recirculation door.
  - Misaligned seals to the recirculation door.

Step	Action	Yes	No
Schematic Reference: HVAC Schematics . *Connector End View Reference:* Component Connector End Views . DEFINITION: Air recirculation is inoperative or is always ON.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Turn ON the ignition, with the engine OFF. 2. Place the blower motor switch in the maximum speed position. 3. Place the mode switch in the bi-level position. 4. Place the recirculation switch in the outside air position. 5. Place the recirculation switch in the recirculation position. Do you hear an audible difference in the airflow when	Go to	

	the recirculation switch is placed in the recirculation position?	Diagnostic Aids	Go to Step 3
3	1. Place the recirculation switch in the outside air position. 2. Observe the drive shaft of the recirculation actuator. 3. Place the recirculation switch in the recirculation position. Does the drive shaft of the recirculation actuator rotate?	Go to Diagnostic Aids	Go to Step 4
4	1. Observe the drive shaft of the recirculation actuator. 2. With a scan tool, command the recirculation actuator to the recirculation position and to the outside air position. Does the drive shaft of the recirculation actuator rotate?	Go to Step 12	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the recirculation actuator. 3. Turn ON the ignition, with the engine OFF. 4. Probe the ignition 3 voltage circuit of the recirculation actuator with a test lamp that is connected to a good ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 13
6	1. Connect a test lamp between the ignition 3 voltage circuit and the door control A circuit of the recirculation actuator. 2. With a scan tool, command the recirculation actuator to the recirculation position and to the outside air position. Does the test lamp illuminate with either command?	Go to Step 7	Go to Step 8
7	1. Connect a test lamp between the ignition 3 voltage circuit and the door control B circuit of the recirculation actuator. 2. With a scan tool, command the recirculation actuator to the recirculation position and to the outside air position. Does the test lamp illuminate with either command?	Go to Step 10	Go to Step 9
8	Test the control A circuit of the recirculation actuator for an open, a high resistance, a short to ground or a short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 12
	Test the control B circuit of the recirculation actuator for an open, a high resistance, a short to ground or a short to voltage. Refer to Circuit Testing and Wiring		

9	Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 12
10	Inspect the recirculation door and the recirculation actuator for the following conditions: • A misaligned recirculation actuator. Refer to Recirculation Actuator Replacement . • Broken or binding linkages. • A broken or binding recirculation door. • An obstruction that prevents the recirculation door from operating within its full range of motion. • Missing seals to the recirculation door. • Misaligned seals to the recirculation door. Did you find and correct the condition?	Go to Step 16	Go to Step 11
11	Inspect for poor connections at the harness connector of the recirculation actuator. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 14
12	Inspect for poor connections at the harness connector of the HVAC control module. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 15
13	Repair the ignition 3 voltage circuit of the recirculation actuator. Refer to Wiring Repairs . Did you complete the repair?	Go to Step 16	--
14	Replace the recirculation actuator. Refer to Recirculation Actuator Replacement . Did you complete the replacement?	Go to Step 16	--
15	Replace the HVAC control module. Refer to Control Module References . Did you complete the replacement?	Go to Step 16	--
16	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Symptoms - HVAC Systems - Automatic

Important: Review the system operation in order to familiarise yourself with the system functions. Refer to:

- Air Delivery Description and Operation .
- Air Temperature Description and Operation .

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns and is not seized.
- The A/C compressor will not operate in cold outside air temperatures. Refer to Air Temperature Description and Operation .
- The following conditions may cause window fogging:
  - Wet carpet or mats.
  - High humidity.
  - Interior water leak.
  - Blocked A/C evaporator drain tube.
  - Maximum passenger capacity.
  - Blocked body pressure relief valves.
- Inspect the air distribution system for causes of reduced air flow:

  Blocked or damaged air inlet or outlet vents.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Too Cold in Vehicle .
- Too Hot in Vehicle .

Too Cold in Vehicle

Step	Action	Values	Yes	No
Schematic Reference: HVAC Schematics . *Connector End View Reference:* Component Connector End Views . DEFINITION: The temperature cannot be adjusted, or heating is insufficient.				
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	Check operation of air mix doors to make sure they are not jammed or broken Is the air mix door broken or jammed?	-	Go to HVAC Module Assembly Replacement .	Go to Step 3
3	Place the blower motor switch in each speed position. Does the blower motor operate in any speed position?	--	Go to Step 4	Go to Blower Motor Inoperative .
4	Does the blower motor operate at the desired speeds?	--	Go to Step 5	Go to Blower Motor Malfunction .
5	1. Start the engine. 2. Place the mode switch in the face position. 3. Place the recirculation switch in the ON position. 4. Observe the recirculation door. 5. Place the recirculation switch in the OFF position. Does the recirculation door move from the recirculation position to the outside air position?	--	Go to Step 6	Go to Air Recirculation Malfunction .
6	Place the passenger temperature switch in the OFF position. Does the Too Cold in vehicle condition occur when heating or defrosting is desired?	--	Go to Step 7	Go to Step 9
7	1. Start the engine. 2. Turn OFF the HVAC controls. Does the A/C compressor operate?	--	Go to Air Conditioning Compressor Replacement .	Go to Step 8

8	Inspect the cooling system for the following conditions: - A low coolant level. - A loose or worn accessory drive belt. - A leaking radiator hose or heater hose. - A kinked radiator hose or heater hose. - A missing radiator cap pressure seal. - A leaking radiator cap. Refer to Heating Performance Diagnostic . Did you find and correct the condition?	--	Go to Step 24	Go to Step 9
9	1. Place the mode switch in face position. 2. Turn ON the ignition, with the engine OFF. 3. Place the blower motor switch in the maximum speed position. 4. Inspect for airflow through the inside air temperature sensor by placing a 5 cm (2 in) square piece of paper over the sensor air inlet. Does the paper stay in place?	--	Go to Step 10	Go to Step 17
10	1. Install a thermometer near the inside air temperature sensor. 2. With a scan tool, observe the Inside Air Temp parameter in the Climate Control Panel data list. Does the scan tool indicate the sensor temperatures is within 3° C (5°F) of the thermometer temperature?	--	Go to Step 11	Go to Step 14
11	1. Turn OFF the ignition. 2. Cover the sunload sensor. 3. Turn ON the ignition. 4. With a scan tool, observe the Driver and Passenger Solar Sensor parameter in the Climate Control Panel	220 Counts		

	Open/Short data list. Is the Sunload Sensor parameter greater than the specified value?		Go to Step 12	Go to Step 18
12	1. Uncover the sunload sensor. 2. Direct a light source at the sunload sensor. 3. Observe the Driver and Passenger Sunload parameter. Do the counts change?	--	Go to Step 13	Go to Step 18
13	Test the resistance of the ambient air temperature sensor. Refer to Sensor Resistance Table . Is the resistance near the value in the Sensor Resistance Table?	--	Go to Testing for Intermittent Conditions and Poor Connections .	Go to Step 15
14	Test the resistance of the inside air temperature sensor. Refer to Sensor Resistance Table . Is the resistance near the value in the Sensor Resistance Table?	--	Go to Step 19	Go to Step 17
15	Inspect for poor connections at the harness connector of the ambient air temperature sensor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	--	Go to Step 24	Go to Step 17
16	Inspect the aspirator tube for a air leak or obstruction. Did you find and correct the condition?	--	Go to Step 24	--
17	Inspect for poor connections at the harness connector of the inside air temperature sensor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	--	Go to Step 24	Go to Step 20
18	Inspect for poor connections at the harness connector of the sunload sensor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the	--		

	condition?		Go to Step 24	Go to Step 22
19	Inspect for poor connections at the harness connector of the HVAC control module. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	--	Go to Step 24	Go to Step 23
20	Replace the inside air temperature sensor. Refer to Inside Air Temperature Sensor Replacement . Did you complete the replacement?	--	Go to Step 24	--
21	Replace the sunload sensor. Refer to Sun Load Sensor Replacement . Did you complete the replacement?	--	Go to Step 24	--
22	Replace the ambient air temperature sensor. Refer to Ambient Air Temperature Sensor Replacement . Did you complete the replacement?	--	Go to Step 24	--
23	Replace the HVAC control module. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 24	--
24	Operate the system in order to verify the repair. Did you correct the condition?	--	System OK	Go to Step 2

Too Hot in Vehicle

Test Description

The numbers below refer to the step numbers on the diagnostic table.

Step	Action	Values	Yes	No
Schematic Reference: HVAC Schematics. *Connector End View Reference:* Component Connector End Views. DEFINITION: The temperature cannot be adjusted, or cooling is insufficient during A/C operation.				
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle.
2	Check operation of air mix doors to make sure they are not jammed or broken Is the air mix door broken or jammed?	-	Go to HVAC Module Assembly Replacement.	Go to Step 3
3	**Important:** All DTCs that are set must be diagnosed first unless you were sent to this diagnostic from a specific DTC diagnostic. 1. Turn ON the ignition, with the engine OFF. 2. Place the blower motor switch in each speed position. Does the blower motor operate in any speed position?	--	Go to Step 4	Go to Blower Motor Inoperative.
4	Does the blower motor operate at the desired speeds?	--	Go to Step 5	Go to Blower Motor Malfunction
5	1. Start the engine. 2. Place the mode switch in the face position. 3. Place the recirculation switch in the ON position. 4. Observe the recirculation door. 5. Place the recirculation switch in the OFF position. Does the recirculation door move from the recirculation position to the	--		Go to Symptoms - HVAC Systems

	outside air position?		Go to Step 6	- Automatic.
6	**Important:** The ambient air temperature must be above 3° C (38°F). 1. Start the engine. 2. With a scan tool clear any DTCs that are stored in the HVAC control module. 3. Place the left air temperature switch in the coldest position. 4. Place the mode switch in the bi-level position. 5. Place the blower motor on high speed. Does the A/C compressor operate?	--	Go to Step 7	Go to Air Conditioning Compressor Replacement.
7	Perform the A/C system performance test. Refer to Air Conditioning (A/C) System Performance Test. Did you find and correct the condition?	--	Go to Step 24	Go to Step 8
8	Inspect the inside air temperature sensor for proper installation. Refer to Inside Air Temperature Sensor Replacement. Did you find and correct the condition?	--	Go to Step 24	Go to Step 9
9	1. Turn ON the ignition, with the engine OFF. 2. Place the mode switch in face position. 3. Place the blower motor switch in maximum speed position. 4. Inspect for airflow through the inside air temperature sensor by placing a 5 cm (2 in) square piece of paper over the sensor air inlet. Does the paper stay in place?	--	Go to Step 10	Go to Step 17
10	1. Install a thermometer near the inside air temperature sensor. 2. With a scan tool, observe the Inside Air Temp parameter in the Climate Control Panel data list. Does the scan tool indicate the	--		

	sensor temperatures is within 3° C (5°F) of the thermometer temperature?		Go to Step 11	Go to Step 14
11	1. Turn OFF the ignition. 2. Cover the sunload sensor. 3. Start the engine. 4. Adjust driver side temperature to 22°C (72°F). 5. With a scan tool, observe the Driver and Passenger Solar Sensor parameter in the Climate Control Panel Open/Short data list. Is the Solar Sensor parameter greater than the specified value?	220 Counts	Go to Step 12	Go to Step 18
12	1. Uncover the sunload sensor. 2. Direct a light source at the sunload sensor. 3. Observe the Driver and Passenger Sunload parameter. Do the counts change?	--	Go to Step 13	Go to Step 18
13	Test the resistance of the ambient air temperature sensor. Refer to Sensor Resistance Table. Is the resistance near the value in the Sensor Resistance Table?	--	Go to Testing for Intermittent Conditions and Poor Connections.	Go to Step 15
14	Test the resistance of the inside air temperature sensor. Refer to Sensor Resistance Table. Is the resistance near the value in the Sensor Resistance Table?	--	Go to Step 19	Go to Step 17
15	Inspect for poor connections at the harness connector of the ambient air temperature sensor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	--	Go to Step 24	Go to Step 17
16	Inspect the aspirator tube for an air leak or obstruction. Did you find and correct the condition?	--	Go to Step 24	--
	Inspect for poor connections at the harness connector of the inside air temperature sensor. Refer to			

17	Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	--	Go to Step 24	Go to Step 20
18	Inspect for poor connections at the harness connector of the sunload sensor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	--	Go to Step 24	Go to Step 21
19	Inspect for poor connections at the harness connector of the HVAC control module. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	--	Go to Step 24	Go to Step 23
20	Replace the inside air temperature sensor. Refer to Inside Air Temperature Sensor Replacement. Did you complete the replacement?	--	Go to Step 24	--
21	Replace the sunload sensor. Refer to Sun Load Temperature Sensor Replacement. Did you complete the replacement?	--	Go to Step 24	--
22	Replace the ambient air temperature sensor. Refer to Ambient Air Temperature Sensor Replacement. Did you complete the replacement?	--	Go to Step 24	--
23	Replace the HVAC control module. Refer to Control Module References. Did you complete the replacement?	--	Go to Step 24	--
24	Operate the system in order to verify the repair. Did you correct the condition?	--	System OK	Go to Step 2

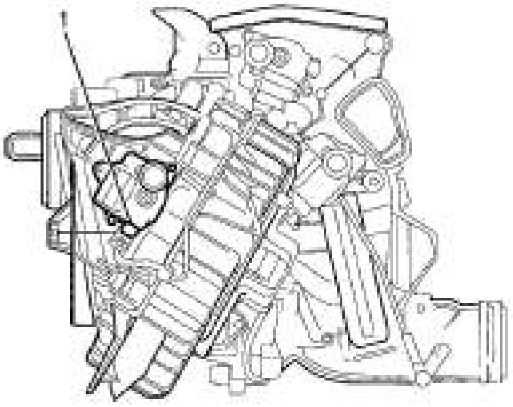
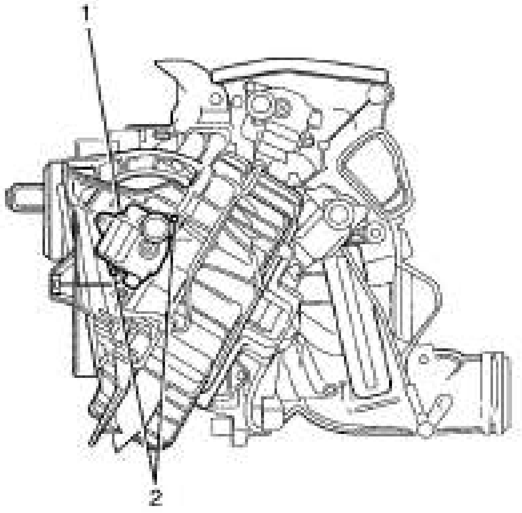
Air Inlet Valve Actuator Replacement (RHD)

Removal Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.



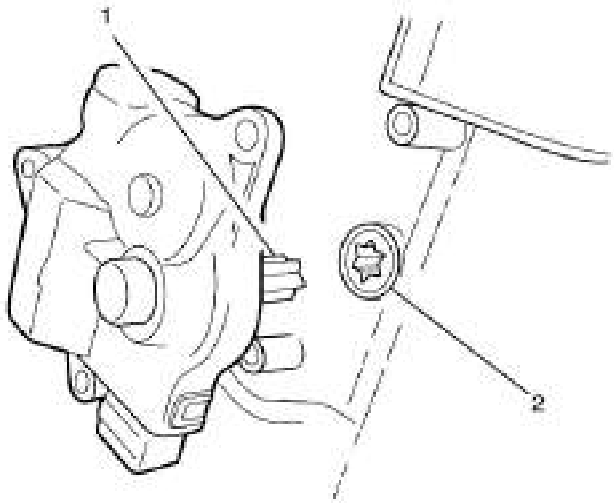
3. Disconnect the recirculation actuator electrical connector (1).



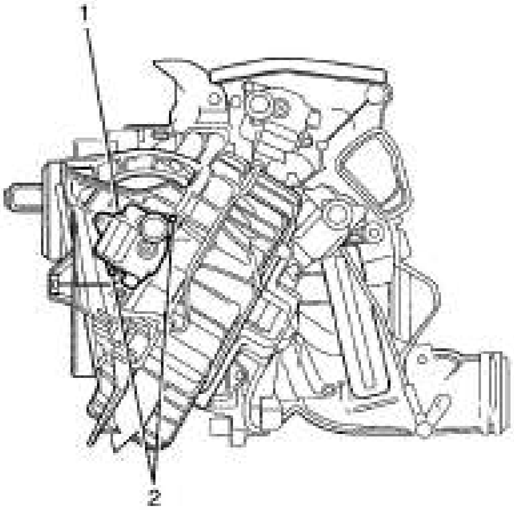
4. Remove the recirculation actuator to HVAC module assembly retaining screws (2).

5. Remove the recirculation actuator (1) from the HVAC module assembly (3).
6. Inspect air intake door shaft end for damage, also check the air intake door for full movement, open/close. If damage is evident, replace the air intake housing. Refer to Air Inlet Assembly Replacement.

Installation Procedure



1. Align the actuator drive gear (1) with the door shaft spline (2).

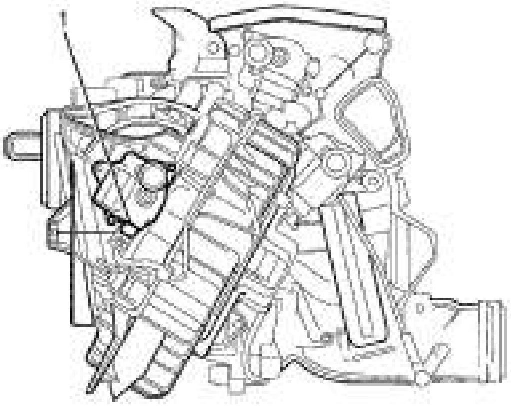


2. Install the air intake recirculation actuator (1) to the HVAC module assembly (3).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the recirculation actuator to HVAC module assembly retaining screws (2).

   Tighten
   Tighten the screws to 1.2 N·m (9 lb ft).



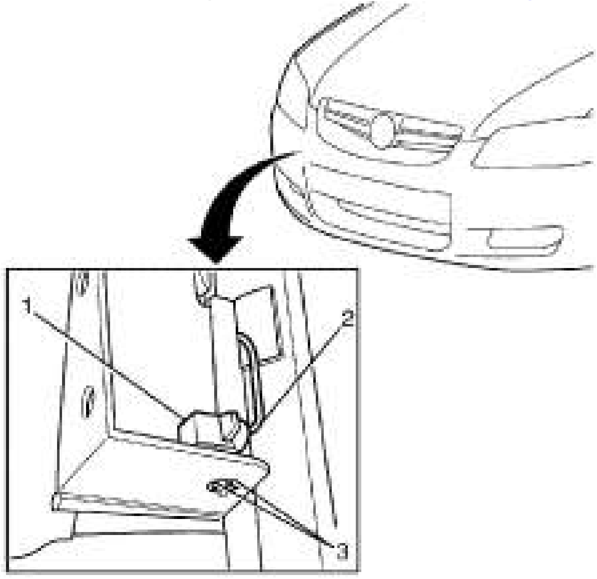
4. Connect the recirculation actuator electrical connector (1).
5. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
6. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | Document ID: 1977406

Ambient Air Temperature Sensor Replacement

Removal Procedure

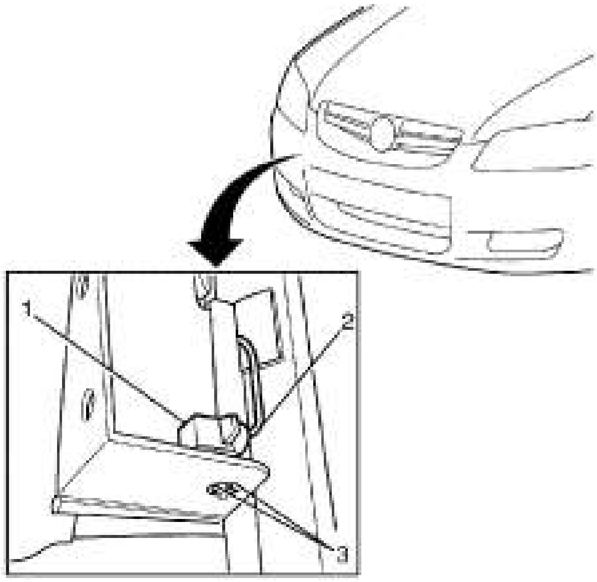
1. Remove front bumper. Refer to Front Bumper Fascia Replacement.



Important: To remove the ambient temperature sensor (1) squeeze the locking tabs (3) and push free from the bracket.

2. Detach the ambient air temperature sensor (1) from the bracket.
3. Disconnect the ambient temperature sensor electrical connector (2).
4. Remove the ambient air temperature sensor (1).

Installation Procedure



1. Connect the ambient temperature sensor electrical connector (2).

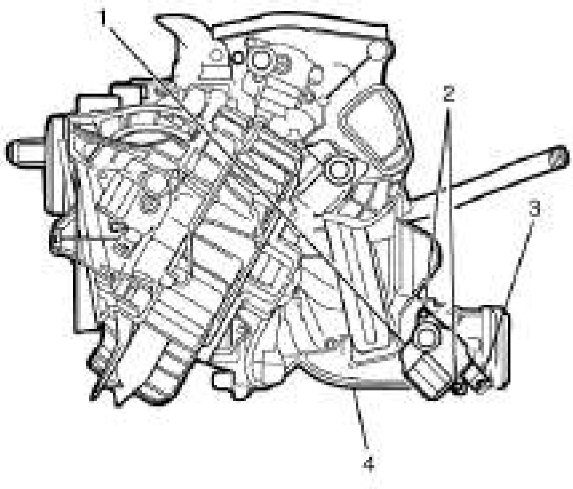
   Important: Make sure that the locking tabs (3) and are correctly located.

2. Install the ambient temperature sensor (1) to the bracket.
3. Install the front bumper fascia. Refer to Front Bumper Fascia Replacement.

Auxiliary Mode Valve Actuator Replacement

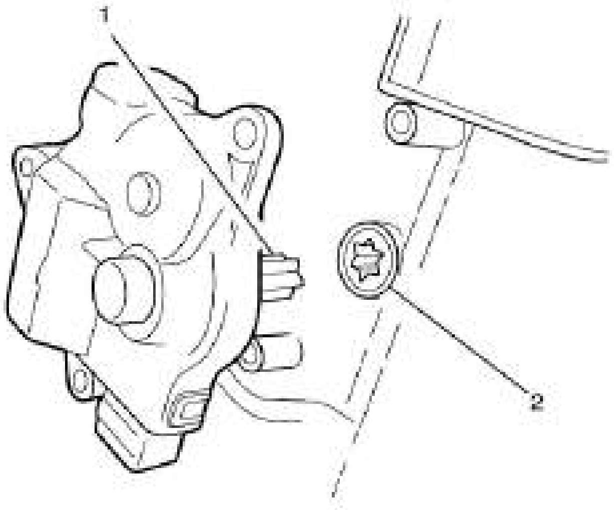
Removal Procedure

1. Remove the Instrument Panel Centre Trim Panel. Refer to Instrument Panel Center Trim Panel Replacement.

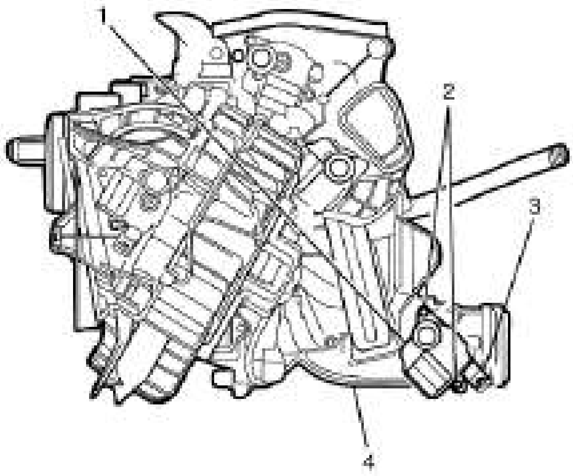


2. Disconnect the auxiliary mode door actuator electrical connector (3).
3. Remove the auxiliary mode door actuator to HVAC module assembly retaining screws (2).
4. Remove the auxiliary mode door actuator (3) from the HVAC module assembly (4).

Installation Procedure



1. Align the actuator drive gear (1) with the door shaft spline (2).



2. Install the auxiliary mode door actuator (3) to the HVAC module assembly (4)..

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the auxiliary mode door actuator to HVAC module assembly retaining screws (2).

   Tighten
   Tighten the bolts to 1.2 N·m (9 lb ft).

4. Connect the auxiliary mode door actuator electrical connector (3).
5. Install the Instrument Panel Centre Trim Panel. Refer to Instrument Panel Center Trim Panel Replacement.

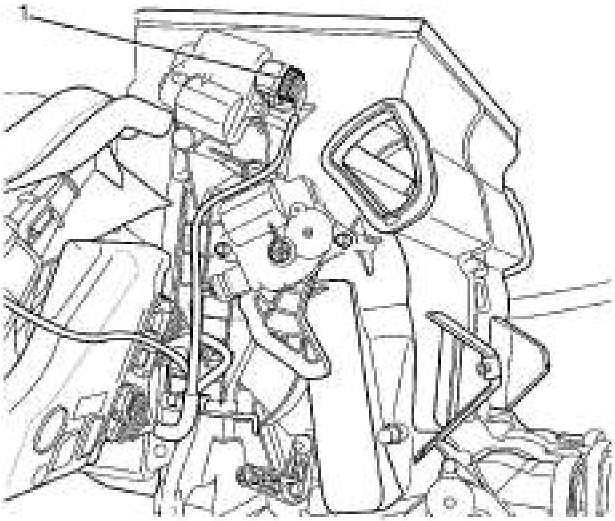
6. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | Document ID: 1994740

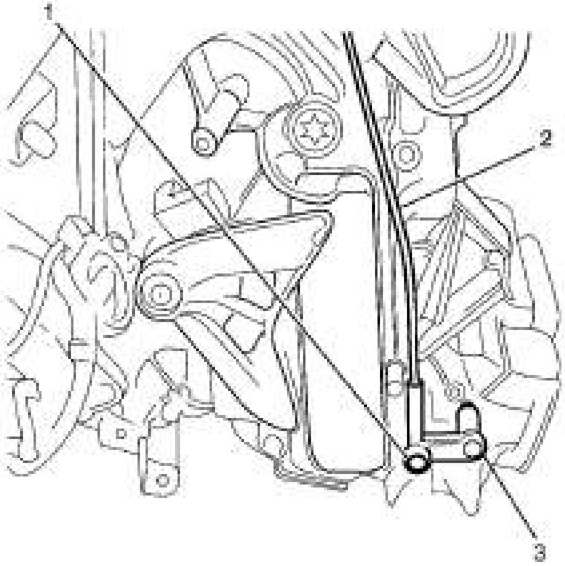
Defroster Valve Actuator Replacement

Removal Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
3. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
4. Remove the left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.

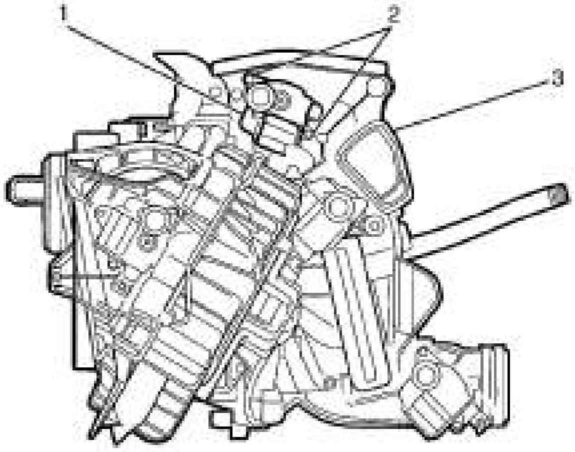


5. Disconnect the defrost mode actuator electrical connector (1).

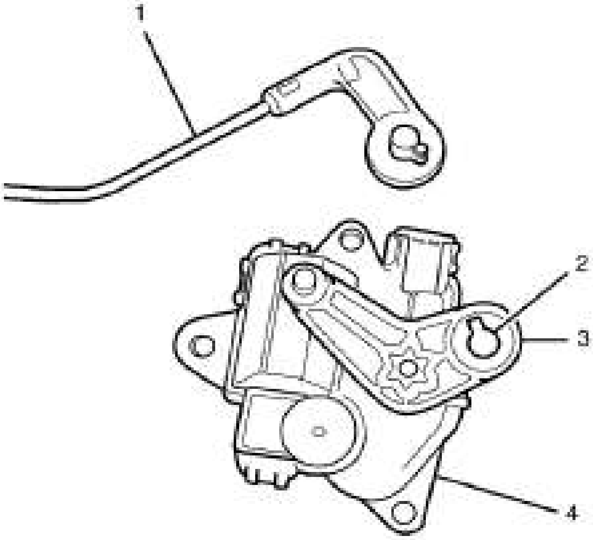


Important: Using a suitable tool, squeeze the rear passenger mode rod to rear passenger mode door lever retaining clip (1) to detach the rear passenger mode rod (2) from the rear passenger mode door lever (3).

6. Detach the rear passenger mode rod (2) from the mode door lever (3).



7. Remove the defrost mode actuator to HVAC module assembly retaining screws (2).
8. Remove the defrost mode actuator and the rear passenger mode lever (1) from the HVAC module assembly (3).



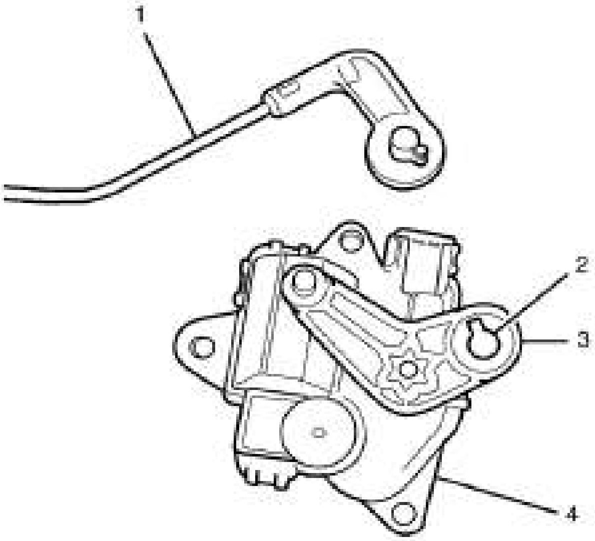
Important: Rotate the rear passenger mode rod (1) to match the actuator lever locking position opening (2), then remove rear passenger mode rod (1).

9. Detach the rear passenger mode rod (1) from the defrost mode actuator (4).

   Important: Take note of the rear passenger mode lever (3) position in relation to the actuator housing (4).

10. Gently remove the rear passenger mode lever (3) from the defrost mode actuator (4).

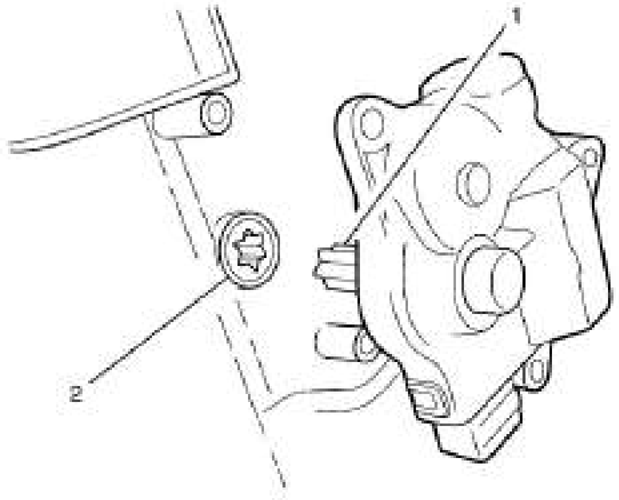
Installation Procedure



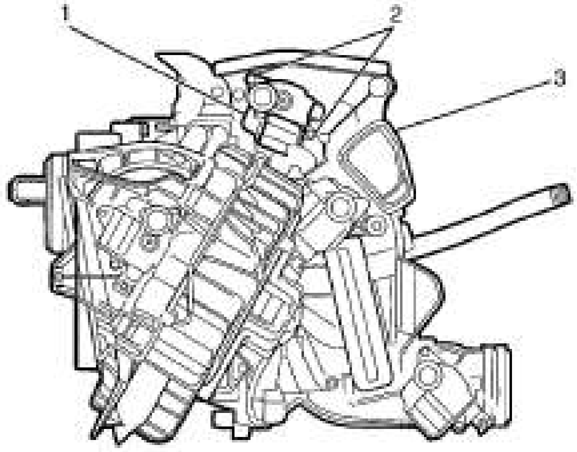
1. Install the rear passenger mode lever (3) to the defrost mode actuator (4).

   Important: Rotate the rear passenger mode rod (1) to match the actuator lever locking position opening (2), to install the rear passenger mode rod (1).

2. Attach the rear passenger mode rod (1) to the actuator (4).



3. Align the actuator drive gear (1) with the door shaft spline (2).

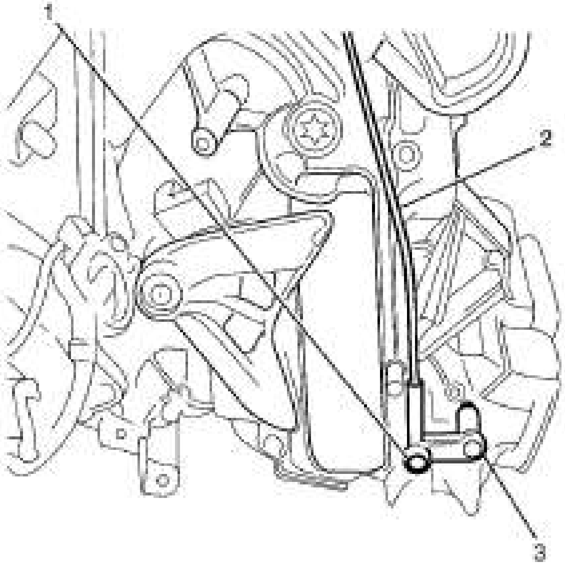


4. Install the and the rear passenger mode lever (1) to the HVAC module assembly (3).

   Notice: Refer to Fastener Notice in the Preface section.

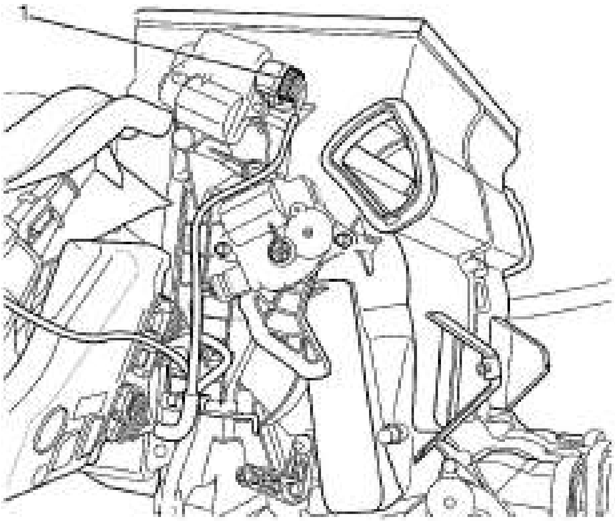
5. Install the defrost mode actuator to HVAC module assembly retaining screws (2).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).



Important: Make sure the rear passenger mode rod to rear passenger mode door lever retaining clip (1) is correctly engaged to prevent the rear passenger mode door lever (3) from functioning incorrectly.

6. Attach the rear passenger mode rod (2) to the mode door lever (3).



7. Connect the defrost mode actuator electrical connector (1).
8. Install left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.
9. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
10. Install instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
11. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.

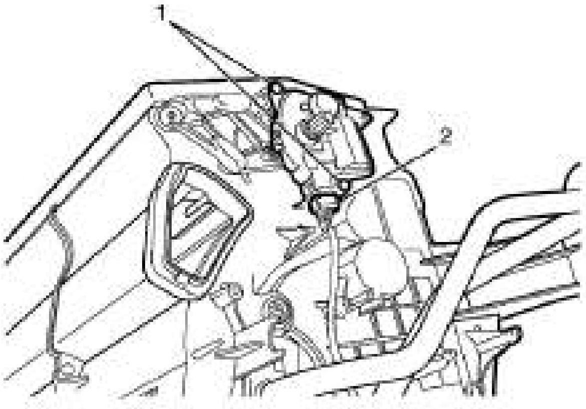
12. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | **Document ID: 2005678**

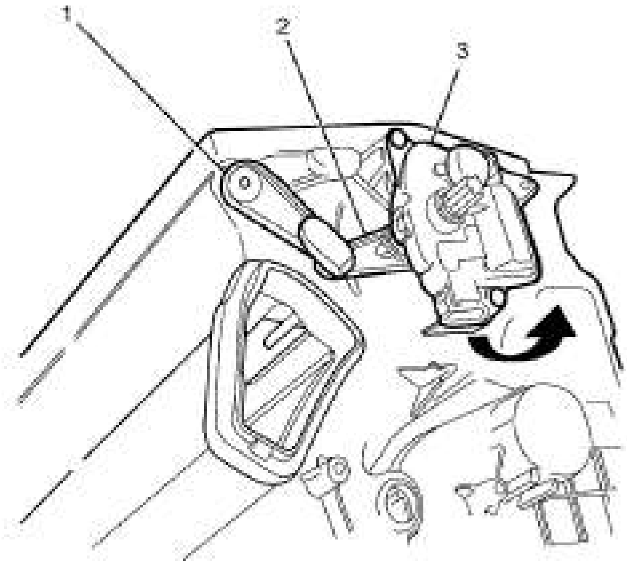
Floor Air Valve Actuator Replacement

Removal Procedure

1. Remove the right side console lower extension. Refer to Instrument Panel Extension Replacement.
2. Remove the instrument panel lower right trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
3. Remove right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side .

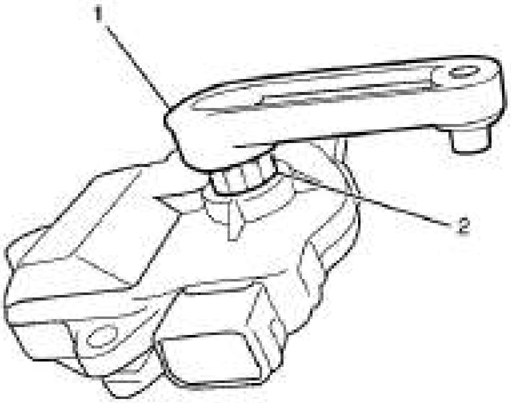


4. Disconnect the face/floor actuator electrical connector (3).
5. Remove the face/floor actuator to HVAC module assembly retaining screws (1).



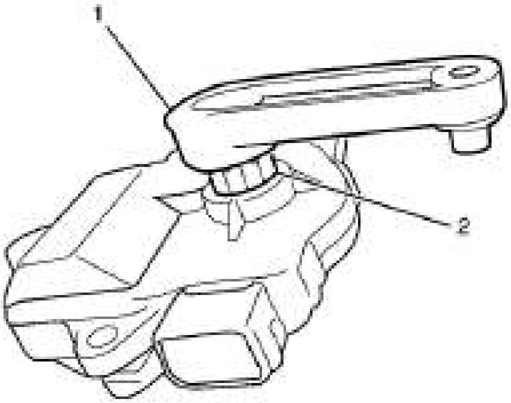
Important: Pivot the face/floor mode actuator (3) upwards and remove the face/floor mode actuator lever (2) from the face door mode lever (1).

6. Remove the face/floor mode actuator lever (2) from the face door mode lever (1).

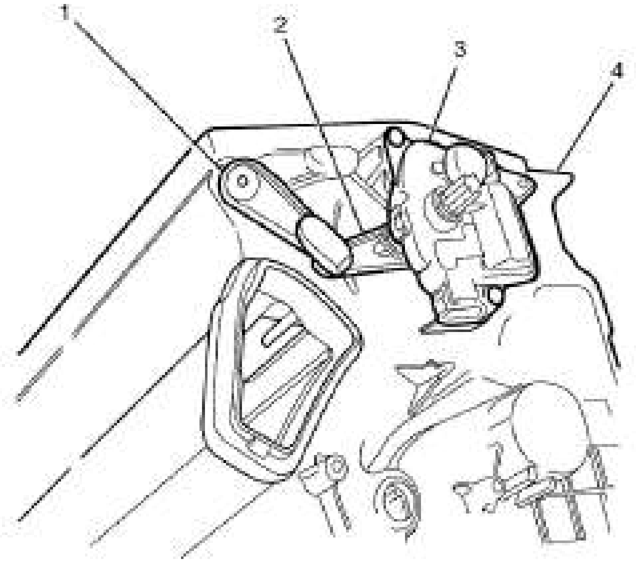


7. Record where the face/floor mode actuator lever (1) is located onto the face/floor actuator drive spline (2) for installation.

Installation Procedure

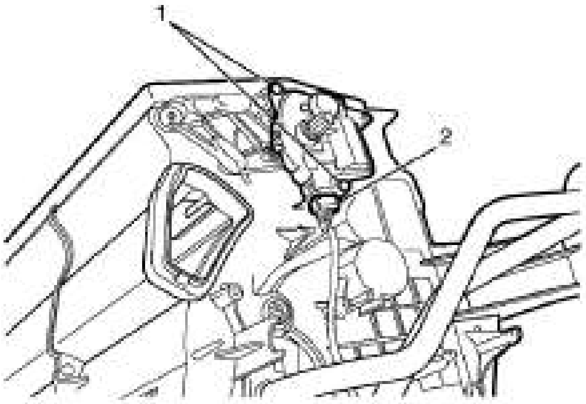


1. Detach and move the face/floor mode actuator lever (1) to the recorded position on the face/floor actuator drive spline (2) as required.



2. Install the actuator lever (2) to the face door mode lever (1) and pivot the face/floor mode actuator (3) into position on the HVAC module assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.



3. Install the face/floor mode actuator to HVAC module assembly retaining screws (1).

Tighten
Tighten the bolts to 1.2 N·m (9 lb ft).

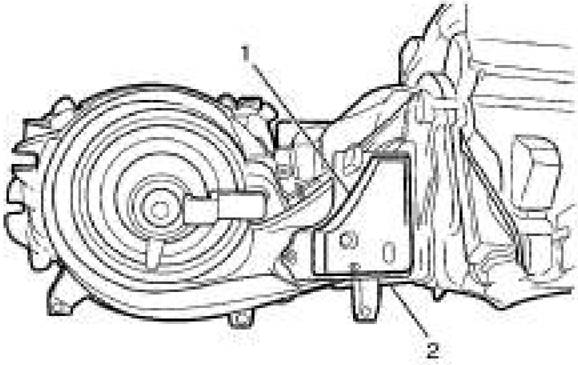
4. Connect the face/floor mode actuator electrical connector (3).
5. Install the instrument panel lower right trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
6. Install right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side.
7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | Document ID: 1977413

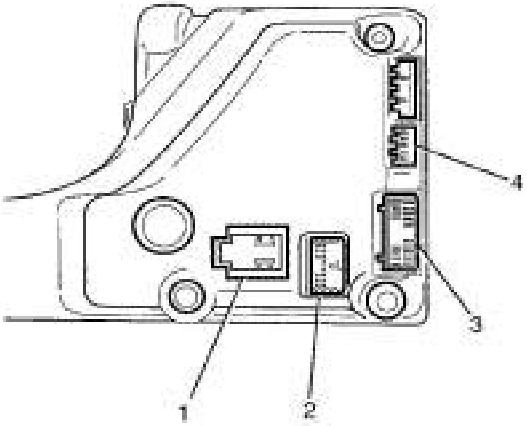
HVAC Control Module Replacement (RHD)

Removal Procedure

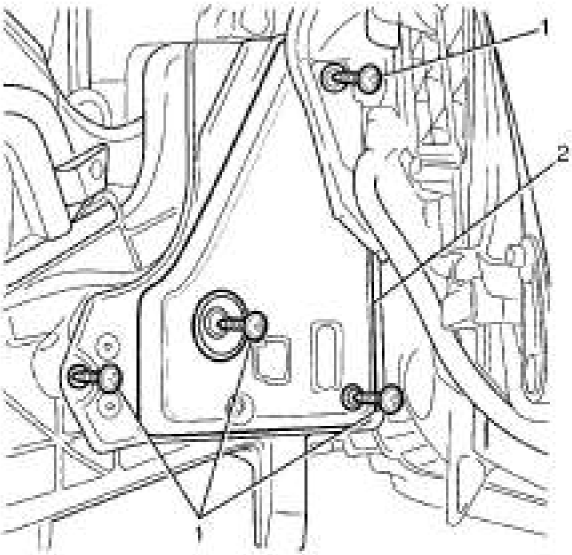
1. Remove the glove box assembly. Refer to Instrument Panel Compartment Replacement .
2. Remove left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .



3. Locate the HVAC control module (1) on the left side of the HVAC module assembly (2).



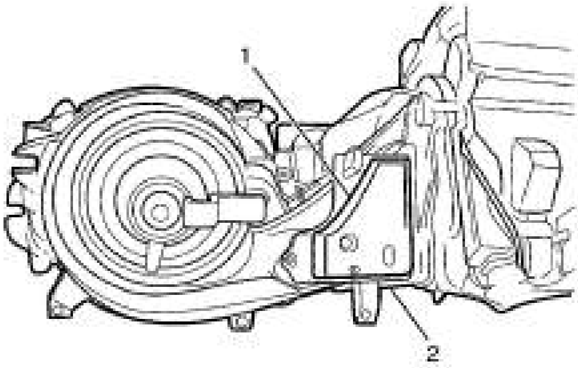
4. Disconnect the HVAC control module electrical connectors (1 - 4).



Important: Make sure the HVAC control module electrical connectors are disconnected before removing the HVAC control module to HVAC module assembly retaining screws (1). The HVAC control module to HVAC module assembly retaining screws (1) contact the HVAC control module (2) circuit board and can short on removal.

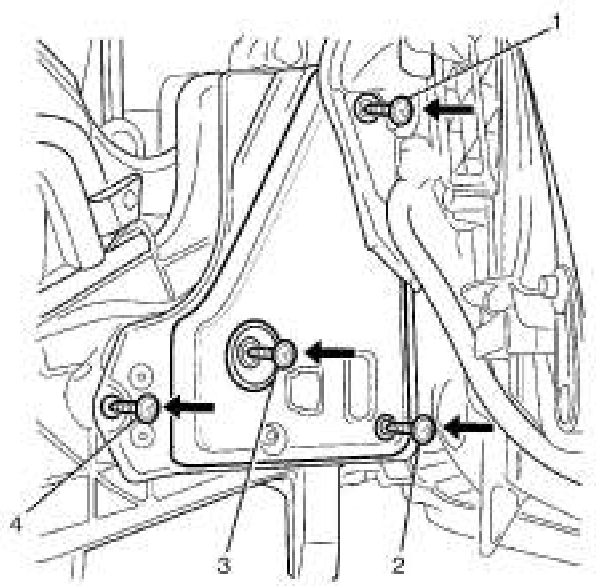
5. Remove the HVAC control module to HVAC module assembly retaining screws (1).
6. Remove HVAC control module (2).

Installation Procedure



1. Install the HVAC control module (1) to the HVAC module assembly (2).

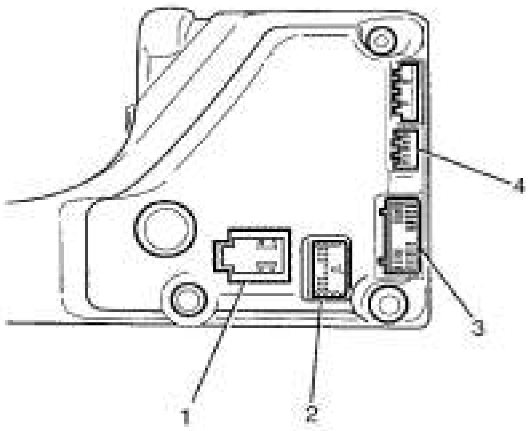
Notice: Refer to Fastener Notice in the Preface section.



Important: The HVAC control module to HVAC module assembly retaining screws (1 - 4) should be tightened in the sequence shown to prevent damage to HVAC control module circuit board.

2. Install the HVAC control module to HVAC module assembly retaining screws (1 - 4).

Tighten
Tighten the screws to 2 N·m (18 lb in).



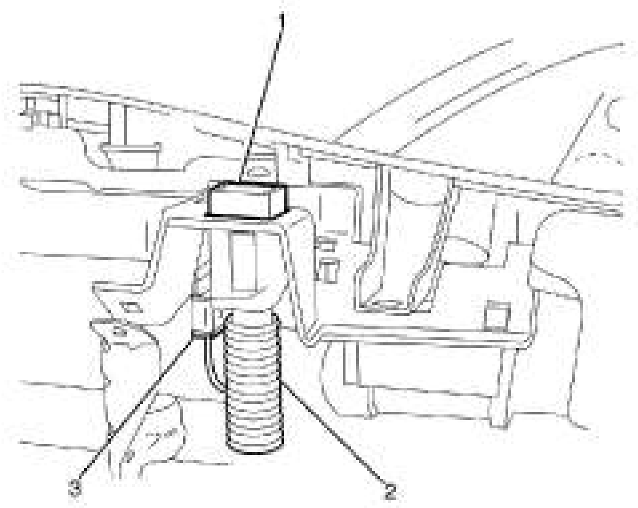
3. Connect the electrical connectors (1 - 4) to the HVAC control module.
4. Install Left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .
5. Install the glove box assembly. Refer to Instrument Panel Compartment Replacement .
6. If re-programming is required. Refer to Control Module References .
7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | Document ID: 1977409

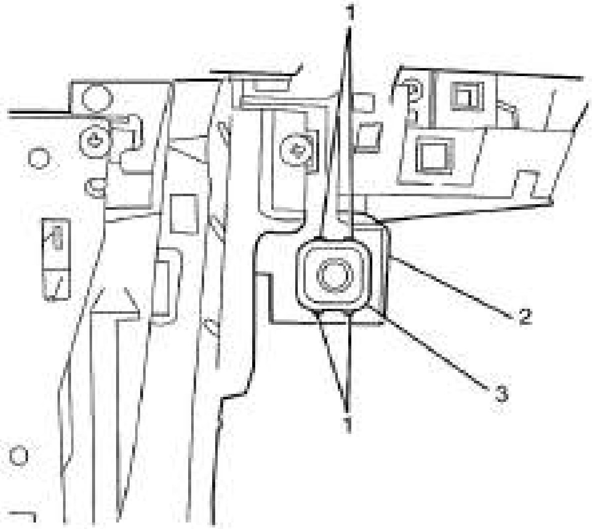
Inside Air Temperature Sensor Replacement

Removal procedure

1. Remove the driver side instrument panel lower trim. Refer to Instrument Panel Insulator Panel Replacement - Right Side.



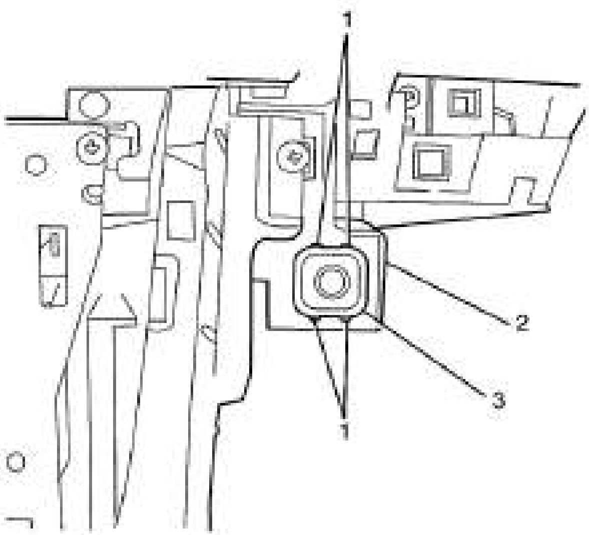
2. Remove the aspirator tube (2) from the rear of the inside air temperature sensor (1).
3. Disconnect the inside air temperature sensor electrical connector (3).



Important: From the front of the inside air temperature sensor (3) use a suitable tool to push down on the four inside air temperature sensor to instrument panel carrier retaining clips (1). Withdraw the inside air temperature sensor (1) rearwards towards the bulkhead from the instrument panel carrier (3) .

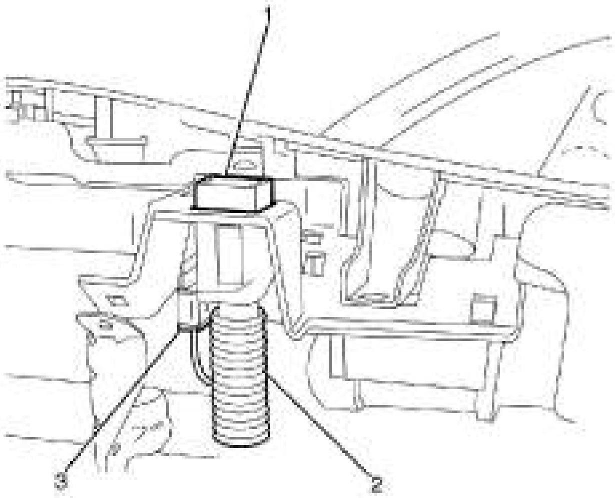
4. Remove the inside air temperature sensor (3) from the instrument panel carrier (2).

Installation Procedure



Important: Make sure the inside air temperature sensor to instrument panel carrier retaining clips (1) are correctly engaged to avoid an induced rattle condition.

1. Install the inside air temperature sensor (3) to the instrument panel carrier (2).



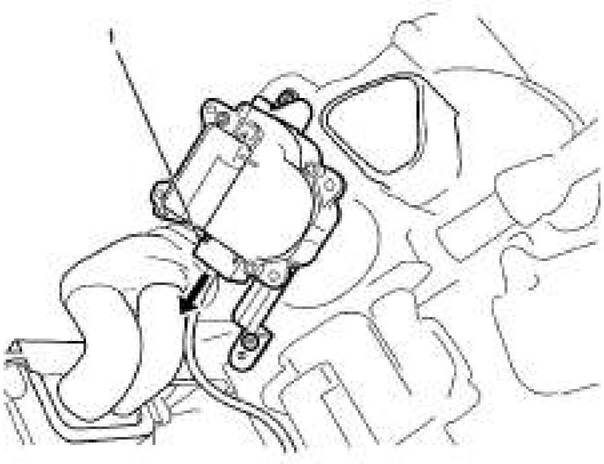
2. Connect the inside air temperature sensor electrical connector (3).
3. Install the aspirator tube (2) to the rear of the inside air temperature sensor (1).
4. Install the driver side instrument panel lower trim cover. Refer to Instrument Panel Insulator Panel Replacement - Right Side.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | **Document ID: 1994765**

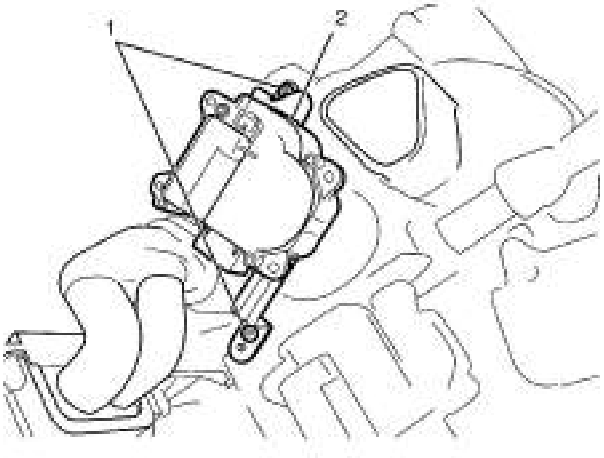
Mode Valve Actuator Replacement

Removal Procedure

1. Remove the instrument panel (I/P) carrier. Refer to Instrument Panel Retainer Replacement.

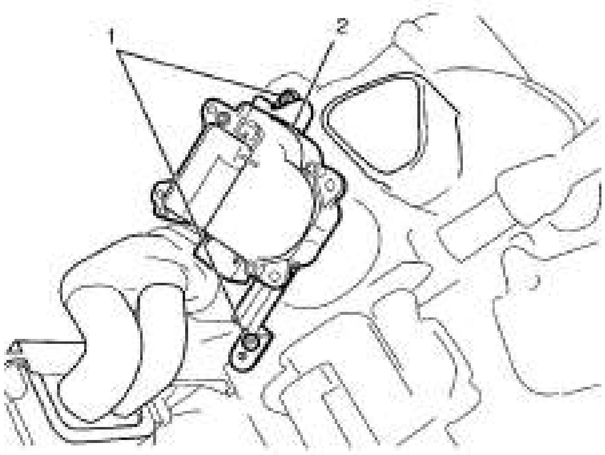


2. Disconnect the mode actuator electrical connector (1).



3. Remove the mode actuator (2) to HVAC unit retaining screws (1).
4. Remove the mode actuator (2) from the HVAC unit.

Installation Procedure

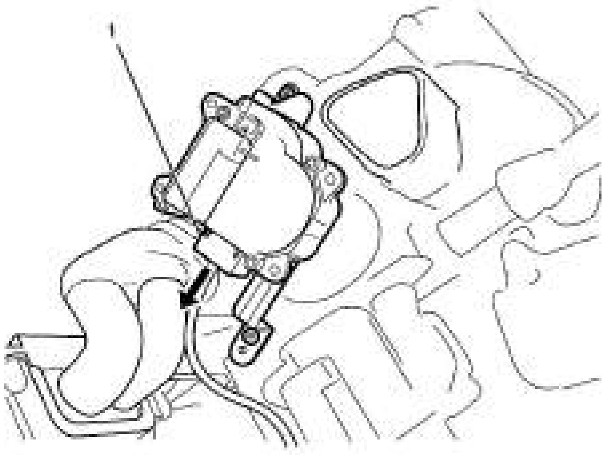


1. Install the mode actuator (1) to the HVAC unit.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the mode actuator (2) to HVAC unit retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).



3. Connect the electrical connector (1) to the mode actuator.
4. Install the I/P carrier. Refer to Instrument Panel Retainer Replacement.

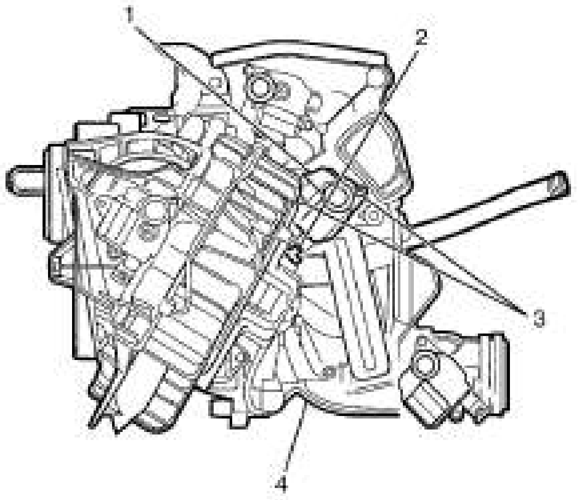
Sun Load Temperature Sensor Replacement

Refer to Sunload and Twilight Sentinel Sensor Replacement.

Temperature Valve Actuator Replacement - Left Side (RHD)

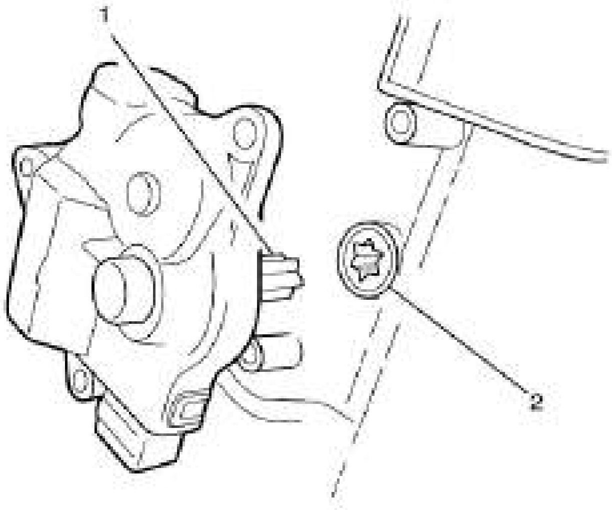
Removal Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
3. Remove left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.

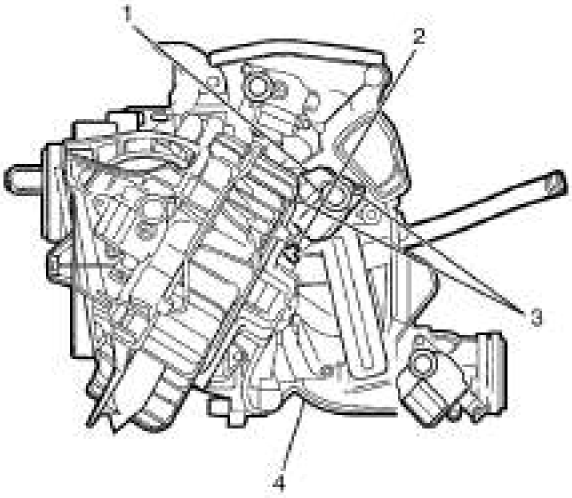


4. Disconnect the passenger air mix mode actuator electrical connector (2).
5. Remove the passenger air mix mode actuator to HVAC module assembly retaining screws (3).
6. Remove the passenger air mix actuator (1) from the HVAC module assembly (4).

Installation Procedure



1. Align the actuator drive gear (1) with the door shaft spline (2).



2. Install the passenger air mix actuator (1) to the HVAC module assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the passenger air mix actuator to HVAC module assembly retaining screws (3).

   Tighten
   Tighten the screws to 1 N·m (9 lb ft).

4. Connect the passenger air mix actuator electrical connector (2).
5. Install left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.
6. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.

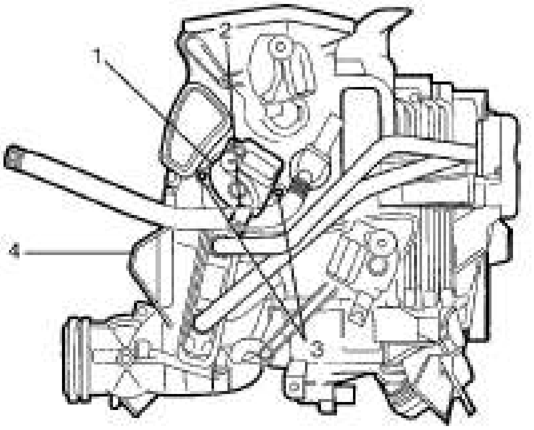
7. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
8. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Repair Instructions | Document ID: 1994757

Temperature Valve Actuator Replacement - Right Side (RHD)

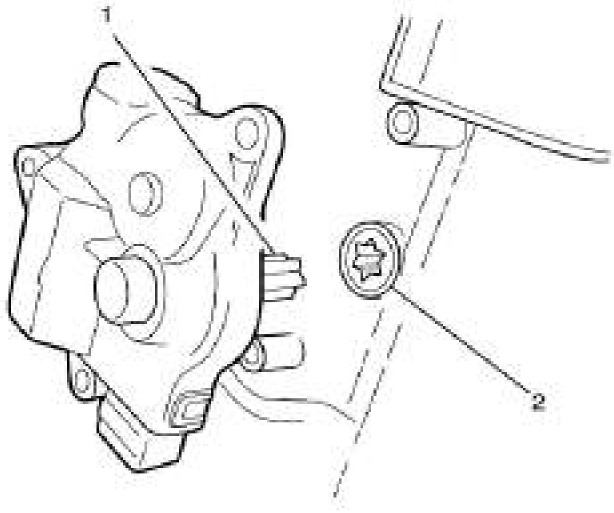
Removal Procedure

1. Remove the right side console lower extension. Refer to Instrument Panel Extension Replacement.
2. Remove right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side.

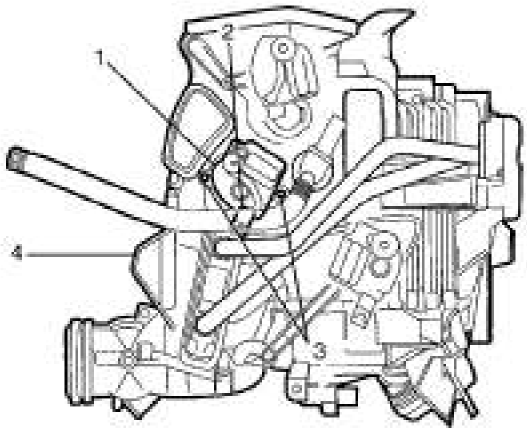


3. Disconnect the driver air mix actuator electrical connector (2).
4. Remove the driver air mix actuator to HVAC module assembly retaining screws (3).
5. Remove the driver air mix actuator from the HVAC module assembly (4).

Installation Procedure



1. Align the actuator drive gear (1) with the door shaft spline (2).



2. Install the driver air mix actuator (1) to HVAC module assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the driver air mix actuator to HVAC module assembly retaining screws (3).

   Tighten
   Tighten the screws to 1 N·m (9 lb ft).

4. Connect the driver air mix actuator electrical connector (2).
5. Install the right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side.
6. Install the right side console lower extension. Refer to Instrument Panel Extension

Replacement.

7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

Air Delivery Description and Operation (SWB)

The Air Delivery Description and Operation is divided into 6 primary areas:

- HVAC Control Components.
- Air Speed.
- Air Speed Auxiliary.
- Air Distribution.
- Recirculation.
- Automatic Operation.

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC System to maintain air temperature and distribution settings. The battery positive voltage circuit provides power that the control module uses for keep alive memory (KAM). The Body Control Module (BCM), which is the vehicle power mode master, provides a device on signal. The control module supports the following features:

Feature	Availability
Purge	Yes
Personalisation	Yes
Actuator Calibration	Yes

Personalisation

If the personalisation feature for climate control is selected through the radio, the HVAC control module will receive information that defines the current driver of the vehicle from the BCM module through GMLAN communication. This information will be stored inside the HVAC control module memory. When a different key is selected, the HVAC control module will recall the appropriate driver settings. Upon a battery reset, the HVAC control module shall also set the driver ID to Driver 1. The HVAC system will memorise the following system configurations for up to 2 unique drivers:

- Driver set temperature
- Passenger set temperature
- Mode
- Blower motor speed
- A/C compressor request, auto ON or A/C OFF

Mode Actuator

The mode actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position. When the ignition is cycled from OFF to ON the mode and temperature actuators (doors) are driven to their 0% positions which for the temperature door is full cold and the mode doors are to the closed position. The actuators are then driven to the previous settings before the ignition was turned OFF by using the same amount of counts recorded.

Recirculation Actuator

The recirculation actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position. When the ignition is cycled from OFF to ON the mode and temperature actuators (doors) are driven to their 0% positions which for the temperature door is full cold and the mode doors are to the closed position. The actuators are then driven to the previous settings before the ignition was turned OFF by using the same amount of counts recorded.

Blower Motor Control Processor

The blower motor control processor is an interface between the HVAC control module and the blower motor. The blower motor speed control, blower motor supply voltage and ground circuits enable the control processor to operate. The HVAC control module provides a pulse width modulation (PWM) signal to the control processor in order to command the blower motor speed. The control processor uses the blower motor ground as a low side control to adjust the blower motor speed.

Air Speed

The blower motor forces air to circulate within the vehicle's interior. The vehicle operator determines the blower motors speed by placing the blower motor switch in a desired speed position or by selecting automatic operation. In manual operation, once a blower speed is selected, the blower speed remains constant, until a new speed is selected. In automatic operation, the HVAC control module will determine what blower speed is necessary in order to achieve or maintain a desired temperature.

As the requested blower speed increases, the following conditions occur:

- The HVAC control module increases the amount of time that the blower motor speed control circuit is modulated to ground.
- The voltage and duty cycle, measured between the blower motor speed control circuit and ground, decrease.

As the requested blower speed decreases, the following conditions occur:

- The HVAC control module decreases the amount of time that the blower motor speed control circuit is modulated to ground.
- The voltage and duty cycle, measured between the blower motor speed control circuit and ground, increase.

Air Distribution

The HVAC control module controls the mode actuator in order to distribute airflow to a desired outlet. The mode switch provides the vehicle operator with the ability to override the automatic setting. When the mode door is moved to the defrost position, the A/C compressor piston stroke is increased and the recirculation actuator will be moved to the outside air position.

Important: The HVAC system allows air to the outboard face outlets in all air distribution modes. This allows air to be circulated higher in the cabin under any operating condition. The face outlets have three operating positions, open, side window deflector and closed. To reduce air from these outlets, the individual outlet thumbwheel must be turned to the OFF or side window deflector position.

HVAC Air Flow Direction

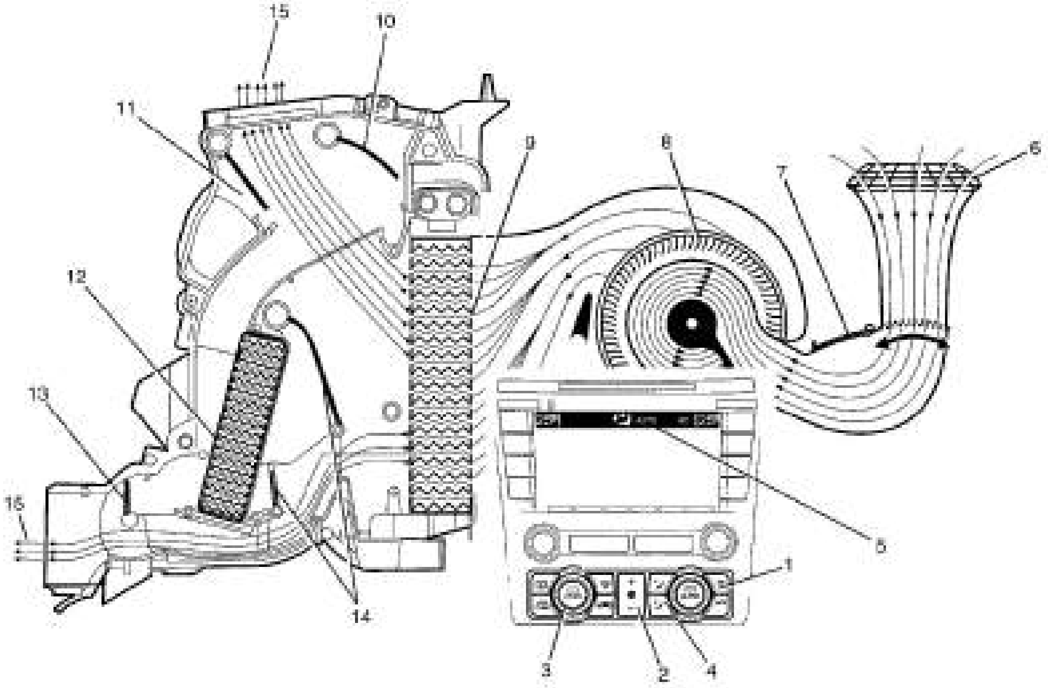
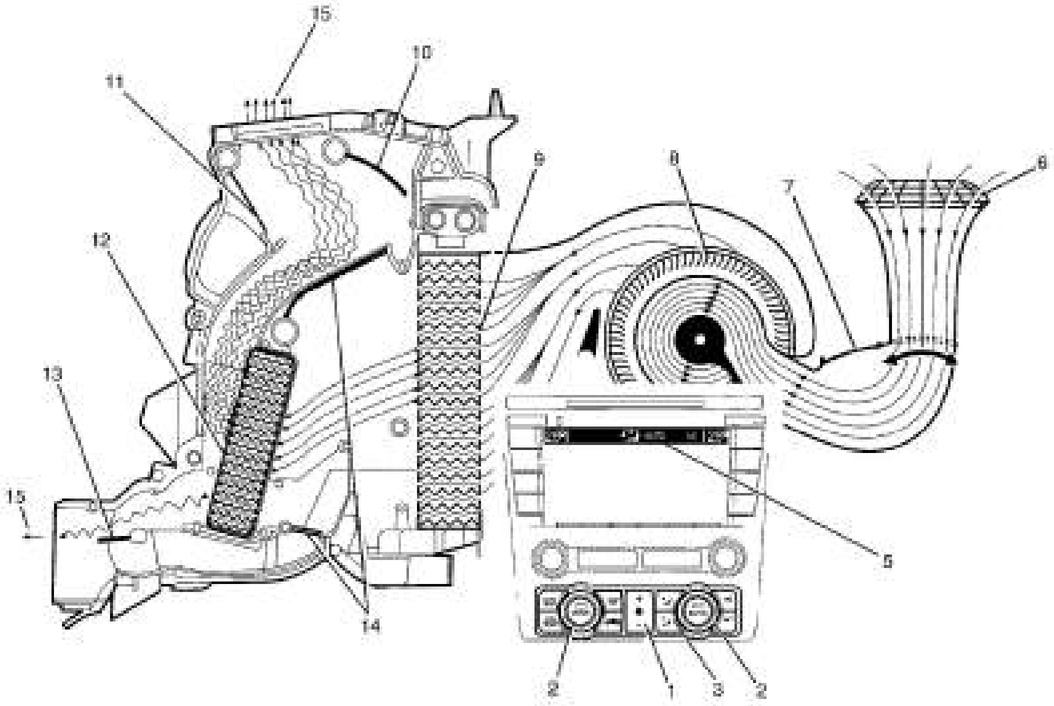
(8) Fresh Air Intake

(9) Recirculation Air Intake



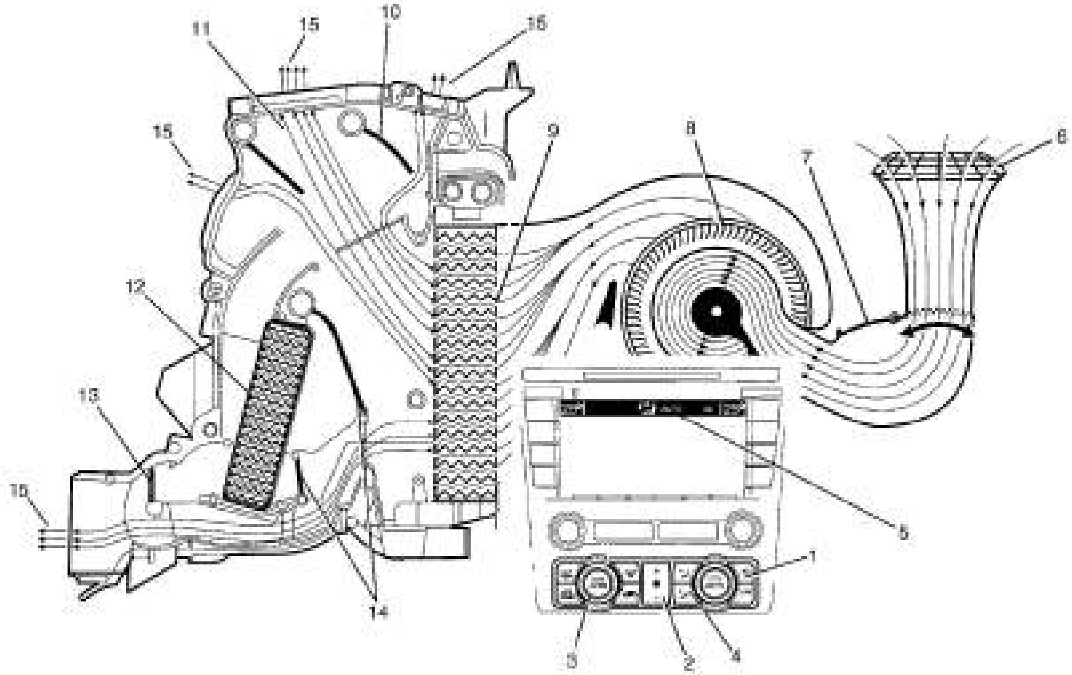
Face Mode Full Cold

The A/C switch is on (1) or auto button is pressed. The fan switch is set to any one of twenty speeds (2). The temperature is set to the full cold position (3). The mode control switch is set to face mode (4). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8), and is then forced through the cold evaporator fins (9). In full cold mode, the air mix doors (14) are fully closed sealing off the passage through the heater core (12). The air travels through the open face door (11). The cold air (15) is then directed through the centre and side vents.



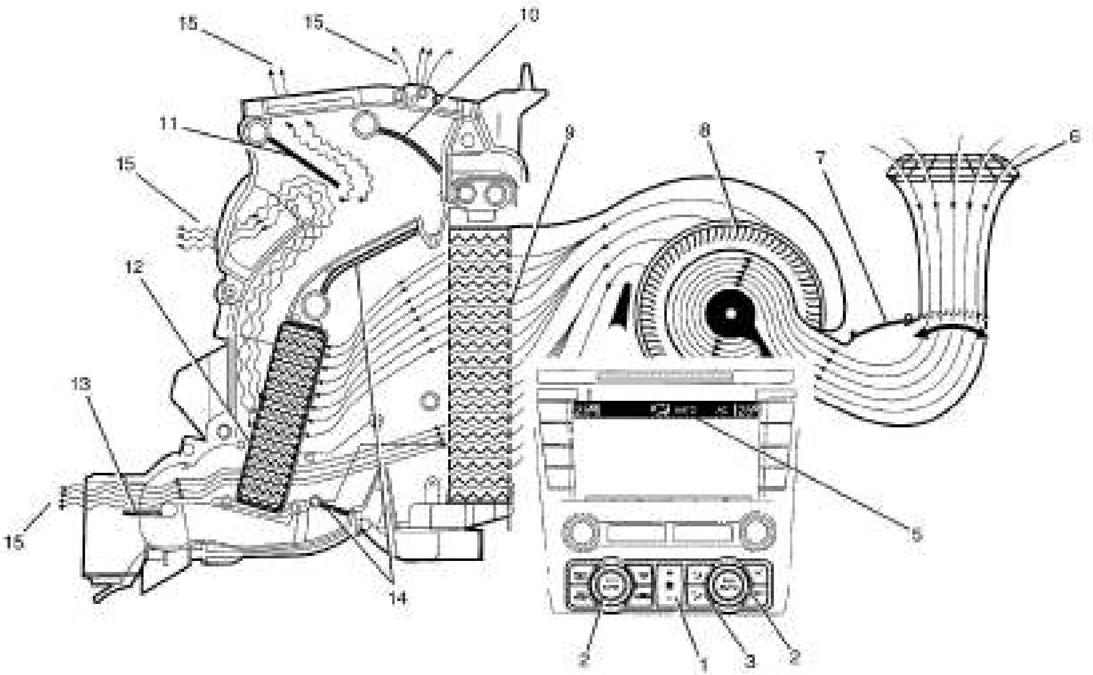
Face Mode Full Hot

The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to face mode (3). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8). This air is then forced through the evaporator core fins (9). In full heat mode, the air mix doors (14) are fully open directing all incoming air through the heater core (12). The air travels through the open face door (11). The heated air (15) is then directed out of the HVAC module assembly to the centre and side vents.



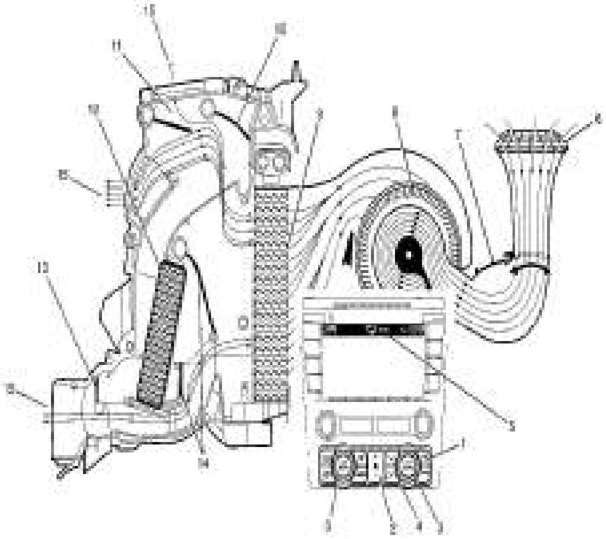
Bi-level Mode Full Cold

The A/C switch is on (1) or auto button is pressed. The fan switch is set to any one of twenty speeds (2). The temperature switch is set to the full cold position (3). The mode control switch is set to bi-level mode (4). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8), and is then forced through the cold evaporator fins (9). In full cold mode, the air mix doors (14) are fully closed sealing off the passage through the heater core (12). The air travels through the half opened face door (11) and the through the face/floor door (15) which is open to both face and floor. The cold air (15) is then directed through the centre and side vents as well as the floor ducts.



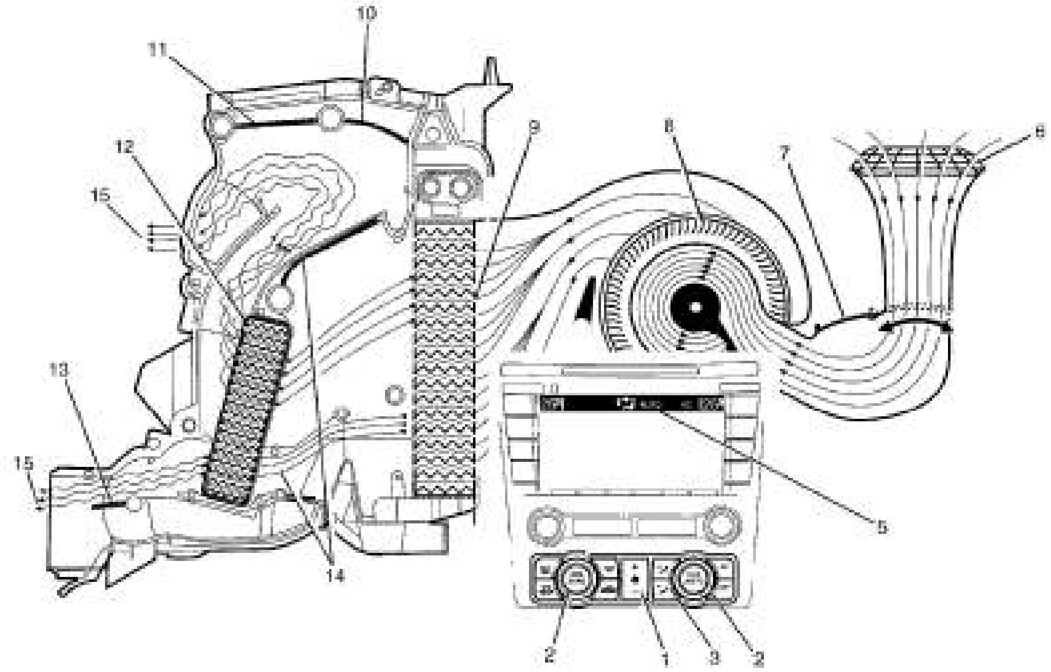
Bi-level Mode Full Hot

The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to bi-level mode (3). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8). This air is then forced through the evaporator core fins (9). In full heat mode, the air mix doors (14) are fully open directing all incoming air through the heater core (12). The air travels through the half opened face door (11) and through the face/floor door (10), which is fully open to face and floor. The heated air (15) is then directed through the centre and side vents as well as to the floor ducts.



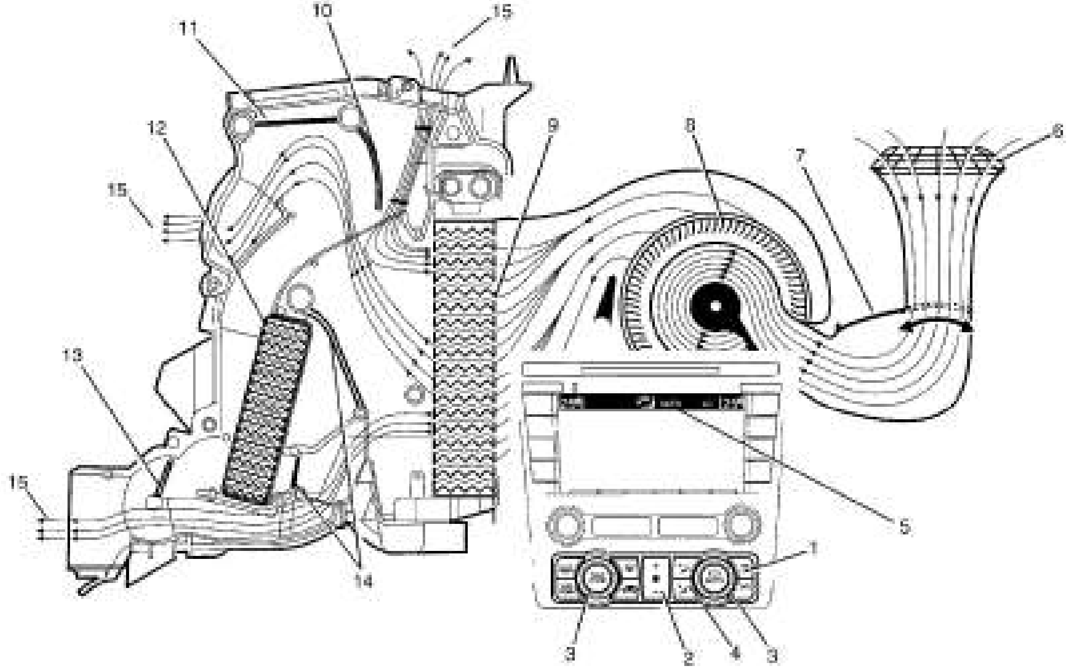
Floor Mode Full Cold

The A/C switch is on (1) or the auto button is pressed. The fan switch is set to any one of twenty speeds (2). The temperature switch is set to the full cold position (3). The mode control switch is set to floor mode (4). The recirculation door (7) is closed allowing outside (6) air to enter and flow into the HVAC module assembly via the plenum chamber inlet (7). Air is drawn into the HVAC module assembly by the blower motor (8), and is then forced through the cold evaporator fins (9). In full cold mode, the air mix doors (10) are fully closed sealing off the passage through the heater core (11). The air travels through the face/floor door (12), which is fully open in the floor mode. The cold air (13) is then directed to floor ducts.



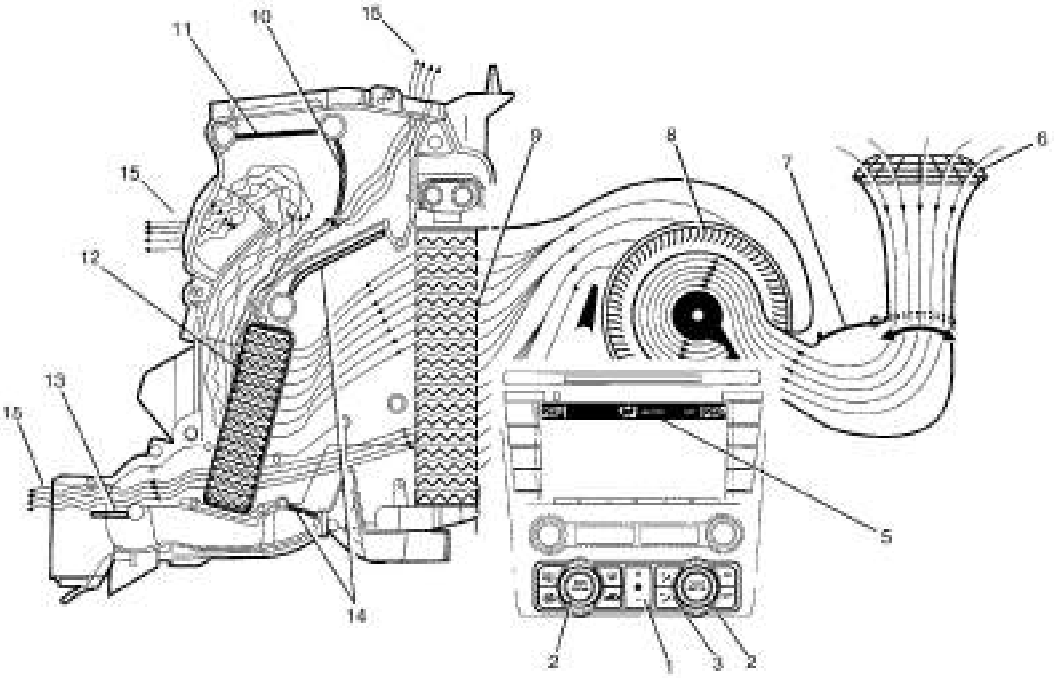
Floor Mode Full Hot

The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to floor mode (3). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet (6). Air is drawn into the HVAC module assembly by the blower motor (7). This air is then forced through the evaporator core fins (8). In full heat mode, the air mix doors (9) are fully open directing all incoming air through the heater core (10). The air travels through the face/floor door (11), which is fully open in the floor mode. The heated air (12) is then directed to the floor ducts and rear (15).



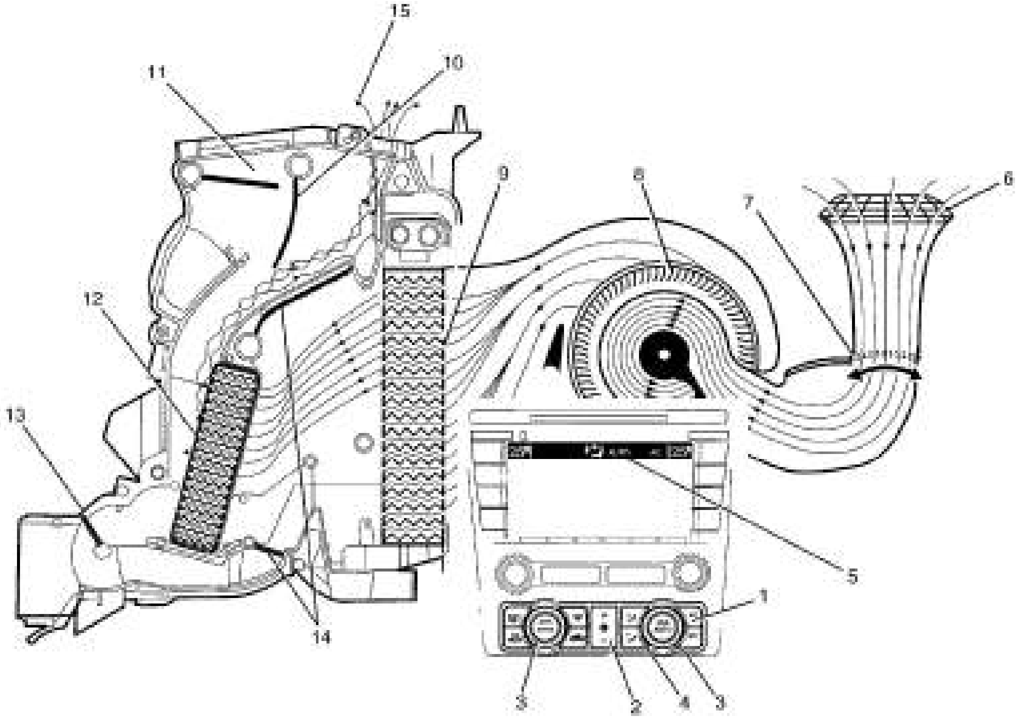
Blend Mode Full Cold

The A/C switch is on (1) or the auto button is pressed. The fan switch is set to any one of twenty speeds (2). The temperature switch is set to the full cold position (3). The mode control switch is set to blend mode (4). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8), and is then forced through the cold evaporator fins (9). In full cold mode, the air mix doors (14) are fully closed sealing off the passage through the heater core (12). The air travels through the defrost/floor door (10), which is positioned half way between, defrost and floor modes. The cold air (15) is then directed to both the front windscreen, floor ducts and rear passengers.



Blend Mode Full Hot

The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to blend mode (3). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet . Air is drawn into the HVAC module assembly by the blower motor (8). This air is then forced through the evaporator core fins (9). In full heat mode, the air mix doors (14) are fully open directing all incoming air through the heater core (12). The air travels through the defrost/floor door (11), which is positioned half way between defrost and floor modes. The heated air (15) is then directed to both the front windscreen and the floor ducts and rear passengers.



Defrost Mode

The A/C switch is on (1) or the auto button is pressed. The fan switch is set to any one of twenty speeds (2). The temperature switch is set to the full hot position (3). The mode control switch is set to defrost mode (4). The recirculation door (7) is closed allowing outside air (6) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (8). This air is then forced through the cold evaporator core fins (9) removing moisture from the air. In full heat mode, the air mix doors (14) are fully open allowing dehumidified incoming air through the heater core (12). The air travels through the defrost/floor door (10) which is fully open in the defrost mode. The heated air (15) is then directed to the front windscreen via the defrost outlets.

Recirculation

The HVAC control module controls the air intake through the recirculation actuator. Recirculation is not available when the mode is in defrost.

Pollution mode

The system can be set to pollution mode which selects recirculation when the vehicle speed is less than 15 km/h. This helps to prevent exhaust fumes entering the interior in heavy, stop/start traffic. To switch pollution mode on or off, press and hold the recirculation button for four seconds. When pollution mode is activated, the display shows Pollution Mode Activated. When it is switched off, the display shows Pollution Mode Inactive.

Automatic Operation

In automatic operation, the HVAC control module will maintain the comfort level inside of the vehicle by controlling the A/C compressor piston stroke, the blower motor, the air temperature actuators, mode actuator and recirculation.

To place the HVAC system in full automatic operation, the AUTO selection must be activated.

Once the desired temperature is reached, the blower motor, mode, recirculation and temperature actuators will automatically adjust to maintain the temperature selected. The HVAC control module performs the following functions to maintain the desired air temperature:

- Regulate blower motor speed
- Position the air temperature actuator
- Position the mode actuator
- Position the recirculation actuator
- Request A/C operation

When the warmest position is selected in automatic operation the blower speed will increase gradually until the vehicle reaches normal operating temperature. When normal operating temperature is reached the blower will stay on high speed and the air temperature actuators will stay in the full heat position. The mode actuator will remain in the floor position.

When the coldest position is selected in automatic operation the blower will stay on high and the air temperature actuators will stay in the full cold position. The mode actuator will remain in the face position and the recirculation actuator will remain in the recirculation position.

In cold temperatures, the automatic HVAC system will provide heat in the most efficient manner. The vehicle operator can select an extreme temperature setting, but the system will not warm the vehicle any faster. In warm temperatures, the automatic HVAC system will also provide air conditioning in the most efficient manner. Selecting an extreme cool temperature will not cool the vehicle any faster.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Automatic | Description and Operation | Document ID: 1994769

Air Temperature Description and Operation (LWB)

The air temperature controls are divided into 4 primary areas:

- Automatic Operation.
- The Heating and Air Conditioning System.
- The A/C Cycle.
- Auxiliary heating and A/C system.

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The battery positive voltage circuit provides power that the control module uses for keep alive memory (KAM). The instrument panel module (IPM), which is the vehicle power mode master, provides a device on signal. The control module supports the following features:

Feature	Availability
Purge	Yes
Personalisation	Yes
Actuator Calibration	No

Air Temperature Actuators

The air temperature actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position. When the ignition is cycled from OFF to ON the mode and temperature actuators (doors) are driven to their 0% positions which for the temperature door is full cold and the mode doors are to the closed position. The actuators are then driven to the previous settings before the ignition was turned OFF by using the same amount of counts recorded

Air Temperature Sensors

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The vehicle uses the following air temperature sensors:

- Ambient.
- Inside.

A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal decreases as the resistance decreases. The sensor signal varies between 0-5 volts.

The inside temperature sensor operates within a temperature range between -40 to +90°C (-40 to +194). If the sensor is shorted to ground, voltage, or an open, the system will operate using an estimated default value to allow the system to operate. The ambient sensor operates within a temperature range between -30 to +70°C (-22 to +158°F). If the HVAC control has determined that the ambient temperature sensor has failed, the driver information centre (DIC) display shall display - - - - in place of the outside air temperature. If the sensor is shorted to ground, voltage, or an open, the system will operate using an estimated default value to allow the system to operate. If the engine coolant temperature is not more than 3°C (5.4°F) above the sensor reading, or if the engine has not been started in 3 hours, then the actual ambient air temperature sensor reading is displayed. Also at vehicle speeds greater than 35 km/h (22 m.p.h.), the ambient air temperature displayed may be allowed to increase, but only at a slow, filtered rate. The DIC displays the ambient air temperature value that it receives from the HVAC control module through a GMLAN message.

Sunload Sensor

The sunload sensor is a 2-wire photo diode. The vehicle uses left and right sunload sensors. The 2 sensors are integrated into the sunload sensor assembly along with the ambient light sensor. Low reference and signal circuits enable the sensor to operate. As the sunload increases, the sensor signal decreases. The sensor operates within an intensity range between completely dark and bright. The sensor signal varies between 0-5 volts. The HVAC control module converts the signal to a range between 0-255 counts. The sunload sensor provides the HVAC control module a measurement of the amount of light shining on the vehicle. Bright or high intensity light causes the vehicle's inside temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle. If the sensor is open or shorted, no sunload adjustment occurs and the SERVICE VEHICLE SOON message is displayed.

Evaporator Temperature Sensor

The HVAC control module monitors the temperature of the air passing through the evaporator by the A/C evaporator air temperature sensor. This sensor is located on the evaporator core. The temperature is used to cycle the A/C compressor ON and OFF to prevent the evaporator core from freezing. A thermistor inside the sensor varies its resistance to monitor the evaporator air temperature. The HVAC control module monitors the voltage drop across the thermistor when supplied with a 5-volt reference signal. The HVAC control module will send a LS GMLAN message to the engine control module (ECM) to request the A/C compressor piston stroke to minimum stroke if the temperature drops below 2°C (37°F).

The sensor operates within a temperature range between -40 to +215°C (-40 to +355°F). If the HVAC control module detects an open in the evaporator temperature sensor or circuit, the class 2 message sent to the ECM will not submit the A/C ON request. The HVAC control module will then send a request to the infotainment unit for display of the SERVICE A/C SYSTEM that will be displayed on the DIC. The HVAC control module will also display A/C OFF on the module as long as the condition is present.

A/C Refrigerant Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5-volt reference, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0-5 volts. When the A/C refrigerant pressure is low, the signal value is near 0 volts. When the A/C refrigerant pressure is high, the signal value is near 5 volts.

The A/C refrigerant pressure sensor prevents the A/C system from operating when a pressure exceeds a predetermined value.

If the ECM detects a failure in the A/C refrigerant pressure sensor or circuit, the class 2 message sent to the HVAC control module will be invalid. The HVAC control module will then send a request to the infotainment unit for display of the SERVICE A/C SYSTEM that will be displayed on the infotainment facia The HVAC control module will also display A/C OFF on the module as long as the condition is present.

Heating and A/C Operation

The purpose of the heating and A/C System is to provide the following:

- Heated air.
- Cooled air.
- Remove humidity from the interior of the vehicle.
- Reduce windshield fogging.

Regardless of the temperature setting, the following can effect the rate that the HVAC system can achieve a desired temperature:

- Recirculation actuator setting.
- Difference between inside and desired temperature.
- Difference between ambient and desired temperature.
- Blower motor speed setting.
- Mode setting.

The HVAC control module commands or monitors the following actions when an air temperature setting is selected.

- WARMEST POSITION - The air temperature actuator door position directs maximum air flow through the heater core.
- COLDEST POSITION - The air temperature actuator door position directs maximum air flow around the heater core.
- BETWEEN THE WARMEST AND COLDEST POSITION - The following sensors are monitored to direct the appropriate amount of air through the heater core to achieve the desired temperature:
  - Sunload.
  - Ambient temperature.
  - Inside temperature.

The A/C system is engaged by selecting any switch on the HVAC control module except the A/C switch. The A/C switch will illuminate A/C OFF when the A/C switch is selected. The control module sends a GMLAN A/C request message to the engine control module (ECM) for A/C compressor operation. The following conditions must be met in order for the HVAC to turn on the compressor :

- HVAC control module:
  - Evaporator Temperature more than 4°C (39°F).
  - Control module operating range 9-16 volts.
- ECM:

  - Engine coolant temperature (ECT) is less than 125°C (257°F) or 120°C (248°F).
  - Engine RPM is between 450-6,000 RPM.
  - A/C pressure is between 196 and 3200 kPa.

Once engaged, the compressor will be disengaged for the following conditions:

- Throttle position is 100 percent.
- A/C pressure is more than 3 137 kPa (455 psi) or 2 850 kPa (413 psi).
- A/C pressure is less than 193 kPa (28 psi) or 200 kPa (29 psi).
- Engine coolant temperature (ECT) is more than 125°C (257°F) or 120°C (248°F).
- Engine speed is more than 5,500 RPM.
- Transmission shift.
- ECM detects high torque load.
- ECM detects insufficient idle quality.
- ECM detects a hard launch condition.

Dual Zone Operation

Dual-zone (DZ) mode Dual-zone mode allows different temperatures to be set for the left and right sides or to link them. When linked, the passenger's side temperature setting mirrors whatever the driver's side temperature is set to. To set a different temperature for the passenger's side, adjust the passenger's temperature control. To link the passenger's side temperature to the driver's side, press and hold the AUTO button for at least three seconds. Note Linking automatically occurs if the passenger's and driver's sides are set to the same temperature when the ignition is turned on. On a tri-zone climate control 3, the rear temperature setting mirrors whatever the driver's side temperature is set to.

Tri Zone Operation

Selecting tri-zone (TZ) mode activates the rear passenger controls. The climate control can still be operated as described in section Dual-zone (DZ) mode. Note The rear passenger controls are only activated when tri-zone (TZ) is selected. Refer to Rear passenger controls further on in this section.

Automatic Operation

In automatic operation, the HVAC control module will maintain the comfort level inside of the vehicle by controlling the A/C compressor piston stroke, the blower motor, the air temperature actuators, mode actuator and recirculation.

To place the HVAC system in automatic mode, the following is required:

- The blower motor switch must be in the AUTO position.
- The air temperature switch must be in any other position other than full hot or cold.
- The mode switch must be in the AUTO position.

Once the desired temperature is reached, the blower motor, mode, recirculation and temperature actuators will automatically adjust to maintain the temperature selected. The HVAC control module performs the following functions to maintain the desired air temperature:

- Regulate blower motor speed.
- Position the air temperature actuator.
- Position the mode actuator.
- Position the recirculation actuator.
- Request A/C operation.

When the warmest position is selected in automatic operation, the blower speed will stay on high speed and the air temperature actuators will stay in the full heat position. When the coldest position is selected in automatic operation, the blower will stay on high and the air temperature actuators will stay in the full cold position.

In cold temperatures, the automatic HVAC system will provide heat in the most efficient manner. The vehicle operator can select an extreme temperature setting, but the system will not warm the vehicle any faster. In warm temperatures, the automatic HVAC system will also provide air conditioning in the most efficient manner. Selecting an extremely cool temperature will not cool the vehicle any faster.

Auxiliary HVAC Control Module

Turn the rear temperature control L clockwise (warmer) or counterclockwise (cooler) to set the temperature for the rear. The rear temperature setting is shown in the front and rear displays when adjusting it. Note The rear temperature is dependent on the driver’s side temperature. When the pointer is set to the centre of the bar graphic in the display, the rear temperature is set to approximately the same setting as for the driver’s side. Press + or - on the fan button to increase or decrease the fan speed. The fan speed is shown in the display. Note This will affect the fan speed for all three zones. Press the mode button to switch between the following positions for the rear: Floor mode directs air to the floor-level outlets located under the front seats. Face mode directs air to the vents in the rear of the centre console Bi-level mode directs air to the floor-level outlets and the vents in the rear of the centre console The setting is shown in the display. Note If windscreen defrost is set, no air will come out of the rear vents. Pressing the AUTO button switches the system to full automatic control. Note When pressing the AUTO button, all functions (including the fan speed) are controlled automatically. Press the ON button P to switch the air to the rear off or on. FAN OFF appears in the display when it is off.

Auxiliary Air Temperature Actuator

The auxiliary air temperature actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position. When the ignition is cycled from OFF to ON the mode and temperature actuators (doors) are driven to their 0% positions which for the temperature door is full cold and the mode doors are to the closed position. The actuators are then driven to the previous settings before the ignition was turned OFF by using the same amount of counts recorded.

Air Temperature Description and Operation (SWB)

The air temperature controls are divided into 4 primary areas:

- Automatic Operation.
- The Heating and Air Conditioning System.
- The A/C Cycle.
- Auxiliary heating and A/C system.

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The battery positive voltage circuit provides power that the control module uses for keep alive memory (KAM). The instrument panel module (IPM), which is the vehicle power mode master, provides a device on signal. The control module supports the following features:

Feature	Availability
Purge	Yes
Personalisation	Yes
Actuator Calibration	No

Air Temperature Actuators

The air temperature actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position. When the ignition is cycled from OFF to ON the mode and temperature actuators (doors) are driven to their 0% positions which for the temperature door is full cold and the mode doors are to the closed position. The actuators are then driven to the previous settings before the ignition was turned OFF by using the same amount of counts recorded

Air Temperature Sensors

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The vehicle uses the following air temperature sensors:

- Ambient.
- Inside.

A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal decreases as the resistance decreases. The sensor signal varies between 0-5 volts.

The inside temperature sensor operates within a temperature range between -40 to +90°C (+20.3 to +135.5°F). If the sensor is shorted to ground, voltage, or an open, the system will operate using an estimated default value to allow the system to operate. The ambient sensor operates within a temperature range between -30 to +70°C. If the HVAC control module has determined that the ambient temperature sensor has failed, the driver information centre (DIC) display shall display - - - - in place of the outside air temperature. If the sensor is shorted to ground, voltage, or an open, the system will operate using an estimated default value to allow the system to operate. If the engine coolant temperature is not more than 3°C (5.4°F) above the sensor reading, or if the engine has not been started in 3 hours, then the actual ambient air temperature sensor reading is displayed. Also at vehicle speeds greater than 35 km/h (22 m.p.h.), the ambient air temperature displayed may be allowed to increase, but only at a slow, filtered rate. The DIC displays the ambient air temperature value that it receives from the HVAC control module through a GMLAN message.

Sunload Sensor

The sunload sensor assembly, located centrally on the top of the instrument panel near the windscreen is a 2-wire photo diode, effectively houses two sunlight sensors one for the left side and one for the right side. The 2 sensors are integrated into the sunload sensor assembly along with the ambient light sensor. Low reference and signal circuits enable the sensor to operate. As the sunload increases, the sensor signal decreases. The sensor operates within an intensity range between completely dark and bright. The sensor signal varies between 0-5 volts. The HVAC control module converts the signal to a range between 0-255 counts. The sunload sensor provides the HVAC control module a measurement of the amount of light shining on the vehicle. Bright or high intensity light causes the vehicle's inside temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle. If the sensor is open or shorted, no sunload adjustment occurs and the SERVICE VEHICLE SOON message is displayed.

Evaporator Temperature Sensor

The HVAC control module monitors the temperature of the air passing through the evaporator by the A/C evaporator air temperature sensor. This sensor is located on the evaporator core. The temperature is used to cycle the A/C compressor ON and OFF to prevent the evaporator core from freezing. A thermistor inside the sensor varies its resistance to monitor the evaporator air temperature. The HVAC control module monitors the voltage drop across the thermistor when supplied with a 5-volt reference signal. The HVAC control module will send a LS GMLAN message to the engine control module (ECM) to request the A/C compressor piston stroke to minimum stroke if the temperature drops below 2°C (37°F).

The sensor operates within a temperature range between -40 to +215°C (-40 to +355°F). If the HVAC control module detects an open in the evaporator temperature sensor or circuit, the GMLAN message sent to the ECM will not submit the A/C ON request. The HVAC control module will then send a request to the infotainment unit for display of the SERVICE A/C SYSTEM that will be displayed on the DIC. The HVAC control module will also display A/C OFF on the module as long as the condition is present.

A/C Refrigerant Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5-volt reference, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0-5 volts. When the A/C refrigerant pressure is low, the signal value is near 0 volts. When the A/C refrigerant pressure is high, the signal value is near 5 volts.

The A/C refrigerant pressure sensor prevents the A/C system from operating when a pressure exceeds a predetermined value.

If the ECM detects a failure in the A/C refrigerant pressure sensor or circuit, the GMLAN message sent to the HVAC control module will be invalid. The HVAC control module will then send a request to the infotainment unit for display of the SERVICE A/C SYSTEM that will be displayed on the infotainment facia The HVAC control module will also display A/C OFF on the module as long as the condition is present.

Heating and A/C Operation

The purpose of the heating and A/C System is to provide the following:

- Heated air.
- Cooled air.
- Remove humidity from the interior of the vehicle.
- Reduce windshield fogging.

Regardless of the temperature setting, the following can effect the rate that the HVAC system can achieve a desired temperature:

- Recirculation actuator setting.
- Difference between inside and desired temperature.
- Difference between ambient and desired temperature.
- Blower motor speed setting.
- Mode setting.

The HVAC control module commands or monitors the following actions when an air temperature setting is selected.

- WARMEST POSITION--The air temperature actuator door position directs maximum air flow through the heater core.
- COLDEST POSITION--The air temperature actuator door position directs maximum air flow around the heater core.
- BETWEEN THE WARMEST AND COLDEST POSITION--The following sensors are monitored to direct the appropriate amount of air through the heater core to achieve the desired temperature:
  - Sunload.
  - Ambient temperature.
  - Inside temperature.

The A/C system is engaged by selecting any switch on the HVAC control module except the A/C switch. The A/C switch will illuminate A/C OFF when the A/C switch is selected. The control module sends a GMLAN A/C request message to the engine control module (ECM) for A/C compressor operation. The following conditions must be met in order for the HVAC to turn on the compressor :

- HVAC control module:
  - Evaporator Temperature more than 4°C (39°F).

  - Control module operating range 9-16 volts.
- ECM:
  - Engine coolant temperature (ECT) is less than 125°C (257°F) or 120°C (248°F).
  - Engine RPM is between 450-6,000 RPM.
  - A/C pressure is between 196 and 3200 kPa .

Once engaged, the compressor will be disengaged for the following conditions:

- Throttle position is 100 percent.
- A/C pressure is more than 3 137 kPa (455 psi) or 2 850 kPa (413 psi).
- A/C pressure is less than 193 kPa (28 psi) or 200 kPa (29 psi) .
- Engine coolant temperature (ECT) is more than 125°C (257°F) or 120°C (248°F).
- Engine speed is more than 5,500 RPM.
- Transmission shift
- ECM detects high torque load.
- ECM detects insufficient idle quality.
- ECM detects a hard launch condition.

Dual Zone Operation

Dual-zone (DZ) mode Dual-zone mode allows different temperatures to be set for the left and right sides or to link them. When linked, the passenger's side temperature setting mirrors whatever the driver's side temperature is set to. To set a different temperature for the passenger's side, adjust the passenger's temperature control. To link the passenger's side temperature to the driver's side, press and hold the AUTO button for at least three seconds. Note Linking automatically occurs if the passenger's and driver's sides are set to the same temperature when the ignition is turned on.

Automatic Operation

In automatic operation, the HVAC control module will maintain the comfort level inside of the vehicle by controlling the A/C compressor piston stroke, the blower motor, the air temperature actuators, mode actuator and recirculation.

To place the HVAC system in automatic mode, the following is required:

- The blower motor switch must be in the AUTO position.
- The air temperature switch must be in any other position other than full hot or cold.
- The mode switch must be in the AUTO position.

Once the desired temperature is reached, the blower motor, mode, recirculation and temperature actuators will automatically adjust to maintain the temperature selected. The HVAC control module performs the following functions to maintain the desired air temperature:

- Regulate blower motor speed.
- Position the air temperature actuator.
- Position the mode actuator.

- Position the recirculation actuator.
- Request A/C operation.

When the warmest position is selected in automatic operation, the blower speed will stay on high speed and the air temperature actuators will stay in the full heat position. When the coldest position is selected in automatic operation, the blower will stay on high and the air temperature actuators will stay in the full cold position.

In cold temperatures, the automatic HVAC system will provide heat in the most efficient manner. The vehicle operator can select an extreme temperature setting, but the system will not warm the vehicle any faster. In warm temperatures, the automatic HVAC system will also provide air conditioning in the most efficient manner. Selecting an extremely cool temperature will not cool the vehicle any faster.

Automatic HVAC Description and Operation (SWBRHD)

1. Mode directions UP - Defrost, Bi-Level, Blend, Face, Floor
2. A/C Compressor output - OFF/output increase
3. Occupant climate control ON/OFF - Sleep mode, the air mix actuators are still operating in the back ground to try and maintain the selected set temperatures, which means at ON (wake up) the temperature output will be near the selected set temperatures.
4. Fully automatic mode - auto text is illuminated when in fully automatic mode. auto text is off, the occupant climate control is in semi automatic mode.
5. Temperature adjustment Driver Side - Set Temperature Range - Full cold to full hot, 17 to 30 in 1 (one) degree increments.
6. Mode directions Down - Floor, Face, Blend, Bi-Level, Defrost.
7. Blower speeds - Semi automatic mode Twenty (20) speeds. Fully automatic mode infinite speeds.
8. Fresh / Recirculation - When in recirculation mode, will automatically go to fresh air after Thirty (30) minutes depending on ambient temperature.
9. Temperature adjustment Passenger side - Set temperature range - Full cold to full hot, 17 to 30 in 1 (one) degree increments.
10. Ambient temperature display - The ambient temperature is displayed on the infotainment facia when the button is pressed.
11. Rear window defrost - Automatically turns off after 15 minutes the first time then every 5 minutes.
12. Front windscreen defrost - In this mode the A/C is automatically ON, Recirculation is not allowed.

General Description

The VE occupant climate control HVAC will be provided in Two (2) Variants: Dual Zone (DZ) - Temperature adjustment is independent for both Passenger and Drivers side.

A module called the HVAC control module (HCM) is attached to the HVAC on the Passenger side is the micro processor used to monitor inputs, process data, calculate changes to operating functions and control HVAC outputs.

The Inputs are:

- Can Bus information - Priority key user, Engine RPM, Vehicle road speed, Coolant temperature, A/C system pressure via the pressure transducer.
- In-car temperature sensor.
- Ambient temperature sensor.
- Evaporative temperature sensor.
- Electric mode actuators (DC motors) voltage, position feed back via photo interrupters.
- Blower fan voltage.
- Ignition voltage.
- Sun load sensor.
- Variable stroke compressor electronic control valve displacement (ECVD) actual position.

The Outputs are:

- Air distribution mode - Face, Floor, Defrost, Blend, Bi-Level, Air intake and Rear Passenger.
- Vent temperatures by adjusting the air mixing doors, including the rear passenger.
- Blower fan speeds.
- infotainment facia for display changes and Ambient temperature reading.
- Rear window defrost relay.
- Compressor displacement (output) via the ECVD. From OFF to Maximum output.
- Variable stroke compressor ECVD (electronic control valve) target position.
- Maximum blower fan speed relay.

Recommended Settings:

The vehicle owner should be encouraged to use the occupant climate control in fully Automatic mode and at a set temperature of between 22-24 degrees. Changing the set temperature to suit different conditions may cause the occupant climate control to behave differently from what the customer expects (eg. Setting to 17°C on a hot day may cause the customer to complain that the blower fan speed is too high).

Occupant Climate Control (OCC) When OFF is Selected:

The vehicle owner should be made aware that if the occupant climate control system is turned OFF, the following will occur:

- The air mixing (temperature) electric actuators will continue to operate (motor movement noise) in the background so as to make sure that when the occupant climate control system is re-activated it will be closer to the set temperature before the occupant climate control system was turned OFF.
- Default mode for the air inlet is fresh air, which will mean to the vehicle owner that even though the blower fan is not operating, when driving Ram air will forced into the HVAC. Depending on the set temperature before turning the occupant climate control OFF the vehicle owner may feel either too Hot or too Cold. If this is the case we suggest that they manually select Recirculation mode, this will prevent the Ram air from entering the HVAC

Automatic and Semi Automatic Mode - DZ and TZ:

The occupant climate control system should be set to automatic mode as in this mode the occupant climate control system will automatically control the vehicles interior temperature to the selected set temperature by the vehicles owner. The vehicle owner has the option of selecting semi automatic mode to "over rule" a function used in automatic mode. They might not like the blower fan speed selected in automatic mode, so they have the option of adjusting the Blower fan speed by operating that function on the infotainment facia, This will then take the occupant climate control system into semi automatic mode. This means that the occupant climate control system is still monitoring all the sensor readings and making automatic changes to mode and temperature, but - it can no longer use the blower motor as part of it’s calculations for altering the system, as the vehicle owner now has control of that function. The occupant climate control will try and compensate for having no blower fan speed control by altering another component to aid in meeting the required set interior temperature

Points to Remember on DZ Occupant Climate Control (OCC) Systems:

The occupant climate control system will alter mode positions, blower fan speeds and temperature in either automatic or semi automatic mode. These modes are face and floor. The passenger cannot have an individual blower speed from the driver as there is only one (1) blower motor in the HVAC.

Solar Load

The solar load sensor is located in the defrost panel of the crash pad. The sensor body houses two solar sensors, one for the passenger side and one for the driver side of the vehicle interior. These sensors are positioned at an approximate angle of 40 degrees so the side windows are also covered for solar load changes. A twilight sensor for automatic headlamp function is also contained in the solar sensor body.

Side Window Defrost Air Bleed from the HVAC - DZ :

As a design intention there is a constant bleed of air to the side windows in face mode. This air bleed is used to keep the side windows clear of any fogging that may be caused by the vehicle owner's breath exhaling, especially at low ambient temperatures. There is also an air bleed to defrost in floor mode

Evaporator Temperature Control

As the A/C system uses a Denso variable stroke and "clutchless" compressor that utilises an ECVD (electronic control valve) operated via the HVAC Control Module to increase or decrease the crankcase pressure in the compressor, which then alters the compressor output (displacement). The evaporator temperature sensor has no bearing on the cycling of the compressor as there is no direct or indirect electrical connection to the compressor from the vehicles wiring harness, as no clutch exists on the compressor. The compressor is operating constantly when the engine is operating, only the compressor output is adjusted. The evaporator temperature sensor is located in the lower section of the HVAC in the air intake stream after the evaporator and is used for sensing the incoming air temperature after the evaporator into the HVAC, to be used as part of the output calculation by the evaporator temperature sensor values are also required to operate the ECVD (electronic control valve) of the compressor to alter the stroke (displacement / output) for the A/C system.

Blower Fan Control:

- Automatic Mode - There are stepless and varying Blower fan speeds available. These are selected by the dependant on the input signals.
- Semi Automatic Mode - There are twenty (20) blower fan speeds available for selection by the vehicle owner.

  The blower fan speeds are will vary according to:
- Vehicle road speed - When the vehicle is travelling down the highway, the ram air effect into the HVAC, in fresh air mode will increase the air force coming from the vents, so will decrease the blower fan speed to compensate for this ram air.
- In car temperature sensor.
- Ambient air temperature sensor.
- Solar load sensor - If the cabin temperature is at or near the set temperature, the blower fan will be at the minimum. An increase in sun load will cause the blower fan speed to increase. Example: Ambient temperature 30 degree, high sun load, the blower fan will be on maximum to provide more cooling. If the vehicle enters a tunnel, all of a sudden the sun load has dramatically reduced, causing the vehicle owner to feel colder, The blower fan speed is reduced until the vehicle emerges from the tunnel.

- Drivers set temperature.
- Coolant temperature.
- Air distribution mode i.e.. Fresh or Recirculation mode.
- Ignition voltage.

Air Distribution Control

There are six distribution air modes that can be selected, either automatically or Semi Automatically. These are:

- Defrost.
- Blend (Floor and Defrost).
- Bi-Level (Floor and Face).
- Face.
- Floor.
- Centre console rear outlet.

When in Automatic mode and a set temperature above 25°C, only Floor and Defrost will be selected. If the set temperature is below 25°C, Face will be selected. If the vehicle interior temperature is at the desired temperature, the occupant climate control will select either Bi-Level (floor/face) or Face only, dependant on if the cabin temperature is required to warm up or cooled down. If cooling of the cabin is required, Floor mode may be selected for a short time (A/C purge), followed by Face mode. If heating of the cabin is required, Defrost mode will be selected until the engine coolant temperature is warm enough, this is called Defrost delay, then followed by Blend (floor/defrost). Then as the in car temperature increases, the mode should change to Bi-Level (floor/face). If heating is required and the coolant temperature is warm, Floor mode may be selected for a short time (Purge), followed by Bi-Level (floor/face) or Blend (floor/defrost), depending on conditions.

Air Inlet Control:

When Recirculation mode is selected either automatically or manually, the occupant climate control will return the air inlet to Fresh air mode after approximately 30 minutes, briefly and then will return to recirculation mode, this is to avoid a Carbon Dioxide build up in the cabin through exhaling by the vehicle occupants, which will cause drowsiness.

Automatic Mode:

The air inlet mode selected will vary according to:

- In car temperature.
- Ambient temperature.
- Solar load.
- Drivers set temperature.
- Start up conditions.
- Evaporator temperature.
- A/C High pressure.
- Engine coolant temperature.

If the vehicle cabin does not require cooling, fresh air will be selected. If extreme cooling of the vehicle cabin is required, such as when the ambient temperature is high and the vehicle has been standing in direct sunlight for an extended period, fresh may be selected for a short time (fresh delay), then recirculation mode until the vehicle cabin has cooled down. The Fresh air the engine bay cooling temperature becomes very high, Recirculation may be selected to increase cooling of the Vehicle Radiator.

Vent Air Temperature Control

The vent temperatures will vary between approximately 5 degrees C (Maximum cooling) and 70 degrees C (maximum heating). The temperature coming from the vent positions may / will be higher or lower than what is selected by the vehicle owner as a set temperature.

Semi Automatic Mode

This mode is where the passenger can adjust their set temperature, independent of the driver side set temperature. To access this mode when the driver set temp is in "locked mode", meaning that when the driver alters the set temperature, it alters both sides. For "unlocking mode", the passenger simply adjusts their temperature and the set temperature then becomes independent from the driver side set temperature. If the occupant climate control was in automatic mode the AUTO button LED illuminated, it will then go to semi automatic mode AUTO button LED not illuminated.

Automatic Mode

When a set temperature of between 17degrees C and 30 degrees C is selected, the air temperature will be controlled automatically. The Vent temperature will vary according to:

- In car temperature.
- Ambient temperature.
- Solar load.
- Driver or Passenger side set temperature.

When the vehicle cabin is at the desired temperature, the average vent air temperature should be the same as the set temperature. If the vehicle cabin requires cooling, the occupant climate control will try to control the vent temperature to less than the set temperature. If the vehicle cabin requires heating, the occupant climate control will try to control the vent temperature to be more than the set temperature. The more cooling required, the higher the vent temperature. Generally, the Blower fan speed will be low (less than 50%) before the occupant climate control starts to control the temperature. (e.g. When extreme cooling is required, the blower fan will start at maximum and the air mix will start at minimum. As the vehicle cabin temperature cools downs, the blower speed will decrease gradually.

- Increasing the set temperature will increase the vent temperature (providing air mix is not at maximum).
- Decreasing the set temperature will decrease the vent temperature (providing air mix is not at minimum).
- As the In car temperature increases, the vent temperature will decrease.
- As the Solar load decreases, the vent temperature will increase.
- As the Solar load increases, the vent temperature will decrease.
- As the Ambient temperature increases, the vent temperature will decrease.

- As the Ambient temperature decreases, the vent temperature will increase.

Occupant Climate Control (OCC) Cold Start Routines.

There are Four cold start routines incorporated into the occupant climate control system logic to cater for various conditions on first "key on" in the morning, typically at low ambient temperatures.

Each routine has its own respective set of criteria to satisfy before the routine is executed:

- Recirculation Delay: Automatically defaults to recirculation mode to prevent further ingress of cold air into the vehicle cabin.
- Defrost Delay: To reduce cold air at the floor during warm-up and prevents the driver breath from "fogging up" the front windscreen.
- HVAC Purge: Allows engine coolant to heat up the heater core and avoid humidity to face and windscreen when the blower fan is activated.
- A/C Purge: To avoid hot air blowing on face when the blower fan is activated.
- Fresh Delay: Uses cooler outside air to purge hot air from the vehicle.

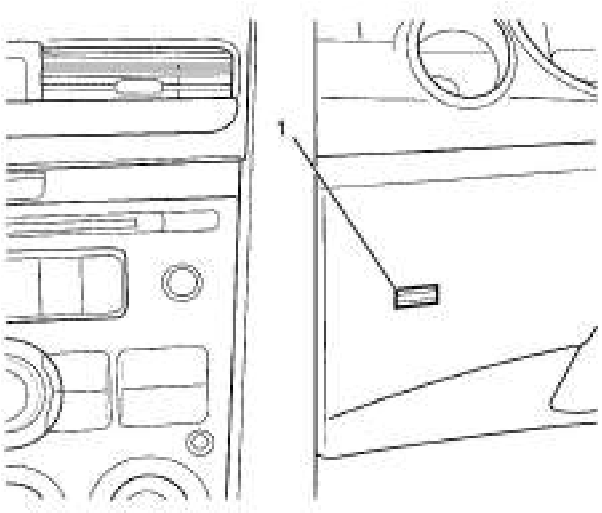
HVAC Unit Construction, Components and Associated Sensors

General Description

There is one type of Occupant Climate Control (OCC) HVAC module assemblies fitted across the VE Series Vehicle range:

Dual zone system-HVAC (OCC)

In-Car Temperature Sensor

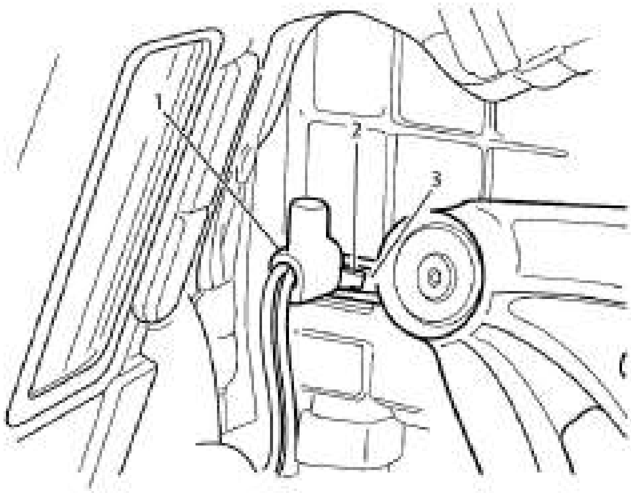


The in-car temperature sensor is an negative temperature coefficient (NTC) thermistor used to monitor the vehicles's interior temperature. Resistance signals are constantly monitored by the OCC module and are used for subsequent control of the OCC system.

It is essential that the venturi and aspirator tube assembly by properly connected to the in-car temperature sensor if the sensor is to provide correct information to the OCC module.

The in-car temperature sensor is located on the left-hand side of the steering column behind the sensor inlet air holes (1) on the instrument cluster trim assembly.

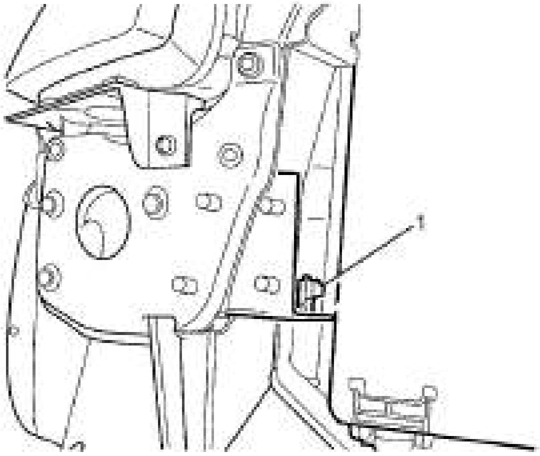
Evaporator Temperature Sensor



The evaporative temperature sensor is a negative temperature coefficient (NTC) thermistor used to monitor the temperature of the air into the HVAC module assembly after it has passed through the evaporator core. Resistance values are constantly monitored by the OCC module and are used for subsequent control of the OCC system.

The evaporative temperature sensor (1) is located on the HVAC case by a plastic retaining clip in the down stream air flow of the evaporator.

Ambient Temperature Sensor

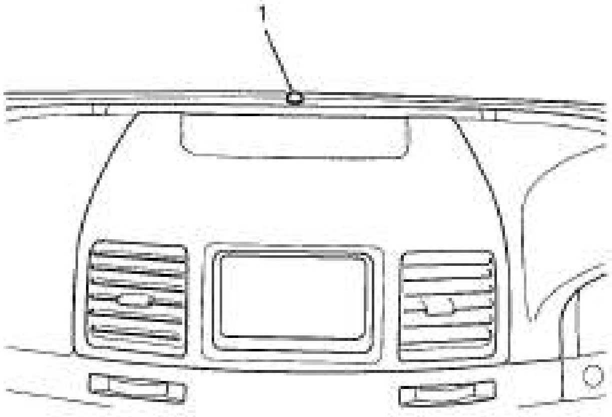


The ambient temperature sensor (1) is installed on a bracket (2) that is located at the front of the A/C condenser (3), on the lower right-hand side.

It is a negative temperature coefficient NTC thermistor used to monitor the ambient (outside) temperature. This sensor is slow reacting, due to the dense plastic housing surrounding it. The OCC takes into account road speed before updating the temperature display to avoid false readings in heavy traffic or extended idle conditions.

Resistance signals are sent directly from the ambient temperature sensor to the OCC module for interpretation.

Sun Load Sensor



The sun load sensor (1) is located in the centre of the defrost panel to monitor the sun's heating load upon the vehicle.

It is a photochemical type sensor, where a small electrical current will be generated, which depending on the sun load (strength) over it. When the sun's intensity is high, the OCC module will select a higher blower fan speed and increased vehicle cooling automatically. Likewise, when the sun load is low, such as going into an underground car park, the OCC module will automatically reduce the fan speeds and increase heating slightly.

Signals are sent from the sun load senor directly to the BCM, then to the OCC module via the serial data line input.

Symptoms - HVAC Systems - Manual

Important: Review the system operation in order to familiarise yourself with the system functions. Refer to:

- Air Delivery Description and Operation.
- Air Temperature Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.
- The A/C compressor will not operate in cold outside air temperatures. Refer to Air Temperature Description and Operation.
- The following conditions may cause window fogging:
  - Wet carpet or mats
  - High humidity
  - Interior water leak
  - Blocked A/C evaporator drain tube
  - Maximum passenger capacity
  - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:

  Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Blower Motor Malfunction.
- Heating Performance Diagnostic.

Blower Motor Always On

If the blower motor is always on one of the following DTC's should set. Refer to DTC diagnosis first.

Causes	Actions
Can bus message fault	**DTC test U0073, U0020, U0140, U0155, U0184 AND U0249**
HCM Issue	DTC test B0193

Blower Motor Inoperative

Step	Action	Yes	No
Schematic Reference: HVAC Schematics . *Connector End View Reference:* Component Connector End Views . DEFINITION: The blower motor is inoperative in all speed positions.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	1. Turn ON the ignition, with the engine OFF. 2. Place the blower motor switch in each speed position. Does the blower motor operate in any speed position?	Go to Blower Motor Malfunction .	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the blower motor. 3. Connect a test lamp between the blower motor supply voltage circuit and the blower motor control circuit. 4. Turn ON the ignition, with the engine OFF. 5. Place the blower motor switch in each speed position. Does the test lamp illuminate in any speed position?	Go to Step 10	Go to Step 4
4	Test the blower motor supply voltage circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 5
5	Test the blower motor control circuit for an open or high resistance between the blower motor and X124. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 6
6	1. Turn OFF the ignition. 2. Connect the blower motor. 3. HVAC control module. 4. Turn ON the ignition, with the engine OFF. 5. Place the blower motor switch in each speed position. Does the blower motor operate in any speed position?	Go to Step 11	Go to Step 7

7	Check for any serial data codes or faults Did you find a fault?	Go to Step 8	Go to Step 9
8	Test GMLAN wiring. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 9
9	**Important:** The blower motor switch is part of the infotainment unit facia and communicates via GMLAN Test the blower motor switch control circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 12
10	Inspect for poor connections at the blower motor. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 13
11	Inspect for poor connections at the HVAC control module. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 14
12	**Important:** The blower motor switch is part of the infotainment unit facia and communicates via GMLAN Inspect for poor connections at the infotainment unit facia . Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 16	Go to Step 15
13	Replace the blower motor. Refer to Blower Motor Replacement . Did you complete the replacement?	Go to Step 16	--
14	Replace the HVAC control module. Refer to HVAC Control Module Replacement . Did you complete the replacement?	Go to Step 16	--
15	Replace the blower switch. Refer to Radio Replacement . Did you complete the replacement?	Go to Step 16	--
	Operate the system in order to verify the repair.		

16	Did you correct the condition?	System OK	Go to Step 2

Blower Motor Malfunction

Step	Action	Yes	No
Schematic Reference: HVAC Schematics . *Connector End View Reference:* Component Connector End Views . DEFINITION: The blower motor operates in at least one, but not all, speed positions.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	1. Turn ON the ignition, with the engine OFF. 2. Place the blower motor switch in each speed position. Are any blower speeds available?	Go to Step 4	Go to Step 3
3	Check for blown blower motor fuse 9 Was the fuse blown?	Replace the fuse with the correct amperage fuse.	Go to Step 4
4	Check for power at the blower motor. Circuit Testing and Wiring Repairs . Is voltage available, but the blower motor will not operate?	Replace the blower motor. Refer to Blower Motor Replacement .	Go to Step 5
5	1. Operate all the blower speeds, one at a time at the IRC blower control. 2. There should be 20 blower speeds available. Are all blower speeds available?	Go to Step 9	Go to Step 6
6	1. Back probe the 2 pin connector at the blower motor. 2. Activate the 20 blower fan speeds one at a time starting from the lowest, using the IRC blower control. 3. Compare the voltages to the graph. Refer to Sensor Resistance Table . Were the voltages approximate to the graph?	Go to Step 9	Go to Step 7
	Connect scan tool.		

7	Go to miscellaneous test, switch data. Select all 20 blower fan speeds using the scan tool increase / decrease soft keys Were all speeds available?	Carry out IRC test for blower switch function.	Go to Step 8
8	Replace the HVAC control module. Refer to HVAC Control Module Replacement . Did you find and correct the condition?	Go to Step 9	--
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 2

Too Hot in Vehicle

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. The ambient air temperature must be above 3°C (38°F) for this A/C compressor test.

6. The specified values are from the A/C System Performance Test.

Step	Action	Values	Yes	No
Schematic Reference: HVAC Schematics. *Connector End View Reference:* Component Connector End Views. DEFINITION: The temperature cannot be adjusted, or cooling is insufficient during A/C operation.				
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle.
2	**Important:** All DTCs that are set must be diagnosed first unless you were sent to this diagnostic from a specific DTC diagnostic. 1. Turn ON the ignition, with the engine OFF. 2. Place the blower motor switch in each speed position. Does the blower motor operate in any speed position?	--	Go to Step 3	Go to Blower Motor Inoperative.
3	Does the blower motor operate at the desired speeds?	--	Go to Step 4	Go to Blower Motor Malfunction.
4	1. Start the engine. 2. Place the mode switch in the face position. 3. Place the recirculation switch in the ON position. 4. Observe the recirculation door. 5. Place the recirculation switch in the OFF position. Does the recirculation door move from the recirculation position to the outside air position?	--	Go to Step 5	Go to Symptoms - HVAC Systems - Manual
	Important: The ambient air temperature must be above 3°C (38°F).			

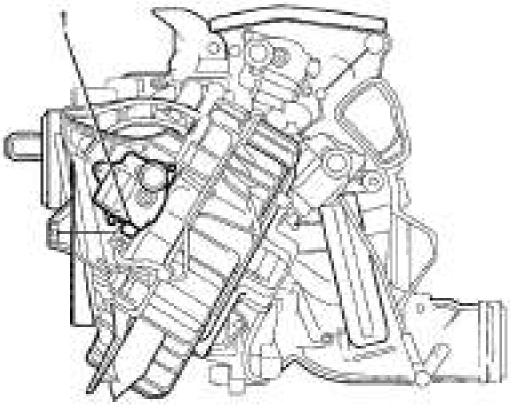
5	1. Start the engine. 2. With scan tool, clear any DTCs that are stored in the HVAC control module. 3. Place the air temperature switch in the coldest position. 4. Place the mode switch in the bi-level position. 5. Place the blower motor on high speed. Does the A/C compressor operate?	--	Go to Step 6	Go to Air Conditioning Compressor Replacement
6	Perform the A/C system performance test. Refer to Air Conditioning (A/C) System Performance Test. Did you find and correct the condition?	--	Go to Step 8	Go to Step 1
7	Replace the HVAC control module. Refer to Control Module References. Did you complete the replacement?	--	Go to Step 8	--
8	Operate the system in order to verify the repair. Did you correct the condition?	--	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Manual | Repair Instructions | Document ID: 1976251

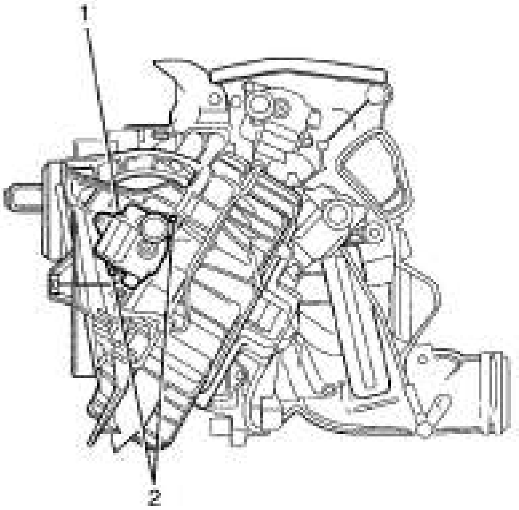
Air Inlet Valve Actuator Replacement (RHD)

Removal Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.



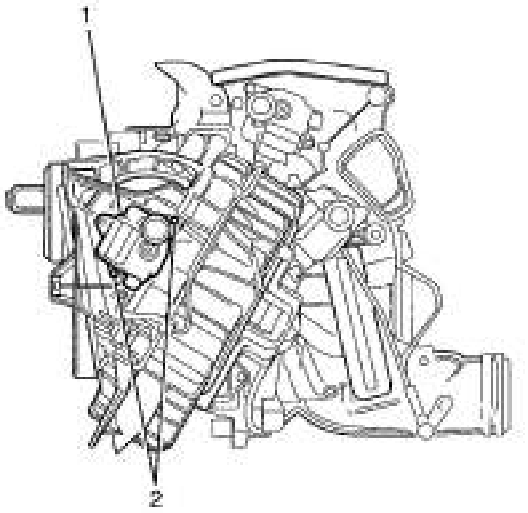
3. Disconnect the recirculation actuator electrical connector (1).



4. Remove the recirculation actuator to HVAC module assembly retaining screws (2).

5. Remove the recirculation actuator (1) from the HVAC module assembly (3).
6. Inspect air intake door shaft end for damage, also check the air intake door for full movement, open/close. If damage is evident, replace the air intake housing. Refer to Air Inlet Assembly Replacement.

Installation Procedure

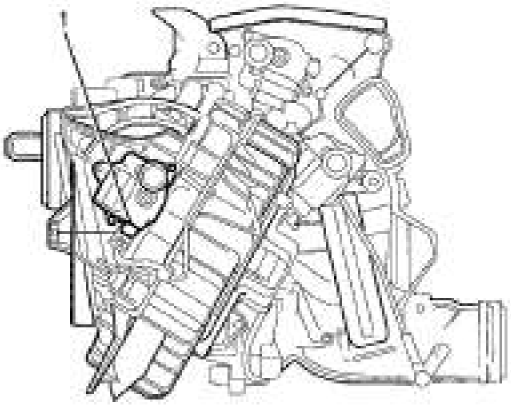


1. Install the air intake recirculation actuator (1) to the HVAC module assembly (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the recirculation actuator (1) to HVAC module assembly retaining screws (2).

   Tighten
   Tighten the screws to 1.2 N·m (9 lb ft).



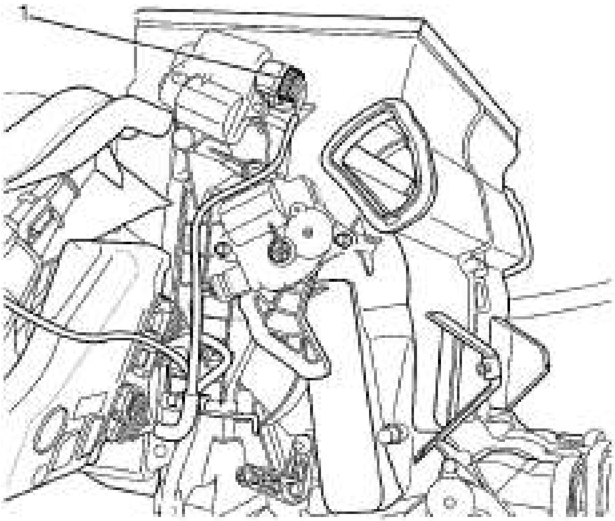
3. Connect the recirculation actuator electrical connector (1).
4. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
5. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
6. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Manual | Repair Instructions | Document ID: 1994804

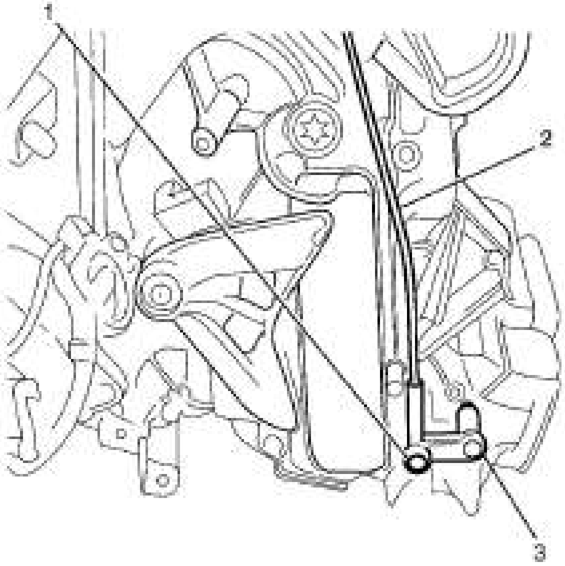
Defroster Valve Actuator Replacement (RHD)

Removal Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side .
2. Remove the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement .
3. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement .
4. Remove the left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .

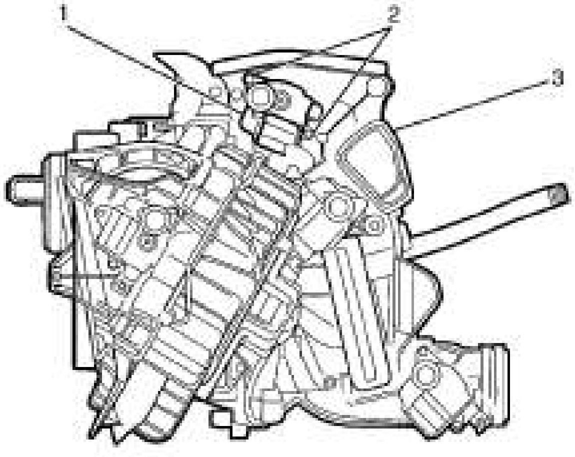


5. Disconnect the defrost mode actuator electrical connector (1).

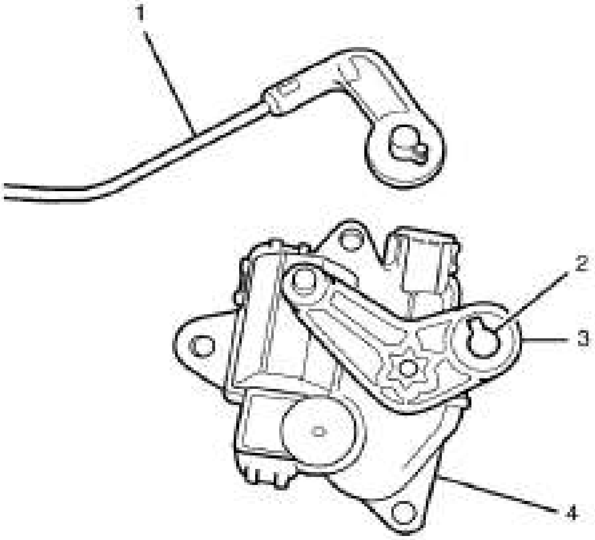


Important: Using a suitable tool, squeeze the rear passenger mode rod to rear passenger mode door lever retaining clip (1) to detach the rear passenger mode rod (2) from the rear passenger mode door lever (3).

6. Detach the rear passenger mode rod (2) from the mode door lever (3).



7. Remove the defrost mode actuator to HVAC module assembly retaining screws (2).
8. Remove the defrost mode actuator and the rear passenger mode lever (1) from the HVAC module assembly (3).



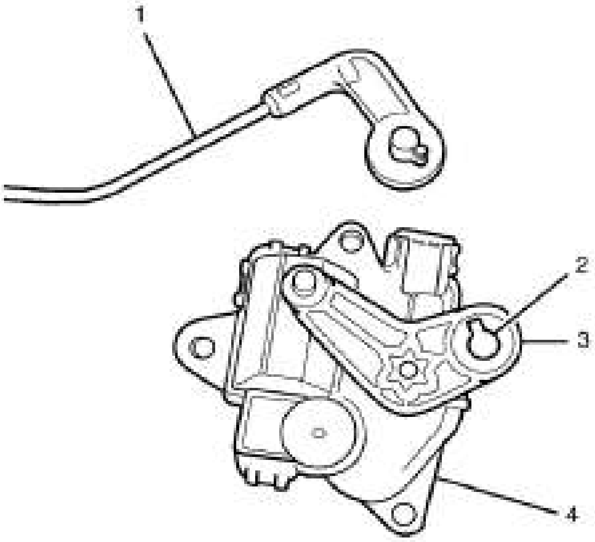
Important: Rotate the rear passenger mode rod (1) to match the actuator lever locking position opening (2), then remove rear passenger mode rod (1).

9. Detach the rear passenger mode rod (1) from the defrost mode actuator (4).

   Important: Take note of the rear passenger mode lever (3) position in relation to the defrost mode actuator (4).

10. Gently remove the rear passenger mode lever (3) from the defrost mode actuator (4).

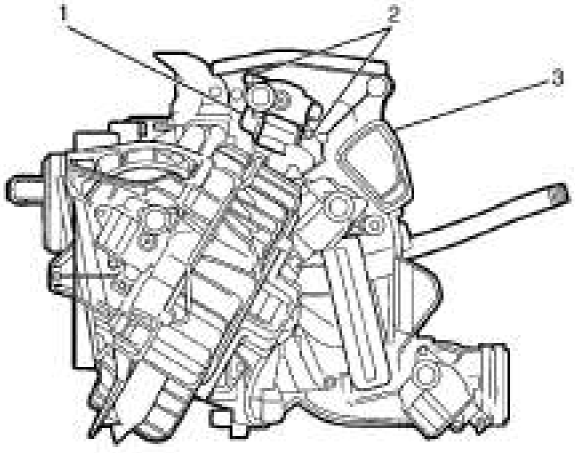
Installation Procedure



1. Install the rear passenger mode lever (3) to the defrost mode actuator (4).

   Important: Rotate the rear passenger mode rod (1) to match the actuator lever locking position opening (2), to install the rear passenger mode rod (1).

2. Attach the rear passenger mode rod (1) to the actuator (4).

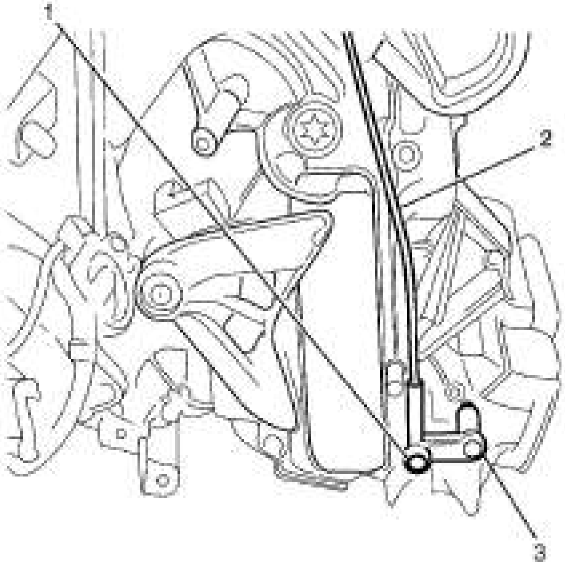


3. Install the and the rear passenger mode lever (1) to the HVAC module assembly (3).

   Notice: Refer to Fastener Notice in the Preface section.

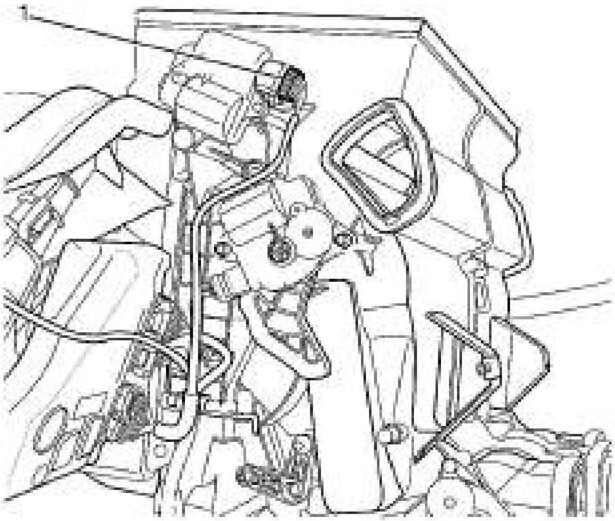
4. Install the defrost mode actuator to HVAC module assembly retaining screws (2).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).



Important: Make sure the rear passenger mode rod to rear passenger mode door lever retaining clip (1) is correctly engaged to prevent the rear passenger mode door lever (3) from functioning incorrectly.

5. Attach the rear passenger mode rod (2) to the mode door lever (3).

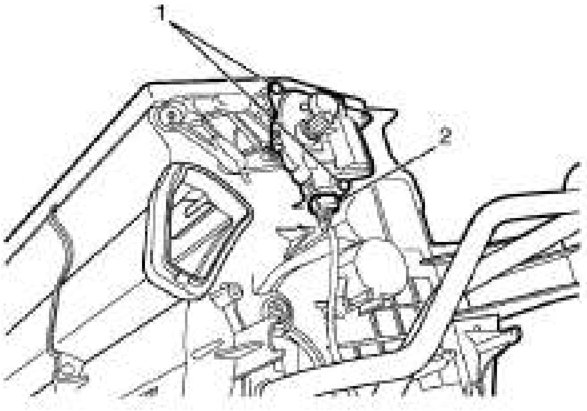


6. Connect the defrost mode actuator electrical connector (1).
7. Install left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .
8. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement .
9. Install instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement .
10. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side .
11. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup .

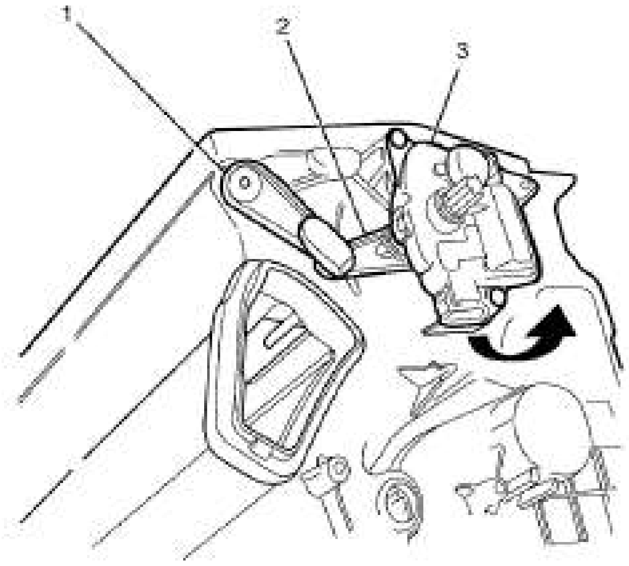
Floor Air Valve Actuator Replacement

Removal Procedure

1. Remove the right side console lower extension. Refer to Instrument Panel Extension Replacement.
2. Remove the instrument panel lower right trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
3. Remove right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side.

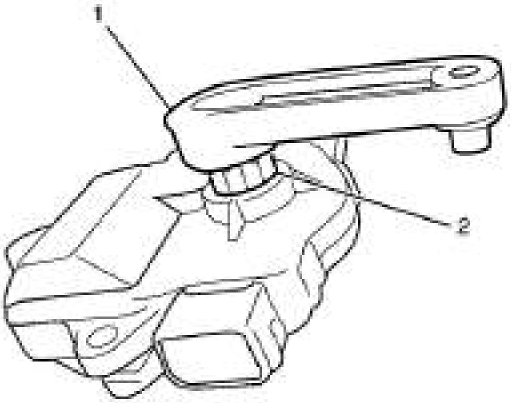


4. Disconnect the face/floor actuator electrical connector (2).
5. Remove the face/floor actuator to HVAC module assembly retaining screws (1).



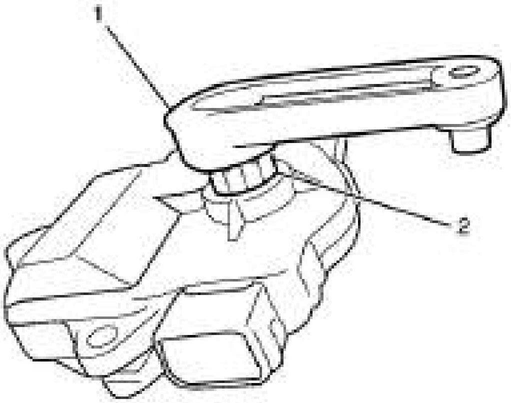
Important: Pivot the face/floor mode actuator (3) upwards and remove the face/floor mode actuator lever (2) from the face door mode lever (1).

6. Remove the face/floor mode actuator lever (2) from the face door mode lever (1).

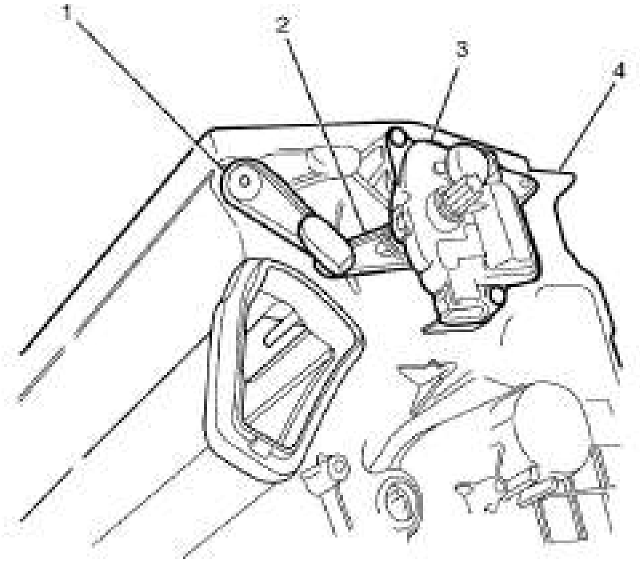


7. Record where the face/floor mode actuator lever (1) is located onto the face/floor actuator drive spline (2) for installation.

Installation Procedure

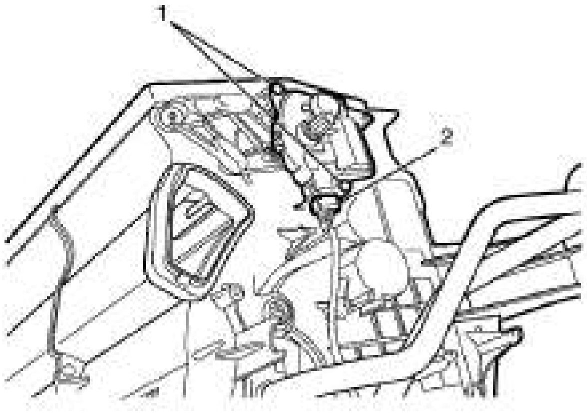


1. Detach and move the face/floor mode actuator lever (1) to the recorded position on the face/floor actuator drive spline (2) as required.



2. Install the actuator lever (2) to the face door mode lever (1) and pivot the face/floor mode actuator (3) into position on the HVAC module assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.



3. Install the face/floor mode actuator to HVAC module assembly retaining screws (1).

Tighten
Tighten the bolts to 1.2 N·m (9 lb ft).

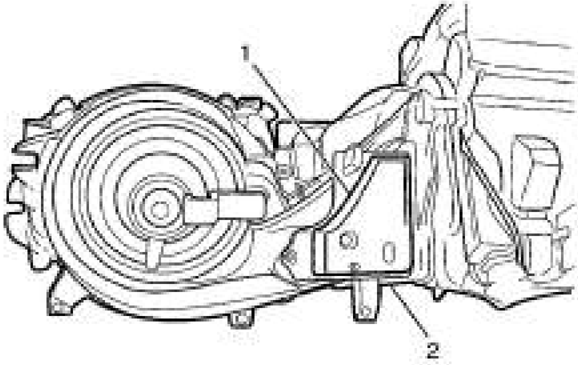
4. Connect the face/floor mode actuator electrical connector (2).
5. Install the instrument panel lower right trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
6. Install right side floor duct. Refer to Floor Air Outlet Duct Replacement - Right Side.
7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | HVAC | HVAC - Manual | Repair Instructions | Document ID: 1990491

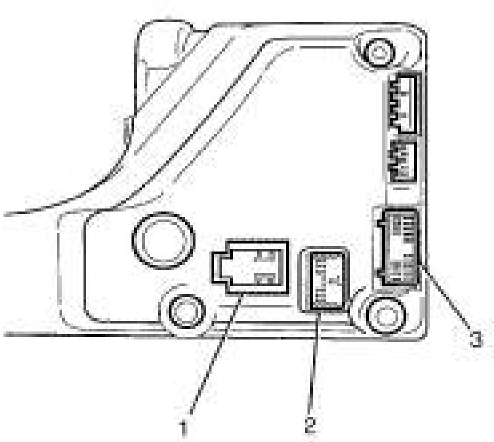
HVAC Control Module Replacement (RHD)

Removal Procedure

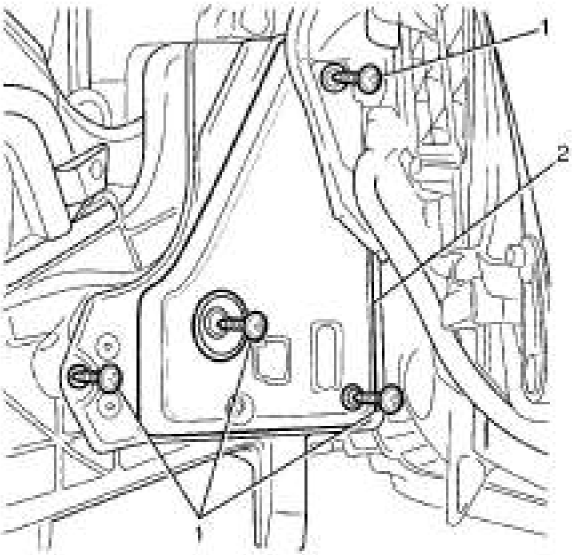
1. Remove the glove box assembly. Refer to Instrument Panel Compartment Replacement .
2. Remove left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .



3. Locate the HVAC control module (1) on the left side of the HVAC module assembly (2).



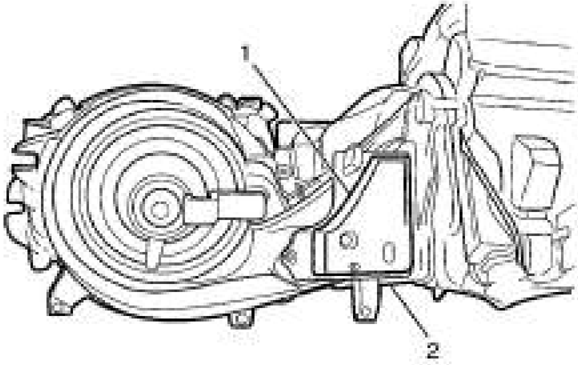
4. Disconnect the HVAC control module electrical connectors (1 - 3).



Important: Make sure the HVAC control module electrical connectors are disconnected before removing the HVAC control module to HVAC module assembly retaining screws (1). The HVAC control module to HVAC module assembly retaining screws (1) contact the HVAC control module (2) circuit board and can short on removal.

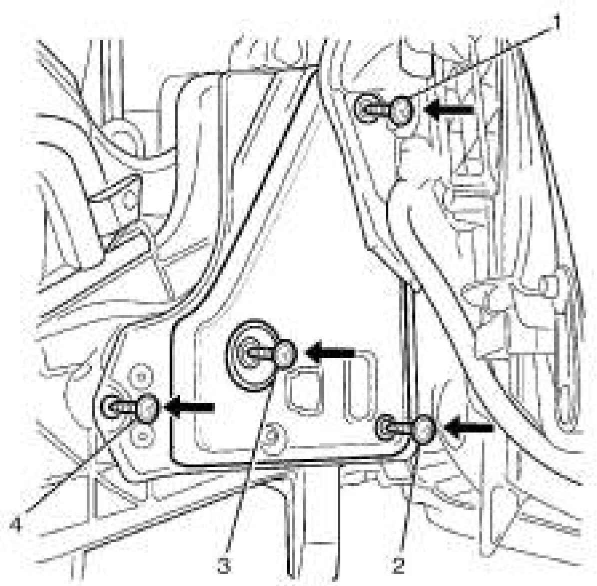
5. Remove the HVAC control module to HVAC module assembly retaining screws (1).
6. Remove HVAC control module (2).

Installation Procedure



1. Install the HVAC control module (1) to the HVAC module assembly (2).

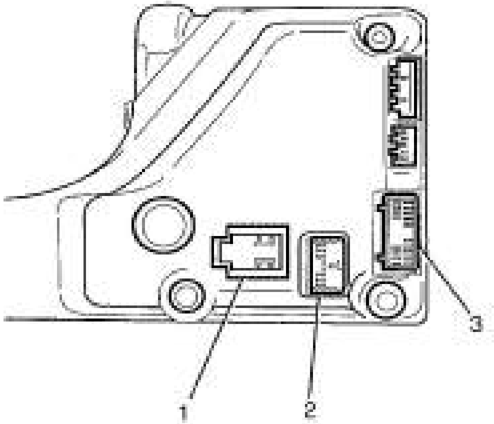
Notice: Refer to Fastener Notice in the Preface section.



Important: The HVAC control module to HVAC module assembly retaining screws (1 - 4) should be tightened in the sequence shown to prevent damage to HVAC control module circuit board.

2. Install the HVAC control module to HVAC module assembly retaining screws (1 - 4).

Tighten
Tighten the screws to 2 N·m (18 lb in).

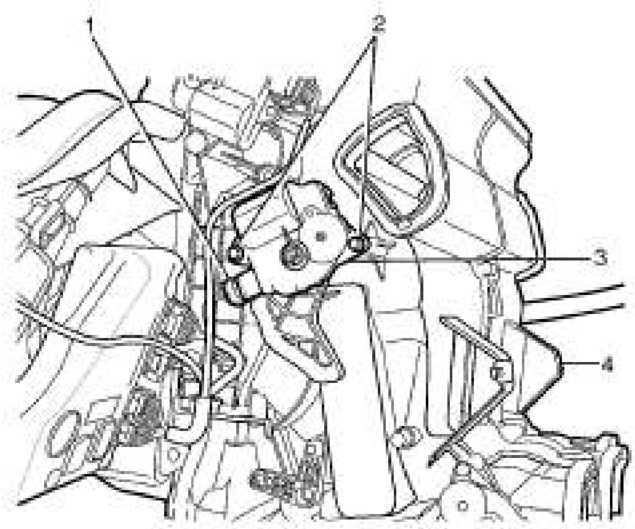


3. Connect the electrical connectors (1 - 3) to the HVAC control module.
4. Install left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side .
5. Install the glove box assembly. Refer to Instrument Panel Compartment Replacement .
6. If re-programming is required. Refer to Control Module References .
7. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup .

Mode Valve Actuator Replacement - Left Side (SWB RHD)

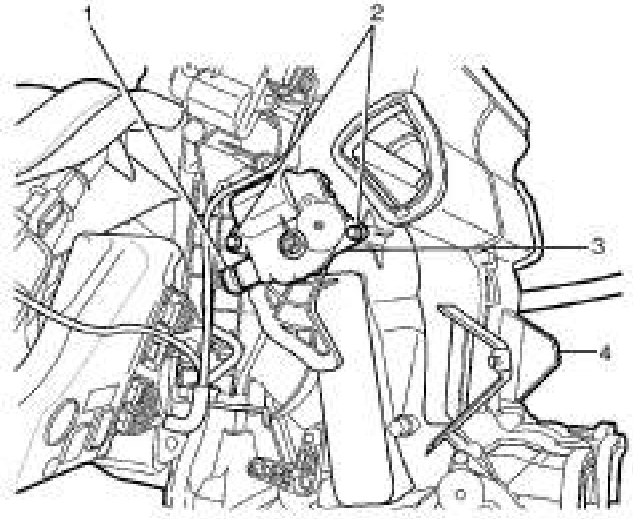
Remove Procedure

1. Remove the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement in Instrument Panel, Gages, and Console.
3. Remove the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
4. Remove the left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.



5. Disconnect the air mix actuator electrical connector (1).
6. Remove the air mix actuator to HVAC module assembly retaining screws (2).
7. Remove the air mix actuator (3) from the HVAC module assembly (4).

Installation Procedure



1. Install the air mix actuator (3) to the HVAC module assembly (4).

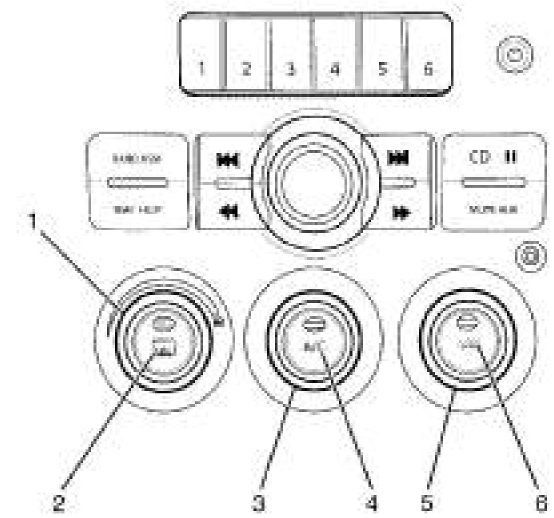
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the air mix actuator to HVAC module assembly screws (2).

   Tighten
   Tighten the screws to 1.5 N·m (13 lb ft).

3. Connect the air mix actuator electrical connector (1).
4. Install left side floor duct. Refer to Floor Air Outlet Duct Replacement - Left Side.
5. Install the I/P compartment assembly. Refer to Instrument Panel Compartment Replacement.
6. Install instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement in Instrument Panel, Gages, and Console.
7. Install the I/P lower trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
8. Perform HVAC system relearn. Refer to HVAC Control Module Programming and Setup.

Air Delivery Description and Operation



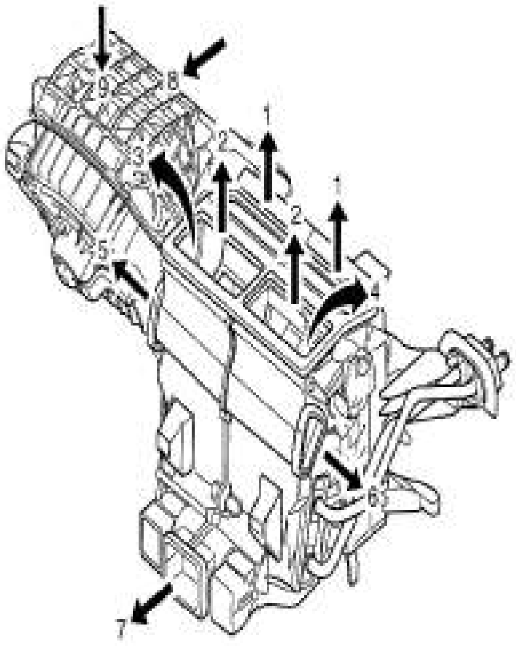
1. Blower motor speeds - There are 20 speeds available. The outer button ring (1) is used to alter speeds, clockwise speed increases, anti-clockwise speed decreases.
2. Heated rear window (HRW) button (2)- Activates the rear window defrosting. When activated, the LED is illuminated. When deactivated, the LED is not illuminated. The HRW has a timer to automatically deactivate the HRW.
3. Temperature control - Temperature adjustment from cold to hot via the outer ring of the control (3). Anti-clockwise cold, clockwise hot.
4. A/C button (4)- Push the button and the A/C is ON and the LED is illuminated. When the LED is not illuminated, the A/C is OFF. The A/C can be engaged in all mode positions.

   Important: It is possible for the A/C to disengage while the LED is on in the following conditions, wide open throttle or a A/C system over pressure situation.

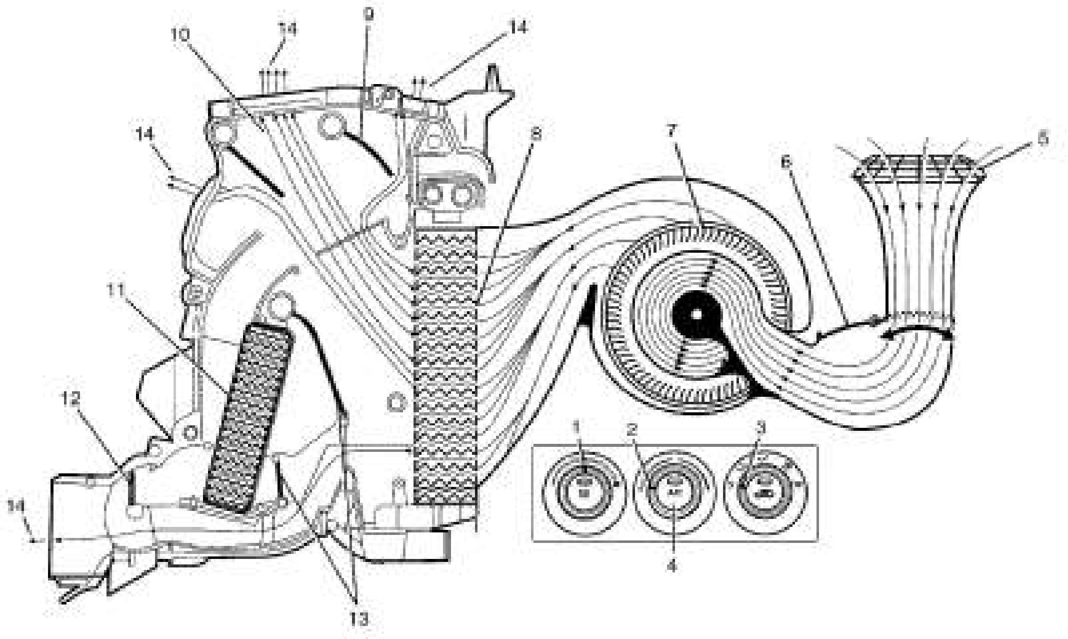
5. Mode outlet positions - Five mode outlet positions are available, via the outer ring (5) of the control. These are: Face, Bi-level (face/foot), Foot (floor), Blend (defrost/foot), Defrost. In the defrost mode, the A/C is automatically engaged, LED illuminated
6. Air intake mode to HVAC - Recirculation mode can be selected by pushing the button (6), the LED will illuminate. In recirculation mode, the air entering the HVAC will come from the vehicle interior and no fresh air will enter. Recirculation mode can be activated in: Face, Bi-level, and Foot outlet modes. If moving the control from Foot to Blend mode, the recirculation will be deactivate (LED Off), but it can be reactivated by pushing the recirculation button (LED On). Recirculation mode can not be selected in Defrost mode.

   Important: Recirculation reuses interior air and is therefore not recommended for long periods owing to a build up of carbon dioxide from occupants exhaling. If recirculation mode is used for an extended period of time about 30 minutes, the system will automatically select fresh air mode to let some fresh air into the cabin for ventilation then return to recirculation mode.

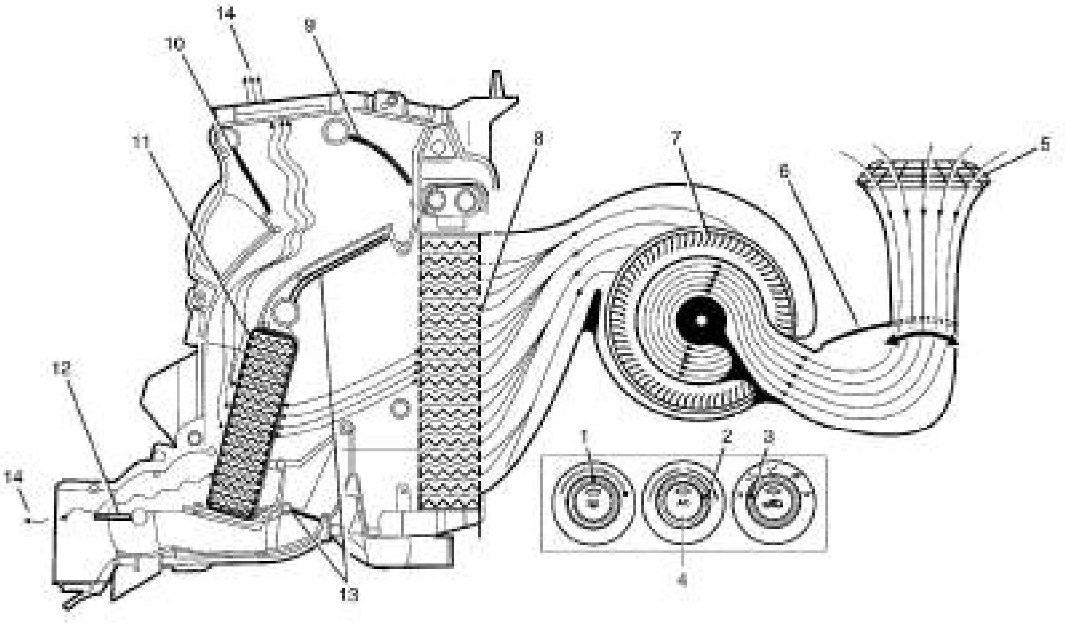
HVAC Air Flow Direction



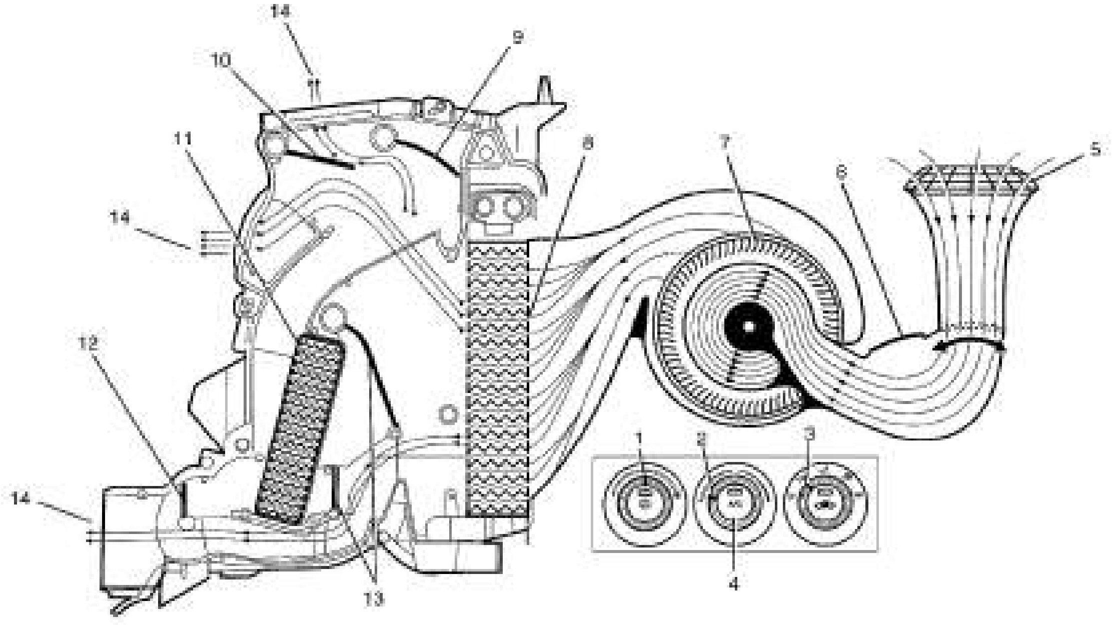
(1) Defrost to Windscreen
(2) Face Vent Outlet
(3) Passenger Side I/P Outlet
(4) Driver Side I/P Outlet
(5) Passenger Side Floor Outlet
(6) Drivers Side Floor Outlet
(7) Centre Console Rear Passengers Outlet
(8) Fresh Air Intake
(9) Recirculation Air Intake



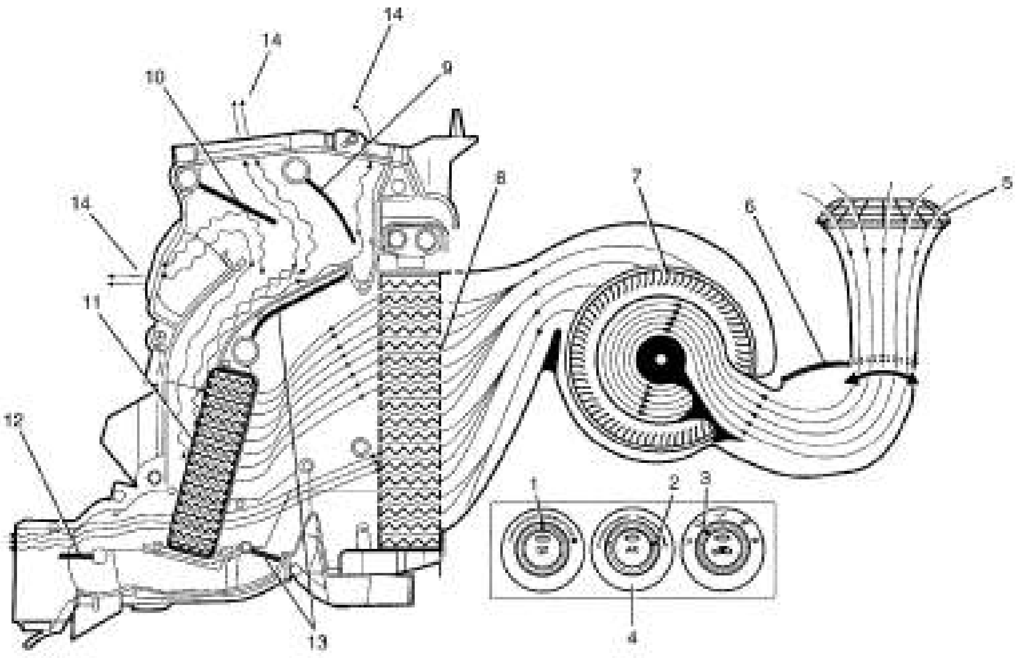
The A/C switch is on (4). The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full cold position (2). The mode control switch is set to face mode (3). The recirculation door (6) is closed, allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (7) and is then forced through the cold evaporator fins (8). In full cold mode, the air mix doors (13) are fully closed, sealing off the passage through the heater core (11). The air travels through the open face/foot door (10). The cold air (14) is then directed through the centre and side vents.



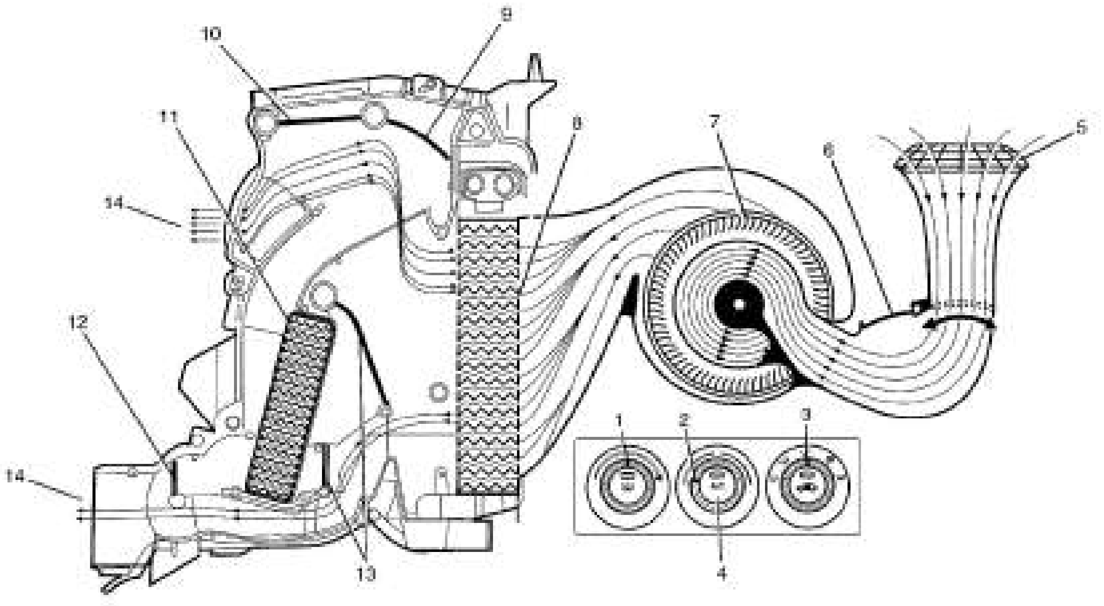
The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to face mode (3). The recirculation door (6) is closed, allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet . Air is drawn into the HVAC module assembly by the blower motor (7). This air is then forced through the evaporator core fins (8). In full heat mode, the air mix doors (13) are fully open, directing all incoming air through the heater core (11). The air travels through the open face/foot door (10). The heated air (14) is then directed out of the HVAC module assembly to the centre and side vents.



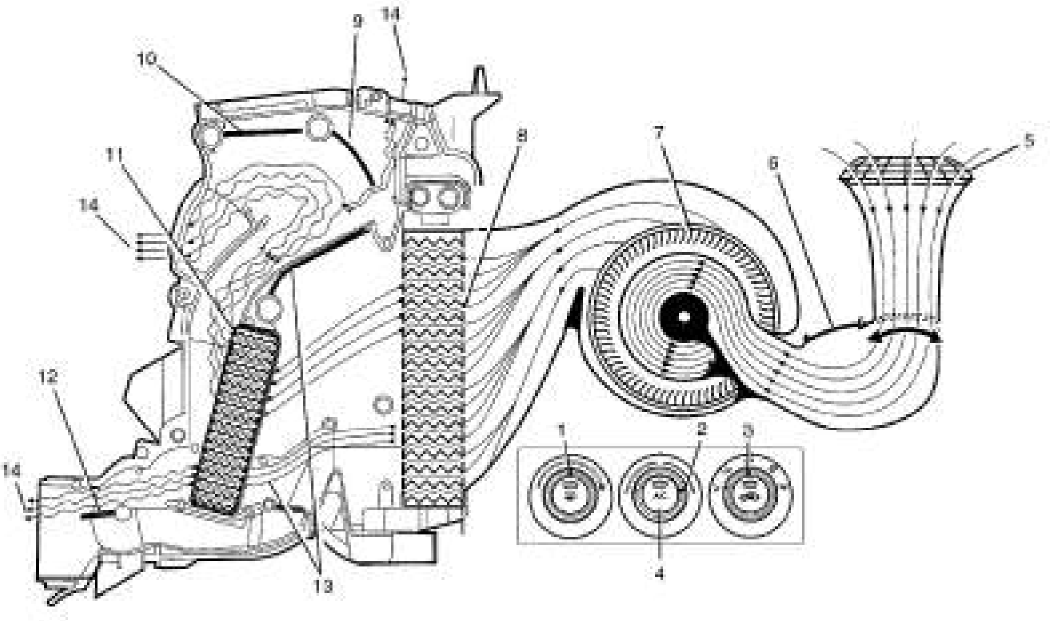
The A/C switch is on (4). The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full cold position (2). The mode control switch is set to bi-level mode (3). The recirculation door (6) is closed allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet . Air is drawn into the HVAC module assembly by the blower motor (7), and is then forced through the cold evaporator fins (8). In full cold mode, the air mix doors (13) are fully closed sealing off the passage through the heater core (11). The air travels through the opened face/foot door (10) and then through the defrost/floor door (9), which is fully open in the floor mode. The cold air (14) is then directed through the centre and side vents as well as the floor ducts.



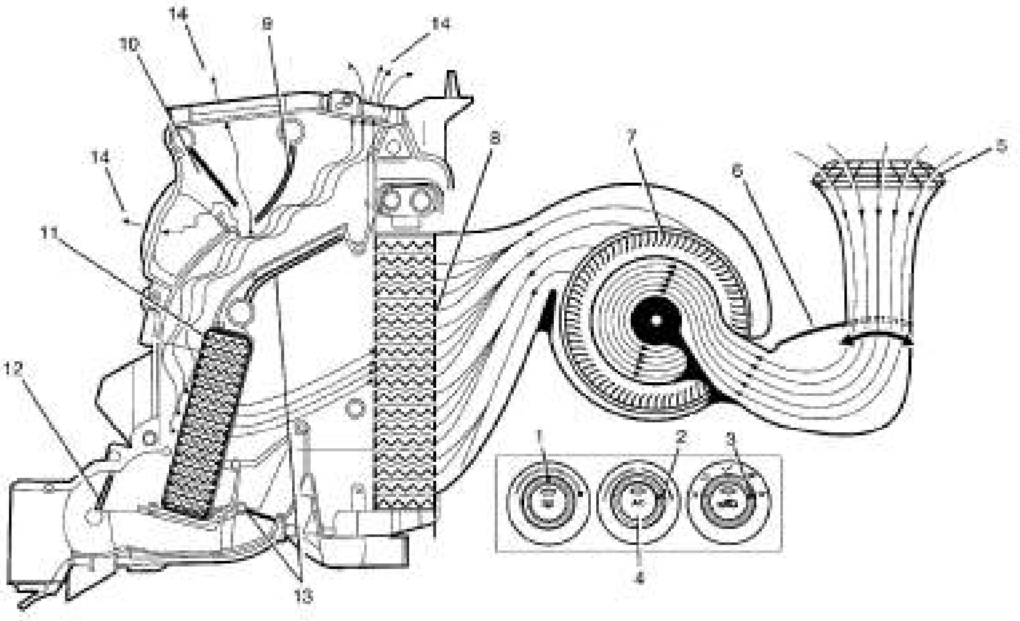
The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to bi-level mode (3). The recirculation door (6) is closed, allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (7). This air is then forced through the evaporator core fins (8). In full heat mode, the air mix doors (13) are fully open, directing all incoming air through the heater core (11). The air travels through the half opened face door (10) and through the defrost / floor door (9), which is fully open in the floor mode. The heated air (14) is then directed through the centre and side vents as well as to the floor ducts.



The A/C switch is on (4). The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full cold position (2). The mode control switch is set to floor mode (3). The recirculation door (6) is closed, allowing outside (5) air to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (7), and is then forced through the cold evaporator fins (8). In full cold mode, the air mix doors (13) are fully closed, sealing off the passage through the heater core (11). The air travels through the face/ floor door (10), which is fully open in the floor mode. The cold air (14) is then directed to floor ducts.



The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to floor mode (3). The recirculation door (4) is closed, allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (7). This air is then forced through the evaporator core fins (8). In full heat mode, the air mix doors (13) are fully open, directing all incoming air through the heater core (11). The air travels through the face/ floor door (10), which is fully open in the floor mode. The heated air (14) is then directed to the floor ducts.



The A/C switch is on (4). The fan switch is set to any one of twenty speeds (1). The temperature switch is set to the full hot position (2). The mode control switch is set to defrost mode (3). The recirculation door (6) is closed, allowing outside air (5) to enter and flow into the HVAC module assembly via the plenum chamber inlet. Air is drawn into the HVAC module assembly by the blower motor (7). This air is then forced through the cold evaporator core fins (8) removing moisture from the air. In full heat mode, the air mix doors (13) are fully open, allowing dehumidified incoming air through the heater core (11). The air travels through the defrost door (9), which is fully open in the defrost mode. The heated air (14) is then directed to the front windscreen via the defrost outlets.

Air Temperature Description and Operation

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The HVAC module assembly is operated manually by a combination of electrical and mechanical components. The case is of a 3-piece, plastic construction. The left and right cases are assembled with a centre divider that houses the doors and are secured together with screws. The case sump is secured to the upper case assembly with screws. The blower resistor is integrated into the HVAC control module which is screwed to the HVAC blower motor fan assembly, which in turn is secured to the HVAC unit with a combination of pivot pins and screws.

Cold Operation

When the temperature switch is turned to the Full Cold position, it locates the air mix door in a position that does not allow any air to flow through the heater core. The result is that all air entering the vehicle cabin will be external air temperature.

Warm Operation

When the temperature switch is turned from the Full Cold position, it pulls the air mix doors open. When the temperature switch is turned to a warm position, the air mix doors will be partially open. This will cause some incoming air to pass through the heater core and some air to bypass the heater core. The mixture of heated and cool air will result in warm air entering the vehicle cabin.

Hot Operation

When the temperature switch is turned to the Full Hot position, the air mix doors will be in a position that directs all incoming air through the heater core. Therefore, all air entering the vehicle cabin will be heated air.

Mode Actuators

The mode actuators are used to adjust the mode positions and temperature. The mode actuators consist of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position.

Recirculation Actuator

The recirculation actuator is used to adjust the fresh air inlet/recirculation door. The recirculation actuator consists of a DC drive motor, reduction gears, printed circuit board (PCB) and a photo electric cell. The DC motors are provided with a supply voltage of 12 Volts from the HCM. The photo interrupter counts the revolutions of the DC motor drive shaft, these counts are then used by the HCM for reference to the actuator position.

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1000 XX: Electronic Control Unit

Circuit/System Description

The internal fault detection is handled inside the control module. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The module has detected an internal malfunction.

Action Taken When the DTC Sets

The module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the module.
- If this DTC is retrieved as both a current and history DTC, replace the module that set the

DTC.

Circuit/System Verification

If this DTC is retrieved as a current DTC, replace the module that set the DTC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC B1001

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1001 XX: Option Configuration

Circuit/System Description

Some control modules must be configured with serial numbers, vehicle options, or other information. If a control module was not properly configured after installation that module may set DTC B1001. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 volts and data link communications operate normally.

Conditions for Setting the DTC

The control module is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC B1010

DTC Descriptor

DTC B1010 5A: System Sensor Data Mismatch Invalid Odometer Signal.

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle- Vehicle prior to using this diagnostic procedure.

Circuit / System Description

The navigation interface module (NIM) communicates with the body control module (BCM) to receive odometer data via the GMLAN. When there is an error regarding data supplied, this DTC will set in the NIM.

Conditions for Running the DTC

The radio must detect one of the following power modes:

- System voltage is between 9-16 volts.
- Engine is running.

Conditions for Setting the DTC

No change in the odometer pulse counter for 100 seconds while the vehicle is driven at speed above 40Km/h.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Diagnostic Aids

The odometer signal is provided via GMLAN message sent from the BCM, any corresponding set BCM DTCs should be tested prior to diagnosing DTC B1010 5A.

DTC Descriptor

DTC B1016: Vehicle Identification Number Not Programmed

Circuit/System Description

The body control module (BCM) performs a self test and vehicle identification number (VIN) verification. This DTC indicates that a VIN is not programmed or that the BCM has an internal fault. The internal fault detection is handled inside the control module, no external circuits are involved.

Conditions for Running DTC

The only requirements are that voltage and ground are supplied to the BCM.

Conditions for Setting the DTC

The BCM has detected that the VIN is not programmed.

Action Taken When DTC Sets

The vehicle will not start.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

DTC U0073

DTC Descriptor

DTC U0073: High Speed Communication Bus

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle.

Circuit / System Description

The high speed GMLAN serial data circuits are high speed serial data buses used to communicate information between the control modules. Typical data transmission speeds must be high enough to ensure that a required real-time response is maintained. The high speed GMLAN serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTCs

- Supply voltage to the modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The module setting the DTC has attempted to establish communications on the GMLAN circuits more than 3 times.

Action Taken When the DTCs Sets

- The module suspends all message transmission.
- The module uses default values for all parameters received on the serial data circuits.
- The module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- An intermittent condition is likely to be caused by a short on the high speed GMLAN serial data circuits.

- This DTC cannot be retrieved with a current status. Diagnosis is accomplished using the symptom Scan Tool Does Not Communicate with High Speed GMLAN Device.
- Refer to Data Link References.

Low Speed GMLAN Serial Data	1	U0100-U0249	1	--
1. Scan tool does not communicate with low speed GMLAN device 2. Scan tool does not communicate with high speed GMLAN device				

Circuit/System Description

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the DLC, the scan tool can be used to monitor each module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the ignition switch is in RUN, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn sets a DTC associated with the loss of SOH of the non-communicating control module. The DTC is unique to the control module which is not communicating. Note: a loss of serial data communications DTC does not represent a failure of the module that set it.

Conditions for Running the DTC

The system voltage is between 9-16 volts.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they're transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A control module on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more modules was interrupted during diagnosis.
    - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the BCM and the scan tool with either the low or high speed GMLAN serial data system inoperative. This condition is due to the BCM using both the low and high speed GMLAN systems.

- Use Data Link References to determine if the module uses high or low speed GMLAN serial data communications.
- Some control modules may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.
- This diagnostic can be used for any control module that is not communicating, regardless of the type of serial data circuit it is connected to, providing the vehicle is equipped with the control module.

Circuit/System Verification

Verify that following BCM DTCs are not present:

- U1814
- U2099
- B1428
- B1370
- B1380
- B1440

- B1441

  If any listed DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle to diagnose that DTC prior to this diagnostic.

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Control module locations on the low and high speed GMLAN serial data circuits
- The control modules B+, ignition, ground, communication enable and serial data circuit terminals

1. Determine the module that is not communicating. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition OFF, disconnect the necessary harness connector of the module that is not communicating.
3. Test for less than 5 Ω between each ground circuit terminal and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
4. If equipped, verify that a test lamp illuminates between each B+ circuit terminal and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.
5. If equipped, ignition ON, verify that a test lamp illuminates between each ignition circuit terminal and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.

   Note: Only the high speed GMLAN modules have a serial data communication enable circuit OR an accessory wakeup serial data circuit, and the BCM is the output for these circuits. Refer to the module schematics to identify which modules have these circuits.
6. If equipped, ignition ON, verify that a test lamp illuminates between the communication enable circuit terminal OR the accessory wakeup circuit terminal and ground.

   If the test lamp does not illuminate, test the circuit for an open/high resistance. If the circuits test normal, replace the BCM.
7. Ignition OFF for 60 seconds, test for less than 5 Ω between the serial data circuit terminals and the DLC terminal listed below:
   - Low speed GMLAN serial data terminal 1
   - High speed GMLAN serial data terminal 6 or 14

   If greater than the specified range, test the serial data circuit for an open/high resistance between the non communicating control module and a module setting the DTC or a serial data splice pack.
8. If all circuits test normal, replace the control module that is not communicating.

Repair Instructions

DTC U1304

DTC Descriptors

DTC U1304: CAN-Bus No Communication with SIM (Seat Interface Module)

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit / System Description

Modules connected to the high and low speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the modules. The modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

The seat interface module (SIM) acts as a gateway module between the GMLAN and UART data communication systems. The SIM receives information such as the driver ID from the BCM via the GMLAN, the SIM then processes the data and transmits to the memory seat module (MSM) via a UART data connection.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

1. Ignition OFF, disconnect the SIM harness connector.
2. Test for less than 1 ohm between the module ground circuits and ground.

   If greater than 1 ohm, repair the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between all battery positive voltage circuits and ground.

   If the test lamp does not illuminate, repair the circuit for a short to ground or an open/high resistance. If the circuit fuse is open, also test the positive voltage outputs of the module for a short to ground. If the circuits test normal, replace the SIM.
4. Verify that a test lamp illuminates between all ignition voltage circuits and ground.

   If the test lamp does not illuminate, repair the circuit for a short to ground or an open/high resistance. If the circuit fuse is open, also test the positive voltage outputs of the SIM for a short to ground. If the circuits test normal, replace the SIM.
5. Ignition ON, verify that a test lamp illuminates between the serial data communication enable circuit OR the accessory wakeup serial data circuit and ground.

   If the test lamp does not illuminate, repair the circuit for an open/high resistance. If the circuits test normal, replace the BCM.
6. Test for less than 1 ohm in the low speed GMLAN serial data circuit between the SIM and the module that displays the DTC.

   If greater than 1 ohm, test the low speed GMLAN serial data circuit for open/high resistance.
7. If all circuits test normal, replace the SIM.

DTC Descriptor

DTC U1814 00: Powertrain High Speed Communication Enable Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wakeup Serial Data	U 1814	U 0100	--	--

Circuit/System Description

The accessory wakeup serial data circuit is a positive voltage signal to wake up the engine control module (ECM) and the transmission control module (TCM). The signal is activated in 2 ways; any time the ignition switch is in the ACC or RUN position, or anytime the body control module (BCM) determines that communication is needed from the powertrain. When the ignition switch is in the ACC or RUN position, the accessory voltage circuit input to the BCM is internally connected to the accessory wakeup serial data circuit output, and voltage is supplied to the modules. The BCM also supplies voltage to the accessory wakeup serial data circuit when it determines that communication is necessary with the powertrain and the ignition is not in the ACC or RUN position such as during remote start.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the accessory wakeup serial data circuit.

Action Taken When the DTC Sets

- The modules use a default value for the missing parameters until the next ignition cycle.
- The module(s) is never signaled, therefore the specific subsystem(s) will not function.
- The vehicle may not start.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to ground may also set multiple no communication codes for GMLAN high speed modules.

DTC U2099

DTC Descriptor

DTC U2099 00: High Speed Communication Enable Circuit

Diagnostic Fault Information

Perform the Diagnostic System Check - VehicleDiagnostic System Check - Vehicle .

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data Wake Up	U2099, U0100-U0249[1]	U0100-U0249	U0100-U0249[2]	--
[1] Vehicle will not start. [2] May be history only. If cleared the DTC should return after several ignition cycles.				

Circuit/System Description

The body control module (BCM) applies voltage to the high speed GMLAN serial data wake up circuit, when the ignition key is in ACC, ON or START to enable several modules for bus communication.

Depending on option content, modules that may receive the signal are as follows:

- Electronic brake control module (EBCM)
- Electronic suspension control (ESC) module

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The BCM attempts to enable the modules connected to the high speed GMLAN serial data wake up circuit.

Conditions for Setting the DTC

The BCM senses a short to ground on the high speed GMLAN serial data wake up circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The modules use a default value for the missing parameters.

- The module(s) is never signaled, therefore the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to ground will also set multiple history no communication codes for GMLAN high speed modules

DTC U2100

DTC Descriptor

DTC U2100 00: CAN-Bus Circuit Malfunction

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle.

Circuit Description

The GMLAN serial data circuits are controller area network (CAN) serial data buses used to communicate information between the control modules. Typical data transmission speeds must be high enough to ensure that a required real-time response is maintained. On this vehicle there are 2 totally different types of GMLAN serial data circuits, the High speed 2-wire circuit and Low speed single wire circuit. Refer to Data Link Communications Description and Operation for the complete description of these buses. The GMLAN serial data circuits also communicate directly to the DLC connector. Messages are interpreted by the externally connected CANdi module which acts as a transceiver for the scan tool.

Modules connected to the GMLAN serial data circuits monitor communications during normal vehicle operation, where operation information is exchanged among the modules. All the modules on the GMLAN networks, maintain a transmit error counter (TEC) and a receive error counter (REC). The counter values increase with detected errors and will decrease with error-free messages. If the TEC value exceeds 255, the controller removes itself from the network and DTC U2100 will result.

Conditions for Running the DTCs

- Supply voltage to the modules are in the normal operating range.
- The vehicle is in the RUN power mode.

Conditions for Setting the DTC

The module setting the DTC has attempted to establish communications on the GMLAN circuits for more than 7 times.

Action Taken When the DTCs Sets

- The module suspends all message transmission.
- The module uses default values for all parameters received on the serial data circuits.
- The module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC cannot be retrieved with a current status. Diagnosis of a current DTC is accomplished via the symptom refer to Scan Tool Does Not Communicate with High Speed GMLAN Deviceor Scan Tool Does Not Communicate with Low Speed GMLAN Device depending on the module serial data communication.
- An intermittent condition is likely to be caused by a short on the GMLAN serial data circuits. Use the Scan Tool Does Not Communicate with High Speed GMLAN Deviceor Scan Tool Does Not Communicate with Low Speed GMLAN Device procedure in order to isolate an intermittent condition.

Data Link References

This table identifies which serial data link that a particular module uses for in-vehicle data transmission. Some modules may use more than one data link to communicate. Some modules may have multiple communication circuits passing through them without actively communicating on that data link. This table is used to assist in correcting a communication malfunction. For the description and operation of these serial data communication circuits refer to Data Link Communications Description and OperationData Link Communications Description and Operation.

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	1	U0100-U0249*	1	--
High Speed GMLAN Serial Data (-)	1	U0100-U0249*	1	--
Ground (DLC, terminal 5)	--	1	--	--
* No communications with one or more high speed GMLAN modules. An open in only one high speed GMLAN serial data circuit may allow degraded communication between the modules. An open between the data link connector (DLC) and the first splice will only effect the communication with the scan tool. The vehicle modules will still communicate. 1. No communication with any high speed GMLAN module				

Circuit/System Description

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 ohms resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another control module. The resistors are used as the load for the High Speed GMLAN buss during normal vehicle operation. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds one volt to the high speed GMLAN serial data bus (+) circuit and subtracts one volt from the high speed GMLAN serial data bus (-) circuit. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note that a loss of serial data DTC does not represent a failure of the module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they're transparent to the vehicle operator and technician, and/or have no associated symptoms.

Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

- A control module on the data communication circuit was disconnected while the communication circuit is awake.
- Power to one or more modules was interrupted during diagnosis
- A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
- Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.

- Do not replace a control module reporting a U code. The U code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the BCM and the scan tool with the high speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle. When the scan tool attempts to communicate with the vehicle a message "no CANdi module detected" will be displayed.
- The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed GMLAN communications with the scan tool.
- The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.

  These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:

  - Vehicle will not crank.
  - Vehicle cranks but will not start.
  - Vehicle stability enhancement system warning lights and messages.
  - PRNDL gear indicator position errors.
  - Tire Pressure Monitor (TPM) system warning lights.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

Note: Each control module may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- High speed GMLAN serial data circuit terminating resistors
- Control module locations on the high speed GMLAN serial data circuits
- Each control module's high speed GMLAN serial data circuit terminals

1. Attempt to communicate with all control modules on the high speed GMLAN serial data circuit, refer to Data Link References. Communications should not be available with two or more control modules on the high speed GMLAN serial data circuit.

   If only one control module is not communicating, diagnose that control module only; refer to DTC U0100-U0249.
2. Disconnect the scan tool from the DLC. The following tests will be done at the DLC connector.
3. All access doors closed, ignition OFF for 60 seconds, test for less than 10 Ω between the ground circuit terminal 5 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON, test for less than 4.5 V between the serial data circuits listed below and ground:
   - Terminal 6
   - Terminal 14

   If greater than the specified range, test the serial data circuit for a short to voltage; refer to Testing the Serial Data Circuits for a Short to Voltage.
5. Ignition OFF for 60 seconds, test for greater than 100 Ω between the serial data circuits listed below and ground:
   - Terminal 6
   - Terminal 14

   If not the specified value, test the serial data circuit for a short to ground; refer to Testing the Serial Data Circuits for a Short to ground.
6. Test for 50-70 Ω between the serial data circuits terminal 6 and terminal 14.

   If less than 35 Ω, test for a short between the serial data circuits; refer to Testing the Serial Data Circuits for a Short between the Circuits.

If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.

If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance; refer to Testing the Serial Data Circuits for an Open/High Resistance.

If infinite, test the serial data circuits between the DLC and the first connection to the serial data circuit for an open/high resistance.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module.
2. Ignition ON, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are greater than 4.5 V.

   If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Ignition ON, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are greater than 4.5 V.

   If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
   - A short to voltage on the serial data circuit between 2 control modules
   - A short to voltage on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module.
2. Ignition OFF for 60 seconds, test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω.

   If all serial data circuits are greater than the specified range, replace the control module that was disconnected.
3. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to ground.
4. Ignition OFF for 60 seconds, test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω.

   If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
   - A short to ground on the serial data circuit between 2 control modules
   - A short to ground on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Ignition OFF for 60 seconds, test for less than 35 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 35 Ω.

   If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Ignition OFF for 60 seconds, test for less than 35 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 35 Ω.

   If each pair of serial data circuits is within the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
   - Serial data circuits shorted together between 2 control modules
   - Serial data circuits shorted together between a control module and a terminating resistor
   - A shorted terminating resistor

Testing the Serial Data Circuits for an Open / High Resistance

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Ignition OFF for 60 seconds, test for greater than 100k Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 100k Ω.

   If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Ignition OFF for 60 seconds, test for greater than 100k Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 100k Ω.

   If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
   - An open/high resistance on the serial data circuit between 2 control modules
   - An open/high resistance on the serial data circuit between a control module and a terminating resistor
   - An open/high resistance terminating resistor

Scan Tool Does Not Communicate with Low Speed GMLAN Device

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Speed GMLAN Serial Data	1	U0100-U0249*	1	--
Ground (DLC, terminal 5)	--	1*	--	--
* An open between the data link connector serial data circuit terminal 1 or ground circuit terminal 5 and the BCM circuit will only effect the communication with the scan tool. 1. No communication on any low speed GMLAN module				

Circuit/System Description

The serial data is transmitted over a single wire to the appropriate control modules. The transmission speed for GMLAN low speed is up to 83.33 Kb/s. Under normal vehicle operating conditions, the speed of the buss is 33.33 Kb/s. The control modules toggle the serial data circuit between 0-5 V during normal communications. To wake the control modules connected to the GMLAN low speed serial data circuit, a voltage wake up pulse of 10 V is sent out. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note: a loss of serial data communications DTC does not represent a failure of the module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they're transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A control module on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more modules was interrupted during diagnosis

  - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the BCM and the scan tool with the low speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
- An open in the low speed GMLAN serial data circuit between the splice pack and a module will only affect that specific module. This type of failure will set a loss of communication DTC for each module effected, and the other modules will still communicate.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle. When the scan tool attempts to communicate with the vehicle a No CANdi Module Detected message will be displayed.
- An open between the DLC and JX 200 will only effect the communication with the scan tool. The vehicle modules will still communicate, and the vehicle will start.
- The engine will not start when there is a total malfunction of the low speed GMLAN serial data circuit.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed LAN communications with the scan tool.

  These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:

  - Vehicle will not crank.
  - Vehicle cranks but will not start.
  - Vehicle stability enhancement system warning lights and messages.
  - PRNDL gear indicator position errors.
  - Tire Pressure Monitor (TPM) system warning light.

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Control module locations on the low speed GMLAN serial data circuit
- The low speed GMLAN serial data circuit terminals for each control module

1. Attempt to communicate with all control modules on the low speed GMLAN serial data circuit, refer to Data Link References . Communications should not be available with two or more control modules on the low speed GMLAN serial data circuit.

   If only one control module is not communicating, diagnose that control module only, refer to DTC U0100-U0249 .

   If one or more control modules are communicating but not all, refer to Testing the Serial Data Circuit for an Open/High Resistance.
2. Disconnect the scan tool from the DLC. The following tests will be done at the DLC connector.
3. All access doors closed, ignition OFF for 60 seconds, test for less than 10 Ω between the ground circuit terminal 5 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON, test for less than 4.5 V between the serial data circuit terminal 1 and ground.

   If greater than the specified range, test the serial data circuit for a short to voltage, refer to Testing the Serial Data Circuit for a Short to Voltage.
5. Ignition OFF for 60 seconds, test for greater than 100 Ω between the serial data circuit terminal 1 and ground.

   If less than the specified range, test the serial data circuit for a short to ground, refer to Testing the Serial Data Circuits for a Short to ground.
6. Disconnect the appropriate harness connector at the JX 200 splice pack.
7. Test for less than 2 Ω between the DLC serial data circuit terminal 1 and the JX200 splice pack terminal 1.

   If greater than the specified range, test the serial data circuit for an open/high resistance. If the circuits test normal, replace the splice pack.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 200 splice pack.
2. Ignition ON, test for less than 4.5 V between the DLC serial data circuit terminal 1 and ground.

   If greater than the specified range, repair the short to voltage.
3. Test for less than 4.5 V between each serial data circuit at the splice pack connector and ground.

   If greater than the specified range, perform the appropriate test listed below:

   - Serial data circuits with one control module, test the serial data circuit for a short to voltage. If the circuit tests normal replace the control module.

- Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to voltage. If the circuits test normal, replace the control module that causes the short to voltage when connected.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 200 splice pack.
2. Test for infinite resistance between the DLC serial data circuit terminal 1 and ground.

   If not the specified value, repair the short to ground.
3. Ignition OFF for 60 seconds, test for greater than 100 Ω between each serial data circuit at the splice pack and ground.

   If less than the specified range, perform the appropriate test listed below:

   - Serial data circuits with one control module, test the serial data circuit for a short to ground. If the circuit tests normal replace the control module.
   - Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to voltage. If the circuits test normal, replace the control module that causes the short to ground when connected.

Testing the Serial Data Circuit for an Open / High Resistance

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 200 splice pack.
2. Install a 3 A fused jumper wire between the disconnected splice pack connector terminal 1 and a low speed GMLAN serial data circuit terminal that is not communicating.
3. Ignition ON, verify the scan tool communicates with the control modules connected to the low speed GMLAN serial data circuit.

   If any control module does not communicate, test each section of the serial data circuit for an open/high resistance. If the circuits test normal, replace the control module that does not communicate when connected.
4. If all circuits test normal, replace the splice pack.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Scan Tool Does Not Power Up

Circuit / System Description

The data link connector (DLC) is a standardized 16 cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool power battery positive voltage at terminal 16
- Scan tool power ground at terminal 4
- Common signal ground at terminal 5

Diagnostic Aids

- The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON and the power mode master (PMM) module sends the appropriate power mode message.
- If the battery positive voltage, ground circuits and connections of the DLC are functioning properly, the malfunction must be due to the scan tool/CANdi module.
- Use the DMM MIN/MAX function to capture/locate intermittent conditions.

Circuit / System Testing

1. Ignition ON, test for battery voltage between the battery positive voltage circuit of the DLC and ground.

   If less than battery voltage, repair the voltage supply circuit for a short to ground or an open/high resistance.

2. Test for less than 1.0 ohm of resistance between the ground circuit of the DLC and ground.
   If greater than 1.0 ohm, repair the ground circuit for an open/high resistance.
3. If all tests normal, refer to the scan tool/CANdi module user guide.

Repair Instructions

Perform the Diagnostic Repair VerificationDiagnostic Repair Verification .

Symptoms - Data Communications

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Data Link Communications Description and Operation .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

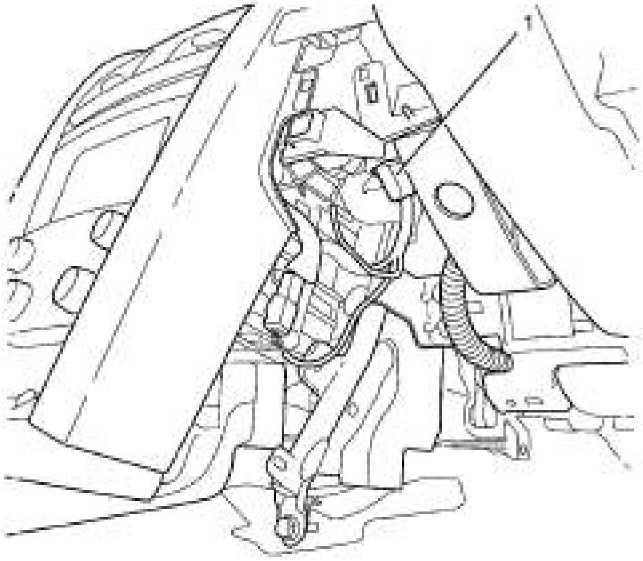
Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Scan Tool Does Not Power Up
- Scan Tool Does Not Communicate with High Speed GMLAN Device
- Scan Tool Does Not Communicate with Low Speed GMLAN Device

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Data Communications | Repair Instructions | **Document ID: 2146796**

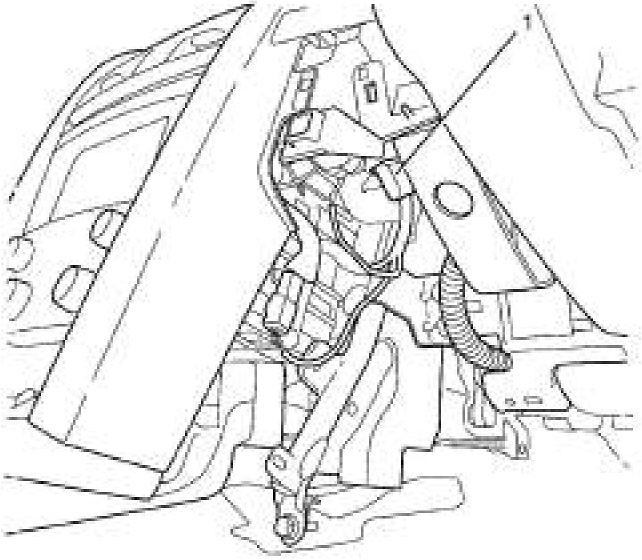
Data Link Connector Replacement (RHD)

Removal Procedure



1. Remove the knee bolster. Refer to Knee Bolster Replacement.
2. Remove the front floor console side trim panel. Refer to Front Floor Console Side Trim Panel Replacement - Right Side.
3. Remove the instrument panel extension trim panel. Refer to Instrument Panel Extension Replacement.
4. Remove the tape from the data link resistor (1).
5. Disconnect the data link resistor (1) from the instrument panel harness.

Installation Procedure



1. Connect the data link resistor (1) to the instrument panel harness.
2. Tape the data link resistor (1) to the instrument panel harness.
3. Install the instrument panel extension trim panel. Refer to Instrument Panel Extension Replacement.
4. Install the front floor console side trim panel. Refer to Front Floor Console Side Trim Panel Replacement - Right Side.
5. Install the knee bolster. Refer to Knee Bolster Replacement.

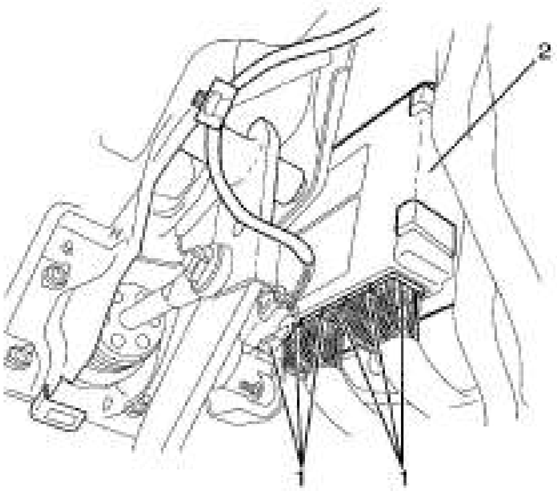
Body Control Module Replacement (RHD)

Removal Procedure

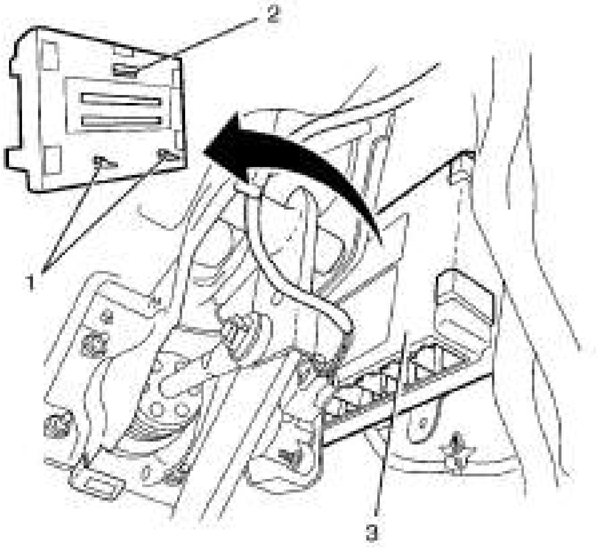
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the right closeout insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
4. Remove the knee bolster. Refer to Knee Bolster Replacement .
5. Remove the instrument panel retainer. Refer to Instrument Panel Retainer Replacement .



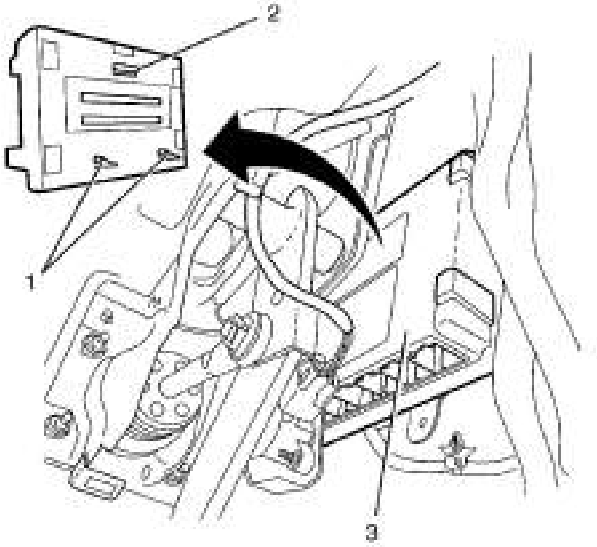
6. Disconnect the body control module (BCM) electrical connectors (1) from the BCM (2).



Important: Release the lower retaining clips (1), lift the BCM and unhook the upper retaining clip (2).

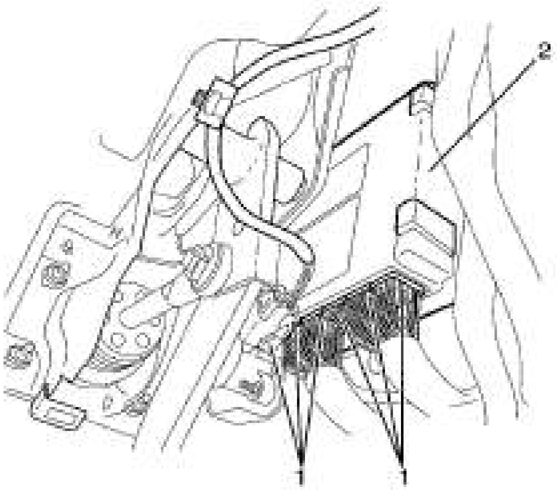
7. Remove the BCM (3).

Installation Procedure



Important: Locate the upper retaining clip (2) and engage the lower retaining clips (1).

1. Install the BCM (3).



2. Connect the body control module (BCM) electrical connectors (1) to the BCM (2).
3. Install the instrument panel retainer. Refer to Instrument Panel Retainer Replacement .
4. Install the knee bolster. Refer to Knee Bolster Replacement .
5. Install the right closeout insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Right Side .

   Caution: Refer to SIR Caution in the Preface section.

6. Enable the SIR system. Refer to SIR Disabling and Enabling .
7. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
8. Re-programme the (BCM). Refer to Body Control Module Programming and Setup .

Body Control System Description and Operation

The body control system consists of the body control module (BCM), communications, and various input and outputs. Some inputs, outputs and messages require other modules to interact with the BCM. The BCM also has discrete input and output terminals to control the vehicle's body functions. The BCM is wired to the GMLAN High speed serial data buss and the GMLAN Low speed serial data buss and acts as a gateway between them. If the BCM does not communicate the vehicle will not start due to the inability of the engine control module (ECM) and theft deterrent module (TDM) to communicate without the BCM providing the gateway function.

Power Mode Master

This vehicles BCM functions as the power mode master (PMM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination the power mode that will be sent over the serial data circuits to the other modules that need this information, and so the PMM will activate relays and other direct outputs of the PMM as needed. Refer to Power Mode Description and Operation for a complete description of power mode functions.

Serial Data Gateway

The BCM in this vehicle functions as a gateway or translator. The purpose of the gateway is to translate serial data messages between the GMLAN high speed buss and the GMLAN low speed buss for communication between the various modules. The gateway will interact with each network according to that network's transmission protocol.

One example of this necessary communication is the communication between the ECM which is high speed serial data and TDM which is low speed serial data. If these modules can not exchange information, the vehicle will not start.

Communication between the BCM and a scan tool can be on the high speed GMLAN network or low speed GMLAN network. If one network is lost, the BCM can still communicate with the scan tool. A lost communication DTC typically is set in modules other than the module with a communication failure.

Body Control Module

The various BCM input and output circuits are described in the corresponding functional areas indicated on the BCM electrical schematics. Some BCM functions with the subsystems may be as a gateway only or as an enable for the system. The BCM related systems/subsystems include, but are not limited to the following:

- Antilock Brake System (ABS) - Refer to ABS Description and Operation .
- Automatic Day-Night Mirror - Refer to Inside Rearview Mirror Description and Operation .
- Cruise Control System - Refer to Cruise Control Description and Operation .
- Exterior Lighting - Refer to Exterior Lighting Systems Description and Operation .
- Horn System - Refer to Horns System Description and Operation .
- HVAC - Refer to Air Delivery Description and Operation and Air Temperature Description and Operation .

- Instrument Cluster Indicator Control - Refer to Instrument Cluster Description and Operation .
- Interior Lighting - Refer to Interior Lighting Systems Description and Operation .
- Power Door Lock System - Refer to Power Door Locks Description and Operation .
- Rear Window Defogger System - Refer to Rear Window Defogger Description and Operation .
- Redundant Steering Wheel Controls - Refer to Radio/Audio System Description and Operation .
- Remote Function Actuation (RFA) control - Refer to Keyless Entry System Description and Operation .
- Retained Accessory Power (RAP) - Refer to Retained Accessory Power (RAP) Description and Operation .
- Shift Lock Control System - Refer to Automatic Transmission Shift Lock Control Description and Operation .
- Starting System - Refer to Starting System Description and Operation .
- Supplemental Inflatable Restraint (SIR) System - Refer to SIR System Description and Operation .
- Suspension System - Refer to Electronic Suspension Control Description and Operation .
- Tire Pressure Monitor (TPM) System - Refer to Tire Pressure Monitor Description and Operation .
- Vehicle Theft Deterrent - Refer to Theft Systems Description and Operation .
- Wiper/Washer System Functions - Refer to Wiper/Washer System Description and Operation .

Data Link Communications Description and Operation

Circuit Description

The communication among control modules is performed through the High speed GMLAN serial data circuits and the Low speed GMLAN serial data circuit. The modules that need real time communication are attached to the High Speed GMLAN network. The body control module (BCM) is the gateway between the high and low speed networks. Refer to Body Control System Description and OperationBody Control System Description and Operation for more information about the gateway.

Signal supervision is the process of determining whether an expected signal is being received or not. Some messages are sent on a periodic basis and are interpreted as a heartbeat of a device. If such a signal is lost, the signal supervision part of the software will set a no communication DTC (U. code) against the missing device. This code is mapped on the scan tool screen as a code against the physical device. A lost communication DTC typically is set in modules other than the module with a communication failure.

GMLAN High Speed Circuit Description

The data link connector (DLC) allows a scan tool to communicate with the high speed GMLAN serial data circuit. The serial data is transmitted on two twisted wires that allow speed up to 500 Kb/s. The twisted pair is terminated with two 120 ohms resistors, the location of these resistors is listed in the Master Electrical Component ListMaster Electrical Component List. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level. The idle level, which is approximately 2.5 volts, is considered recessive transmitted data and is interpreted as a logic 1. Driving the lines to their extremes, adds one volt to the high speed GMLAN serial data bus (+) and subtracts one volt from the high speed GMLAN serial data bus (-) wire. If a communication signal is lost, the application will set a no communication code against the respective control module. This code is mapped on the sacn tool screen as a code against the physical device. Note: a loss of serial data DTC does not represent a failure of the module that the code is set in.

The high speed GMLAN serial data allows communication between the BCM, ECM, transmission control module (TCM), steering angle sensor (SAS), EBCM, automatic headlamp levelling module (AHLL) and the electronic suspension control module (ESCM) depending on RPO.

GMLAN Low Speed Circuit Description

The data link connector (DLC) allows a scan tool to communicate with the low speed GMLAN serial data circuit. The serial data is transmitted over a single wire to the appropriate control modules. Under normal vehicle operating conditions, the speed of the buss is 33.33 Kb/s. This protocol produces a simple pulse train sent out over the GMLAN low speed serial data bus. When a module pulls the buss high, 5 volts, this creates a logic state of 0 on the buss. When the buss is pulled low, 0 volts, it is translated as a logic state of 1. To wake the control modules connected to the GMLAN low speed serial data buss, a high voltage wake up pulse is sent out over the buss, the voltage level of the pulse is +10 volts. Modules connected to the GMLAN low speed buss can be part of a virtual network as described in GMLAN High Speed Circuit Description above. The modules on the GMLAN low speed serial data buss are connected to the buss using several splice or "star" connectors separating groups of modules. Refer to Data Communication Schematics for specific schematics information.

The following lists state the splices and modules connected to the low speed serial data circuits:

I / P Splice

- BCM
- Secondary information centre (SIC)
- Instrument panel cluster (IPC)
- Inflatable Restraint Sensing and Diagnostic Module (SDM)
- Theft deterrent module (TDM)
- Infotainment unit - integrated radio chassis (IRC)
- Heating ventilation and cooling (HVAC) control module
- Remote function actuator (RFA)
- Rear seat entertainment (RSE) control module
- Navigation interface module (NIM)
- Seat interface module (SIM)
- Object detection module - ultrasonic park assist (UPA)
- Telematics control module

Data Link Connector (DLC)

The data link connector (DLC) is a standardized 16-cavity connector. The DLC low speed serial data circuit is connected directly to the I/P splice then to all other splices or modules. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

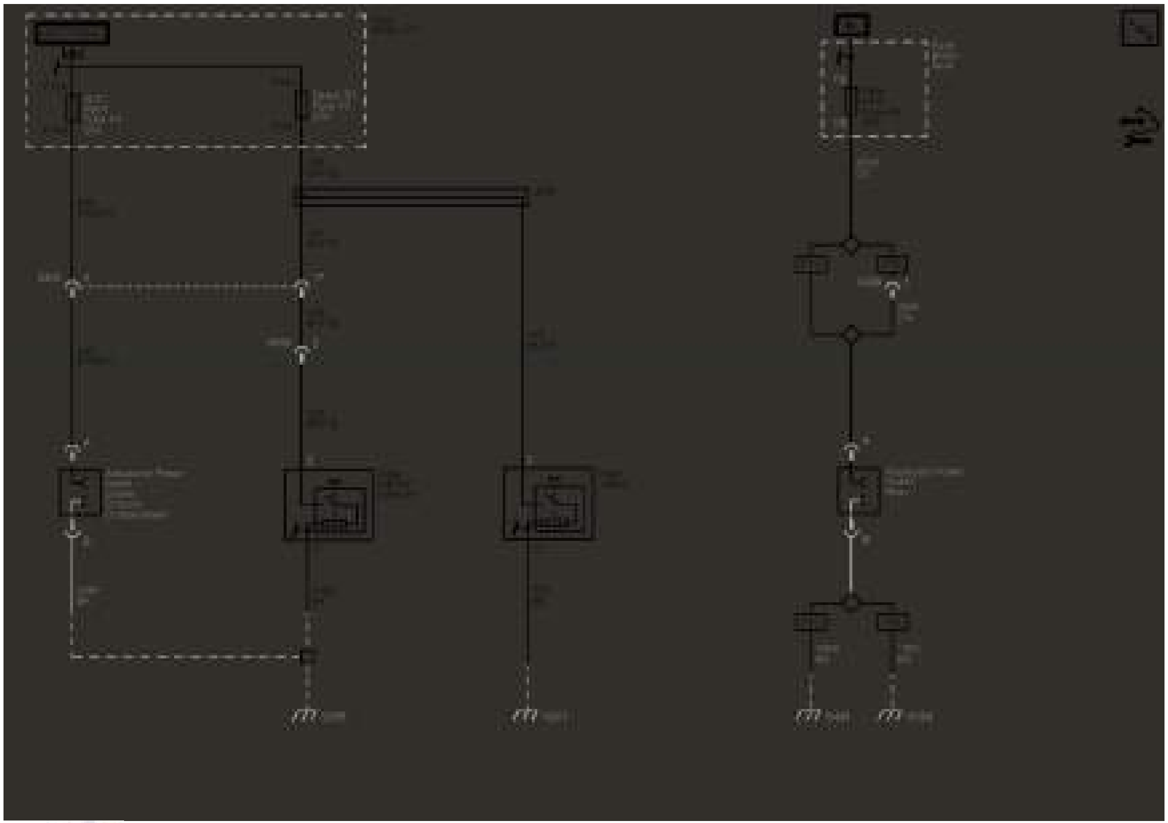
- Pin 1 GMLAN low speed communications terminal
- Pin 4 Scan tool power ground terminal
- Pin 5 Common signal ground terminal
- Pin 6 High speed GMLAN serial data bus (+) terminal
- Pin 14 High speed GMLAN serial data bus (-) terminal
- Pin 16 Scan tool power, battery positive voltage terminal

Serial Data Reference

The scan tool communicates over the various busses on the vehicle. When a scan tool is installed on a vehicle, the scan tool will try to communicate with every module that could be optioned into the vehicle. If an option is not installed on the vehicle, the scan tool will display No Comm for that options specific control module.

In order to avert misdiagnoses of No Communication with a specific module, refer to Data Link ReferencesData Link References for a list of modules, the busses they communicate with, and the RPO codes for a specific module.

Cigar Lighter / Power Outlet Schematics



Diagnostic Starting Point - Power Outlets

Begin the system diagnosis by reviewing the system Description and Operation. Reviewing the Description and Operation information will help you determine the correct symptom diagnostic procedure to use when a malfunction exists. Reviewing the Description and Operation information will also help you determine if the condition is a fault or part of normal operation.

Symptoms - Power Outlets

Review the system operation in order to familiarize yourself with the system functions. Refer to Diagnostic Starting Point - Power Outlets .

Visual/Physical Inspection

Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Power Outlet Receptacle Inoperative

Power Outlet Receptacle Inoperative

1. Perform the Diagnostic System Check - Vehicle.
2. Using a test lamp, test the power outlet socket supply voltage circuit.

   If test lamp does not illuminate, repair or replace the supply voltage circuit.
3. Using a DMM, test the power outlet socket ground circuit to a known good ground.

   If DMM indicates that the circuit is not intact, repair or replace the ground circuit.

   If DMM indicates that the circuit is intact, replace the power outlet socket.

Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement (LWBLHD)

Instrument Panel

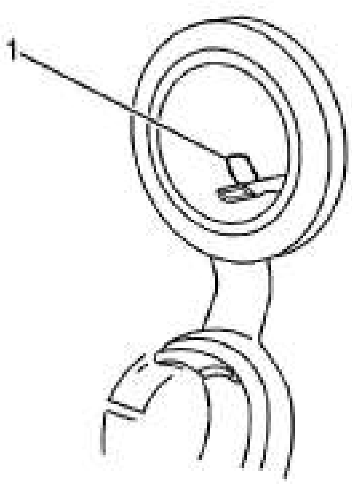
Tools Required

J 42059 Cigar Lighter Socket Remover

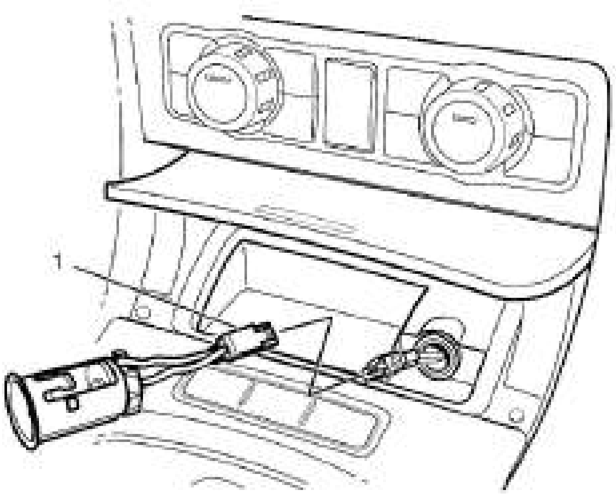
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

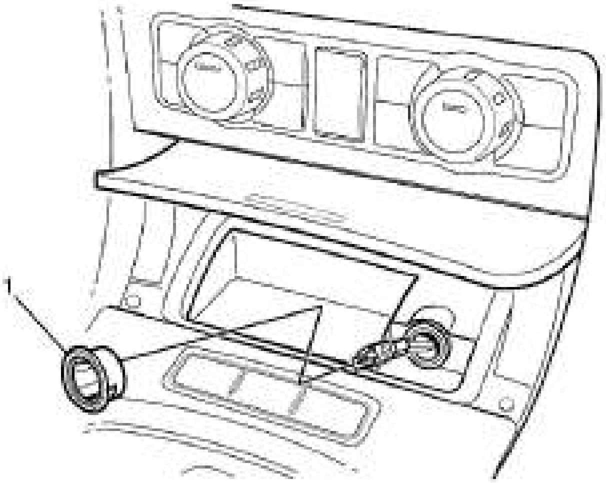
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. With any accessories removed, place the T receptacle of J 42059 into one of the retaining tabs (1). Angle the other side into the opposite retaining tab. Pull the power accessory receptacle straight out.

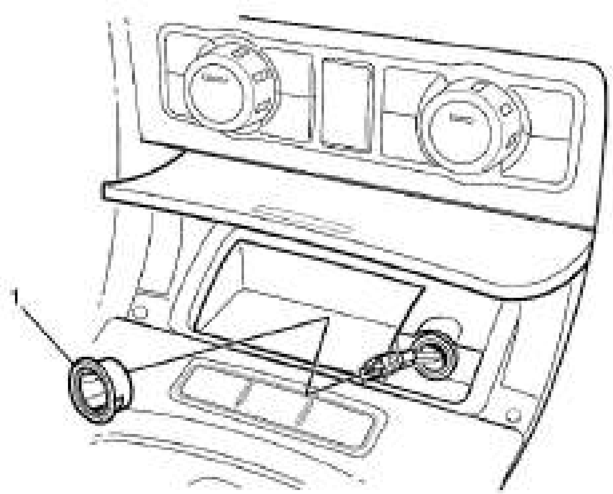


3. Disconnect the power accessory receptacle electrical connector (1).

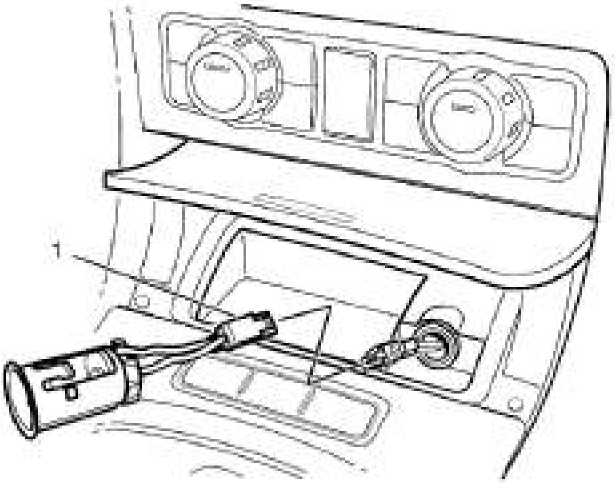


4. Remove the bezel (1).

Installation Procedure



1. Install the bezel (1).



2. Connect the power accessory receptacle electrical connector (1).
3. Install the accessory power receptacle to the receptacle bezel.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Centre Console -- Rear

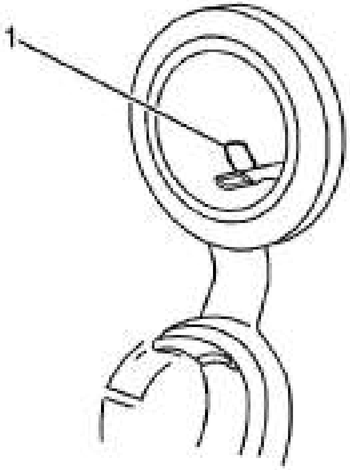
Tools Required

J 42059 J 42059 Cigar Lighter Socket Remover

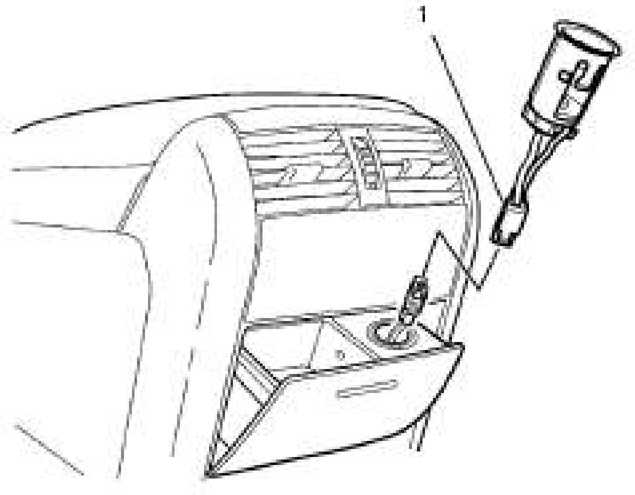
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

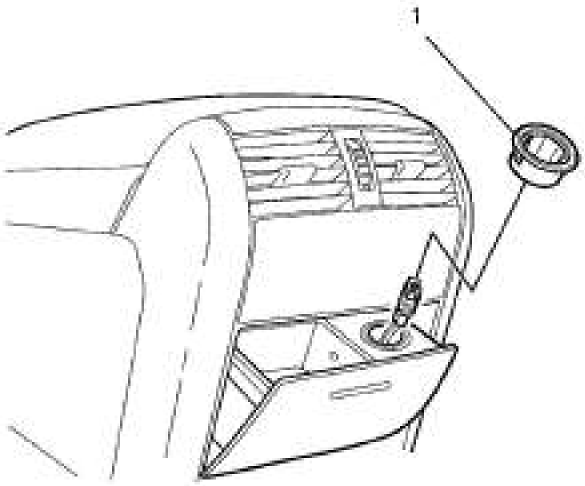
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. With any accessories removed, place the T receptacle of J 42059 into one of the retaining tabs (1). Angle the other side into the opposite retaining tab. Pull the power accessory receptacle straight out.

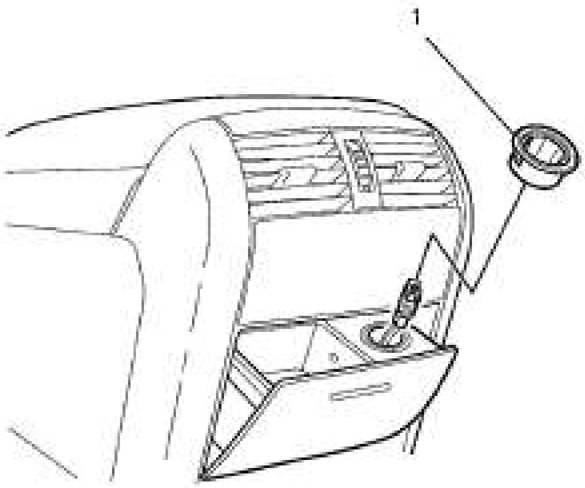


3. Disconnect the power accessory receptacle electrical connector (1).

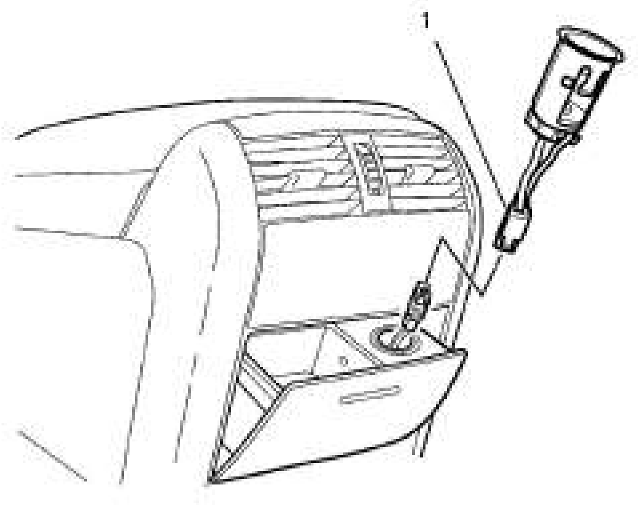


4. Remove the bezel (1).

Installation Procedure



1. Install the bezel (1).



2. Connect the power accessory receptacle electrical connector (1).
3. Install the accessory power receptacle to the receptacle bezel.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Centre Console

Tools Required

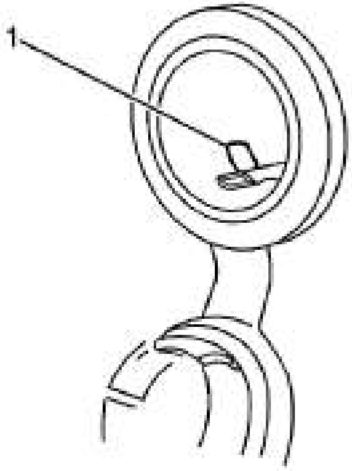
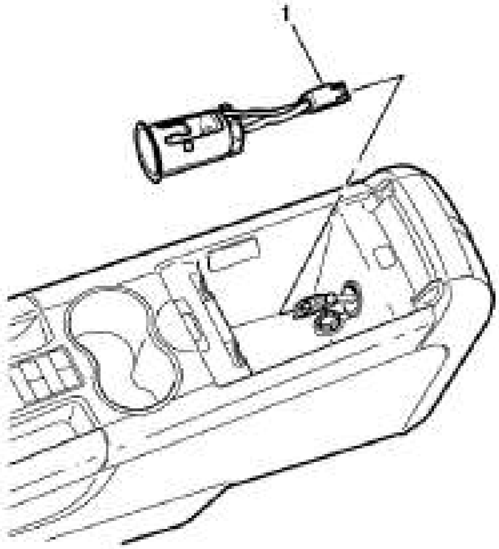
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. Place the T receptacle of J 42059 into one of the retaining tabs (1). Angle the other side into the opposite retaining tab. Pull the power accessory receptacle straight out.



3. Disconnect the power accessory receptacle electrical connector (1).

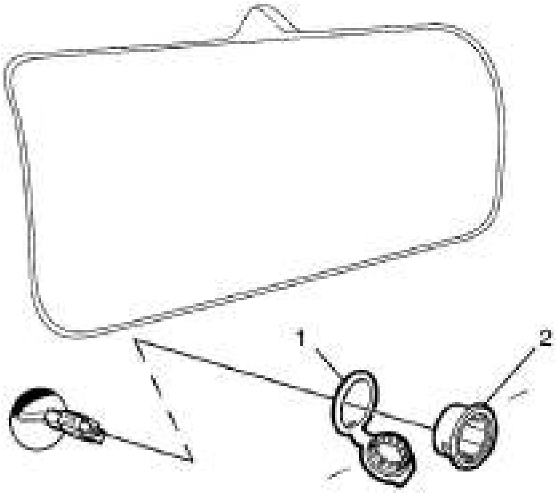
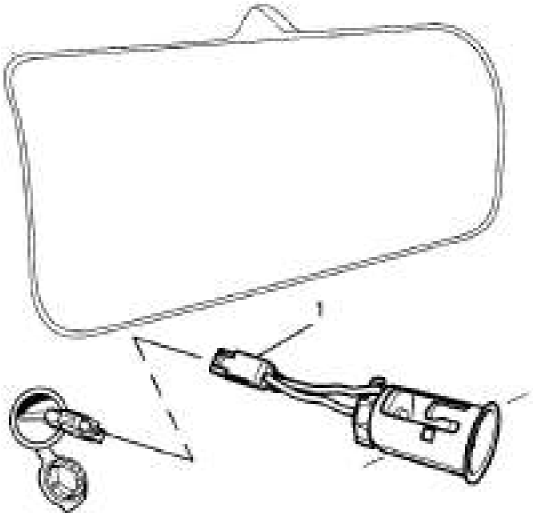
4. Remove the cover (1) and the bezel(2).

Installation Procedure



1. Install the cover (2) and the bezel (1).



2. Connect the power accessory receptacle electrical connector (1).
3. Install the accessory power receptacle to the receptacle bezel.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement (Sportwagon)

Centre Console

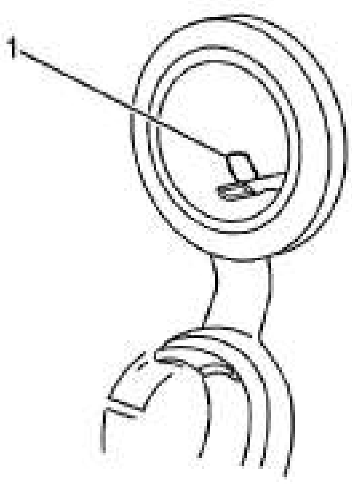
Tools Required

J 42059 Cigar Lighter Socket Remover

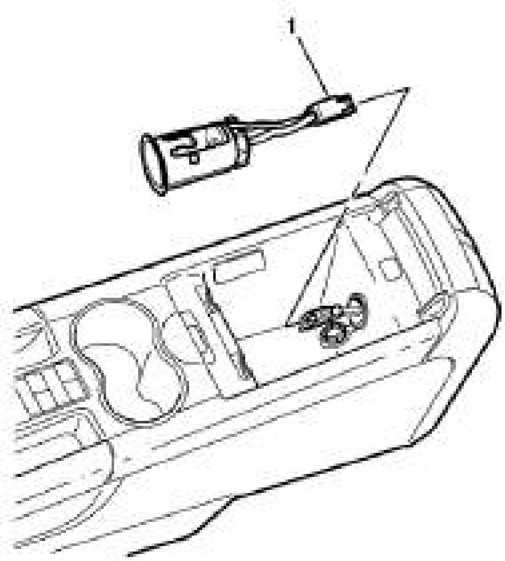
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

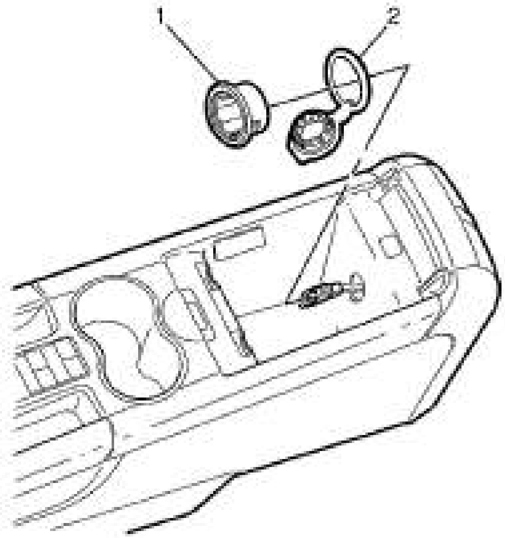
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. Release the accessory power receptacle by placing special tool J 42059 onto the accessory power receptacle retaining tab (1). Angle the other side of the tool onto the opposite accessory power receptacle retaining tab.

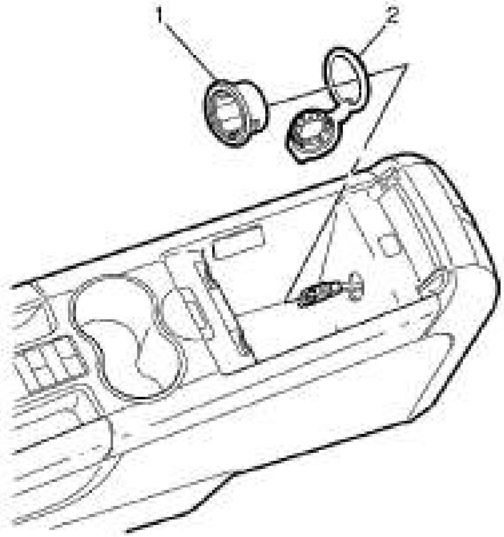


3. Detach the accessory power receptacle from the accessory power receptacle bezel.
4. Disconnect the accessory power receptacle electrical connector (1).
5. Remove the accessory power receptacle from the accessory power receptacle bezel.

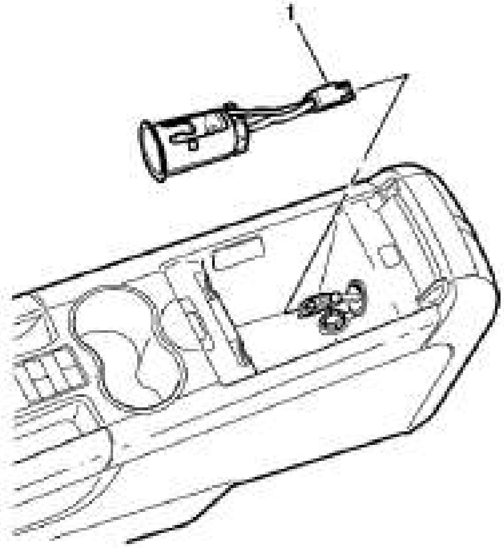


6. Remove the accessory power receptacle bezel (1) and the accessory power receptacle cover (2) from the front floor console.

Installation Procedure



1. Install the accessory power receptacle cover (2) and the accessory power receptacle bezel (1) to the front floor console.



2. Connect the accessory power receptacle electrical connector (1).
3. Install the accessory power receptacle to the accessory power receptacle bezel.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Rear Compartment

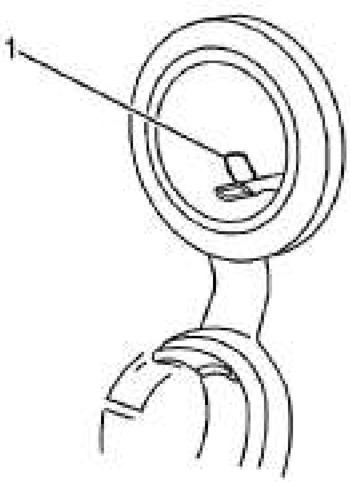
Tools Required

J 42059 Cigar Lighter Socket Remover

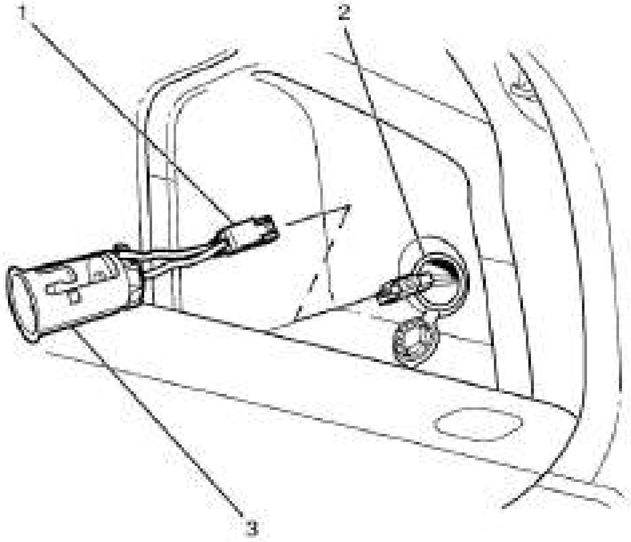
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

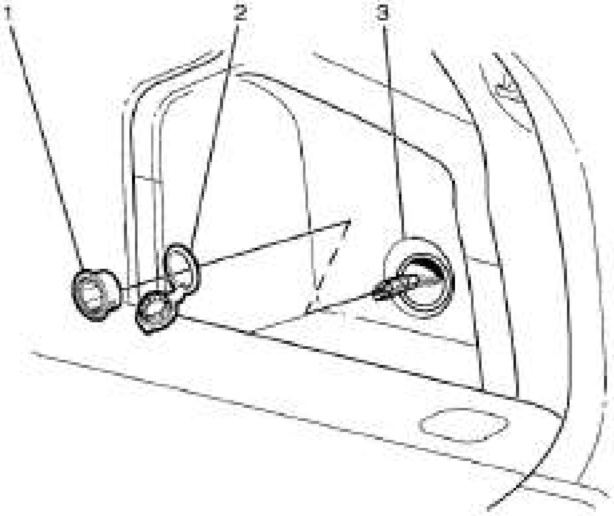
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. Release the accessory power receptacle by placing special tool J 42059 onto the accessory power receptacle retaining tab (1). Angle the other side of the tool onto the opposite power receptacle retaining tab.

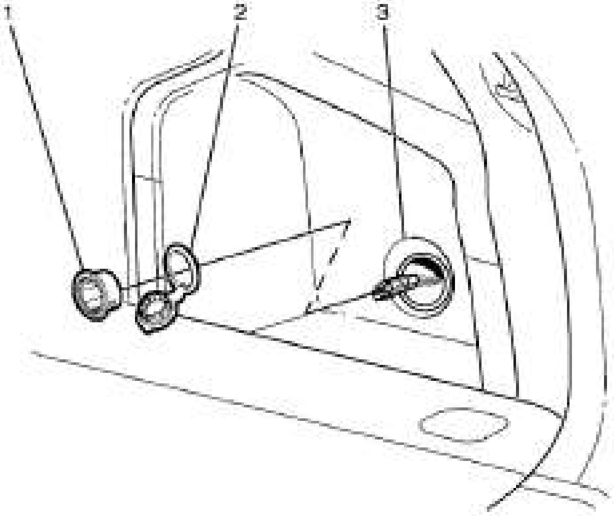


3. Detach the accessory power receptacle (3) from the accessory power receptacle bezel (2).
4. Disconnect the accessory power receptacle electrical connector (1).
5. Remove the accessory power receptacle (3).

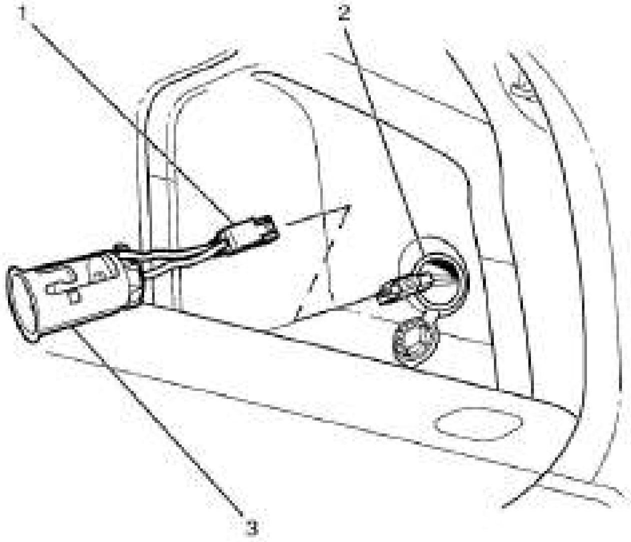


6. Remove the accessory power receptacle bezel (1) and the accessory power receptacle cover (2) from the quarter inner trim finish panel (3).

Installation Procedure



1. Install the accessory power receptacle bezel (1) and the accessory power receptacle cover (2) to the quarter inner trim finish panel (3)



2. Connect the accessory power receptacle electrical connector (1).
3. Install the accessory power receptacle (3) to the receptacle bezel (2).
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement (SWBLHD)

Instrument Panel

Tools Required

Removal Procedure

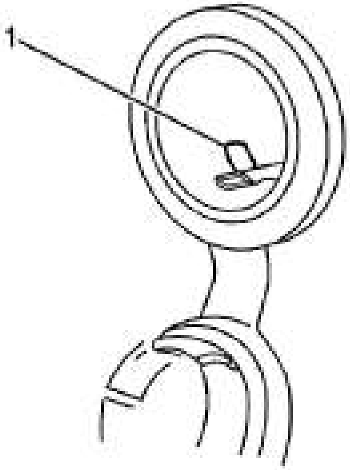
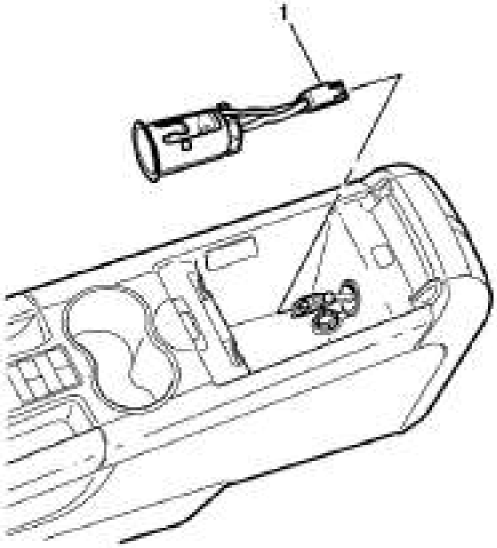
> **Caution:** Refer to Battery Disconnect Caution in the Preface section.

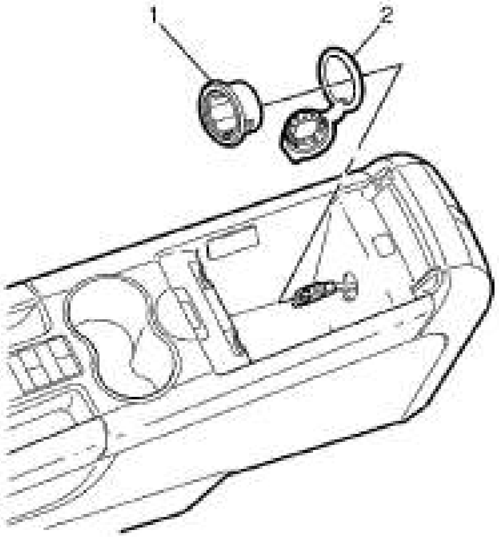
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.



2. Place the T receptacle of J 42059 into one of the retaining tabs (1). Angle the other side into the opposite retaining tab. Pull the power accessory receptacle straight out.

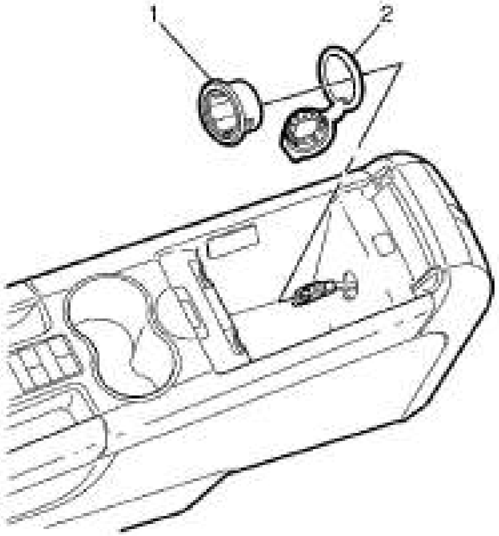


3. Disconnect the power accessory receptacle electrical connector (1).

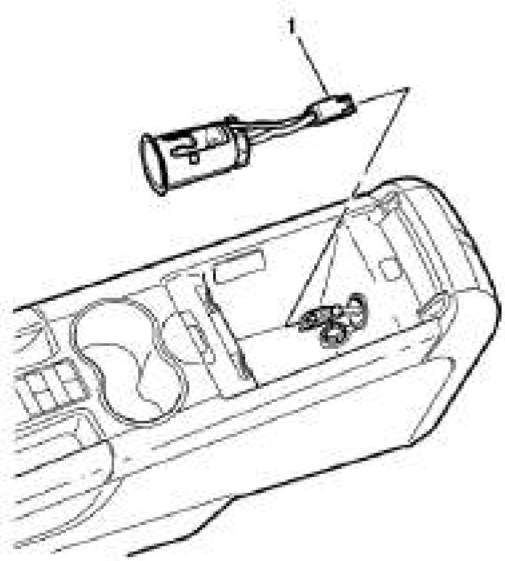


4. Remove the bezel (1) and the cover (2).

Installation Procedure



1. Install the cover (2) and the bezel (1).



2. Connect the power accessory receptacle electrical connector (1).
3. Install the accessory power receptacle to the receptacle bezel.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

Power Outlets Description and Operation (Sportwagon)

The vehicle is fitted with two power outlet located in the centre console and the luggage compartment. The power outlets are operational when the ignition is turned to either the On or the Accessories position, and will provide 120 W of power at 12 V (10 A).

Power Outlets Description and Operation (SWBRHD)

The vehicle is fitted with a centre console power outlet. The power outlet is operational when the ignition is turned to either the On or the Accessories position, and will provide 120 W of power at 12 V (10 A).

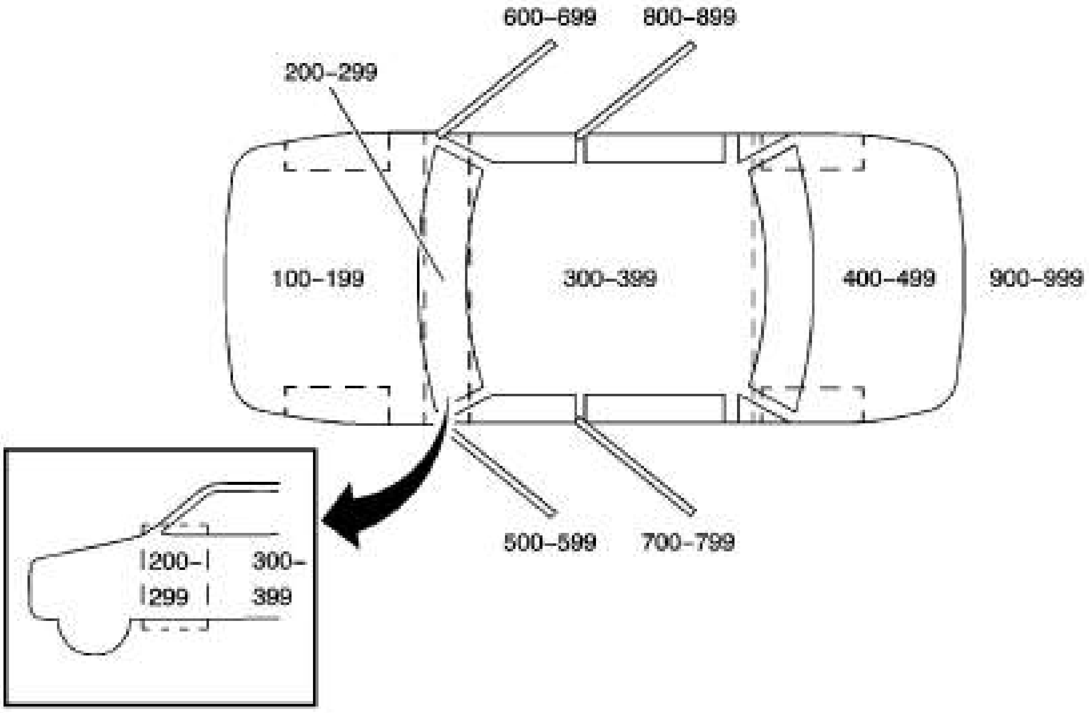
Vehicle Zoning Strategy

All grounds, in-line connectors, pass-through grommets, and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.



Callout Numbers	Zone Description
100-199	Engine compartment- All forward of the dash panel Note: 001-099 are additional for the engine compartment - ONLY to be used if all 100-199 items are used
200-299	Within the instrument panel area
300-399	Passenger compartment - From the instrument panel to the rear wheelhouse
400-499	Luggage compartment - From the rear wheelhouse to the rear of the vehicle
500-599	Within the left front door
600-699	Within the right front door
700-799	Within the left rear door
800-899	Within the right rear door

900-999	Within the luggage compartment lid or hatch

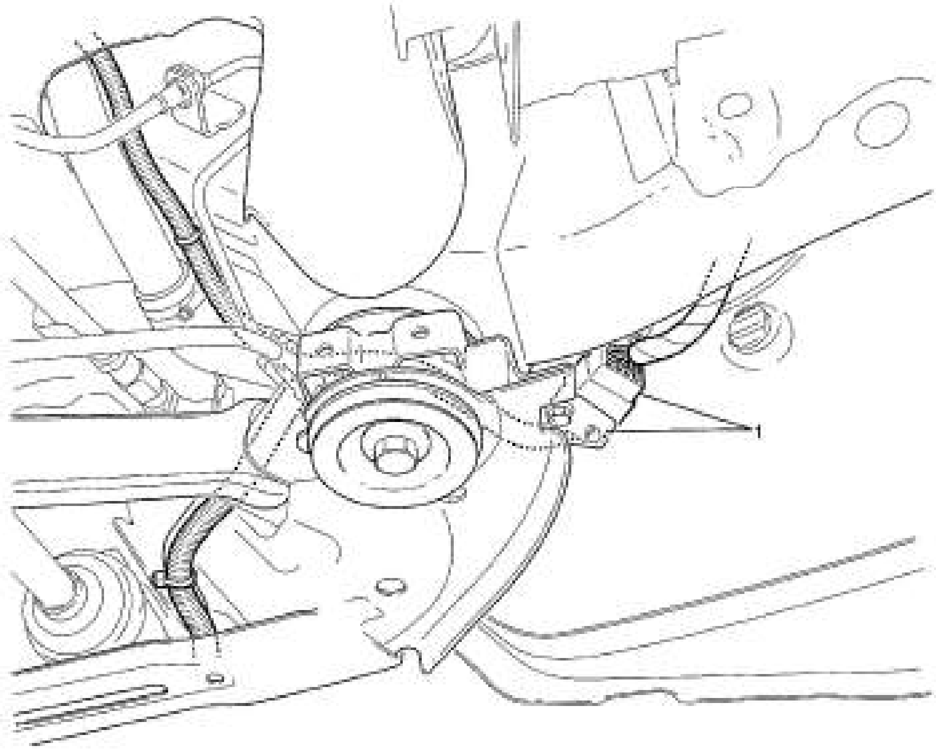
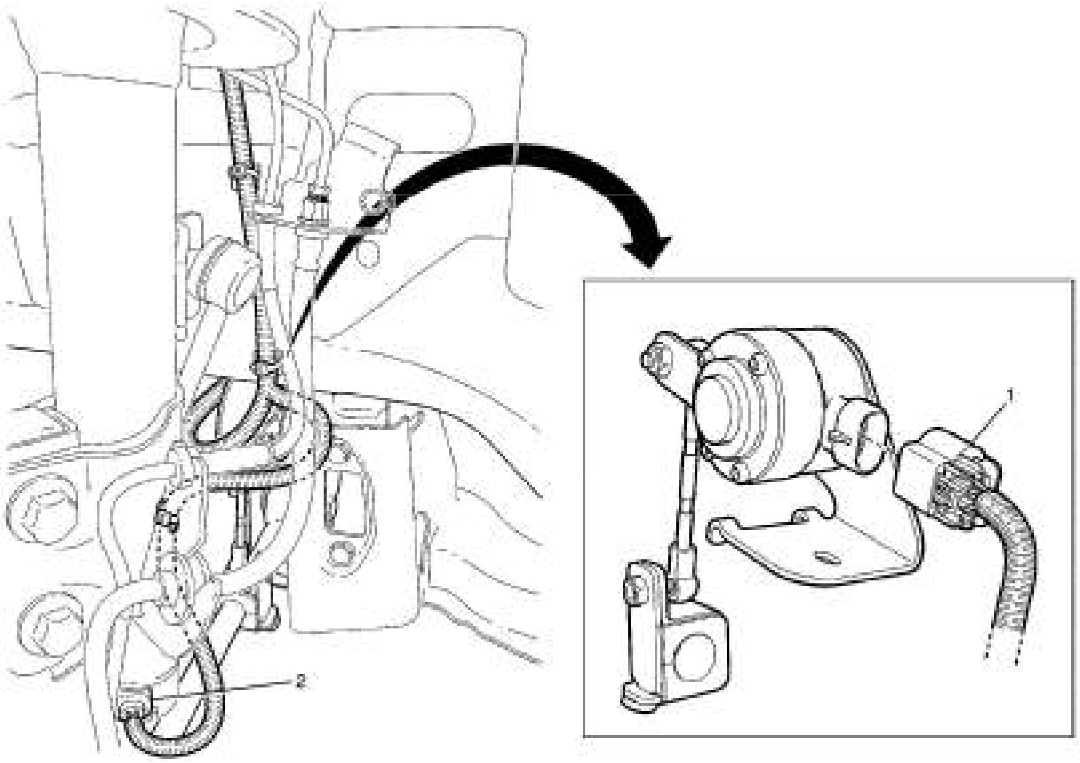
Electronic Suspension Control Wiring -- Rear Body



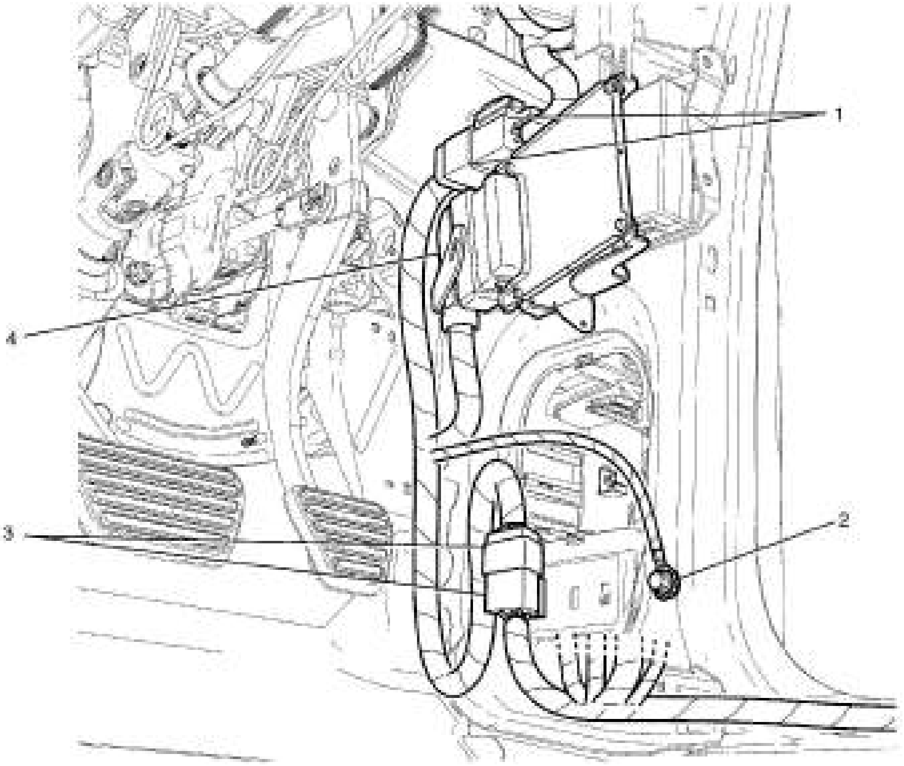
(1) Body Harness to Electronic Suspension Control Rear Harness -- X413

Electronic Suspension Control Wiring -- Right Hand Front



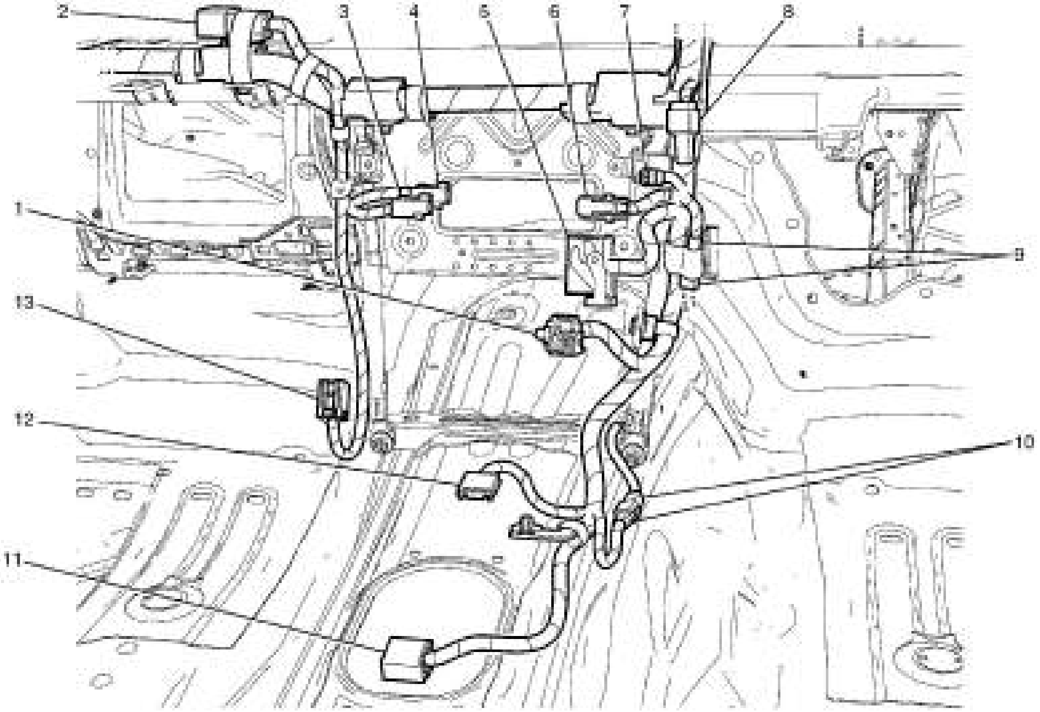
(1) Suspension Position Sensor - RF -- B36
(2) Suspension Damper Actuator - RF -- Y155

Electronic Suspension Control Wiring -- Right Hand Kick Panel



(1) I/P Harness to Electronic Suspension Control Patch Harness -- X237
(2) Right Cockpit Endplate Ground -- G201
(3) Body Harness to Electronic Suspension Control Patch Harness -- X236
(4) Electronic Suspension Control (ESC) Module -- A6

Instrument Panel Wiring -- Centre



(1) Front Cigar Lighter Connector -- X113
(2) I/P Harness to Electronic Suspension Control Console Harness -- X238
(3) Diversity Antenna Connector -- N3
(4) AM/FM Antenna Connector -- W6
(5) Radio Connectors 1, 2, 3, 4 -- A133
(6) Radio Connector 7 -- A133
(7) Ambient Air Temperature Sensor Connector -- B59
(8) Resistor Terminator
(9) Kill Switch Interconnect
(10) Earth Connector
(11) Automatic Transmission Shift Lever Connector -- S22
(12) Multifunction Centre Console Switch Connector -- S73
(13) I/P Harness to Secondary Information Cluster Patch Harness -- X226

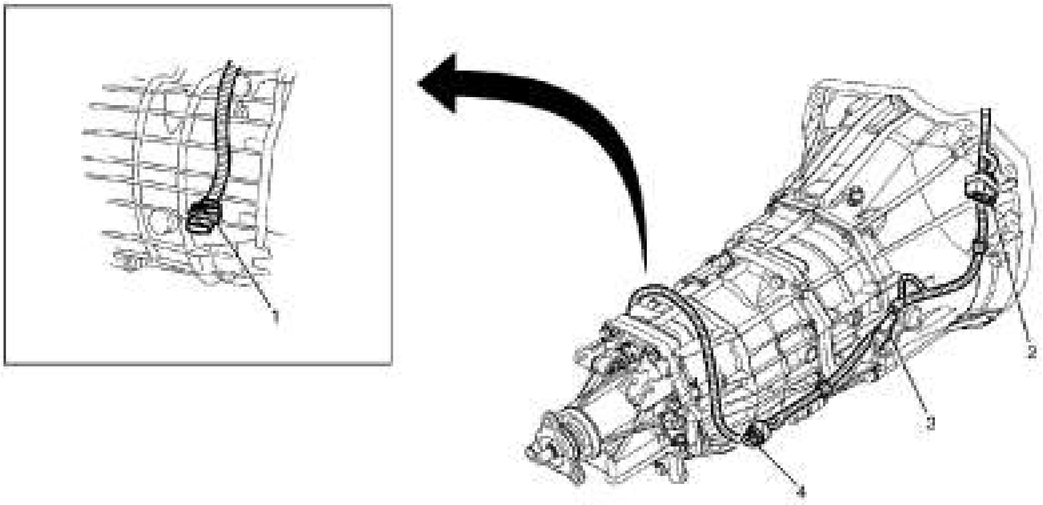
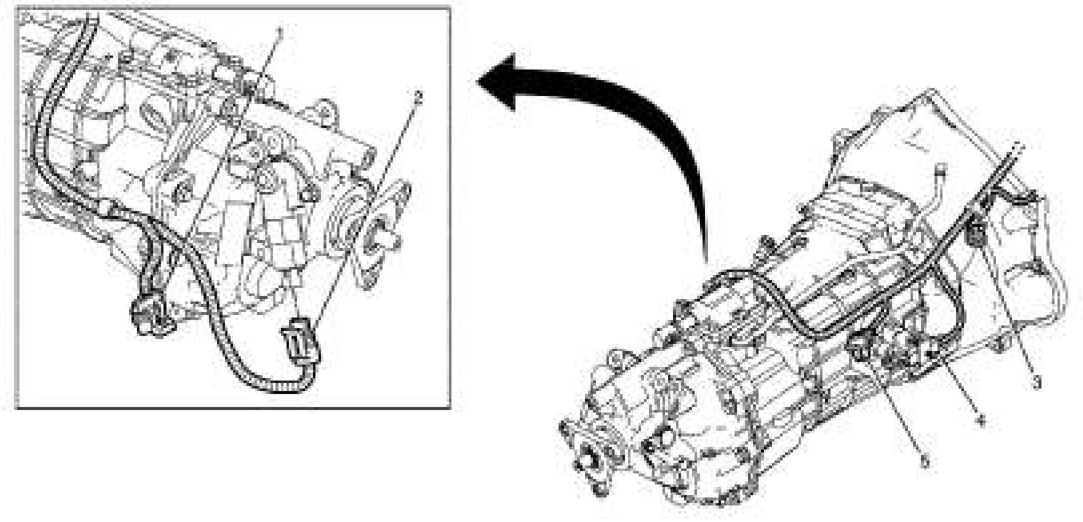
6 Speed Manual Transmission Harness (3.6L)



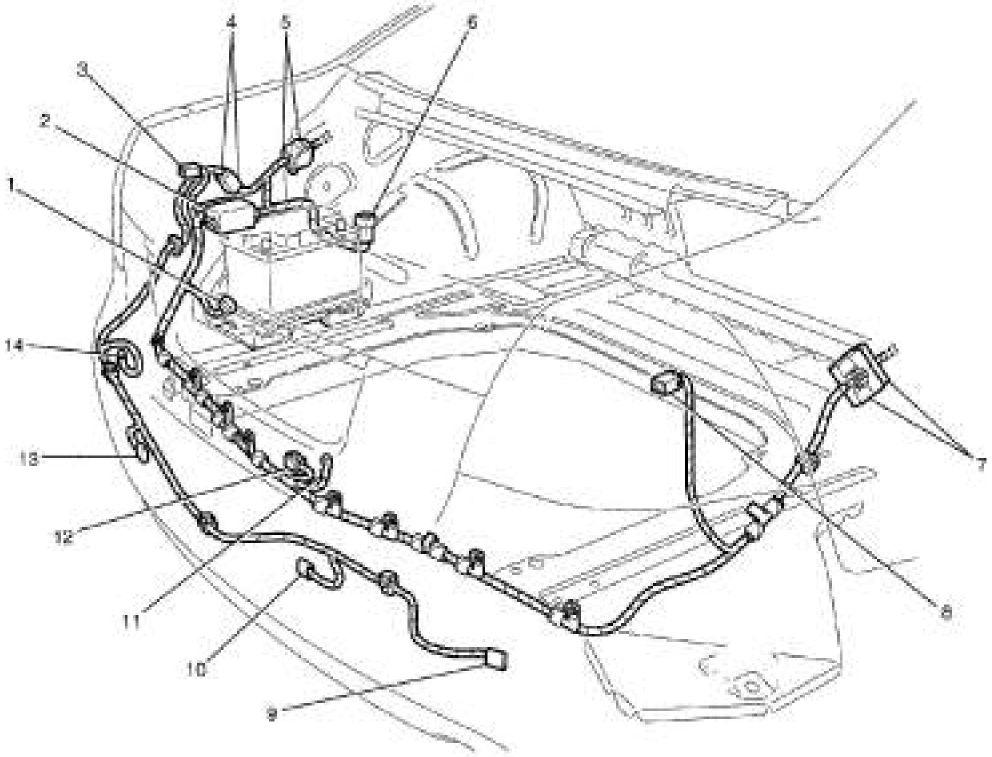
(1) Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 Connector -- B58
(2) Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 Connector -- B166
(3) Backup Lamp Switch Connector -- S32
(4) Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 Connector -- B56

6 Speed Manual Transmission Harness (6.0L)



(1) Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 Connector -- B57
(2) Reverse Lockout Solenoid Connector -- Y144
(3) Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 Connector -- B166
(4) Backup Lamp Switch Connector -- S32
(5) Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 Connector -- B57

Body Rear Wiring -- Rear Object Alarm Sensor Wiring



(1) Battery Current Sensor Connector -- B168
(2) Fuse Block - Rear -- X131
(3) Tail Lamp Assembly - Left Connector -- X451
(4) Body Rear to Rear Fascia Wiring Connector -- X405
(5) Left Hand Body Wiring Connector -- X403
(6) Battery Cable to Body Rear Harness -- X408
(7) Right Hand Body Wiring Connector -- X404
(8) Tail Lamp Assembly - Right Connector -- X450
(9) Rear Object Alarm Sensor - RR Corner Connector -- B133
(10) Rear Object Alarm Sensor - RR Middle Connector -- B133
(11) Rear Compartment Lid Latch Bracket Ground -- G409
(12) Rear Compartment Lid Latch Assembly Connector -- Y23
(13) Rear Object Alarm Sensor - LR Middle Connector -- B133
(14) Rear Object Alarm Sensor - LR Corner Connector -- B133

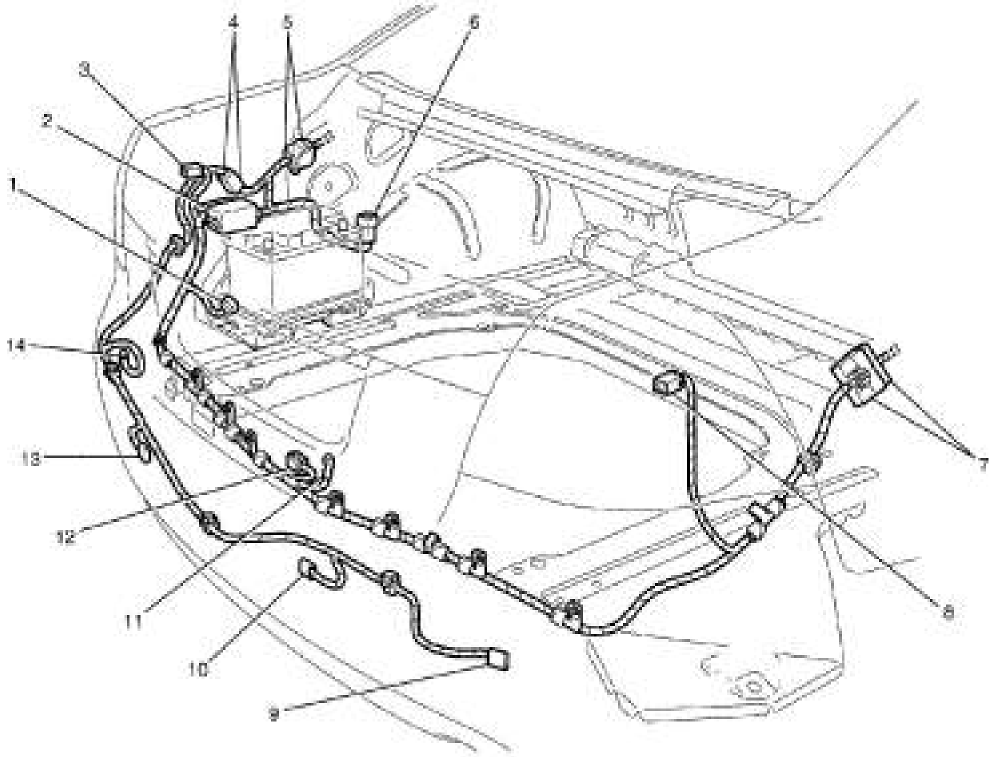
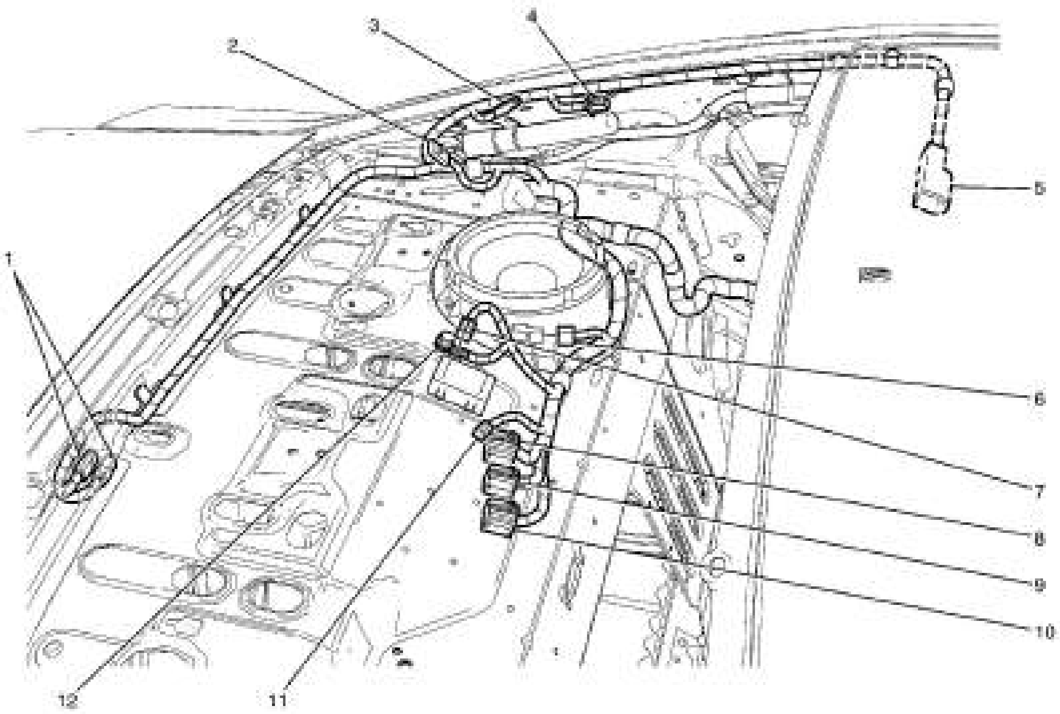
Body Wiring - Rear (Short Wheel Base)



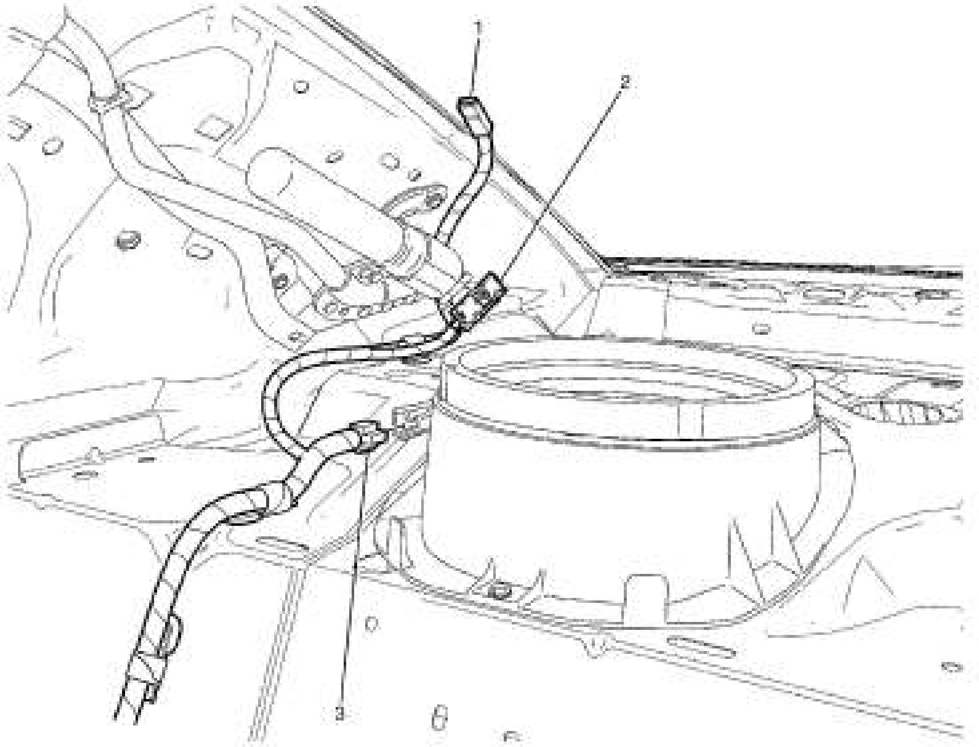
(1) Battery Current Sensor Connector -- B168
(2) Fuse Block - Rear -- X131
(3) Tail Lamp Assembly - Left Connector -- X451
(4) Body Rear to Rear Fascia Wiring Connector -- X405
(5) Left Hand Body Wiring Connector -- X403
(6) Battery Cable to Body Rear Harness -- X408
(7) Right Hand Body Wiring Connector -- X404
(8) Tail Lamp Assembly - Right Connector -- X450
(9) Rear Object Alarm Sensor - RR Corner Connector -- B133
(10) Rear Object Alarm Sensor - RR Middle Connector -- B133
(11) Rear Compartment Lid Latch Bracket Ground -- G409
(12) Rear Compartment Lid Latch Assembly Connector -- Y23
(13) Rear Object Alarm Sensor - LR Middle Connector -- B133
(14) Rear Object Alarm Sensor - LR Corner Connector -- B133

Body Wiring -- Rear Parcel Shelf 2



(1) Rear Compartment Lid Lamp Connectors-- E36-X1 and E36-X2
(2) Inflatable Restraint Roof Rail Module (Left) Connector -- A96
(3) Rear Window Defogger Grid Connector -- R22-X2
(4) Diversity Antenna Connector -- N3
(5) Radio Antenna Connector -- W6
(6) Speaker Rear Subwoofer Connector -- B131
(7) Remote Function Actuator Connector -- A157
(8) Front and Rear Object Alarm Module Connector -- A98-X1
(9) Front and Rear Object Alarm Module Connector -- A98-X2
(10) Front and Rear Object Alarm Module Connector -- A98-X3
(11) Front and Rear Object Alarm Connector -- H31
(12) Parcel Shelf Ground -- G407

Body Wiring -- Rear Parcel Shelf Right Side



(1) Rear Window Defogger Grid Connector -- R22-X1
(2) Inflatable Restraint Roof Rail Module (Right) Connector -- A96
(3) Speaker Rear Subwoofer Connector -- B131

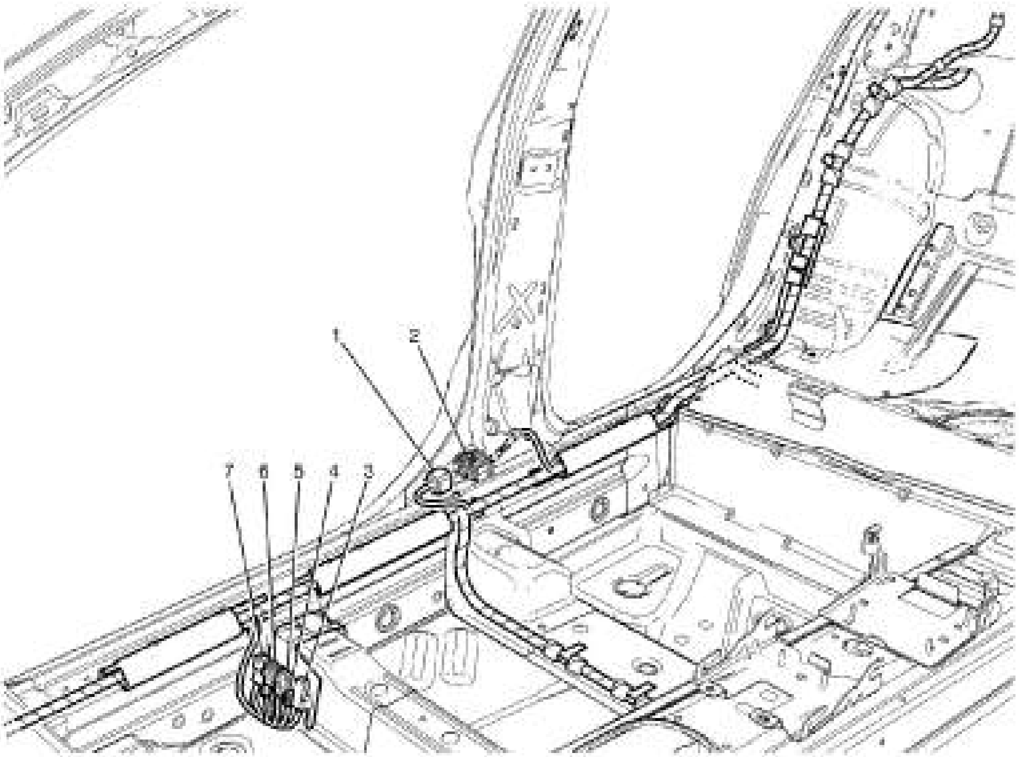
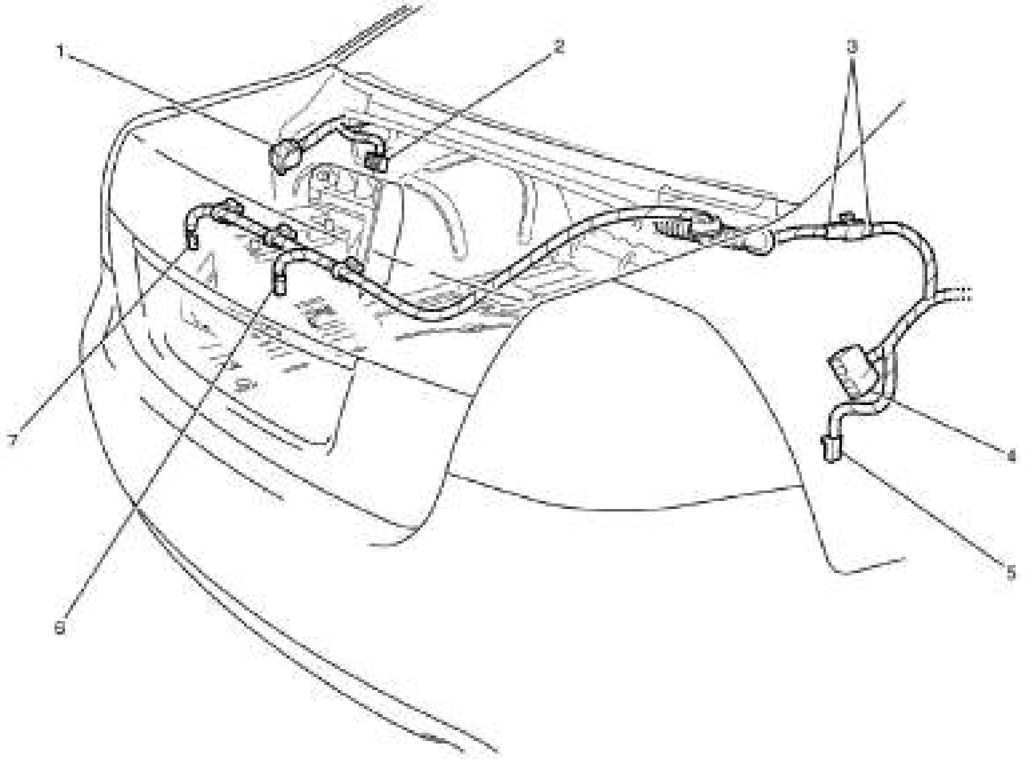
Document ID: 1974901

Body Wiring -- Right Hand Side



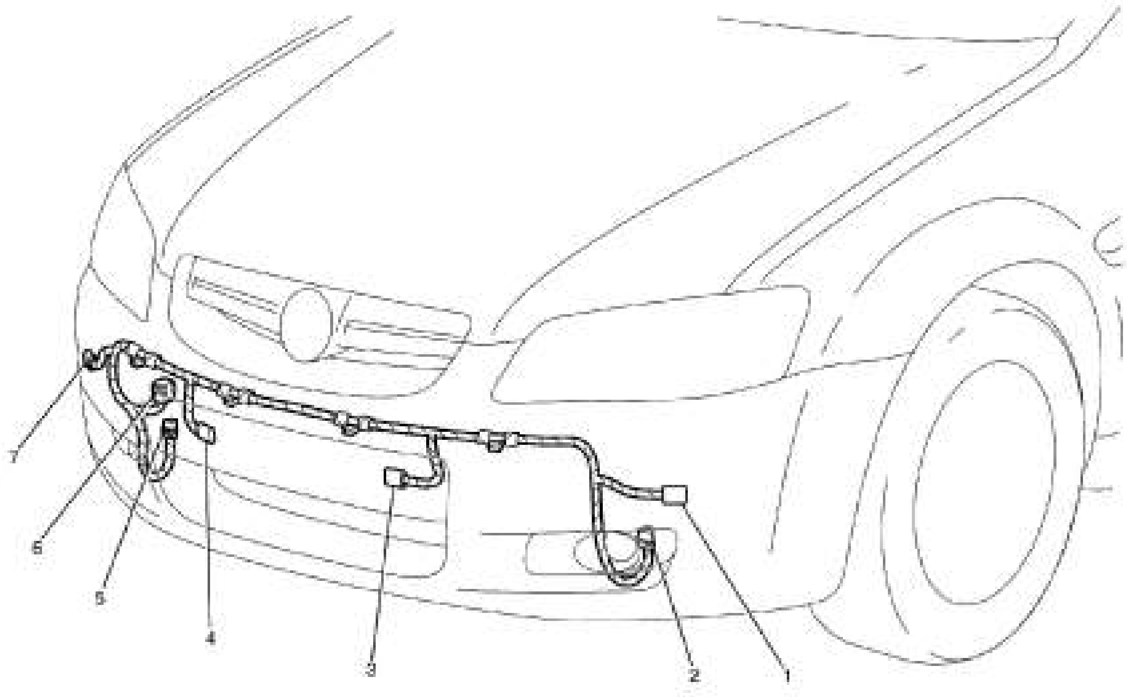
(1) Inflatable Restraint Side Impact Sensor (SIS) (RF) Connector -- B63
(2) Body Harness to Right Hand Rear Door Harness Connector -- X302
(3) Body Harness to Pretensioner Driver Harness Connector -- X356
(4) Body Harness to Driver Seat Harness Connector -- X313
(5) Body Harness to Driver Seat Harness Connector -- X315
(6) Body Harness to Driver Seat Harness Connector -- X306
(7) Body Harness to Driver Seat Harness Connector -- X311

Body Wiring and Decklid Wiring - Rear Compartment (Short Wheel Base except HSV)



(1) Left Hand Body Rear Wiring Connector -- X403
(2) Audio Amplifier Module Connector -- N6
(3) Decklid Wiring to Body Wiring Connector -- X402
(4) Right Hand Body Rear Wiring Connector -- X404
(5) Fuel Filler Door Latch Connector -- Y10
(6) Right License Plate Lamp Connector -- E44
(7) Left License Plate Lamp Connector -- E44

Front Object Alarm Sensor Wiring



(1) Front Object Alarm Sensor - LF Corner Connector -- B133
(2) Left Fog Lamp Connector -- E69
(3) Front Object Alarm Sensor - LF Middle Connector -- B133
(4) Front Object Alarm Sensor - RF Middle Connector -- B133
(5) Right Fog Lamp Connector -- E69
(6) Body Front to Front Fascia Wiring Harness Connector -- X108
(7) Front Object Alarm Sensor - RF Corner Connector -- B133

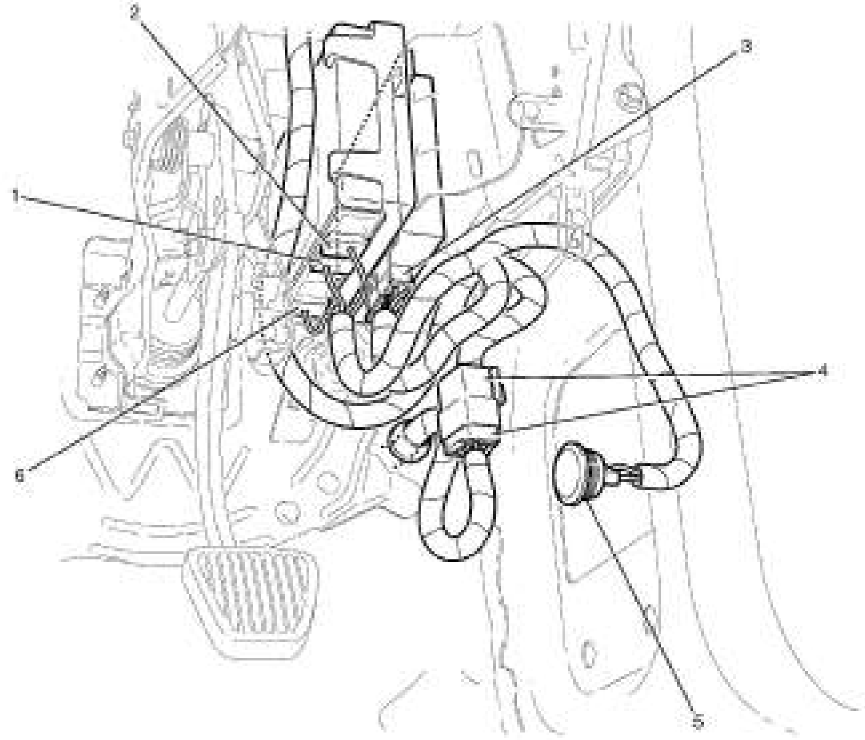
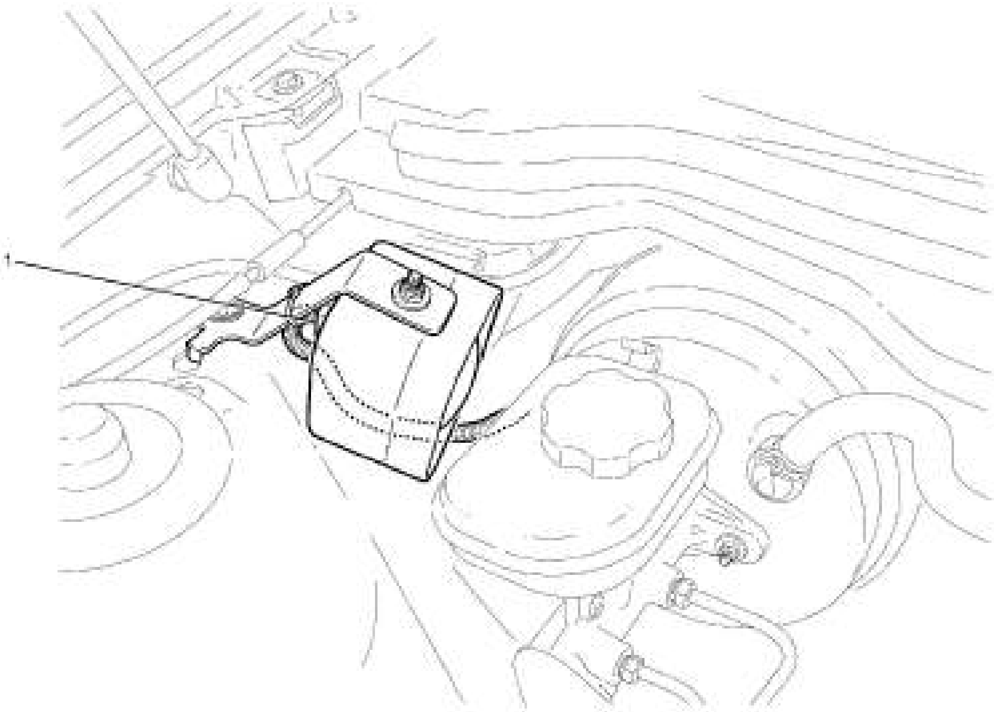
Genuine Accessory Alarm System Harness - Alarm Control Module / Disable Switch



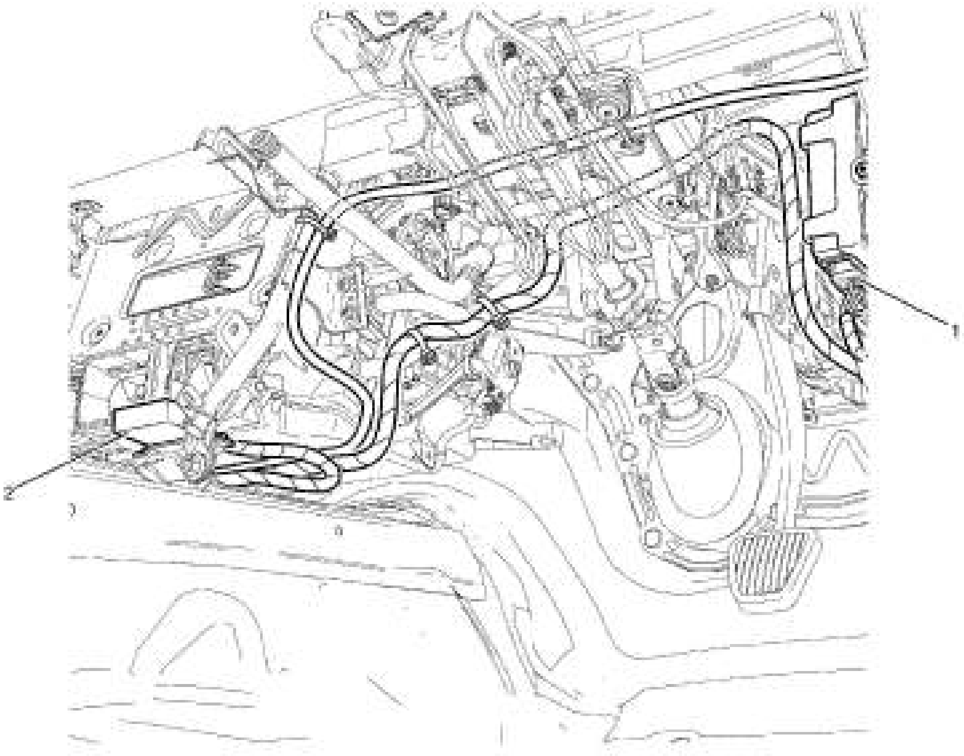
(1) Body Control Module Connector A15 -- X5
(2) Body Control Module Connector A15 -- X6
(3) Alarm Control Module Connector -- A38/A116
(4) Siren Inline Connector
(5) Disable Switch
(6) Body Control Module Connector A15 -- X2

Genuine Accessory Alarm System Harness - Siren



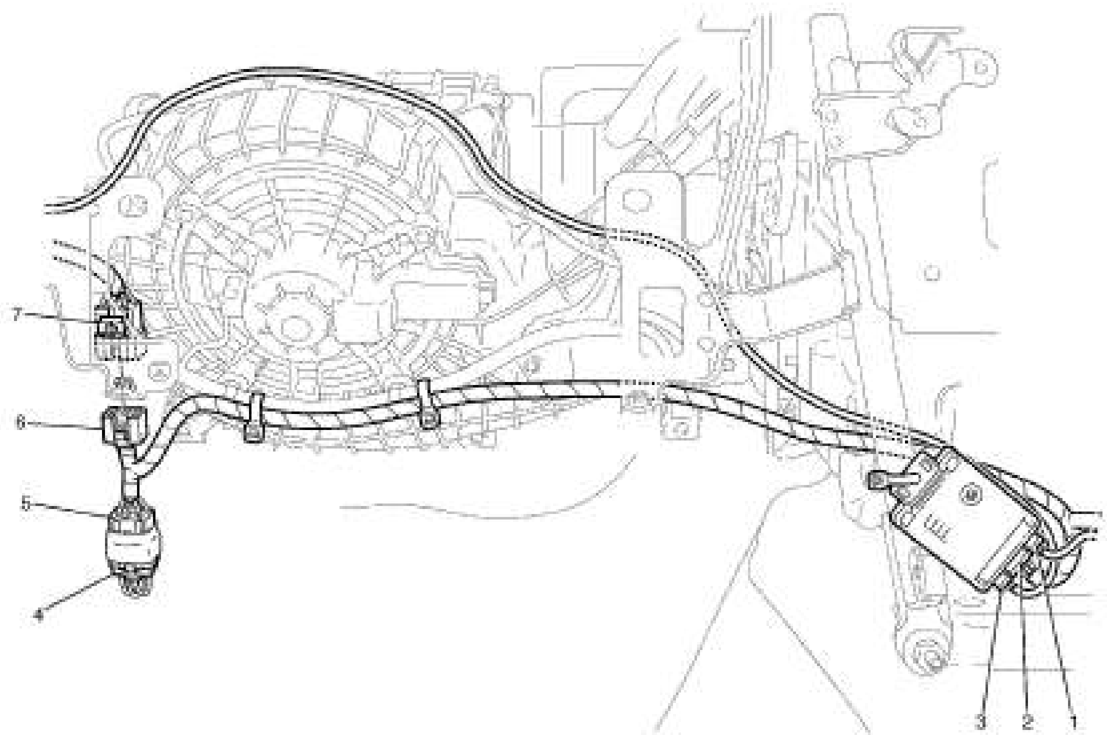
(1) Siren Connector

Genuine Accessory Alarm System Harness - Tilt Sensor



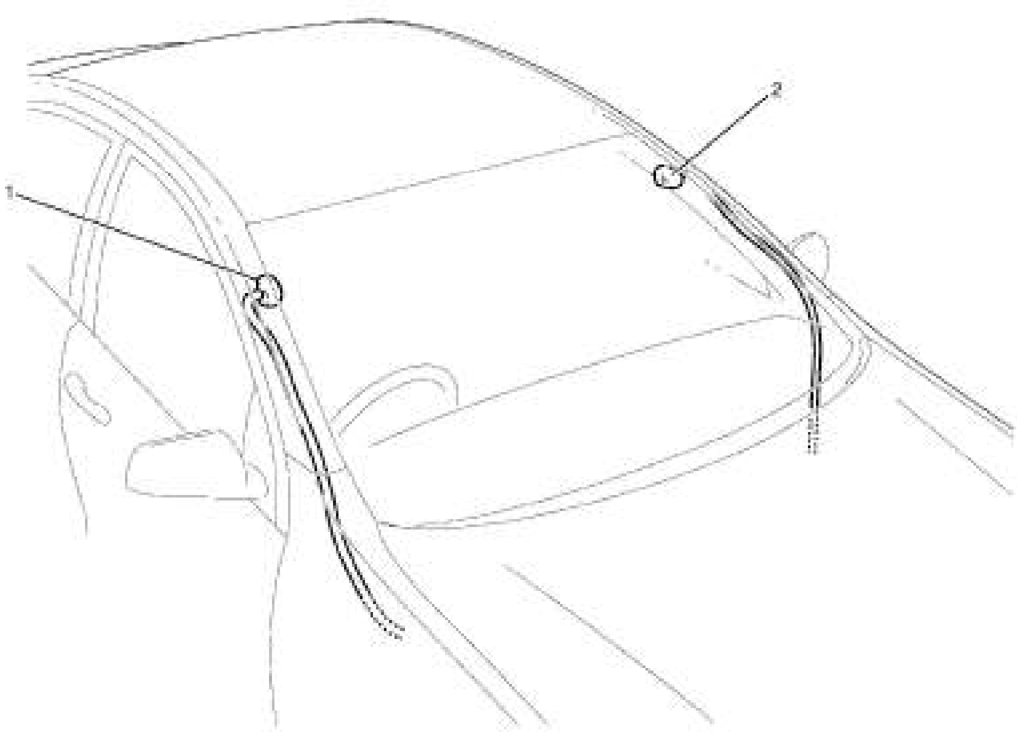
(1) Body Control Module Connector A15 -- X6
(2) Tilt Sensor

Genuine Accessory Alarm System Harness - Ultrasonic Module / Option Programming Connector



(1) Split Eye Ultrasonic Module (Black) -- X2
(2) Split Eye Ultrasonic Module -- X1
(3) Split Eye Ultrasonic Module (Red) -- X3
(4) Dealer Option Programming Jumper Connector
(5) Alarm Harness to Dealer Option Programming Jumper Connector
(6) Alarm Harness to Instrument Panel Harness Connector (X137)
(7) Instrument Panel Dealer Option Connector (X137)

Genuine Accessory Alarm System Harness - Ultrasonic Sensors



(1) Ultrasonic Sensor -- 1

(2) Ultrasonic Sensor -- 2

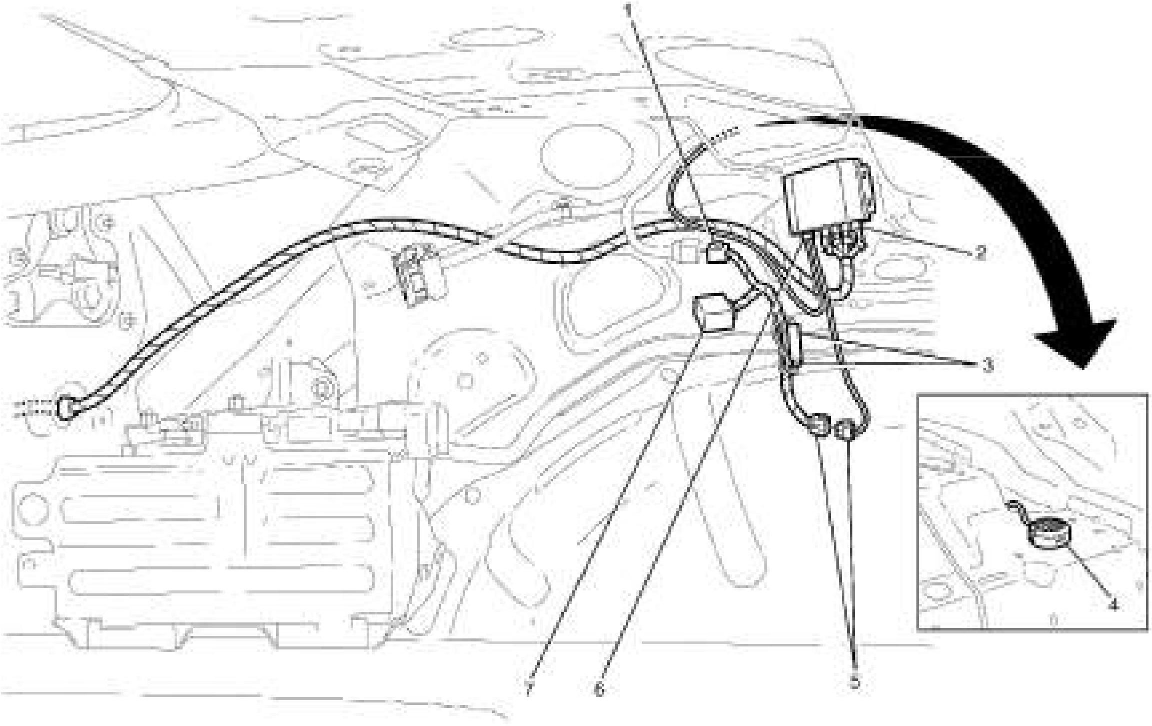
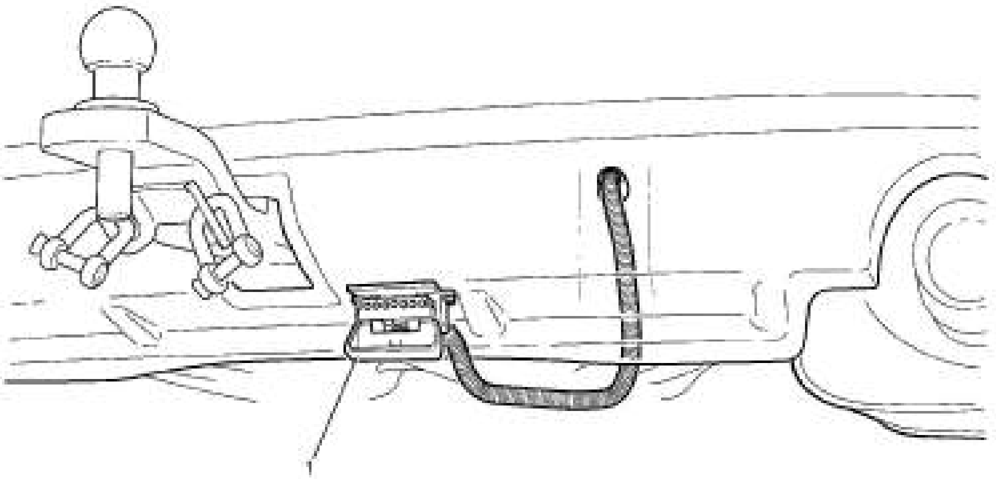
Genuine Accessory Rear Park Assist Harness, Control Module, Warning Buzzer



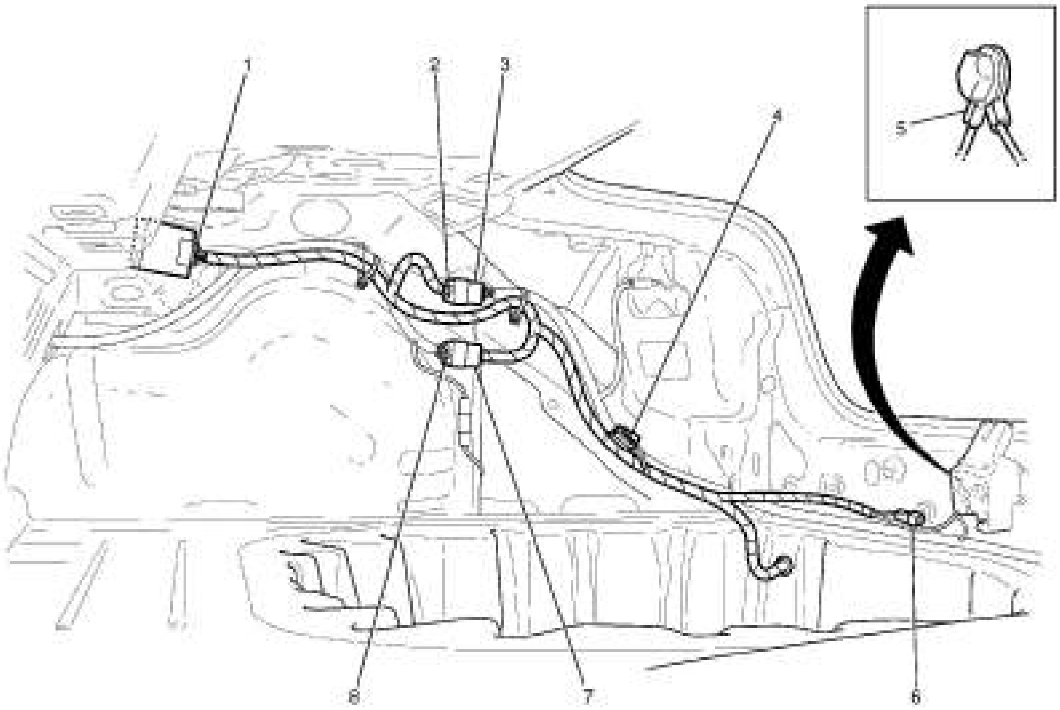
(1) Rear Park Assist Connector (X156)
(2) Rear Park Assist Module Connectors (A98 -- X2 to X5)
(3) Ground Break in Connector (XA)
(4) Rear Park Assist Warning Buzzer (H13)
(5) Rear Park Assist Patch Harness to Rear Park Assist Power/Warning Buzzer Connector (XB)
(6) Rear Park Assist Module Connector (A98 -- X1)
(7) External Relay

Genuine Accessory Trailer Harness- Accessory Trailer Harness Connector



(1) Trailer Harness Connector -- X109

Genuine Accessory Trailer Wiring Harness



(1) Trailer Harness Control Module Connector

(2) Trailer Patch Wiring Harness to Body Rear Wiring Harness Connector

(3) Body Rear Wiring Harness Connector -- X404

(4) Electronic Trailer Brake Connector

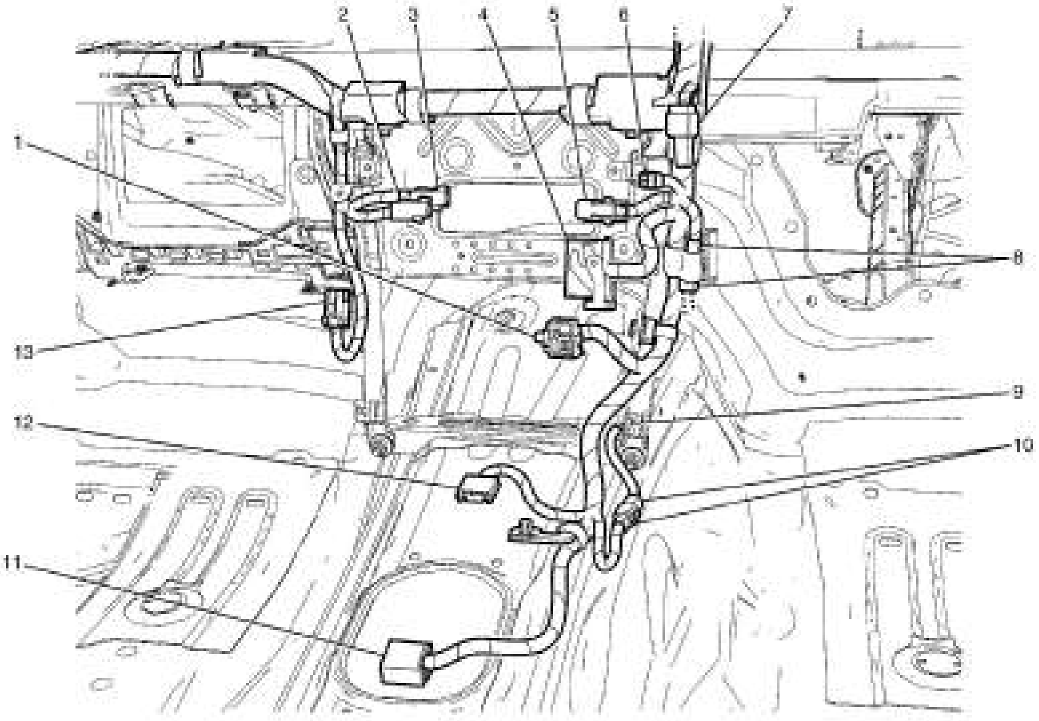
(5) Ground

(6) Rear Park Assist Ground Connector

(7) Body Rear Wiring Harness to Trailer Patch Wiring Harness Connector

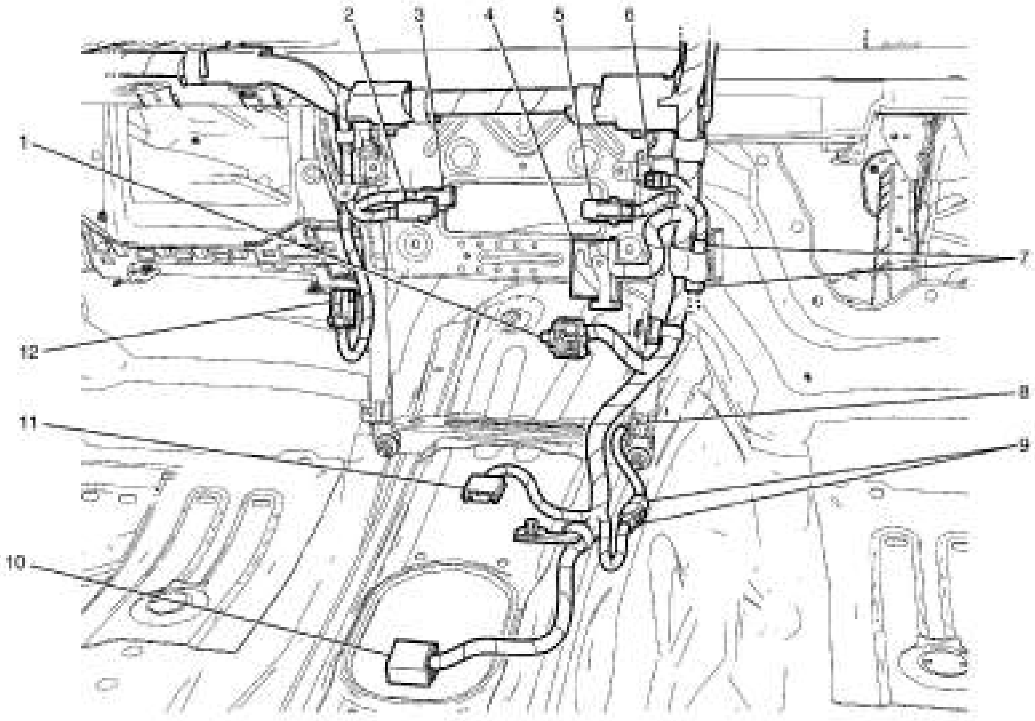
(8) Body Wiring Harness Connector -- X404

Instrument Panel Wiring -- Centre (Right Hand Drive, as of Dec 06)



(1) Cigar Lighter - Front Connector -- X113
(2) Radio Connector 6 -- A133
(3) Radio Connector 5-- A133
(4) Radio Connectors 1, 2, 3, 4 -- A133
(5) Radio Connector 7 -- A133
(6) Inside Air Temperature Sensor Connector -- B59
(7) Resistor Terminator
(8) Kill Switch Interconnect
(9) Console Bracket Ground -- G303
(10) I/P Harness to Console Bracket -- X223
(11) Automatic Transmission Shift Lever Connector -- S22
(12) Multifunction Centre Console Switch Connector -- S73
(13) Sport Gauges Connector -- P6 (SV6), X241 (SS)

Instrument Panel Wiring -- Centre (Right Hand Drive, up to Dec 06)



(1) Cigar Lighter - Front Connector -- X113
(2) Radio Connector 6 -- A133
(3) Radio Connector 5-- A133
(4) Radio Connectors 1, 2, 3, 4 -- A133
(5) Radio Connector 7 -- A133
(6) Inside Air Temperature Sensor Connector -- B59
(7) Kill Switch Interconnect
(8) Console Bracket Ground -- G303
(9) I/P Harness to Console Bracket -- X223
(10) Automatic Transmission Shift Lever Connector -- S22
(11) Multifunction Centre Console Switch Connector -- S73
(12) Sport Gauges Connector -- P6 (SV6), X241 (SS)

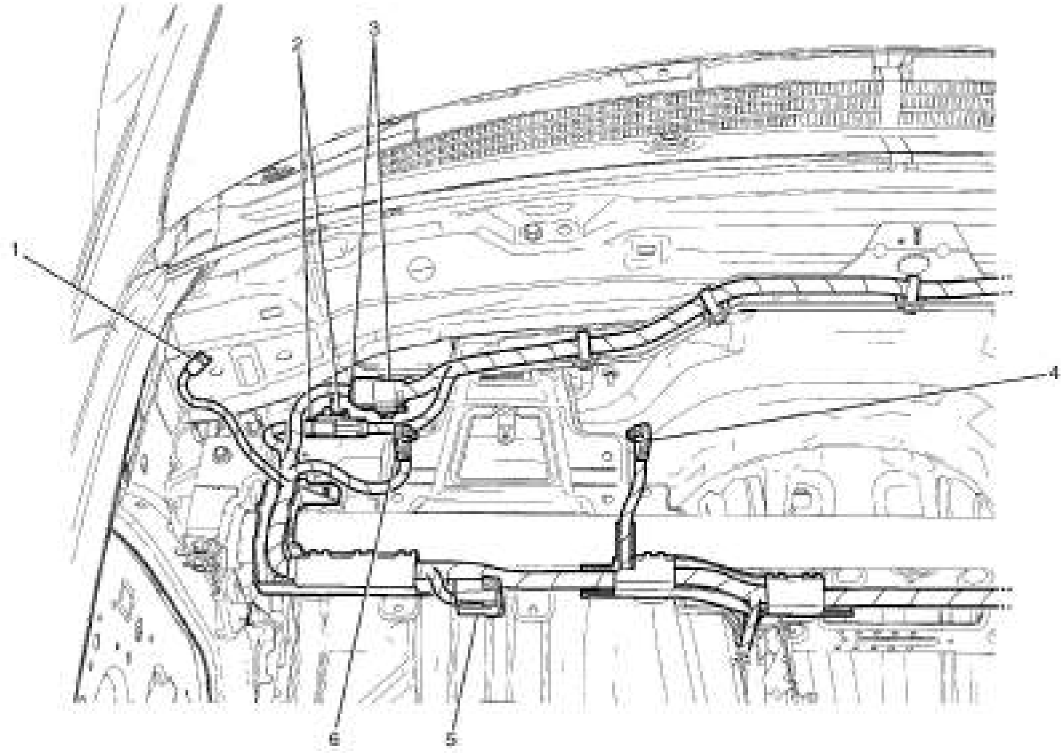
Instrument Panel Wiring -- Left Side (After 12/06)



(1) Speaker - LF Tweeter Connector -- B112

(2) RHS and LHS I/P Harness Crossover Connector 2 -- X228

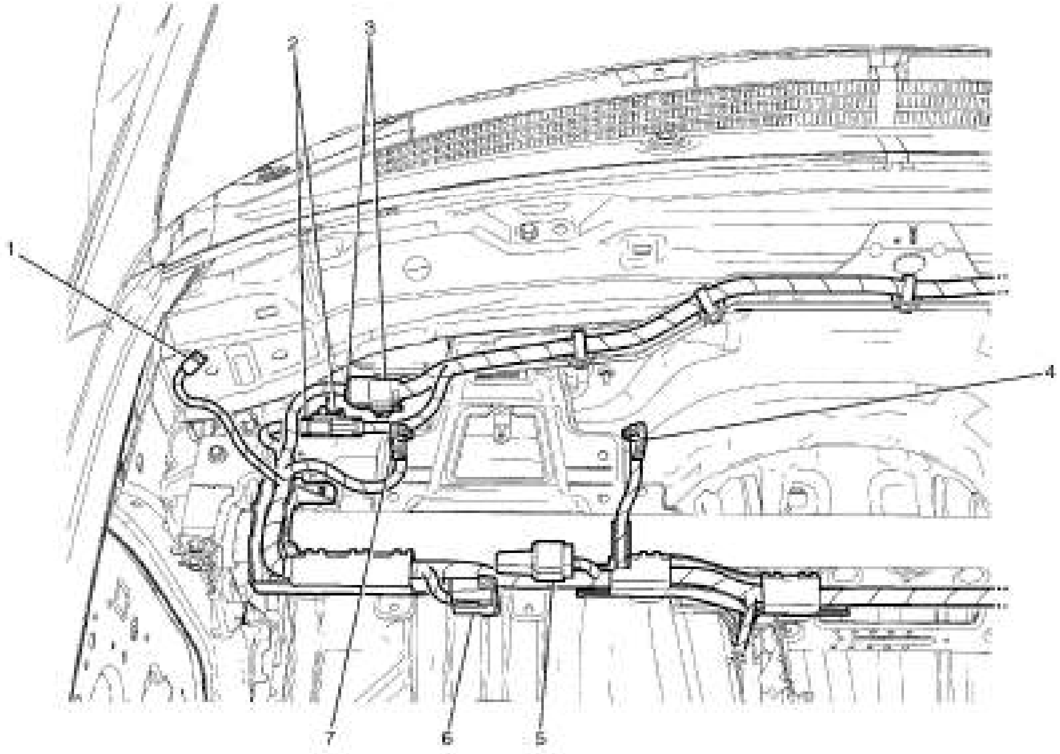
(3) RHS and LHS I/P Harness Crossover Connector 1 -- X229

(4) Inflatable Restraint I/P Module Connector 1 -- A62-X1

(5) I/P Data link Connector -- X95

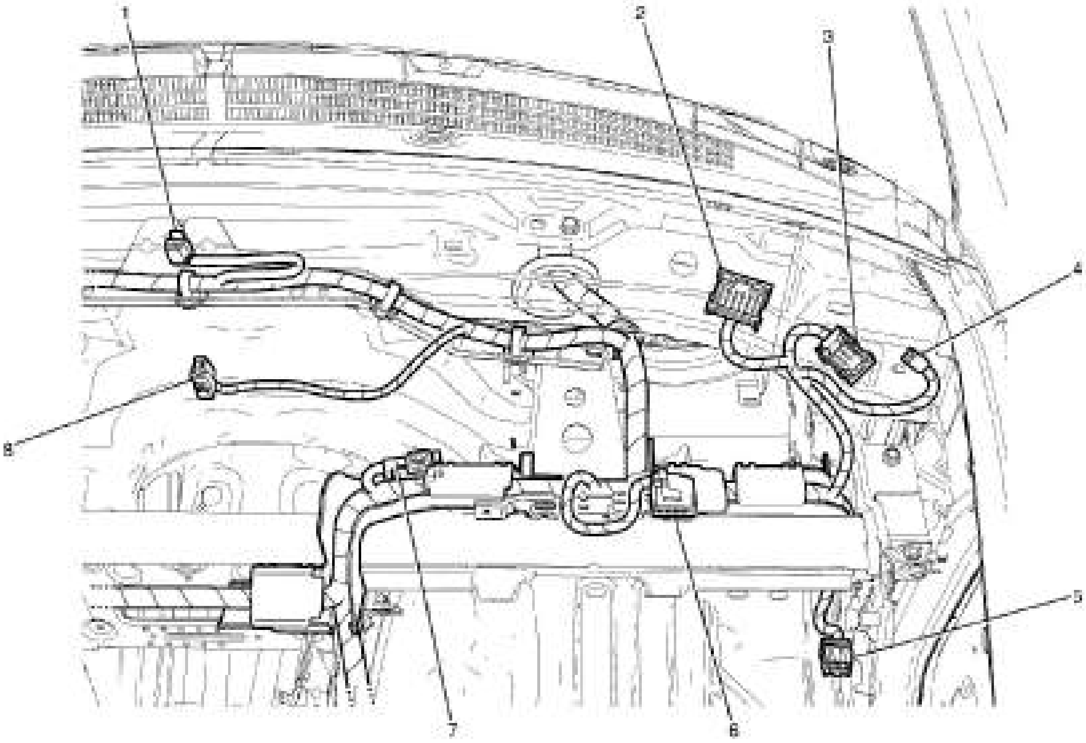
(6) Inflatable Restraint I/P Module Connector 2 -- A62-X2

Instrument Panel Wiring -- Left Side (Up to 12/06)



(1) Speaker - LF Tweeter Connector -- B112
(2) RHS and LHS I/P Harness Crossover Connector 2 -- X228
(3) RHS and LHS I/P Harness Crossover Connector 1 -- X229
(4) Inflatable Restraint I/P Module Connector 1 -- A62-X1
(5) Resistor Terminator
(6) I/P Data link Connector -- X95
(7) Inflatable Restraint I/P Module Connector 2 -- A62-X2

Instrument Panel Wiring - Right Side (Right Hand Drive)



(1) Ambient Light/Sun Load Sensor Connector -- B55
(2) I/P Harness to Headliner Harness Connector 1 -- X212
(3) I/P Harness to Headliner Harness Connector 2 -- X213
(4) Speaker - RF Tweeter Connector -- B112
(5) Headlamp and Dimmer Panel Switch Connector -- S125
(6) Instrument Panel Cluster (IPC) Connector -- P3
(7) Clutch Jumper Harness Connector -- X210 (Manual Transmission Only)
(8) Speaker -- Centre Connector -- B121

Master Electrical Component List

Name	Location	Locator View	Connector End View
A/C Refrigerant Pressure Sensor (3.6L)	Part of the A/C compressor, on the right of the engine	Harness Routing Views	Component Connector End Views
A/C Refrigerant Pressure Sensor (6.0L)	Part of the A/C compressor, on the left of the engine	Harness Routing Views	Component Connector End Views
Accelerator Pedal Position (APP) Sensor	Under right side of instrument panel (I/P) to the right of the brake pedal	Harness Routing Views	Component Connector End Views
Air Mix Actuator	Part of the HVAC unit under the I/P	HVAC Component Views	Component Connector End Views
Ambient Light Sensor	On top of the I/P in the centre near the windshield	Harness Routing Views	Component Connector End Views
Automatic Transmission (4L60-E)	At the rear of the engine assembly, under the vehicle	Lighting Systems Component Views	Component Connector End Views
Automatic Transmission (5L40E)	At the rear of the engine assembly, under the vehicle	Lighting Systems Component Views	Component Connector End Views
Automatic Transmission (6L80)	At the rear of the engine assembly, under the vehicle	Lighting Systems Component Views	Component Connector End Views
Automatic Transmission Shift Lever (4L60-E)	In the passenger compartment in front of the centre console	Harness Routing Views	Component Connector End Views
Automatic Transmission Shift Lever (5L40E)	In the passenger compartment in front of the centre console	Harness Routing Views	Component Connector End Views
Automatic Transmission Shift Lever (6L80)	In the passenger compartment in front of the centre console	Harness Routing Views	Component Connector End Views
Auxiliary Power Outlet - Console	Inside the centre console	Harness Routing Views	Component Connector End Views
Backup Lamp Switch (3.6L)	Right side of the manual transmission case		Component Connector End Views
Backup Lamp Switch	Right side of the manual transmission		Component Connector

(6.0L)	case		End Views
Battery	Inside the rear compartment on the left hand side		Component Connector End Views
Battery Current Sensor	Inside the rear compartment on the left hand side	--	Component Connector End Views
Blower Motor	In the passenger compartment, under the I/P	Harness Routing Views	Component Connector End Views
Bluetooth Connector	On the left side of the centre console	Harness Routing Views	Component Connector End Views
Bluetooth Microphone	Located in the driver's side A pillar	Entertainment/Communication Component Views	Component Connector End Views
Bluetooth Module	Located in the I/P beneath the passenger's side airbag	Entertainment/Communication Component Views	Component Connector End Views
Body Control Module	Below the right side of the I/P	Theft Deterrent System Component Views	Component Connector End Views
Brake Fluid Level Switch (3.6L)	Located inside the master cylinder	Hydraulic Brake Component Views	Component Connector End Views
Brake Fluid Level Switch (6.0L)	Located inside the master cylinder	Hydraulic Brake Component Views	Component Connector End Views
Brake Pedal Position (BPP) Sensor	In the passenger compartment, attached to the top of the brake pedal assembly	Cruise Control Component Views	Component Connector End Views
Camshaft Position (CMP) Exhaust Sensor (3.6L)	In the engine compartment, on the front of the right cylinder head, on the right side, and on the front of the left cylinder head, on the left side		Component Connector End Views
Camshaft Position (CMP) Exhaust Solenoid (3.6L)	In the engine compartment, on the front of the right and left cylinder head, upper centre position		Component Connector End Views
Camshaft Position	In the engine compartment, on the front of the left		Component

(CMP) Intake Sensor (3.6L)	cylinder head, on the right side, and on the front of the right cylinder head, on the left side		Connector End Views
Camshaft Position (CMP) Intake Solenoid (3.6L)	In the engine compartment, on the front of the right and left cylinder head, upper centre position		Component Connector End Views
Camshaft Position Sensor (6.0L)	In the engine compartment, on the front of the right cylinder head, on the right side, and on the front of the left cylinder head, on the left side	Harness Routing Views	Component Connector End Views
Centre High Mounted Stop Lamp (CHMSL)	Centre of the rear window panel	Lighting Systems Component Views	Component Connector End Views
Cigar Lighter - Console	In the rear of the centre console	Harness Routing Views	Component Connector End Views
Console Compartment Lamp	Inside the centre console	Harness Routing Views	Component Connector End Views
Console Compartment Lamp Switch	Inside the centre console	Harness Routing Views	Component Connector End Views
Courtesy Lamp - Left Footwell	Below the passenger knee bolster next to the kick panel	Harness Routing Views	Component Connector End Views
Courtesy Lamp - LF Door	Lower rear of left front door	Harness Routing Views	Component Connector End Views
Courtesy Lamp - RF Door	Lower rear of right front door	Harness Routing Views	Component Connector End Views
Courtesy Lamp - Right Footwell	Below the driver knee bolster next to the kick panel	Harness Routing Views	Component Connector End Views
Crankshaft Position (CKP) Sensor (3.6L)	Right front side of the engine, next to the knock sensor	Harness Routing Views	Component Connector End Views
Crankshaft Position (CKP) Sensor (6.0L)	Right front side of the engine, next to the knock sensor	Harness Routing Views	Component Connector End Views
Cruise Control Switch (Part of the Turn	Attached to the right side of the steering	Cruise Control Component	Component Connector

Signal Multifunction Switch)	column	Views	End Views
Data Link Connector (DLC)	On the bottom of the I/P, under the steering column	Harness Routing Views	Component Connector End Views
Dome Lamp	Centre front of the headliner	Lighting Systems Component Views	Component Connector End Views
Door Latch Assembly - LF	Rear of the left front door	Harness Routing Views	Component Connector End Views
Door Latch Assembly - RF	Rear of the right front door	Harness Routing Views	Component Connector End Views
ECVD Solenoid (3.6L)	Left side of the engine compartment mounted on the A/C line near the accumulator	Harness Routing Views	Component Connector End Views
ECVD Solenoid (6.0L)	Left side of the engine compartment mounted on the A/C line near the accumulator	Harness Routing Views	Component Connector End Views
Electronic Brake Control Module (EBCM) (3.6L)	Right side of the engine compartment, part of the brake pressure modulator valve, mounted to the right strut tower	Antilock Brake System Component Views	Component Connector End Views
Electronic Brake Control Module (EBCM) (6.0L)	Right side of the engine compartment, part of the brake pressure modulator valve, mounted to the right strut tower	Antilock Brake System Component Views	Component Connector End Views
Engine Control Module (3.6L)	Beneath the underhood fuse block on the right side of the engine bay		Component Connector End Views
Engine Control Module (6.0L)	Beneath the underhood fuse block on the right side of the engine bay	Harness Routing Views	Component Connector End Views
Engine Coolant Temperature (ECT) Sensor (3.6L)	In the engine compartment, in the left side of the left cylinder head, between cylinders #2 and #4		Component Connector End Views
Engine Coolant Temperature (ECT) Sensor (6.0L)	Left front of the engine above the #1 spark plug	Harness Routing Views	Component Connector End Views

Engine Cooling Fans	Front of the engine compartment, mounted to the radiator		Component Connector End Views
Engine Oil Level/Temperature Sensor (3.6L)	Under the engine, in the bottom left of the engine oil pan		Component Connector End Views
Engine Oil Level/Temperature Sensor (6.0L)	At the base of the engine block in the sump	Harness Routing Views	Component Connector End Views
Engine Oil Pressure (EOP) Sensor (3.6L)	In the engine compartment, on the left side of the engine, in the oil filter housing		Component Connector End Views
Engine Oil Pressure (EOP) Sensor (6.0L)	Top rear of the engine behind the intake manifold	Harness Routing Views	Component Connector End Views
Evaporative Emission (EVAP) Canister Purge Solenoid Valve (3.6L)	In the engine compartment, on the right side of the engine, above the valve cover		Component Connector End Views
Evaporative Emission (EVAP) Canister Purge Solenoid Valve (6.0L)	Front left side of the engine above the ignition coils	Harness Routing Views	Component Connector End Views
Express Down Window Module	Below the right side of the instrument panel behind the kick panel	Harness Routing Views	Component Connector End Views
Fog Lamp - Left	Left front of the vehicle	Lighting Systems Component Views	Component Connector End Views
Fog Lamp - Right	Right front of the vehicle	Lighting Systems Component Views	Component Connector End Views
Fuel Filler Door Latch	Right rear quarter panel	Harness Routing Views	Component Connector End Views
Fuel Injectors (3.6L)	Top of the engine, part of the fuel rail above each cylinder	Harness Routing Views	Component Connector End Views
Fuel Injectors - Even (6.0L)	Top of the engine, part of the fuel rail above each cylinder	Harness Routing Views	Component Connector End Views
Fuel Injectors - Odd (6.0L)	Top of the engine, part of the fuel rail above each cylinder	Harness Routing Views	Component Connector End Views
Fuel Level Sensor - Secondary	In the left side of the fuel tank beneath the rear compartment	Harness Routing Views	Component Connector End Views
	Under the rear of the		

Fuel Pump and Sender Assembly	vehicle, in the top right side of the fuel tank	Harness Routing Views	Component Connector End Views
Fuse Block - Instrument Panel	Behind the left hand kick panel	--	Component Connector End Views
Fuse Block - Underhood (3.6L)	Right side of the engine bay		Component Connector End Views
Fuse Block - Underhood (6.0L)	Right side of the engine bay		Component Connector End Views
Generator (3.6L)	Lower front left side of the engine		Component Connector End Views
Generator (6.0L)	Lower front left side of the engine		Component Connector End Views
Headlamp and Dimmer Panel Switch	In I/P to the right of the steering wheel	Lighting Systems Component Views	Component Connector End Views
Headlamp Assembly - Left	Left front of the vehicle	Lighting Systems Component Views	Component Connector End Views
Headlamp Assembly - Right	Right front of the vehicle	Lighting Systems Component Views	Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (3.6L - 4spd Auto)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (3.6L - 5spd Auto)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (3.6L - 6spd Manual)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (3.6L - 4spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (3.6L - 5spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (3.6L -	In the exhaust system, behind the catalytic		Component Connector

6spd Manual)	converter		End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (3.6L)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (3.6L - 4spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (3.6L - 5spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (3.6L - 6spd Manual)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (6.0L - 6spd Auto)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (6.0L - 6spd Manual)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (6.0L - 6spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (6.0L - 6spd Manual)	In the exhaust system, behind the catalytic converter	Harness Routing Views	Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (6.0L)	In the exhaust system, in front of the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (6.0L - 6spd Auto)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (6.0L - 6spd Manual)	In the exhaust system, behind the catalytic converter		Component Connector End Views
Hood Ajar Switch	Located on the underside of the front centre of the hood	Theft Deterrent System Component Views	Component Connector End Views
Horn - Left	Behind the bumper on the front left of the vehicle	Horn Component Views	Component Connector End Views
	Behind the bumper on		Component

Horn - Right	the front right of the vehicle	Horn Component Views	Connector End Views
HVAC Control Module	In the passenger compartment, in the centre of the I/P, below the radio	Harness Routing Views	Component Connector End Views
I/P Compartment Lamp	Right side of the I/P compartment opening	Harness Routing Views	Component Connector End Views
I/P Compartment Lamp Switch	Right side of the I/P compartment opening	Harness Routing Views	Component Connector End Views
I/P Data link Connector	On the left side of the I/P, above the I/P compartment	Harness Routing Views	Component Connector End Views
Ignition Coils (3.6L)	On the left and right valve cover, at the top of each cylinder	Harness Routing Views	Component Connector End Views
Ignition Coils - Even (6.0L)	On the left and right valve cover, at the top of each cylinder	Harness Routing Views	Component Connector End Views
Ignition Coils - Odd (6.0L)	On the left and right valve cover, at the top of each cylinder	Harness Routing Views	Component Connector End Views
Ignition Key Cylinder Lamp	In the upper steering column at the key cylinder	Theft Deterrent System Component Views	Component Connector End Views
Ignition Switch	In the upper steering column at the key cylinder	Theft Deterrent System Component Views	Component Connector End Views
Inflatable Restraint Front Sensor - LF	In the front of the engine bay on the left of the radiator	SIR Component Views	Component Connector End Views
Inflatable Restraint Front Sensor - RF	In the front of the engine bay on the right of the radiator	SIR Component Views	Component Connector End Views
Inflatable Restraint I/P Module	Right side of the I/P above the I/P compartment	SIR Component Views	Component Connector End Views
Inflatable Restraint Seat Position Sensor (SPS) - Driver	Beneath the drivers seat	SIR Component Views	Component Connector End Views
Inflatable Restraint Sensing and Diagnostic Module	Beneath the centre console	SIR Component Views	Component Connector End Views
Inflatable Restraint Steering Wheel Module	Centre of the steering wheel	SIR Component Views	Component Connector End Views
Inflatable Restraint	In the steering column	Antilock Brake System	Component

Steering Wheel Module Coil	behind the steering wheel	Component Views	Connector End Views
Instrument Panel Cluster (IPC)	Right side of the I/P	Entertainment/Communication Component Views	Component Connector End Views
Knock Sensor (KS) Bank 1 (3.6L)	In the engine compartment, on the right side of the engine block		Component Connector End Views
Knock Sensor (KS) Bank 2 (3.6L)	In the engine compartment, on the left side of the engine block		Component Connector End Views
Knock Sensor (KS) Left (6.0L)	In the engine compartment, on the left side of the engine block	Harness Routing Views	Component Connector End Views
Knock Sensor (KS) Right (6.0L)	In the engine compartment, on the right side of the engine block	Harness Routing Views	Component Connector End Views
License Plate Lamp - Left	Rear of the vehicle above the left side of the license plate	Lighting Systems Component Views	Component Connector End Views
License Plate Lamp - Right	Rear of the vehicle above the right side of the license plate	Lighting Systems Component Views	Component Connector End Views
Liftgate Latch (F35)	In the rear of the vehicle at the base of the liftgate	--	Component Connector End Views
Liftgate Release Switch (F35)	On the lower left side of the Instrument Panel	--	Component Connector End Views
Manifold Absolute Pressure (MAP) Sensor	In the engine compartment, on the top, rear of the intake manifold	Harness Routing Views	Component Connector End Views
Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor (3.6L)	In the left front side of the engine compartment, attached to the air cleaner assembly	--	Component Connector End Views
Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor (6.0L)	In the left front side of the engine compartment, attached to the air cleaner assembly	Harness Routing Views	Component Connector End Views
Mode Actuator - 1	Part of the HVAC unit under the I/P	HVAC Component Views	Component Connector End Views

Mode Actuator - 2	Part of the HVAC unit under the I/P	HVAC Component Views	Component Connector End Views
Navigation Gateway Module	In the I/P behind the instrument panel compartment	Harness Routing Views	Component Connector End Views
Navigation Module	Within the instrument panel compartment	Harness Routing Views	Component Connector End Views
Outside Rear View Mirror - Left	Upper front of the front left door panel	Harness Routing Views	Component Connector End Views
Outside Rear View Mirror - Right	Upper front of the front right door panel	Harness Routing Views	Component Connector End Views
Park Brake Switch	Centre console attached to the park brake assembly	Hydraulic Brake Component Views	Component Connector End Views
Park/Neutral Position (PNP) Switch (4L60-E)	Left side front of the transaxle	Harness Routing Views	Component Connector End Views
Radio	Centre of the I/P	Entertainment/Communication Component Views	Component Connector End Views
Rear Window Defogger Grid - Right Side	On the right side of the rear window	Harness Routing Views	Component Connector End Views
Rear Window Defogger Grid - Left Side	On the left side of the rear window	Harness Routing Views	Component Connector End Views
Rear Window Wiper Control Module (F35)	In the rear of the vehicle, in the center of the liftgate	--	Component Connector End Views
Rear Window Wiper Motor (F35)	In the rear of the vehicle, in the center of the liftgate	--	Component Connector End Views
Recirculation Actuator (Automatic HVAC)	Part of the HVAC unit under the I/P	HVAC Component Views	Component Connector End Views
Remote Function Actuator	Located on the rear cab panel	Remote Function Component Views	Component Connector End Views
Repeater Lamp - Left	On the left front quarter panel	Lighting Systems Component Views	Component Connector End Views
Repeater Lamp - Right	On the right front quarter panel	Lighting Systems Component Views	Component Connector End Views
	Under the vehicle,		Component

Reverse Lockout Solenoid	towards the rear, on top LH side of the manual transmission		Connector End Views
Seat Adjuster Switch - Driver	On the outboard side of the driver's seat	Remote Function Component Views	Component Connector End Views
Seat Adjuster Switch - Passenger	On the outboard side of the passenger's seat		Component Connector End Views
Seat Belt Pretensioner - LF	Inboard side of the passenger seat between the seat and centre console	SIR Component Views	Component Connector End Views
Seat Belt Pretensioner - RF	Inboard side of the driver seat between the seat and centre console	SIR Component Views	Component Connector End Views
Seat Belt Switch - Driver	In the driver seat belt buckle pretensioner	--	Component Connector End Views
Seat Front Vertical Motor - Driver	Beneath the driver's seat		Component Connector End Views
Seat Rear Vertical Motor - Driver	Beneath the driver's seat		Component Connector End Views
Speaker - Centre	In the centre of the I/P alongside the windshield	Entertainment/Communication Component Views	Component Connector End Views
Speaker - LF Door	At the front of the left front door	Entertainment/Communication Component Views	Component Connector End Views
Speaker - LF Tweeter	Left side of the I/P	Entertainment/Communication Component Views	Component Connector End Views
Speaker - RF Door	At the front of the right front door	Entertainment/Communication Component Views	Component Connector End Views
Speaker - RF Tweeter	Right side of the I/P	Entertainment/Communication Component Views	Component Connector End Views
Starter (3.6L)	Lower right rear of the engine		Component Connector End Views
Starter (6.0L)	Lower right rear of the engine		Component Connector End Views
Steering Angle Sensor	Behind the steering wheel	Antilock Brake System Component Views	Component Connector End Views

Steering Wheel Controls Switch Assembly - Left	Left side of the steering wheel	Entertainment/Communication Component Views	Component Connector End Views
Steering Wheel Controls Switch Assembly - Right	Right side of the steering wheel	Entertainment/Communication Component Views	Component Connector End Views
Tail Lamp Assembly - Left	Rear of the vehicle, in the left rear lamp assembly	Lighting Systems Component Views	Component Connector End Views
Tail Lamp Assembly - Right	Rear of the vehicle, in the right rear lamp assembly	Lighting Systems Component Views	Component Connector End Views
Terminating Resistor - After 12/06	Top centre of the I/P	Harness Routing Views	Component Connector End Views
Theft Deterrent Control Module	Within the steering column behind the steering wheel	Theft Deterrent System Component Views	Component Connector End Views
Theft Horn (3.6L)	On the right hand side at the rear of the engine bay just behind the right strut tower	Horn Component Views	Component Connector End Views
Theft Horn (6.0L)	On the right hand side at the rear of the engine bay just behind the right strut tower	Horn Component Views	Component Connector End Views
Throttle Body (3.6L)	In the engine compartment, on the front centre of the intake manifold		Component Connector End Views
Throttle Body (6.0L)	In the engine compartment, on the front centre of the intake manifold	Harness Routing Views	Component Connector End Views
Transmission Control Module (4L60-E)	In the passenger compartment behind the right hand kick panel	Harness Routing Views	Component Connector End Views
Transmission Control Module (5L40-E)	In the passenger compartment behind the right hand kick panel	Harness Routing Views	Component Connector End Views
Turn Signal Multifunction Switch	On the right side of the steering column	Lighting Systems Component Views	Component Connector End Views
Variable Intake Manifold (VIM) Solenoid (3.6L)	At the rear of the intake manifold	Harness Routing Views	Component Connector End Views
Vehicle Speed Sensor	Rear right hand side of the transmission	Harness Routing Views	Component Connector

(VSS) (4L60-E)	assembly		End Views
Wheel Speed Sensor (WSS) - LF (3.6L)	Inside the left front wheel hub	Antilock Brake System Component Views	Component Connector End Views
Wheel Speed Sensor (WSS) - LF (6.0L)	Inside the left front wheel hub	Antilock Brake System Component Views	Component Connector End Views
Wheel Speed Sensor (WSS) - LR	Top left side of the differential carrier	Antilock Brake System Component Views	Component Connector End Views
Wheel Speed Sensor (WSS) - RF (3.6L)	Inside the right front wheel hub	Antilock Brake System Component Views	Component Connector End Views
Wheel Speed Sensor (WSS) - RF (6.0L)	Inside the right front wheel hub	Antilock Brake System Component Views	Component Connector End Views
Wheel Speed Sensor (WSS) - RR	Top right side of the differential carrier	Antilock Brake System Component Views	Component Connector End Views
Window Motor - LF	Centre of the front left door	Harness Routing Views	Component Connector End Views
Window Motor - RF	Centre of the front right door	Harness Routing Views	Component Connector End Views
Window/Door Lock/Outside Rearview Mirror Switch	In the centre console area, just behind the transmission selector	Harness Routing Views	Component Connector End Views
Windshield Washer Fluid Pump	At the right hand end of the washer fluid reservoir at the front of the engine bay	Harness Routing Views	Component Connector End Views
Windshield Wiper Motor (3.6L)	In the plenum chamber in front of the windshield	Harness Routing Views	Component Connector End Views
Windshield Wiper Motor (6.0L)	In the plenum chamber in front of the windshield	Harness Routing Views	Component Connector End Views
Windshield Wiper/Washer Switch	Left side of the steering column	Harness Routing Views	Component Connector End Views
Yaw Rate and Lateral Acceleration Sensor	In the passenger compartment, under the centre console, in front of the SDM	Harness Routing Views	Component Connector End Views
X102 (42 Cavities)	Front Body Harness to Engine Harness	Harness Routing Views	Inline Harness Connector End Views

Fuse Block - Underhood, Device Usage

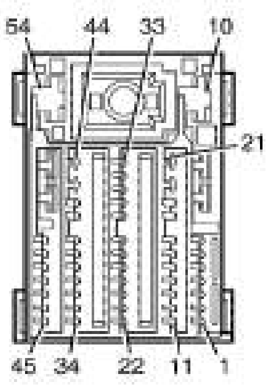
No.	Device	Rating	Description
			Primary Fuses
FU1	BATT MAIN 4 Fuse	50A	Supply to Instrument Panel fuse box and BCM.
FU2	REAR DEFOG Fuse	40A	Rear defog relay R8
FU3	ABS MOTOR Fuse	40A	Retained accessory power (RAP) relay, SIR, door lock fuses and ABS module.
FU4	BATT MAIN 3 Fuse	50A	Evaporative Emissions (EVAP) Canister Purge Solenoid Valve, Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor, Valve Lifter Oil Manifold (VLOM) Assembly (DOD)
FU5	BATT MAIN 1 Fuse	50A	Supply voltage to instrument panel fuse box
FU6	SPARE Fuse		Trailer Wiring, Auxiliary Body Control Module (XBCM) (Export)
FU7	BATT MAIN 2 Fuse	50A	Accessory power feed relay (R8) and power seat circuit breaker
FU8	STARTER Fuse	40A	Starter relay R12

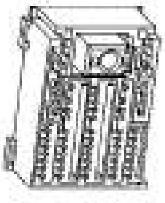
FU9	HVAC BLOWER MOTOR Fuse	40A	HVAC module
FU10	FAN 1 ENGINE COOLING (RIGHT) Fuse	30A	Engine cooling fan relay R17
FU11	SPARE Fuse		
FU12	FAN 2 ENGINE COOLING (LEFT) Fuse	30A	Engine cooling fan R20
Secondary Fuses			
F1	COMM ENABLE Fuse	10A	
F2	A/C CONTROL-HVAC CONTROL MODULE Fuse	10A	HVAC
F3	BACK UP LAMP Fuse	15A	Backup Lamp - Left, Backup Lamp - Right
F4	FOG LAMPS (FRONT) Fuse	15A	Foglamp relay R5
F5	ABS VALVES Fuse	25A	ABS module
F6	SPARE Fuse		
F7	HEADLAMP WASHER Fuse	30A	Headlamp wash relay R7
F8	HORN MAIN Fuse	15A	Horn
F9	TCM Fuse	15A	TCM
F10	LEFT LOW BEAM (BASE/HID) Fuse	10/20A	Left hand low beam
F11	SPARE Fuse		
F12	RIGHT LOW BEAM (BASE/HID) Fuse	10/20A	Right hand low beam
F13	SPARE Fuse		
F14	SPARE Fuse		
F15	FRONT WIPER Fuse	30A	Wiper relays
F16	SPARE Fuse		
F17	HORN THEFT Fuse	10A	Alarm system
F18	SPARE Fuse		
F19	RIGHT HIGH BEAM Fuse	10A	Right hand high beam
F20	SPARE Fuse		
F21	FRONT WASHER (WSW) Fuse	15A	Windscreen Washers
F22	SPARE Fuse		
F23	LEFT HI BEAM Fuse	10A	Left hand high beam
F24	SPARE Fuse		
F25	REVERSE LOCKOUT Fuse	15A	Reverse Lockout Solenoid (Y144)
F26	REAL TIME DAMPING Fuse	25A	Active suspension, electronic suspension control (ESC) module
F27	SPARE Fuse		

F28	ECM 1 Fuse	15A	Engine Control Module (ECM A43)
F29	EVEN COILS/INJECTORS Fuse	20A	Ignition coils and Fuel Injectors
F30	SPARE Fuse		
F31	SPARE Fuse		
F32	EMISSION DEV 2 Fuse	15A	Oxygen Sensors
F33	EMISSION DEV 1 Fuse	15A	Heated Oxygen Sensors, EVAP, IMRC, CMP Solenoids
F34	SPARE Fuse		
F35	ODD COILS/INJECTORS Fuse	20A	Ignition Coils and Fuel Injectors
F36	SPARE Fuse		
F37	HVAC--IGN (LHD ONLY) Fuse	10A	
F38	PHONE CRUISE Fuse	10A	CPP Switch, Telematics Module, Bluetooth connector & Headlamp/Dimmer Switch
F39	IGNITION ENGINE Fuse	10A	MAF, IAT, ECM (A43) &TCM
F40	AIRBAGS Fuse	10A	SIR Module
F41	SPARE Fuse	--	
F42	RIGHT PARK LAMP Fuse	10A	Right park lamps
F43	LEFT PARK LAMP Fuse	10A	Left park lamps
R1	SPARE Relay	--	
R2	COMMS ENABLE Relay	--	AXH VLV Fuse
R3	SPARE Relay	--	
R4	BACK UP LAMPS Relay	--	FOG LAMP Fuse
R5	FOG LAMP-FRONT Relay	--	FUEL PUMP Fuse
R6	HEADLAMP-LO BEAM Relay/(HID)	--	LO HDLP - LT Fuse, LO HDLP - RT Fuse, DRL 2 Fuse
R7	HEADLAMP WASHER Relay	--	LT PRK Fuse, RT PRK Fuse, TRLR PRK Fuse
R8	RR-DEFOG Relay	--	ECM/THROT CONT Fuse, ENG Fuse, INJ-A Fuse, INJ-B Fuse, O2-A SNSR Fuse, O2-B SNSR Fuse, FAN CNRTL PCB Relay, FAN HI PCB Relay, FAN LO PCB Relay
R9	FRONT WIPER HIGH Relay	--	REAR DEFOG Fuse
R10	FRONT WIPER LOW Relay	--	AIRBAG Fuse, AUX HVAC-IGN Fuse, IGN Fuse, ECM-IGN Fuse, MISC IGN Fuse, SEO/ALC Fuse, TRANS IGN 1 Fuse
R11	HEADLAMP-HI BEAM Relay/(HID)	--	STRTR Fuse
R12	CRANK Relay	--	VEH BCK/UP Fuse, TRLR BCK/UP Fuse
R13	POWER TRAIN Relay	--	DRL Fuse
R14	IGNITION MAIN Relay	--	Adjustable Pedals Assembly (JF4 Except AN3)
R15	WSW PUMP FRT Relay	--	Cooling Fan - Right

R16	HORN Relay	--	Cooling Fan - Right, FAN CNTRL Relay
R17	FAN 1 Relay (ENGINE COOLING)	--	Cooling Fan - Left
R18	PARK LAMPS Relay	--	FRT WASH Fuse
R19	FAN 2 Relay (ENGINE COOLING)	--	HI HEADLAMP - LT Fuse, HI HEADLAMP - RT Fuse
R20	FAN 3 Relay (ENGINE COOLING)	--	HORN Fuse

Fuse Block - Underhood X1





Connector Part Information

- OEM: 7283-9457-3W
- Service: See Catalog
- Description: 54-Way F YESC Kaizen Series (BK)

Terminal Part Information

- Pins: 3, 5, 7, 23, 34, 36, 49
- Terminal/Tray: 7116-4101-08/9
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

- Pins: 1, 11, 25, 31, 32, 41, 45-47, 51
- Terminal/Tray: 7116-4101-08/9
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

- Pins: 8, 9
- Terminal/Tray: 7116-4122-02/10
- Core/Insulation Crimp: A/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

- Pins: 20
- Terminal/Tray: 7116-4112-02/9

- Core/Insulation Crimp: C/D
- Release Tool/Test Probe: 12094430/J-35616-35 (VT)

Fuse Block - Underhood X1

Pin	Wire Color	Circuit No.	Function

Connector 7: Accessory Power Outlet - Center Console Compartment
Connector 8: Accessory Power Outlet - I/P
Connector 9: Air Temperature Actuator (C60)
Connector 10: Air Temperature Actuator - Left
Connector 11: Air Temperature Actuator - Right
Connector 12: Air Temperature Actuator - Auxiliary (C63)
Connector 13: Air Temperature Sensor
Connector 14: Air Temperature Sensor - Inside
Connector 15: Alarm Module Connector
Connector 16: Ambient Air Temperature Sensor
Connector 17: Ambient Light Sensor (C60)
Connector 18: Audio Amplifier (UWP)
Connector 19: Audio Amplifier X1 (UQ7 and LHD)
Connector 20: Audio Amplifier X1 (UQ7 and RHD)
Connector 21: Audio Amplifier X2 (UQ7 and LHD)
Connector 22: Audio Amplifier X2 (UQ7 and RHD)
Connector 23: Audio Amplifier X3 (LHD and UQ7)
Connector 24: Audio Amplifier X3 (RHD and UQ7)
Connector 25: Automatic Transmission (MYC)
Connector 26: Automatic Transmission (M30 or M32)
Connector 27: Automatic Transmission Input Shaft Speed (ISS) Sensor
Connector 28: Automatic Transmission Output Shaft Speed (OSS) Sensor
Connector 29: Automatic Transmission Shift Lever
Connector 30: Backup Lamp - Left
Connector 31: Backup Lamp - Right
Connector 32: Backup Lamp Switch (M10 or MV5)
Connector 33: Battery (-)
Connector 34: Battery (+)
Connector 35: Battery Current Sensor
Connector 36: Battery Voltage Gauge
Connector 37: Blower Motor (LHD)
Connector 38: Blower Motor (RHD)
Connector 39: Blower Motor Control Module
Connector 40: Bluetooth Connector

Connector 41: Bluetooth Microphone
Connector 42: Bluetooth Module
Connector 43: Body Control Module (BCM) X1
Connector 44: Body Control Module (BCM) X2
Connector 45: Body Control Module (BCM) X3
Connector 46: Body Control Module (BCM) X4
Connector 47: Body Control Module (BCM) X5
Connector 48: Body Control Module (BCM) X6
Connector 49: Body Control Module (BCM) X7
Connector 50: Brake Fluid Level Switch
Connector 51: Brake Pedal Position (BPP) Sensor
Connector 52: Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust (LY7)
Connector 53: Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake (LY7)
Connector 54: Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust (LY7)
Connector 55: Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake (LY7)
Connector 56: Camshaft Position (CMP) Sensor - Bank 1 Exhaust (LY7)
Connector 57: Camshaft Position (CMP) Sensor - Bank 1 Intake (LY7)
Connector 58: Camshaft Position (CMP) Sensor - Bank 2 Exhaust (LY7)
Connector 59: Camshaft Position (CMP) Sensor - Bank 2 Intake (LY7)
Connector 60: Camshaft Position (CMP) Sensor (LS2 or HSV or L98)
Connector 61: Center Console Compartment Lamp X1
Connector 62: Center Console Compartment Lamp X2
Connector 63: Center Console Compartment Lamp Switch X1
Connector 64: Center Console Compartment Lamp Switch X2
Connector 65: Center High Mounted Stop Lamp (CHMSL)
Connector 66: Clutch Pedal Position (CPP) Switch
Connector 67: Clutch Safety Switch (not an approved name)
Connector 68: Clutch Start Switch
Connector 69: Courtesy Lamp - Left Footwell
Connector 70: Courtesy Lamp - Right Footwell
Connector 71: Cruise Control Clutch Pedal Release Switch
Connector 72: Crankshaft Position (CKP) Sensor (LY7)
Connector 73: Crankshaft Position (CKP) Sensor (without LY7)
Connector 74: Data Link Connector (DLC)
Connector 75: Data Link Resistor
Connector 76: Diagnostic Connector (LPG)
Connector 77: Digital Radio Receiver (U2K)
Connector 78: Digital Video Disc (DVD) Control Module X1
Connector 79: Digital Video Disc (DVD) Control Module X2
Connector 80: Digital Video Disc (DVD) Control Module X3
Connector 81: Digital Video Disc (DVD) Control Module X4
Connector 82: Digital Video Disc (DVD) Control Module X5
Connector 83: Digital Video Disc (DVD) Control Module X6
Connector 84: Digital Video Disc (DVD) Control Module X7
Connector 85: Digital Video Disc (DVD) Control Module X8

Connector 86: Digital Video Disc (DVD) Display X1
Connector 87: Digital Video Disc (DVD) Display X2
Connector 88: Digital Video Disc (DVD) Player X1
Connector 89: Digital Video Disc (DVD) Player X2
Connector 90: Disable Switch
Connector 91: Dome Lamp (without TRV)
Connector 92: Dome/Reading Lamps - Front (C74 without 9C1)
Connector 93: Dome/Reading Lamps (9C1)
Connector 94: Dome/Reading Lamps - Rear (TRV)
Connector 95: Dome/Reading Lamps - Rear (without TRV)
Connector 96: Door Courtesy Lamp - Driver X1
Connector 97: Door Courtesy Lamp - Driver X2
Connector 98: Door Courtesy Lamp - Left Rear X1
Connector 99: Door Courtesy Lamp - Left Rear X2
Connector 100: Door Courtesy Lamp - Passenger X1
Connector 101: Door Courtesy Lamp - Passenger X2
Connector 102: Door Courtesy Lamp - Right Rear X1
Connector 103: Door Courtesy Lamp - Right Rear X2
Connector 104: Door Latch - Driver
Connector 105: Door Latch - Left Rear
Connector 106: Door Latch - Passenger
Connector 107: Door Latch - Right Rear
Connector 108: Door Lock/Window Switch X1
Connector 109: Door Lock/Window Switch X2
Connector 110: Driver Information Center (DIC) (ERG)
Connector 111: Driver Information Center (DIC) (without ERG)
Connector 112: Driving Lamp - Left (HSV or VXR8)
Connector 113: Driving Lamp - Right (HSV or VXR8)
Connector 114: Driving Lamp - HSVDR 1 (HSV or VXR8)
Connector 115: Electronic Brake Control Module (EBCM) (JL4)
Connector 116: Electronic Brake Control Module (EBCM) (JL9)
Connector 117: Electronic Suspension Control (ESC) Switch (HSV)
Connector 118: Electronic Suspension Control (ESC) Module (HSV)
Connector 119: Engine Control Module (ECM) (L98 or HSV or LS2) X1
Connector 120: Engine Control Module (ECM) (L98 or HSV or LS2) X2
Connector 121: Engine Control Module (ECM) (LY7) X1
Connector 122: Engine Control Module (ECM) (LY7) X2
Connector 123: Engine Coolant Temperature (ECT) Sensor (L98 or HSV)
Connector 124: Engine Coolant Temperature (ECT) Sensor (LY7)
Connector 125: Engine Cooling Fan - Left
Connector 126: Engine Cooling Fan - Right
Connector 127: Engine Oil Level and Temperature Sensor
Connector 128: Engine Oil Pressure (EOP) Sensor
Connector 129: Evaporative Emission (EVAP) Canister Purge Solenoid Valve (L98 or HSV)
Connector 130: Evaporative Emission (EVAP) Canister Purge Solenoid Valve (LY7)

Connector 131: Evaporative Emission (EVAP) Canister Vent Solenoid Valve
Connector 132: Fog Lamp - Left Front
Connector 133: Fog Lamp - Rear (T79)
Connector 134: Fog Lamp - Right Front
Connector 135: Front and Rear Object Alarm Module X1
Connector 136: Front and Rear Object Alarm Module X2
Connector 137: Front and Rear Object Alarm Module X3
Connector 138: Front and Rear Object Alarm
Connector 139: Fuel Door Release Actuator
Connector 140: Fuel Injector 1 (LY7)
Connector 141: Fuel Injector 1 (L98 or HSV)
Connector 142: Fuel Injector 2 (LY7)
Connector 143: Fuel Injector 2 (L98 or HSV)
Connector 144: Fuel Injector 3 (LY7)
Connector 145: Fuel Injector 3 (L98 or HSV)
Connector 146: Fuel Injector 4 (LY7)
Connector 147: Fuel Injector 4 (L98 or HSV)
Connector 148: Fuel Injector 5 (LY7)
Connector 149: Fuel Injector 5 (L98 or HSV)
Connector 150: Fuel Injector 6 (LY7)
Connector 151: Fuel Injector 6 (L98 or HSV)
Connector 152: Fuel Injector 7 (L98 or HSV)
Connector 153: Fuel Injector 8 (L98 or HSV)
Connector 154: Fuel Level Sensor - Secondary
Connector 155: Fuel Tank Pressure (FTP) Sensor
Connector 156: Fuel Pump and Sender Assembly
Connector 157: Generator X1 (L76)
Connector 158: Generator X1 (LY7)
Connector 159: Generator X2
Connector 160: Headlamp and Panel Dimmer Switch
Connector 161: Headlamp - Left
Connector 162: Headlamp - Right
Connector 163: Headlamp Washer Fluid Pump
Connector 164: Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (LY7)
Connector 165: Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (L98 or HSV)
Connector 166: Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (LY7)
Connector 167: Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (L98 or HSV or LS2)
Connector 168: Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (LY7)
Connector 169: Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (L98 or HSV)
Connector 170: Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (LY7)
Connector 171: Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (L98 or HSV)
Connector 172: Heated Seat Control Module - Driver (KA1)
Connector 173: Heated Seat Control Module - Passenger (KA1)
Connector 174: Hood Ajar Switch
Connector 175: Horn - Left X1

Connector 176: Horn - Left X2
Connector 177: Horn - Right X1
Connector 178: Horn - Right X2
Connector 179: HVAC Control Module X1 (LHD)
Connector 180: HVAC Control Module X1 (RHD)
Connector 181: HVAC Control Module X2 (LHD)
Connector 182: HVAC Control Module X3 (RHD)
Connector 183: HVAC Control Module (RHD) X4
Connector 184: HVAC Control Module (RHD) X5
Connector 185: Ignition Coil 1 (LY7)
Connector 186: Ignition Coil 1 (L98 or HSV)
Connector 187: Ignition Coil 2 (LY7)
Connector 188: Ignition Coil 2 (L98 or HSV)
Connector 189: Ignition Coil 3 (LY7)
Connector 190: Ignition Coil 3 (L98 or HSV)
Connector 191: Ignition Coil 4 (LY7)
Connector 192: Ignition Coil 4 (L98 or HSV)
Connector 193: Ignition Coil 5 (LY7)
Connector 194: Ignition Coil 5 (L98 or HSV)
Connector 195: Ignition Coil 6 (LY7)
Connector 196: Ignition Coil 6 (L98 or HSV)
Connector 197: Ignition Coil 7 (L98 or HSV)
Connector 198: Ignition Coil 8 (L98 or HSV)
Connector 199: Ignition Key Cylinder Lamp
Connector 200: Ignition Lock Cylinder Control Solenoid
Connector 201: Ignition Switch
Connector 202: Inflatable Restraint Front End Sensor - Left
Connector 203: Inflatable Restraint Front End Sensor - Right
Connector 204: Inflatable Restraint Front Passenger Presence System (PPS) Module X1
Connector 205: Inflatable Restraint Front Passenger Presence System (PPS) Module X2
Connector 206: Inflatable Restraint I/P Module X1
Connector 207: Inflatable Restraint I/P Module X2
Connector 208: Inflatable Restraint Roof Rail Module - Left
Connector 209: Inflatable Restraint Roof Rail Module - Right
Connector 210: Inflatable Restraint Seat Position Sensor - Driver
Connector 211: Inflatable Restraint Seat Position Sensor - Passenger
Connector 212: Inflatable Restraint Sensing and Diagnostic Module (SDM) X1
Connector 213: Inflatable Restraint Sensing and Diagnostic Module (SDM) X2
Connector 214: Inflatable Restraint Side Impact Module - Left X1
Connector 215: Inflatable Restraint Side Impact Module - Left X2
Connector 216: Inflatable Restraint Side Impact Module - Right X1
Connector 217: Inflatable Restraint Side Impact Module - Right X2
Connector 218: Inflatable Restraint Side Impact Sensor (SIS) - Left
Connector 219: Inflatable Restraint Side Impact Sensor (SIS) - Right
Connector 220: Inflatable Restraint Steering Wheel Module Coil X1

Connector 221: Inflatable Restraint Steering Wheel Module Coil X2 (RHD)
Connector 222: Inflatable Restraint Steering Wheel Module Coil X2 (LHD)
Connector 223: Inflatable Restraint Steering Wheel Module X1
Connector 224: Inflatable Restraint Steering Wheel Module X2
Connector 225: Inside Rearview Mirror (ISRVM) (UE1)
Connector 226: Inside Rearview Mirror (ISRVM) (without UE1)
Connector 227: Instrument Panel Cluster
Connector 228: I/P Compartment Lamp X1
Connector 229: I/P Compartment Lamp X2
Connector 230: I/P Compartment Lamp Switch X1
Connector 231: I/P Compartment Lamp Switch X2
Connector 232: Intake Manifold Tuning (IMT) Solenoid Valve (LY7)
Connector 233: Internal Mode Switch (IMS)
Connector 234: Knock Sensor (KS) 1 (LY7)
Connector 235: Knock Sensor (KS) 1 (L98 or HSV)
Connector 236: Knock Sensor (KS) 2 (LY7)
Connector 237: Knock Sensor (KS) 2 (L98 or HSV)
Connector 238: License Lamp - Left
Connector 239: License Lamp - Right
Connector 240: LPG Control Module
Connector 241: LPG Fuel Injector 1
Connector 242: LPG Fuel Injector 2
Connector 243: LPG Fuel Injector 3
Connector 244: LPG Fuel Injector 4
Connector 245: LPG Fuel Injector 5
Connector 246: LPG Fuel Injector 6
Connector 247: LPG Lock-Off
Connector 248: LPG Relay
Connector 249: LPG Switch/Fuel Display
Connector 250: Manifold Absolute Pressure (MAP) Sensor (L98)
Connector 251: Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor
Connector 252: Memory Seat Module - Driver X1
Connector 253: Memory Seat Module - Driver X2
Connector 254: Memory Seat Module - Driver X3
Connector 255: Memory Seat Module - Driver X4
Connector 256: Mode Actuator - Left
Connector 257: Mode Actuator - Right
Connector 258: Mode Actuator - Auxiliary (C63)
Connector 259: Multifunction Switch - Center Console
Connector 260: Navigation Gateway Module (RHD)
Connector 261: Navigation Module X1 (RHD)
Connector 262: Navigation Module X2 (RHD)
Connector 263: Navigation Module X3 (RHD)
Connector 264: Navigation Module X4 (RHD)
Connector 265: Navigation Module X5 (RHD)

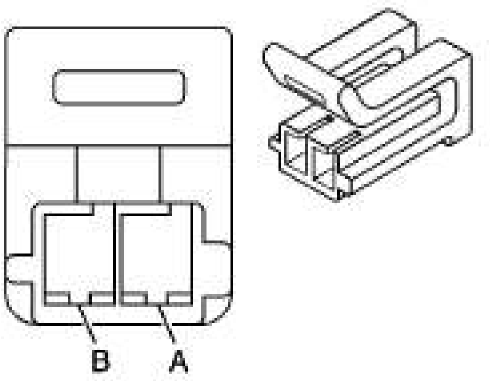
Connector 266: Navigation Module X6 (RHD)
Connector 267: Navigation Module X7 (RHD)
Connector 268: Object Alarm Sensor - Left Front Corner
Connector 269: Object Alarm Sensor - Left Front Middle
Connector 270: Object Alarm Sensor - Left Rear Corner
Connector 271: Object Alarm Sensor - Left Rear Middle
Connector 272: Object Alarm Sensor - Right Front Corner
Connector 273: Object Alarm Sensor - Right Front Middle
Connector 274: Object Alarm Sensor - Right Rear Corner
Connector 275: Object Alarm Sensor - Right Rear Middle
Connector 276: Oil Pressure Gauge
Connector 277: Oil Temperature Gauge
Connector 278: Outside Moisture Sensor
Connector 279: Outside Rearview Mirror - Driver
Connector 280: Outside Rearview Mirror - Passenger
Connector 281: Outside Rearview Mirror Switch
Connector 282: Park Brake Switch
Connector 283: Park/Neutral Position (PNP) Switch (M30 or M32)
Connector 284: Pressure Control (PC) Solenoid Valve
Connector 285: Radio X1
Connector 286: Radio X2
Connector 287: Radio X3
Connector 288: Radio X4
Connector 289: Rail Pressure/Temperature Sensor (LPG)
Connector 290: Rear Compartment Courtesy Lamp X1
Connector 291: Rear Compartment Courtesy Lamp X2
Connector 292: Rear Compartment Lid Latch
Connector 293: Rear Compartment Lid Release Switch
Connector 294: Rear Lock-Off/Service Solenoid Assembly (LPG)
Connector 295: Rear Object Sensor Control Module Connector
Connector 296: Rear Park Assist Module X2
Connector 297: Rear Park Assist Module X3
Connector 298: Rear Park Assist Module X4
Connector 299: Rear Park Assist Module X5
Connector 300: Rear Park Assist Ground Connector X1
Connector 301: Rear Park Assist Ground Connector X2
Connector 302: Rear Window Defogger Grid X1
Connector 303: Rear Window Defogger Grid X2
Connector 304: Recirculation Actuator
Connector 305: Regulator Temperature Sensor (LPG)
Connector 306: Remote Control Door Lock Receiver (RCDLR)
Connector 307: Reverse Lockout Solenoid (L98 or HSV)
Connector 308: Seat Adjuster Switch - Driver (AG3 or AGB)
Connector 309: Seat Adjuster Switch - Driver (AH6 or AJ6)
Connector 310: Seat Adjuster Switch - Passenger

Connector 311: Seat Belt Buckle Pretensioner - Driver
Connector 312: Seat Belt Retractor Pretensioner - Driver
Connector 313: Seat Belt Buckle Pretensioner - Passenger
Connector 314: Seat Belt Retractor Pretensioner - Passenger
Connector 315: Seat Belt Switch - Driver
Connector 316: Seat Belt Switch - Passenger
Connector 317: Seat Front Vertical Motor - Driver (AG1 or AG3)
Connector 318: Seat Front Vertical Motor - Passenger (AG1)
Connector 319: Seat Horizontal Motor - Driver (AG1 or AG3)
Connector 320: Seat Horizontal Motor - Passenger (AG1)
Connector 321: Memory Seat Module (MSM)
Connector 322: Seat Lumbar Motor - Driver X1 (AG3)
Connector 323: Seat Lumbar Motor - Driver X2 (AG3)
Connector 324: Seat Rear Vertical Motor - Driver (AG1 or AG3)
Connector 325: Seat Rear Vertical Motor - Passenger (AG1)
Connector 326: Seat Recline Motor - Driver (AG1 or AG3)
Connector 327: Seat Recline Motor - Passenger (AG1)
Connector 328: Shock Absorber Actuator - Left Front (HSV)
Connector 329: Shock Absorber Actuator - Left Rear (HSV)
Connector 330: Shock Absorber Actuator - Right Front (HSV)
Connector 331: Shock Absorber Actuator - Right Rear (HSV)
Connector 332: Side Marker Lamp - Left Front
Connector 333: Side Marker Lamp - Left Rear
Connector 334: Side Marker Lamp - Right Front
Connector 335: Side Marker Lamp - Right Rear
Connector 336: Siren Connector
Connector 337: Speaker - Center I/P X1 (UW5)
Connector 338: Speaker - Center I/P X2 (UW5)
Connector 339: Speaker - Center I/P (without UW5)
Connector 340: Speaker - Left Front (UQ7)
Connector 341: Speaker - Left Front (UW5 or U65)
Connector 342: Speaker - Left Front Tweeter (U65 or UW5)
Connector 343: Speaker - Left Front Tweeter (UQ7)
Connector 344: Speaker - Left Rear (U65 or UW5)
Connector 345: Speaker - Left Rear (UQ7)
Connector 346: Speaker - Left Subwoofer (UQ7)
Connector 347: Speaker - Right Front (UQ7)
Connector 348: Speaker - Right Front (UW5 or U65)
Connector 349: Speaker - Right Front Tweeter (U65 or UW5)
Connector 350: Speaker - Right Front Tweeter (UQ7)
Connector 351: Speaker - Right Rear (U65 or UW5)
Connector 352: Speaker - Right Rear (UQ7)
Connector 353: Speaker - Right Subwoofer (UQ7)
Connector 354: Starter Motor X1
Connector 355: Starter Motor X2

Connector 356: Steering Angle Sensor
Connector 357: Steering Wheel Controls Switch Assembly
Connector 358: Sunload Sensor (CJ2 or C63)
Connector 359: Sunroof Control Module (RHD)
Connector 360: Sunroof Switch (RHD)
Connector 361: Sunshade - Left
Connector 362: Sunshade - Right
Connector 363: Suspension Position Sensor - Left Front (HSV)
Connector 364: Suspension Position Sensor - Left Rear (HSV)
Connector 365: Suspension Position Sensor - Right Front (HSV)
Connector 366: Suspension Position Sensor - Right Rear (HSV)
Connector 367: Tail Lamp - Left (without HSV or VXR8)
Connector 368: Tail Lamp - Left (HSV or VXR8)
Connector 369: Tail Lamp - Right (without HSV or VXR8)
Connector 370: Tail Lamp - Right (HSV or VXR8)
Connector 371: Telematics Module X1 (RHD)
Connector 372: Telematics Module X2 (RHD)
Connector 373: Theft Deterrent Alarm Siren X1
Connector 374: Theft Deterrent Alarm Siren X2
Connector 375: Theft Deterrent Module (TDM)
Connector 376: Throttle Body
Connector 377: Tilt Sensor
Connector 378: Trailer Connector
Connector 379: Trailer Harness Control Module
Connector 380: Trailer Patch Harness Electrical Brake Connector
Connector 381: Trailer Presence Conncetor
Connector 382: Torque Converter Clutch (TCC) Pulse Width Modulation (PWM) Solenoid Valve
Connector 383: Transmission Control Module (TCM) (M30 or M32)
Connector 384: Turn Signal/Multifunction Switch
Connector 385: Ultrasonic Sensor Control Module
Connector 386: Valve Lifter Oil Manifold (VLOM) Assembly
Connector 387: Variable Intake Manifold (VIM) Module
Connector 388: Vehicle Communication Interface Module (VCIM) X1
Connector 389: Vehicle Communication Interface Module (VCIM) X2
Connector 390: Vehicle Communication Interface Module (VCIM) Battery
Connector 391: Vehicle Speed Sensor (VSS)
Connector 392: Video Display
Connector 393: Video Display - Left Seat Headrest X1
Connector 394: Video Display - Left Seat Headrest X2
Connector 395: Video Display - Right Seat Headrest X1
Connector 396: Video Display - Right Seat Headrest X2
Connector 397: Wheel Speed Sensor (WSS) - Left Front
Connector 398: Wheel Speed Sensor (WSS) - Left Rear
Connector 399: Wheel Speed Sensor (WSS) - Right Front
Connector 400: Wheel Speed Sensor (WSS) - Right Rear

Connector 401: Window Control Module
Connector 402: Window Motor - Driver (AXB)
Connector 403: Window Motor - Driver (AXC)
Connector 404: Window Motor - Left Rear
Connector 405: Window Motor - Passenger (AXB)
Connector 406: Window Motor - Passenger (AXC)
Connector 407: Window Motor - Right Rear
Connector 408: Window Switch - Left Rear
Connector 409: Window Switch - Right Rear
Connector 410: Windshield Washer Fluid Level Switch (TT7 or TT8 or EF7)
Connector 411: Windshield Washer Fluid Pump
Connector 412: Windshield Wiper Motor
Connector 413: Windshield Wiper/Washer Switch
Connector 414: Yaw and Lateral Accelerometer Sensor

1-2 Shift Solenoid (SS) Valve



Connector Part Information

- OEM: 12146094
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Sealed, Pull To Seat (GY)

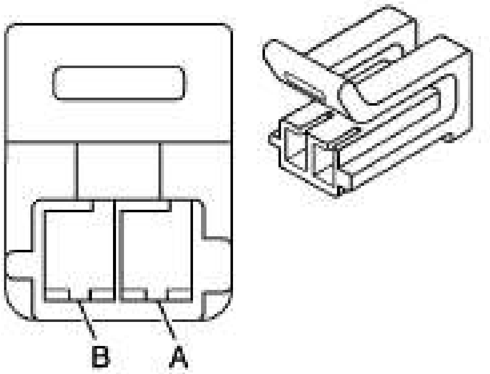
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

1-2 Shift Solenoid (SS) Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 BK	1222	Shift Solenoid A Valve Control
B	0.5 WH	1525	Clutch Pressure Control Solenoid Valve 1 High Control

3-4 Shift Solenoid (SS) Valve



Connector Part Information

- OEM: 12146094
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Sealed, Pull To Seat (GY)

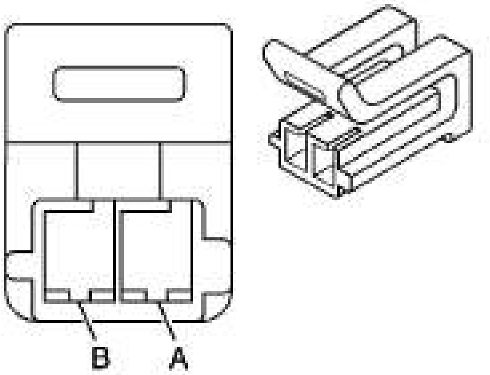
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

3-4 Shift Solenoid (SS) Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 GY	898	Shift Solenoid C Valve Control
B	0.5 WH	1525	Clutch Pressure Control Solenoid Valve 1 High Control

4-5 Shift Solenoid (SS) Valve



Connector Part Information

- OEM: 12146094
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Sealed, Pull To Seat (GY)

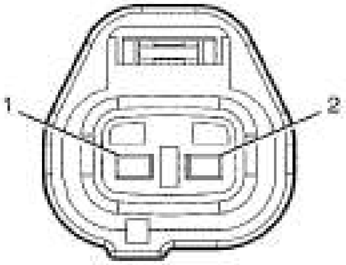
Terminal Part Information

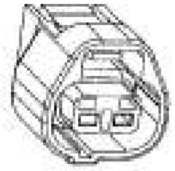
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

4-5 Shift Solenoid (SS) Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 D-BU	1223	Shift Solenoid B Valve Control
B	0.5 WH	1525	Clutch Pressure Control Solenoid Valve 1 High Control

A/C Compressor





Connector Part Information

- OEM: 7283-8125-30
- Service: See Catalog
- Description: 2-Way F (BK)

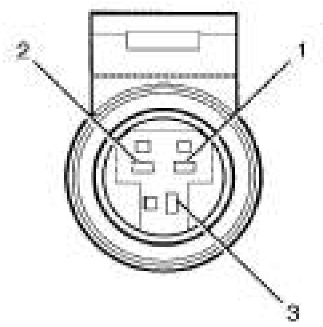
Terminal Part Information

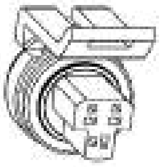
- Terminal/Tray: 7116-4025/11
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 15313892/J-35616-18 (BK)

A/C Compressor

Pin	Wire Color	Circuit No.	Function
1	0.5 D-BU	7393	A/C Compressor Clutch Low Reference
2	0.5 D-GN	7392	A/C Compressor Clutch Supply Voltage

A/C Refrigerant Pressure Sensor





Connector Part Information

- OEM: 7283-2429
- Service: See Catalog
- Description: 3-Way F (BK)

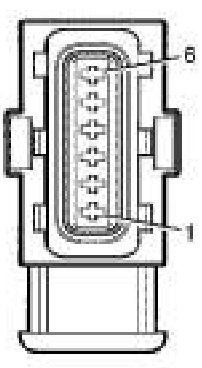
Terminal Part Information

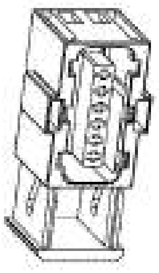
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

A/C Refrigerant Pressure Sensor

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/GN	2759	Low Reference
2	0.5 GY	1688	5-Volt Reference
3	0.5 OG/BK	380	A/C Refrigerant Pressure Sensor Signal

Accelerator Pedal Position (APP) Sensor





Connector Part Information

- OEM: 7283-6463-30
- Service: See Catalog
- Description: 6-Way F (BK)

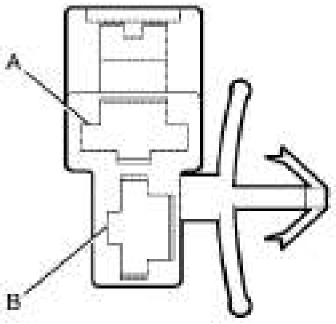
Terminal Part Information

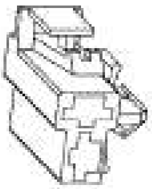
- Terminal/Tray: 4-964274-1/25
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

Accelerator Pedal Position (APP) Sensor

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/YE	1274	5-Volt Reference
2	0.5 WH/BK	1164	5-Volt Reference
3	0.5 D-BU/WH	1161	APP Sensor 1 Signal
4	0.5 BN	1271	Low Reference
5	0.5 PU	1272	Low Reference
6	0.5 L-BU	1162	APP Sensor 2 Signal

Accessory Power Outlet - Center Console Compartment





Connector Part Information

- OEM: 7123-5125-30
- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

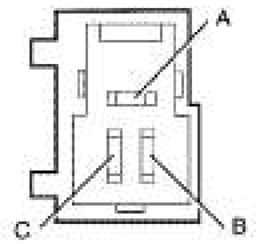
- Terminal/Tray: 7116-2641-02/12
- Core/Insulation Crimp: C/B

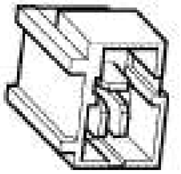
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Accessory Power Outlet - Center Console Compartment

Pin	Wire Color	Circuit No.	Function
A	1.25 BN/WH	9301	Accessory Voltage
B	1.25 BK	2050	Ground

Accessory Power Outlet - I/P





Connector Part Information

- OEM: 7122-6030
- Service: See Catalog
- Description: 3-Way (BK)

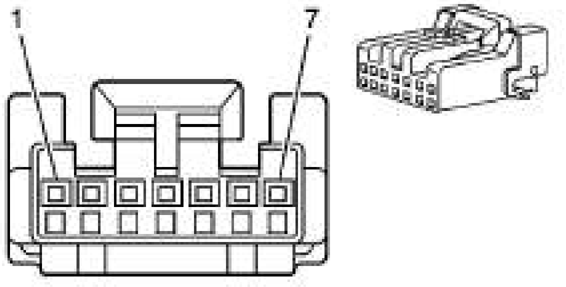
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Accessory Power Outlet - I/P

Pin	Wire Color	Circuit No.	Function
A	1.25 GY	8	Instrument Panel Lamp Supply Voltage
B	1.25 BN/WH	143	Accessory Voltage
C	1.25 BK	850	Ground

Air Temperature Actuator (C60)



Connector Part Information

- OEM: IL-AG5-7S-S3C1
- Service: See Catalog
- Description: 7-Way F (GN)

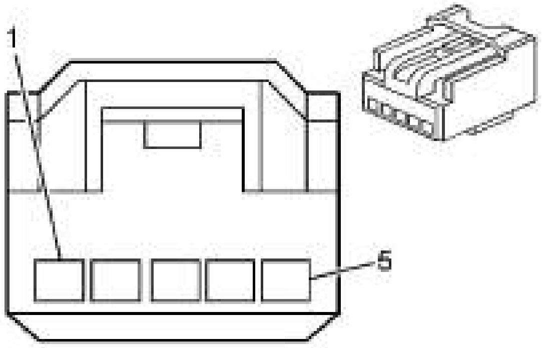
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Air Temperature Actuator (C60)

Pin	Wire Color	Circuit No.	Function
1	0.5 YE	598	5-Volt Reference
2	--	--	Not Used
3	0.5 GY	1791	Low Reference
4	--	--	Not Used
5	0.5 WH	733	Air Temperature Door Position Signal
6	0.5 D-BU/WH	5954	Air Temperature Motor Control
7	0.5 RD/WH	2210	Air Temperature Door Control

Air Temperature Actuator - Left



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

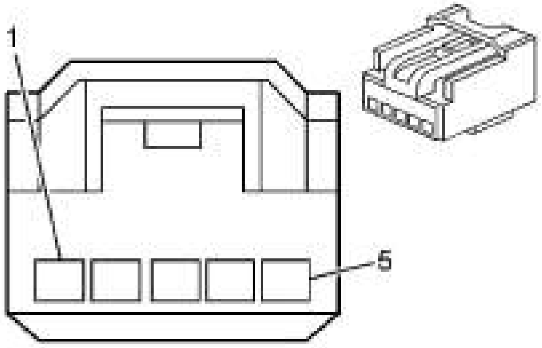
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Air Temperature Actuator - Left

Pin	Wire Color	Circuit No.	Function
1	0.3 WH	2778	Passenger Air Temperature Motor Control
2	0.3 YE	1236	Passenger Air Temperature Door Control
3	0.3 BK/RD	719	Low Reference
4	0.3 BK/YE	1646	Passenger Air Temperature Door Position Signal
5	0.3 BK/WH	598	5-Volt Reference

Air Temperature Actuator - Right



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

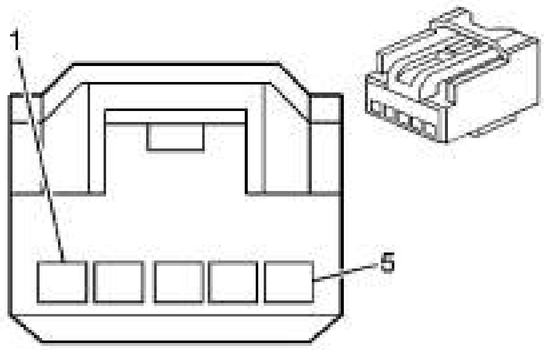
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Air Temperature Actuator - Right

Pin	Wire Color	Circuit No.	Function
1	0.3 D-BU/WH	2148	Passenger Temp B Signal
2	0.3 YE/BK	2147	Passenger Temp A Signal
3	0.3 BN/WH	476	Low Reference
4	0.3 YE/BU	2178	Passenger Temp D Signal
5	0.3 YE/RD	2149	Passenger Temp C Signal

Air Temperature Actuator - Auxiliary (C63)



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

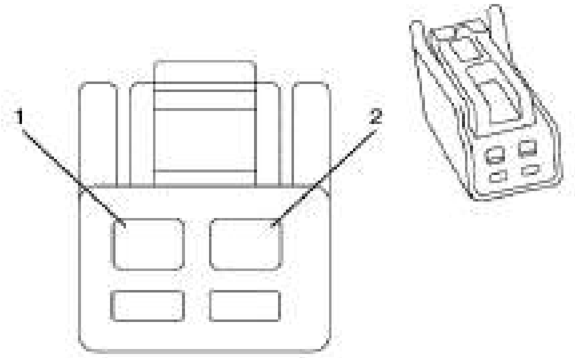
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Air Temperature Actuator - Auxiliary (C63)

Pin	Wire Color	Circuit No.	Function
1	0.3 L-GN/RD	5515	Inside Air Temperature Sensor Assembly Control
2	0.3 D-BU/OG	5516	Inside Air Temperature Sensor Assembly Control
3	0.3 RD/BK	552	Low Reference
4	0.3 PK/BK	5517	Low Reference
5	0.3 D-BU/GN	5518	Auxiliary Inside Air Temperature Sensor Signal

Air Temperature Sensor



Connector Part Information

- OEM: 7283-5845
- Service: See Catalog
- Description: 2-Way F 040-III (NA)

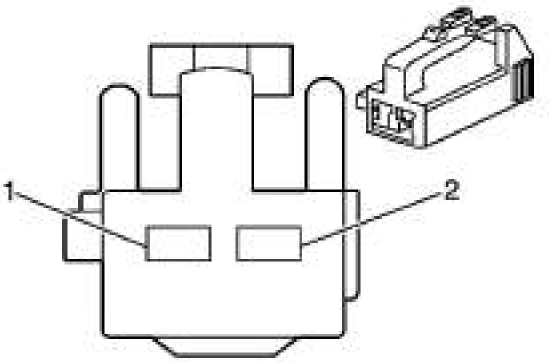
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Air Temperature Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 GY	1791	Low Reference
B	0.5 GY	1199	Air Temperature Door Control

Air Temperature Sensor - Inside



Connector Part Information

- OEM: 7123-1520
- Service: 88988450
- Description: 2-Way F 090 Series (NA)

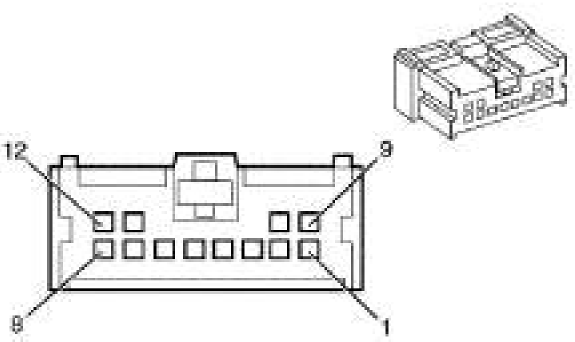
Terminal Part Information

- Terminal/Tray: 7116-1180/11
- Core/Insulation Crimp: C/E/C
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Air Temperature Sensor - Inside

Pin	Wire Color	Circuit No.	Function
A	0.3 D-GN	734	Inside Ambient Temperature Sensor Low Reference
B	0.3 BN	61	Outside Air Temperature Sensor Signal

Alarm Module Connector



Connector Part Information

- OEM:

- Service: See Catalog
- Description: 12-Way F

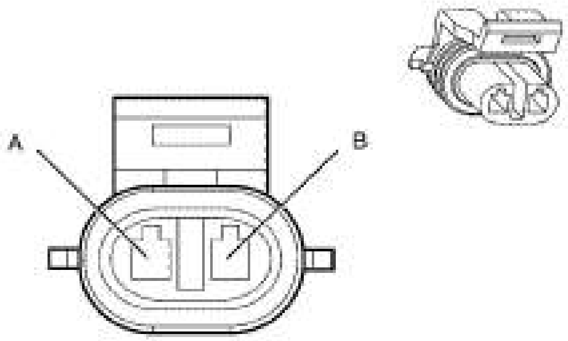
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Alarm Module Connector

Pin	Wire Color	Circuit No.	Function
1	0.35 BK		Battery Power
2	0.35 BK		Horn Signal Input
3	0.35 BK		Siren Battery Test Output
4	0.35 BK		Inclination Sensor Signal
5	0.35 BK		Siren Control Signal
6	0.35 BK		Ground
7	0.35 BK		Intrusion Sensor Signal
8	0.35 BK		Alarm System Status
9	0.35 BK		Alarm Control Module Power Control
10	--	--	Not Used
11	0.35 BK		Disable Signal
12	--	--	Not Used

Ambient Air Temperature Sensor



Connector Part Information

- OEM: 7223-9725-30
- Service: 88987920
- Description: 2-Way F (BK)

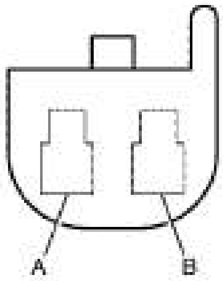
Terminal Part Information

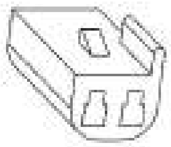
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Ambient Air Temperature Sensor

Pin	Wire Color	Circuit No.	Function
A	0.3 BN	61	Low Reference
B	0.3 L-GN/BK	735	5-Volt Reference

Ambient Light Sensor (C60)





Connector Part Information

- OEM: 7123-8328-30
- Service: 12085535
- Description: 2-Way F (BK)

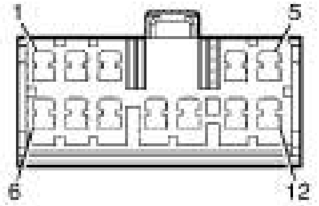
Terminal Part Information

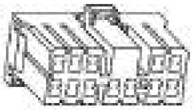
- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Ambient Light Sensor (C60)

Pin	Wire Color	Circuit No.	Function
A	0.3 L-GN/BK	1137	DRL Ambient Light Sensor Signal
B	0.3 BK	850	Ground

Audio Amplifier (UWP)





Connector Part Information

- OEM: 7123-1423
- Service: See Catalog
- Description: 12-Way F

Terminal Part Information

- Pins: 1, 2, 6, 7
- Terminal/Tray: 173630-7/7
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-33 (YE)

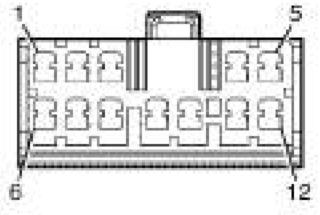
- Pins: 3-5, 8-12
- Terminal/Tray: 173630-7/7
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-33 (YE)

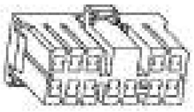
Audio Amplifier (UWP)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	199	Left Rear Speaker Output (+)
2	0.5 D-BU	46	Right Rear Speaker Output (+)
3	1.25 D-BU/WH	346	Left or Rear Subwoofer Speaker Output (+)
4	1.25 RD/WH	2040	Battery Positive Voltage (LHD)
	1.25 OG/WH	2040	Battery Positive Voltage (RHD)
5	1.25 BK	2050	Ground
6	0.5 YE	116	Left Rear Speaker Output (-) (LHD)
	0.5 YE/RD	116	Left Rear Speaker Output (-) (RHD)
7	0.5 L-BU	115	Right Rear Speaker Output (-)
8	1.25 L-GN/BK	1794	[Left or Rear] Subwoofer Speaker Output (-)
9	1.25 D-GN	1795	Right Subwoofer Speaker Output (+)
10	1.25 L-BU/BK	315	Right Subwoofer Speaker Output (-)
11	1.25 RD/WH	2040	Battery Positive Voltage
	1.25 OG/WH	2040	Battery Positive Voltage

12	1.25 BK	2050	Ground

Audio Amplifier X1 (UQ7 and LHD)





Connector Part Information

- OEM: 7123-1423
- Service: See Catalog
- Description: 12-Way F

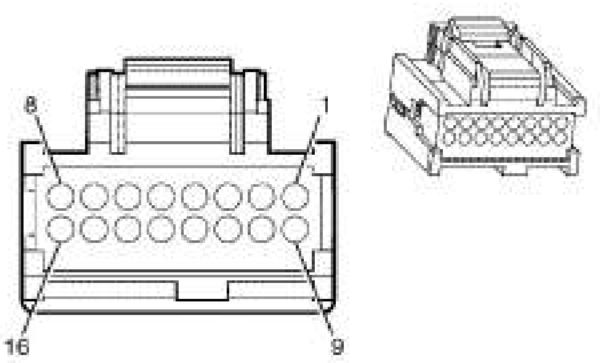
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X1 (UQ7 and LHD)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	--	Left Rear Speaker Output (+)
2	0.5 D-BU	--	Right Rear Speaker Output (+)
3	1 D-BU/WH	--	Left or Rear Subwoofer Speaker Output (+)
4	2 RD/WH	--	Battery Positive Voltage
5	2 BK	--	Ground
6	0.5 YE	--	Left Rear Speaker Output (-)
7	0.5 L-BU	--	Right Rear Speaker Output (-)
8	1 L-GN/BK	--	Subwoofer Speaker Output (-)
9	1 D-GN	--	Right Subwoofer Speaker Output (+)
10	1 L-BU/BK	--	Right Subwoofer Speaker Output (-)
11	2 RD/WH	--	Battery Positive Voltage
12	2 BK	--	Ground

Audio Amplifier X1 (UQ7 and RHD)



Connector Part Information

- OEM: 15394150
- Service: See Catalog
- Description: 16-Way F (BK)

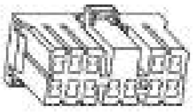
Terminal Part Information

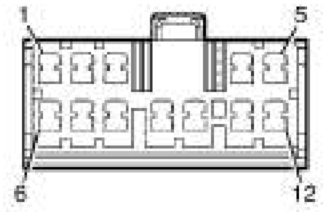
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X1 (UQ7 and RHD)

Pin	Wire Color	Circuit No.	Function
1-3	--	--	Not Used
4	0.3 BN/BU	1946	Right Rear Low Level Audio Signal (-)
5	0.3 BN	1999	Left Rear Low Level Audio Signal (-)
6	0.3 L-GN	1948	Right Front Low Level Audio Signal (-)
7	0.3 D-GN	1947	Left Front Low Level Audio Signal (-)
8	0.3 WH	7066	Amplifier Enable Signal
9-10	--	--	Not Used
11	0.3 OG	6978	Amplifier Mute Control
12	0.3 D-BU	546	Right Rear Low Level Audio Signal (+)
13	0.3 BN/WH	599	Left Rear Low Level Audio Signal (+)
14	0.3 L-GN/WH	512	Right Front Low Level Audio Signal (+)
15	0.3 BN/OG	511	Left Front Low Level Audio Signal (+)
16	--	--	Not Used

Audio Amplifier X2 (UQ7 and LHD)





Connector Part Information

- OEM: 7123-1423
- Service: See Catalog
- Description: 12-Way F

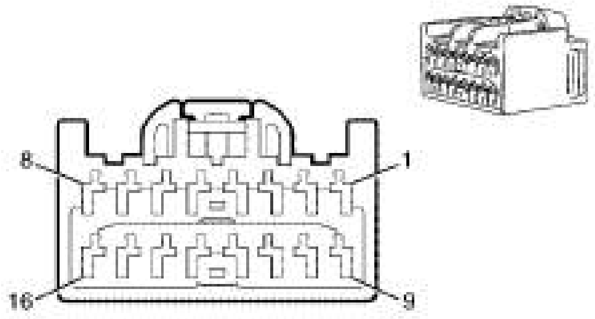
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X2 (UQ7 and LHD)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	--	Left Rear Speaker Output (+)
2	0.5 D-BU	--	Right Rear Speaker Output (+)
3	1 D-BU/WH	--	Rear Subwoofer Speaker Output (+)
4	2 RD/WH	--	Battery Positive Voltage
5	2 BK	--	Ground
6	0.5 YE	--	Left Rear Speaker Output (-)
7	0.5 L-BU	--	Right Rear Speaker Output (-)
8	1 L-GN/BK	--	Subwoofer Speaker Output (-)
9	1 D-GN	--	Right Subwoofer Speaker Output (+)
10	1 L-BU/BK	--	Right Subwoofer Speaker Output (-)
11	2 RD/WH	--	Battery Positive Voltage
12	2 BK	--	Ground

Audio Amplifier X2 (UQ7 and RHD)



Connector Part Information

- OEM: 7283-5534-60
- Service: See Catalog
- Description: 16-Way F

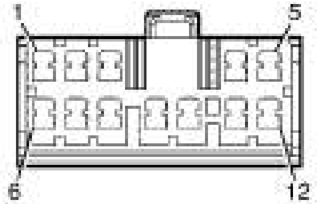
Terminal Part Information

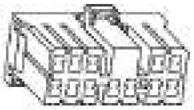
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X2 (UQ7 and RHD)

Pin	Wire Color	Circuit No.	Function
1	0.85 L-BU	115	Right Rear Speaker Output (-)
2	0.85 D-BU	46	Right Rear Speaker Output (+)
3	0.85 L-BU	1960	Front Center Speaker Output (-)
4	0.85 YE	1860	Front Center Speaker Output (+)
5	0.5 OG/BK	5766	Front Center Speaker Output (+)
6	0.5 OG	5756	Roof Center Speaker Output (-)
7	0.85 D-GN	117	Right Front Speaker Output (-)
8	0.85 L-GN	200	Right Front Speaker Output (+)
9-14	--	--	Not Used
15	0.85 BN	199	Left Front Speaker Output (-)
16	0.85 YE/RD	116	Left Front Speaker Output (+)

Audio Amplifier X3 (LHD and UQ7)





Connector Part Information

- OEM: 7123-1423
- Service: See Catalog
- Description: 12-Way F

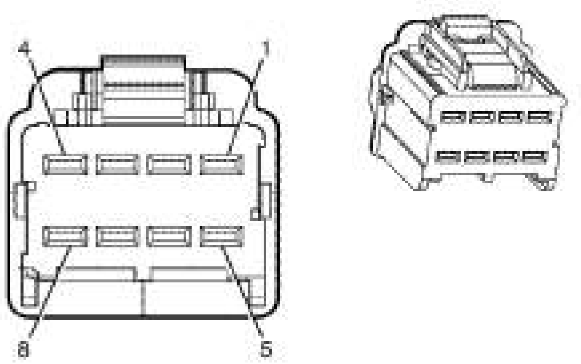
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X3 (LHD and UQ7)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	--	Left Rear Speaker Output (+)
2	0.5 D-BU	--	Right Rear Speaker Output (+)
3	1 D-BU/WH	--	Left or Rear Subwoofer Speaker Output (+)
4	2 RD/WH	--	Battery Positive Voltage
5	2 BK	--	Ground
6	0.5 YE	--	Left Rear Speaker Output (-)
7	0.5 L-BU	--	Right Rear Speaker Output (-)
8	1 L-GN/BK	--	Subwoofer Speaker Output (-)
9	1 D-GN	--	Right Subwoofer Speaker Output (+)
10	1 L-BU/BK	--	Right Subwoofer Speaker Output (-)
11	2 RD/WH	--	Battery Positive Voltage
12	2 BK	--	Ground

Audio Amplifier X3 (RHD and UQ7)



Connector Part Information

- OEM: 6098-4713
- Service: See Catalog
- Description: 8-Way F (BK)

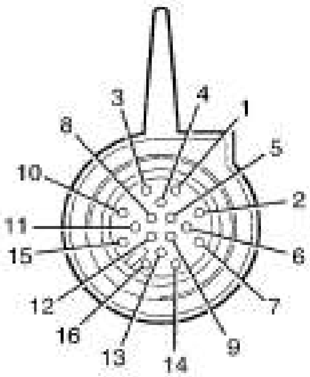
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Audio Amplifier X3 (RHD and UQ7)

Pin	Wire Color	Circuit No.	Function
1	0.85 GY	118	Left Front Speaker Output (-)
2	1.25 L-BU/BK	315	Right Subwoofer Speaker Output (-)
3	1.25 L-GN/BK	1794	Left Subwoofer Speaker Output (-)
4	3 OG/WH	2040	Battery Positive Voltage
5	0.85 TN	201	Left Front Speaker Output (+)
6	1.25 D-GN	1795	Right Subwoofer Speaker Output (+)
7	1.25 D-BU/WH	346	Left Subwoofer Speaker Output (+)
8	3 BK	351	Ground

Automatic Transmission (MYC)



Connector Part Information

- OEM: 7229-4189-30
- Service: See Catalog
- Description: 16-Way F

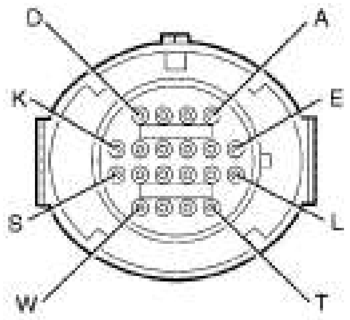
Terminal Part Information

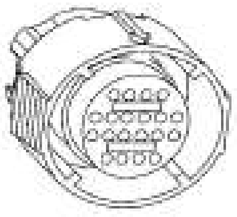
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Automatic Transmission (MYC)

Pin	Wire Color	Circuit No.	Function
1	0.75 OG/YE	3640	Battery Positive Voltage
2	0.75 BK	450	Ground
3	0.5 OG/BK	1786	Park/Neutral Signal
4	0.75 OG/YE	3640	Battery Positive Voltage
5	0.75 BK	450	Ground
6	0.5 WH/BU	17	Stop Lamp Switch Signal
7-8	--	--	Not Used
9	0.5 D-BU	5985	Accessory Wakeup Serial Data
10	0.5 BN/BK	9002	High Speed GMLAN Serial Data Bus+
11	0.5 BN	9003	High Speed GMLAN Serial Data Bus-
12	0.5 PK	439	Ignition 1 Voltage
13	0.5 BN	9001	High Speed GMLAN Serial Data Bus-
14	0.5 BN/BK	9000	High Speed GMLAN Serial Data Bus+
15-16	--	--	Not Used

Automatic Transmission (M30 or M32)





Connector Part Information

- OEM: 15463921
- Service: See Cataolg
- Description: 20-Way F (BK)

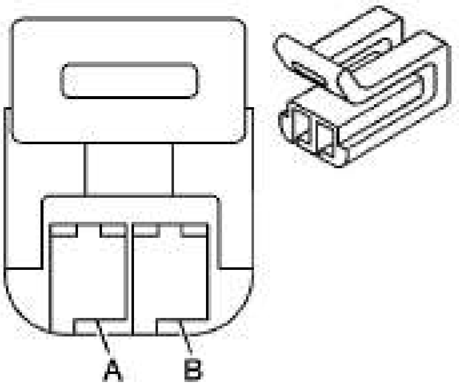
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Automatic Transmission (M30 or M32)

Pin	Wire Color	Circuit No.	Function
A	0.5 L-GN	1222	Shift Solenoid A Valve Control
B	0.5 YE/BK	1223	Shift Solenoid B Valve Control
C	0.5 OG/BK	1228	PC Solenoid Valve High Control
D	0.5 L-BU/WH	1229	PC Solenoid Valve Low Control
E	0.5 PK	439	Ignition 1 Voltage
F-J	--	--	Not Used
K	0.5 OG	1983	Transmission Turbine Speed Switch Signal
L	0.5 YE/BK	1227	TFT Sensor Signal
M	0.5 TN	2762	Low Reference
N	0.5 PK	1224	Transmission Fluid Pressure Switch Signal A
P	0.5 OG	1226	Transmission Fluid Pressure Switch Signal B
R	0.5 D-BU	1225	Transmission Fluid Pressure Switch Signal C
S	0.5 WH/GN	687	3-2 Shift Solenoid Valve Control
T	0.5 BN/OG	422	TCC Solenoid Valve Control
U	0.5 BN	418	TCC PWM Solenoid Valve Control
V	0.5 L-BU	1984	Transmission Turbine Speed Switch Low Reference
W	--	--	Not Used

Automatic Transmission Input Shaft Speed (ISS) Sensor



Connector Part Information

- OEM: 10768934
- Service: See Catalog
- Description: 2-Way F (BK)

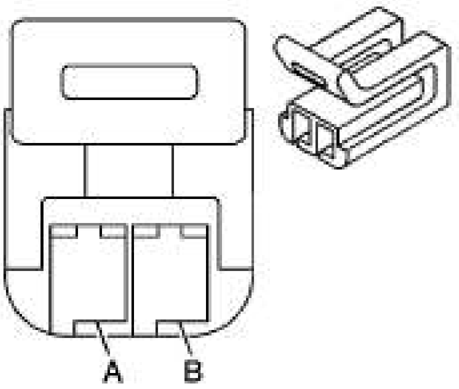
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Automatic Transmission Input Shaft Speed (ISS) Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 YE	1983	Transmission Turbine Speed Switch Signal
B	0.5 WH	1984	Transmission Turbine Speed Switch Low Reference

Automatic Transmission Output Shaft Speed (OSS) Sensor



Connector Part Information

- OEM: 12162201
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Pull To Seat (BK)

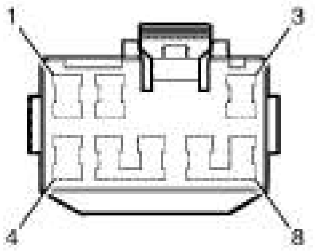
Terminal Part Information

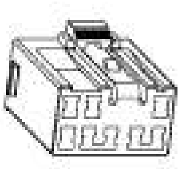
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Automatic Transmission Output Shaft Speed (OSS) Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 OG	822	VSS Low Signal
B	0.5 WH	821	VSS High Signal

Automatic Transmission Shift Lever





Connector Part Information

- OEM: 7283-7087
- Service: See Catalog
- Description: 8-Way F (BK)

Terminal Part Information

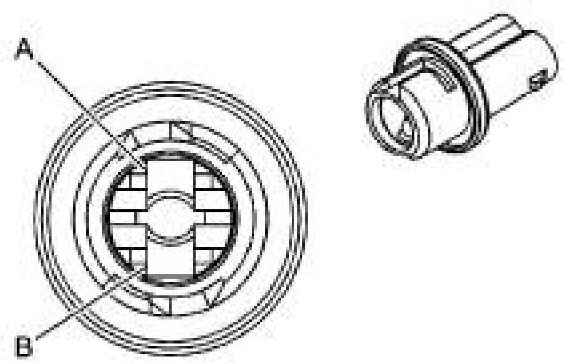
- Terminal/Tray: 7116-4020/11
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Automatic Transmission Shift Lever

Pin	Wire Color	Circuit No.	Function
1	0.3 PU	1375	Transmission Cruise Switch Reference
2	0.3 D-GN/WH	1135	A/T Shift Lock Control Solenoid Supply Voltage
3	0.3 BK	850	Ground
4	0.3 PU/RD	5526	Transmission Range Select Reference

5	--	--	Not Used
6	0.3 PU/WH	1630	Steering Column Key Cylinder Lock Solenoid Control
7	--	--	Not Used
8	0.3 PU/WH	6817	LED Backlight Diming Control

Backup Lamp - Left



Connector Part Information

- OEM: 15317651
- Service: See Catalog
- Description: 2-Way F Bulb Socket (WH)

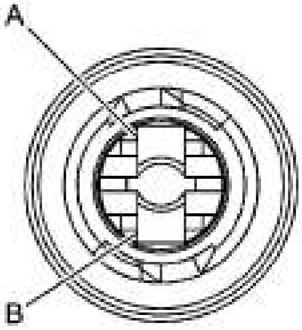
Terminal Part Information

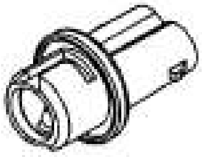
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Backup Lamp - Left

Pin	Wire Color	Circuit No.	Function
1	0.85 L-GN	--	Backup Lamp Supply Voltage
2	0.85 BK	--	Ground

Backup Lamp - Right





Connector Part Information

- OEM: 15317651
- Service: See Catalog
- Description: 2-Way F Bulb Socket (WH)

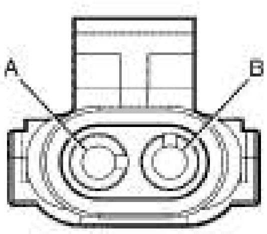
Terminal Part Information

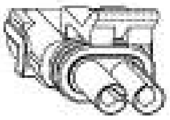
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Backup Lamp - Right

Pin	Wire Color	Circuit No.	Function
1	0.85 L-GN	--	Backup Lamp Supply Voltage
2	0.85 BK	--	Ground

Backup Lamp Switch (M10 or MV5)





Connector Part Information

- OEM: 7282-7420-40

- Service: See Catalog
- Description: 2-way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Backup Lamp Switch (M10 or MV5)

Pin	Wire Color	Circuit No.	Function
A	0.5 L-GN	5007	Backup Lamp Switch Signal
B	0.5 BK	450	Ground

Battery (-)

Terminal Part Information

- Terminal: 7306-2055-03
- Core/Insulation Crimp: N/A
- Description: Battery Terminal

Battery (-)

Pin	Wire Color	Circuit No.	Function
-	50 BK	50	Ground

Battery (+)

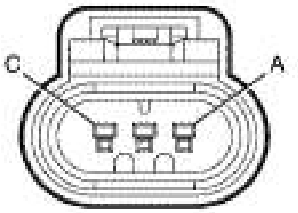
Terminal Part Information

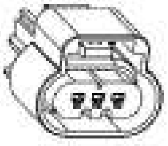
- Terminal: 7306-3053-06
- Core/Insulation Crimp: N/A
- Description: Battery Terminal

Battery (+)

Pin	Wire Color	Circuit No.	Function
+	50 RD	1	Battery Positive

Battery Current Sensor





Connector Part Information

- OEM: 7283-6579-30
- Service: See Catalog
- Description: 3-Way F (BK)

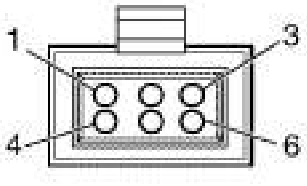
Terminal Part Information

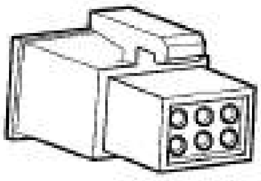
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Battery Current Sensor

Pin	Wire Color	Circuit No.	Function
A	0.3 PK	5076	5-Volt Reference
B	0.3 BN	5077	Low Reference
C	0.3 WH/GN	5075	Battery Current Signal

Battery Voltage Gauge





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

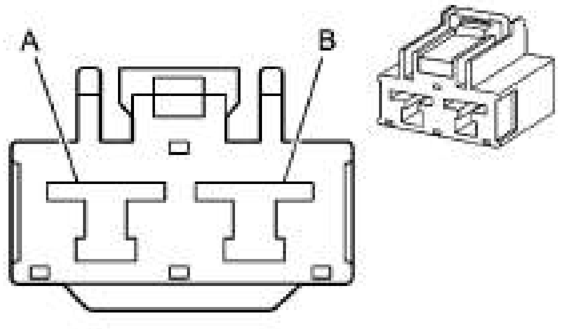
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Battery Voltage Gauge

Pin	Wire Color	Circuit No.	Function
1	0.3 YE		Low Speed GMLAN Serial Data
2	0.3 D-BU		Ground
3	0.3 D-BU/RD		Battery Positive Voltage
4	0.3 YE		Low Speed GMLAN Serial Data
5	0.3 D-BU		Ground
6	0.3 D-BU/RD		Battery Positive Voltage

Blower Motor (LHD)



Connector Part Information

- OEM: 7283-3123
- Service: See Catalog
- Description: 2-Way F (WH)

Terminal Part Information

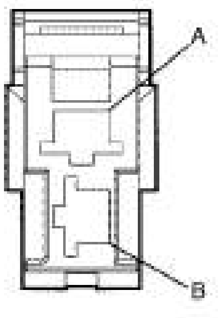
- Terminal/Tray: 7116-6041/11
- Core/Insulation Crimp: A/B
- Release Tool/Test Probe: 12094430/J-35616-44 (YE)

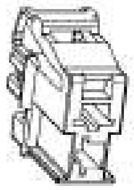
Blower Motor (LHD)

Pin	Wire Color	Circuit No.	Function

A	3 OG	5987	Ground
B	3 PU	65	Blower Motor Supply Voltage

Blower Motor (RHD)





Connector Part Information

- OEM:7123-6020
- Service: See Cataolg
- Description: 2-Way F

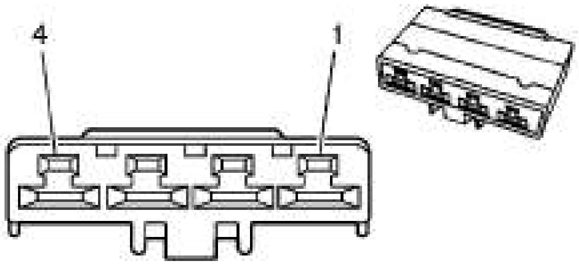
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Blower Motor (RHD)

Pin	Wire Color	Circuit No.	Function
A	3 D-GN	442	Battery Positive Voltage
B	3 OG	5987	HVAC Blower Motor Control Circuit

Blower Motor Control Module



Connector Part Information

- OEM: 7283-3141-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

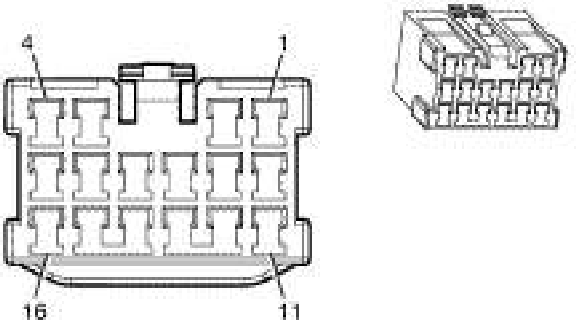
- Pins: 1, 3, 4
- Terminal/Tray: 7116-6041/11
- Core/Insulation Crimp: A/B
- Release Tool/Test Probe: 12094430/J-35616-44 (YE)

- Pin: 2
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Blower Motor Control Module

Pin	Wire Color	Circuit No.	Function
1	3 BK	850	Ground
2	0.5 GY/BK	754	Blower Motor Speed Control
3	3 PU	65	Blower Motor Supply Voltage
4	3 OG	5987	Blower Motor Low Reference

Bluetooth Connector



Connector Part Information

- OEM: 1318386
- Service: See Catalog
- Description: 16-Way F

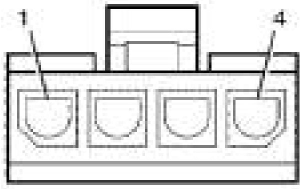
Terminal Part Information

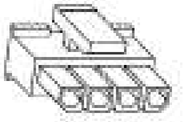
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Bluetooth Connector

Pin	Wire Color	Circuit No.	Function
1	0.5 OG/WH		Battery Positive Voltage
2	0.5 PK/BU		Ignition 1 Voltage
3	0.5 L-GN		Backup Lamp Supply Voltage
4	0.3 D-GN		Low Speed GMLAN Serial Data
5	0.3 BN		Accessory Voltage
6	0.3 D-BU		Bluetooth Connector
7	0.3 OG/BK		Remote Playback Device Left Audio Signal
8	0.3 L-BU		Remote Playback Device Audio Common Signal
9	0.3 WH		Mute Signal
10	0.3 BK		Ground
11	0.3 D-BU		Cellular Telephone Voice Signal
12	0.3 L-BU/BK		Cellular Telephone Voice Low Reference
13	0.3 YE/BK		Cellular Telephone Mute Signal
14	0.5 GY		Left Front Speaker Output (-)
	0.85 L-BU		Front Center Speaker Output (-)
15	0.5 TN		Left Front Speaker Output (+)
	0.85 YE		Front Center Speaker Output (+)
16	--	--	Not Used

Bluetooth Microphone





Connector Part Information

- OEM: 4365-0400
- Service: See Catalog
- Description: 4-Way

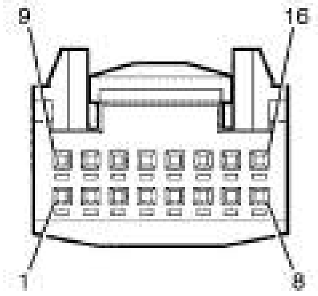
Terminal Part Information

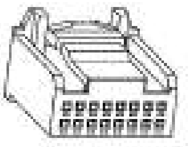
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Bluetooth Microphone

Pin	Wire Color	Circuit No.	Function
1	0.3 D-BU	7043	Microphone Signal
2-3	--	--	Not Used
4	0.3 PK/BK	7044	Microphone Return

Bluetooth Module





Connector Part Information

- OEM: 1318386-1
- Service: See Catalog
- Description: 16-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Bluetooth Module

Pin	Wire Color	Circuit No.	Function
1	0.3 L-BU/BK	659	Cellular Telephone Voice Low Reference
2-3	--	--	Not Used

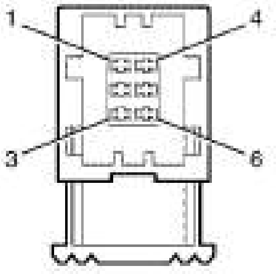
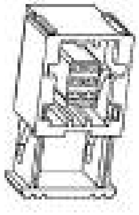
8	0.5 BK	2050	Ground
9-10	--	--	Not Used

Door Latch - Left Rear





Connector Part Information

- OEM: 7283-6931-30
- Service: 88986251
- Description: 6-Way F Sealed (BK)

Terminal Part Information

- Pins: 2, 3
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

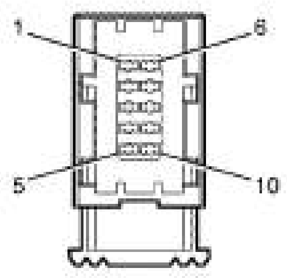
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

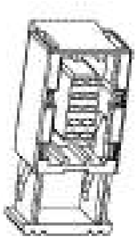
- Pins: 4, 6
- Terminal/Tray: 4-969005-1/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

Door Latch - Left Rear

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.75 BN/RD	294	Door Lock Actuator Unlock Control
3	0.75 GN/WH	295	Door Lock Actuator Lock Control
4	0.3 BN/WH	746	Passengers Door Ajar Switch Signal
5	--	--	Not Used
6	0.5 BK	2050	Ground

Door Latch - Passenger





Connector Part Information

- OEM: 7283-6930-30
- Service: See Catalog
- Description: 10-Way F (BK)

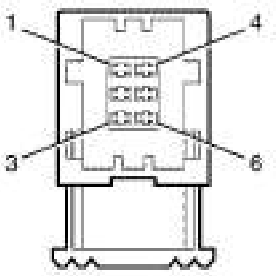
Terminal Part Information

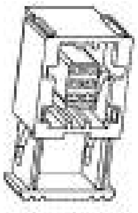
- Pins: 7, 8
- Terminal/Tray: 964274-2/16
- Pins: 1, 3
- Terminal/Tray: 4-969005-1/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

Door Latch - Passenger

Pin	Wire Color	Circuit No.	Function
1	0.3 GY/BK	745	Passengers Door Ajar Switch Signal
2	--	--	Not Used
3	0.5 BK	1350	Ground
4	0.3 PK	781	Driver Door Lock Switch Unlock Signal
5-6	--	--	Not Used
7	0.75 BN/RD	694	Driver Door Lock Actuator Unlock Control
8	0.75 GN/WH	295	Door Lock Actuator Lock Control
9	0.3 PK/BK	780	Driver Door Lock Switch Lock Signal
10	--	--	Not Used

Door Latch - Right Rear





Connector Part Information

- OEM: 7283-6931-30
- Service: 88986251
- Description: 6-Way F Sealed (BK)

Terminal Part Information

- Pins: 5, 6
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

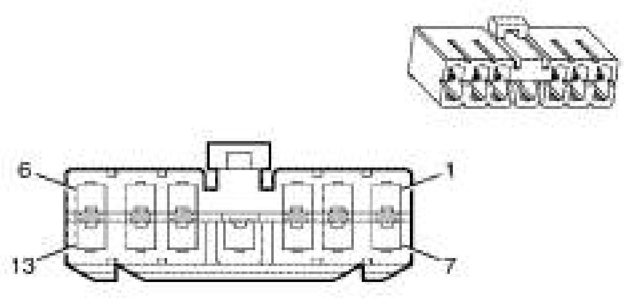
- Pins: 1, 3
- Terminal/Tray: 4-969005-1/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-560/J-35616-33 (YE)

Door Latch - Right Rear

Pin	Wire Color	Circuit No.	Function
1	0.3 BN/WH	746	Passengers Door Ajar Switch Signal

2	--	--	Not Used
3	0.5 BK	1350	Ground
4	--	--	Not Used
5	0.75 BN/RD	294	Door Lock Actuator Unlock Control
6	0.75 GN/WH	295	Door Lock Actuator Lock Control

Door Lock / Window Switch X1



Connector Part Information

- OEM: 7119-3130
- Service: See Catalog
- Description: 13-Way F (WH)

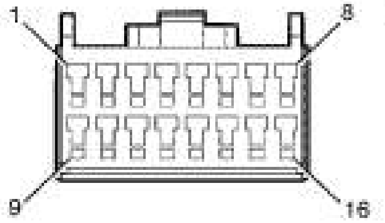
Terminal Part Information

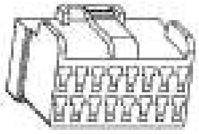
- Terminal/Tray: 7116-1050/27
- Core/Insulation Crimp: C/A
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

Door Lock / Window Switch X1

Pin	Wire Color	Circuit No.	Function
1-6	--	--	Not Used
7	2 PU	169	Power Window Master Switch Left Rear Down Signal
8	2 D-GN	168	Power Window Master Switch Left Rear Up Signal
9	2 BK	2050	Ground
10	2 D-GN	1001	RAP [X] Fuse Supply Voltage
11	2 D-BU	1307	Power Window Master Switch Lockout Signal
12	2 PU/WH	171	Power Window Master Switch Right Rear Down Signal
13	2 L-GN	170	Power Window Master Switch Right Rear Up Signal

Door Lock / Window Switch X2





Connector Part Information

- OEM: 7123-1765-30
- Service: See Catalog
- Description: 16-Way F (BK)

Terminal Part Information

- Terminal/Tray: 173681-2/17
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Door Lock / Window Switch X2

Pin	Wire Color	Circuit No.	Function
1	0.5 D-GN	1301	RAP [X] Fuse Supply Voltage
2	0.5 BN	1300	Power Window Master Switch Left Front Up Signal
3	0.5 GY/BU	1136	Power Window Master Switch Left Front Down Signal
4	0.5 BK	2050	Ground
5	0.5 BN/BK	254	Power Door Unlock Fuse Supply Voltage
6	0.5 WH/BK	81	Driver Mirror Motor Right Control
7	0.5 L-GN/BK	89	Driver Mirror Motor Down Control
8	0.5 WH/BU	7391	Power Window Switch Right and Up
9	0.5 L-BU	166	Power Window Master Switch Right Front Up Signal
10	0.5 GN/BK	167	Power Window Master Switch Right Front Down Signal
11	0.3 YE	6817	LED Backlight Diming Control
12	0.5 PU/WH	889	Passenger Mirror Motor Down Control
13	0.5 OG/WH	881	Passenger Mirror Motor Right Control
14	0.5 BK	2050	Ground
15	0.3 GY/BK	255	Power Door Lock Fuse Supply Voltage
16	0.5 BN/BU	343	Accessory Voltage

Driver Information Center (DIC) (ERG)

Connector Part Information

- OEM: 7282-1060
- Service: See Catalog
- Description: 26-Way

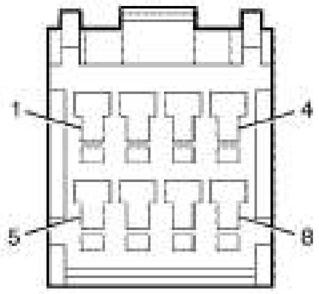
Terminal Part Information

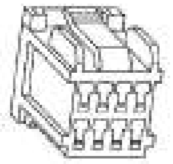
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Driver Information Center (DIC) (ERG)

Pin	Wire Color	Circuit No.	Function
1	0.35 YE	2501	High Speed GMLAN Serial Data Bus-
2	0.35 YE	2501	High Speed GMLAN Serial Data Bus-
3	0.35 YE	2500	High Speed GMLAN Serial Data Bus+
4	0.35 YE		--
5-7	--	--	Not Used
8	0.35 BK/BU		Steering Wheel Position Sensor Low Reference
9-15	--	--	Not Used
16	0.35 YE	2500	High Speed GMLAN Serial Data Bus+
17	0.35 YE		--
18-26	--	--	Not Used

Driver Information Center (DIC) (without ERG)





- OEM: 7123-1685
- Service: See Catalog
- Description: 8-Way F (WH)

Terminal Part Information

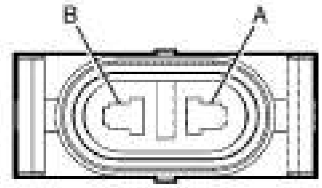
- Terminal/Tray: See Terminal Repair Kit

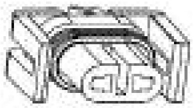
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Driver Information Center (DIC) (without ERG)

Pin	Wire Color	Circuit No.	Function
1	0.3 D-GN	5060	Low Speed GMLAN Serial Data
2-3	--	--	Not Used
4	0.5 RD/WH	1840	Battery Positive Voltage
5-7	--	--	Not Used
8	0.3 BK	1450	Ground

Driving Lamp - Left (HSV or VXR8)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

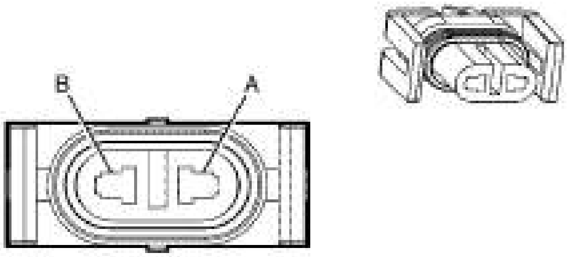
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Driving Lamp - Left (HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
A	0.75 PU		Front Driving Lamp Relay Supply Voltage
B	0.75 BK		Ground

Driving Lamp - Right (HSV or VXR8)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

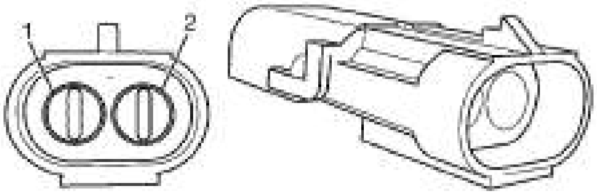
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Driving Lamp - Right (HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
A	0.75 PU		Front Driving Lamp Relay Supply Voltage
B	0.75 BK		Ground

Driving Lamp - HSVDR 1 (HSV or VXR8)



Connector Part Information

- OEM:

- Service: See Catalog
- Description: 2-Way F

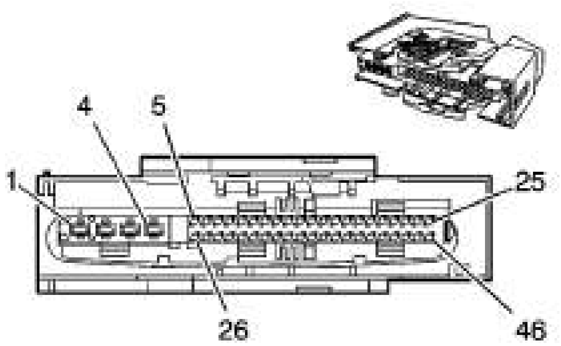
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Driving Lamp - HSVDR 1 (HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
A	0.3 D-BU		Ground
B	0.3 RD/BU		Voltage Supply

Electronic Brake Control Module (EBCM) (JL4)



Connector Part Information

- OEM: 7229-2512-30
- Service: See Catalog
- Description: 46-Way F (BK)

Terminal Part Information

- Pins: 1, 2
- Terminal/Tray: 1-968859-3/7
- Core/Insulation Crimp: A/3
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

- Pins: 3, 4
- Terminal/Tray: 1-968857-3/7
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

- Pins: 5-10, 14-16, 18, 20, 25-27, 35, 37. 45
- Terminal/Tray: 1928498014/17
- Core/Insulation Crimp: N/N

- Release Tool/Test Probe: J-38125-560/J-35616-64B (L-BU)

- Pins: 28
- Terminal/Tray: 1928498014/17
- Core/Insulation Crimp: N/N
- Release Tool/Test Probe: J-38125-560/J-35616-64B (L-BU)

Electronic Brake Control Module (EBCM) (JL4)

Pin	Wire Color	Circuit No.	Function
1	3 BK	350	Ground
2	3 RD/BK	142	Battery Positive Voltage

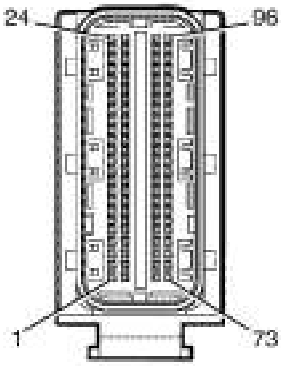
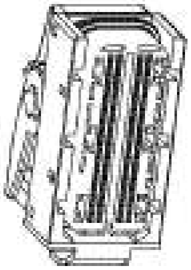
Engine Control Module (ECM) (LY7) X1





Connector Part Information

- OEM: 7283-3389-30
- Service: See Catalog
- Description: 96-Way F (BK)

Terminal Part Information

- Terminal/Tray: 1928498135/19
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe: J-38125-213/J-35616-64B (L-BU)

Engine Control Module (ECM) (LY7) X1

Pin	Wire Color	Circuit No.	Function
1	0.75 L-GN	5282	Cam Phaser Exhaust 1 Signal
2	0.75 PU	5284	Cam Phaser Intake 1 Signal
3	--	--	Not Used
4	0.75 YE/BK	846	Fuel Injector 6 Control
5	0.75 D-GN/WH	428	EVAP Canister Purge Solenoid Control
6	--	--	Not Used

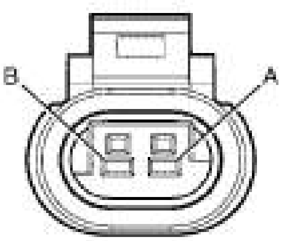
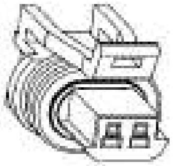
40	--	--	Not Used
41	0.5 D-BU	5985	Accessory Wakeup Serial Data
42	0.5 BN/BK	9000	High Speed GMLAN Serial Data Bus+
43-44	--	--	Not Used
45	0.5 D-BU/BK	473	High Speed Cooling Fan Relay Control
46	0.5 D-GN	335	Low Speed Cooling Fan Relay Control
47	0.5 PU	1272	Low Reference
48	0.5 BN/YE	1274	5-Volt Reference
49	0.5 WH/BK	1164	5-Volt Reference
50	0.5 BN/RD	472	IAT Sensor Signal
51	0.5 PU	3220	HO2S High Signal (Bank 2 Sensor 2)
52	0.5 WH/BU	17	Stop Lamp Switch Signal
53	--	--	Not Used
54	0.5 PK	439	Ignition 1 Voltage
55	0.5 BN	9001	High Speed GMLAN Serial Data Bus-
56	0.75 OG/BK	540	Battery Positive Voltage
57	0.5 YE	447	Starter Relay Coil Control
58	0.5 BN	5069	Main Relay Control

Engine Coolant Temperature (ECT) Sensor (L98 or HSV)





Connector Part Information

- OEM: 7283-0370-30
- Service: See Catalog
- Description: 2-Way F

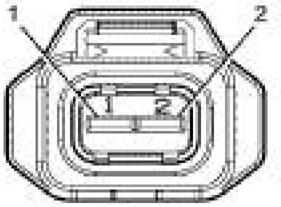
Terminal Part Information

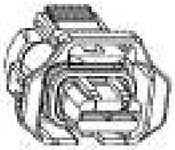
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Engine Coolant Temperature (ECT) Sensor (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/WH	2761	Low Reference
B	0.5 YE/GN	410	ECT Sensor Signal

Engine Coolant Temperature (ECT) Sensor (LY7)





Connector Part Information

- OEM: 7283-6205-30
- Service: See Catalog
- Description: 2-Way F (BK)

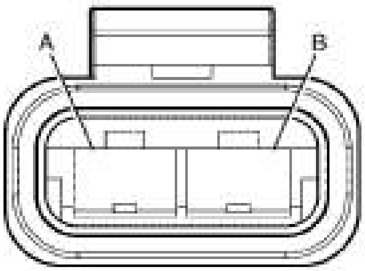
Terminal Part Information

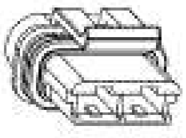
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Engine Coolant Temperature (ECT) Sensor (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.5 YE/GN	410	ECT Sensor Signal
2	0.5 BK	2755	Low Reference

Engine Cooling Fan - Left





Connector Part Information

- OEM: 12020341
- Service: See Catalog
- Description: 2-Way F Metri-Pack 630 Series Sealed (BK)

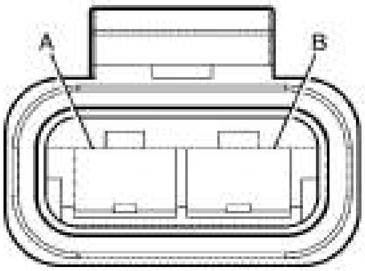
Terminal Part Information

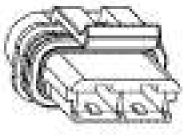
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Engine Cooling Fan - Left

Pin	Wire Color	Circuit No.	Function
A	3 BK	250	Ground
B	3 D-BU	409	Left Cooling Fan Motor Supply Voltage

Engine Cooling Fan - Right





Connector Part Information

- OEM: 12020341

- Service: See Catalog
- Description: 2-Way F Metri-Pack 630 Series Sealed (BK)

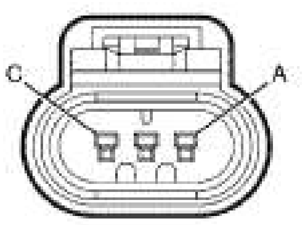
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Engine Cooling Fan - Right

Pin	Wire Color	Circuit No.	Function
A	3 GY	532	Right Cooling Fan Motor Low Reference
B	3 WH	504	Right Cooling Fan Motor Supply Voltage

Engine Oil Level and Temperature Sensor



Connector Part Information

- OEM: 7283-6579-30
- Service: See Catalog
- Description: 3-Way F (BK)

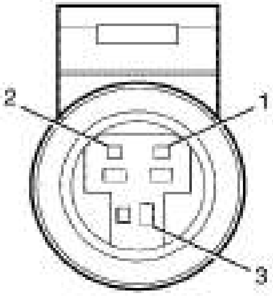
Terminal Part Information

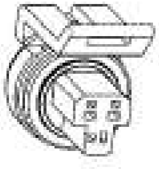
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Engine Oil Level and Temperature Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 BN	1174	Oil Level Switch Signal
B	0.5 D-GN/YE	357	Oil Temperature Sensor Signal (L98 or LY7)
	0.5 YE	357	Oil Temperature Sensor Signal (HSV)
C	0.5 BN/RD	470	Low Reference (L98 or HSV)
	0.5 BK	2755	Low Reference (LY7)

Engine Oil Pressure (EOP) Sensor





Connector Part Information

- OEM: 7283-2429
- Service: See Catalog
- Description: 3-Way F (BK)

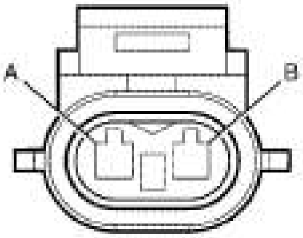
Terminal Part Information

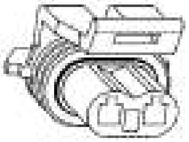
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Engine Oil Pressure (EOP) Sensor

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	2755	Low Reference (L98 or HSV)
	0.5 BN/RD	470	Low Reference (LY7)
2	0.5 GY	2705	5-Volt Reference (L98 or HSV)
	0.5 GY	596	5-Volt Reference (LY7)
3	0.5 BN/WH	331	Oil Pressure Sensor Signal (L98 or HSV)
	0.5 BN/WH	331	Oil Pressure Sensor Signal (LY7)

Evaporative Emission (EVAP) Canister Purge Solenoid Valve (L98 or HSV)





Connector Part Information

- OEM: 7223-9922-50
- Service: 12101858
- Description: 2-Way F

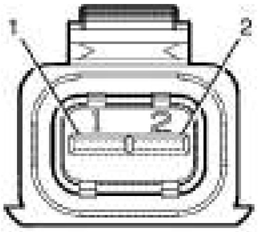
Terminal Part Information

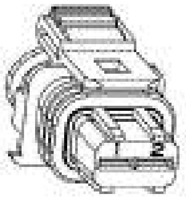
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Evaporative Emission (EVAP) Canister Purge Solenoid Valve (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU	5293	Ignition 1 Voltage
B	0.75 D-GN/WH	428	EVAP Canister Purge Solenoid Control

Evaporative Emission (EVAP) Canister Purge Solenoid Valve (LY7)





Connector Part Information

- OEM: 7283-5483-30
- Service: See Catalog
- Description: 2-Way F (BK)

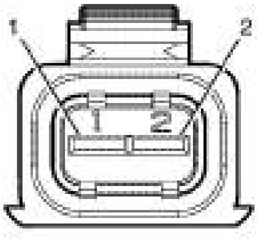
Terminal Part Information

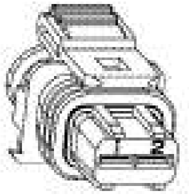
- Terminal/Tray: 1928498056/8
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-561/J-35616-35 (VT)

Evaporative Emission (EVAP) Canister Purge Solenoid Valve (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.75 PK/BU	5293	Ignition 1 Voltage
2	0.75 D-GN/WH	428	EVAP Canister Purge Solenoid Control

Evaporative Emission (EVAP) Canister Vent Solenoid Valve





Connector Part Information

- OEM: 12052643
- Service: 12101858
- Description: 2-Way F Metri-Pack 150 Series Sealed (RD)

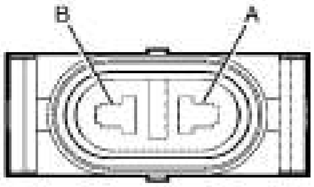
Terminal Part Information

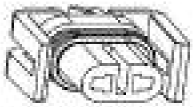
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Evaporative Emission (EVAP) Canister Vent Solenoid Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 OG	3140	Battery Positive Voltage
B	0.5 WH	1310	EVAP Canister Vent Solenoid Control

Fog Lamp - Left Front





Connector Part Information

- OEM: 7223-9928-30
- Service: See Catalog
- Description: 2-Way F 150 Series (BK)

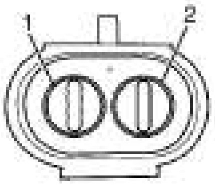
Terminal Part Information

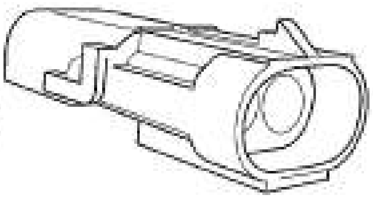
- Terminal/Tray: 12077411/2
- Core/Insulation Crimp: 2/5
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

Fog Lamp - Left Front

Pin	Wire Color	Circuit No.	Function
A	0.75 PU	34	Fog Lamps Supply Voltage
B	0.75 BK	350	Ground

Fog Lamp - Rear (T79)





Connector Part Information

- OEM: 1418893-1
- Service: See Catalog
- Description: 2-Way F

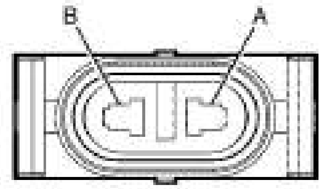
Terminal Part Information

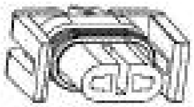
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fog Lamp - Rear (T79)

Pin	Wire Color	Circuit No.	Function
1	0.5 OG	122	Rear Fog Lamp Supply Voltage
2	0.5 BK	1850	Ground

Fog Lamp - Right Front





Connector Part Information

- OEM: 7223-9928-30
- Service: See Catalog
- Description: 2-Way F 150 Series (BK)

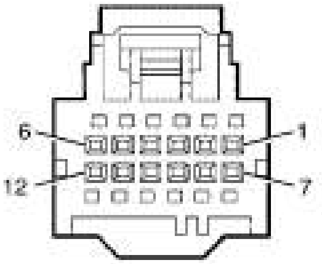
Terminal Part Information

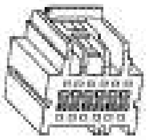
- Terminal/Tray: 12077411/2
- Core/Insulation Crimp: 2/5
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

Fog Lamp - Right Front

Pin	Wire Color	Circuit No.	Function
A	0.75 PU	34	Fog Lamps Supply Voltage
B	0.75 BK	350	Ground

Front and Rear Object Alarm Module X1





Connector Part Information

- OEM: 7283-9783-30
- Service: See Catalog
- Description: 12-Way F

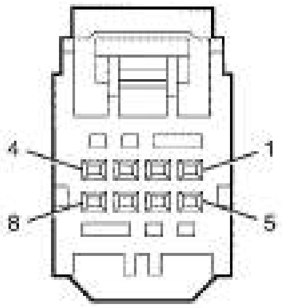
Terminal Part Information

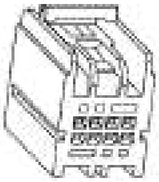
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Front and Rear Object Alarm Module X1

Pin	Wire Color	Circuit No.	Function
1	0.85 OG/PU	2140	Battery Positive Voltage
2	0.3 YE	5247	Object Detection Alarm Signal A
3	0.3 BN	5852	Instrument Panel Lamp Supply Voltage
4	--	--	Not Used
5	0.3 GY	5248	Object Detection Alarm Signal B
6	0.35 D-GN	5060	Low Speed GMLAN Serial Data
7	0.5 BK	1850	Ground
8	0.3 GY	2555	Object Detection Disable Signal
9-12	--	--	Not Used

Front and Rear Object Alarm Module X2





Connector Part Information

- OEM: 7283-9029-40
- Service: See Catalog
- Description: 8-Way F

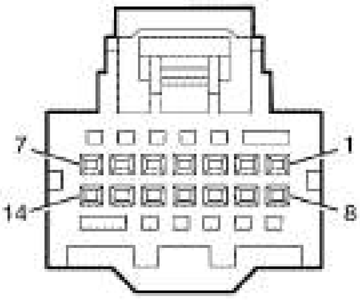
Terminal Part Information

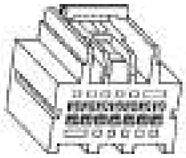
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Front and Rear Object Alarm Module X2

Pin	Wire Color	Circuit No.	Function
1	0.3 PU	2378	RR Corner Object Sensor Signal
2	0.3 D-GN	2377	RR Middle Object Sensor Signal
3	0.3 OG	2376	LR Middle Object Sensor Signal
4	0.3 D-BU	2374	Object Sensor Supply Voltage
5	0.3 YE	2375	LR Corner Object Sensor Signal
6-7	--	--	Not Used
8	0.3 GY	2379	Object Sensor Low Reference

Front and Rear Object Alarm Module X3





Connector Part Information

- OEM: 7283-9068-90
- Service: See Catalog
- Description: 14-Way F

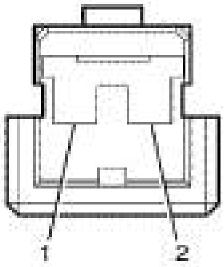
Terminal Part Information

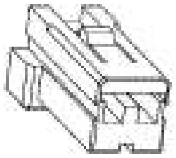
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Front and Rear Object Alarm Module X3

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	6581	Object Sensor Supply Voltage
2-3	--	--	Not Used
4	0.3 PU/WH	5215	LF Corner Object Sensor Signal
5	0.3 WH	5216	LF Middle Object Sensor Signal
6-7	--	--	Not Used
8	0.3 OG/BK	5214	Object Sensor Low Reference
9	--	--	Not Used
10	0.3 WH	5218	RF Middle Object Sensor Signal
11	0.3 BN/WH	5217	RF Corner Object Sensor Signal
12-14	--	--	Not Used

Front and Rear Object Alarm





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way

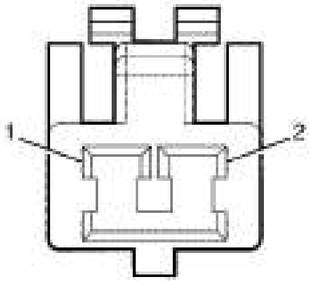
Terminal Part Information

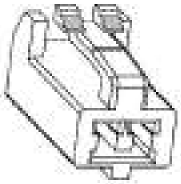
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Front and Rear Object Alarm

Pin	Wire Color	Circuit No.	Function
1	0.3 YE	5247	Object Detection Alarm Signal A
2	0.3 GY	5248	Object Detection Alarm Signal B

Fuel Door Release Actuator





Connector Part Information

- OEM: 7283-1020

- Service: 88953305
- Description: 2-Way F 2.3 Series (WH)

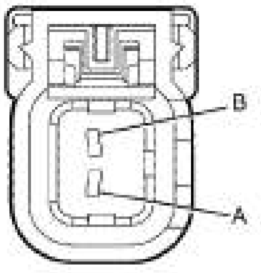
Terminal Part Information

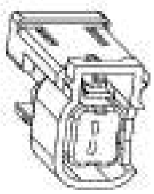
- Terminal/Tray: 7116-4021/11
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Fuel Door Release Actuator

Pin	Wire Color	Circuit No.	Function
1	1.25 D-GN/WH	295	Door Lock Actuator Lock Control
2	1.25 BN/RD	694	Driver Door Lock Actuator Unlock Control

Fuel Injector 1 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-way F (GY)

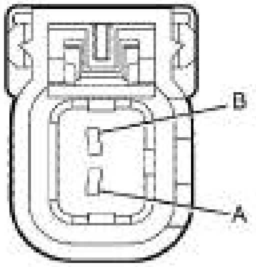
Terminal Part Information

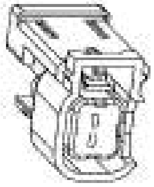
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 1 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK/BU	5291	Ignition 1 Voltage
B	0.5 BN/BK	1744	Fuel Injector 1 Control

Fuel Injector 1 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-way F

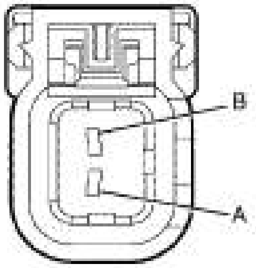
Terminal Part Information

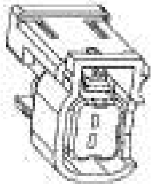
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 1 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU	5291	Ignition 1 Voltage
B	0.75 BN/BK	1744	Fuel Injector 1 Control

Fuel Injector 2 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-Way F (GY)

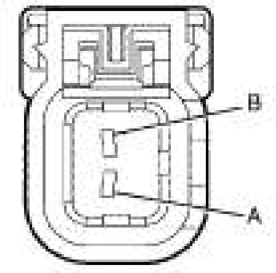
Terminal Part Information

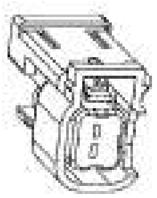
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 2 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK	5292	Ignition 1 Voltage
B	0.8 L-GN/BK	1745	Fuel Injector 2 Control

Fuel Injector 2 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

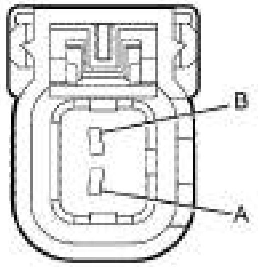
Terminal Part Information

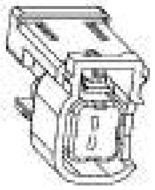
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 2 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK	5292	Ignition 1 Voltage
B	0.75 L-GN/BK	1745	Fuel Injector 2 Control

Fuel Injector 3 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-Way F (GY)

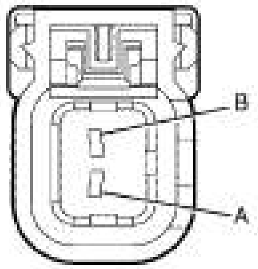
Terminal Part Information

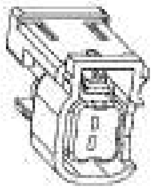
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 3 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK/BU	5291	Ignition 1 Voltage
B	0.8 PK/BK	1746	Fuel Injector 3 Control

Fuel Injector 3 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

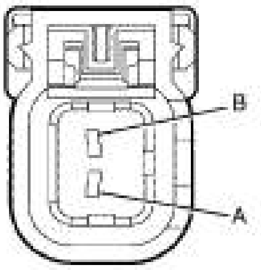
Terminal Part Information

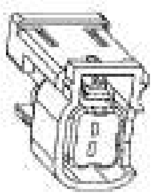
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 3 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU	5291	Ignition 1 Voltage
B	0.75 PK/BK	1746	Fuel Injector 3 Control

Fuel Injector 4 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-Way F (GY)

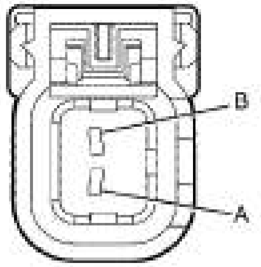
Terminal Part Information

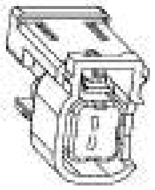
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 4 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK	5292	Ignition 1 Voltage
B	0.8 L-BU/BK	844	Fuel Injector 4 Control

Fuel Injector 4 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

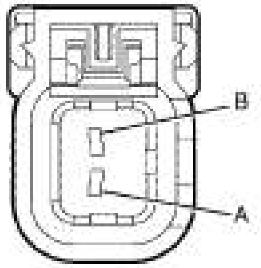
Terminal Part Information

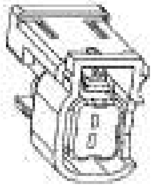
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 4 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK	5292	Ignition 1 Voltage
B	0.75 L-BU/BK	844	Fuel Injector 4 Control

Fuel Injector 5 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-Way F (GY)

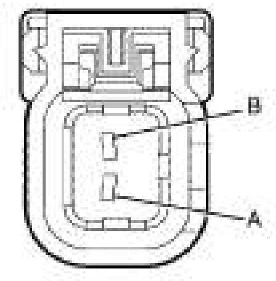
Terminal Part Information

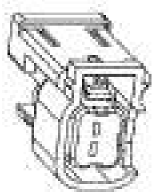
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 5 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK/BU	5291	Ignition 1 Voltage
B	0.8 BN/WH	845	Fuel Injector 5 Control

Fuel Injector 5 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

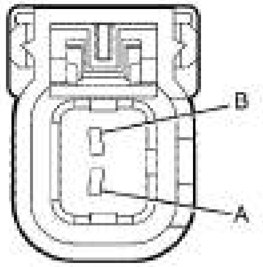
Terminal Part Information

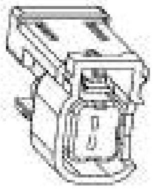
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 5 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU	5291	Ignition 1 Voltage
B	0.75 BN/WH	845	Fuel Injector 5 Control

Fuel Injector 6 (LY7)





Connector Part Information

- OEM: 1-0190667-3
- Service: See Catalog
- Description: 2-Way F (GY)

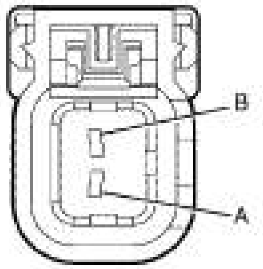
Terminal Part Information

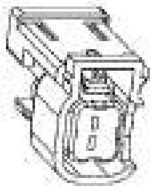
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Injector 6 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.8 PK	5292	Ignition 1 Voltage
B	0.8 YE/BK	846	Fuel Injector 6 Control

Fuel Injector 6 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

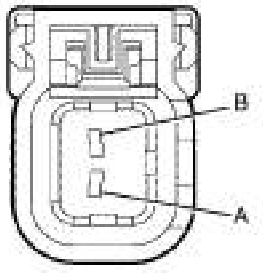
Terminal Part Information

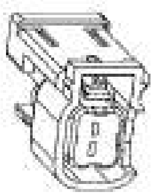
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 6 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK	5292	Ignition 1 Voltage
B	0.75 YE/BK	846	Fuel Injector 6 Control

Fuel Injector 7 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

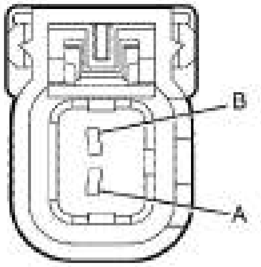
Terminal Part Information

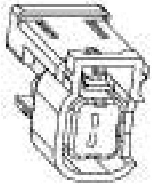
- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 7 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU	5291	Ignition 1 Voltage
B	0.75 OG/BK	877	Fuel Injector 7 Control

Fuel Injector 8 (L98 or HSV)





Connector Part Information

- OEM: 7283-8756
- Service: 15306318
- Description: 2-Way F

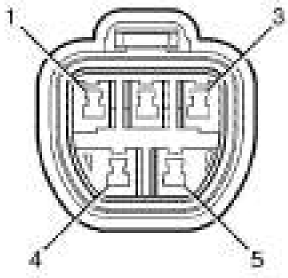
Terminal Part Information

- Terminal/Tray:12176636/19
- Core/Insulation Crimp: C/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Fuel Injector 8 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.75 PK	5292	Ignition 1 Voltage
B	0.75 D-BU/WH	878	Fuel Injector 8 Control

Fuel Level Sensor - Secondary



Connector Part Information

- OEM: 7283-1156
- Service: See Catalog
- Description: 5-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Level Sensor - Secondary

Pin	Wire Color	Circuit No.	Function
1	0.3 BN/YE	452	Fuel Return
2	0.5 L-BU	1937	Fuel Level
3-5	--	--	Not Used

Fuel Tank Pressure (FTP) Sensor

Connector Part Information

- OEM: 13511996
- Service: 19149288
- Description: 3-Way

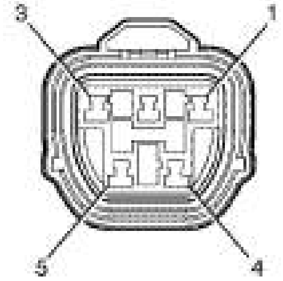
Terminal Part Information

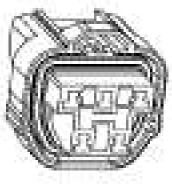
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Tank Pressure (FTP) Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 D-GN	890	Fuel Tank Pressure Sensor Signal
B	0.5 BN/YE	452	Low Reference
C	0.5 GY	2709	5-Volt Reference

Fuel Pump and Sender Assembly





Connector Part Information

- OEM: 15326631
- Service: 19152589
- Description: 4-Way F GT 280 5.8 Series Sealed (BK)

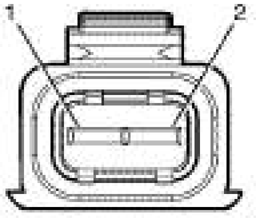
Terminal Part Information

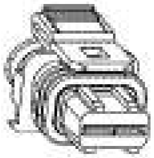
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Fuel Pump and Sender Assembly

Pin	Wire Color	Circuit No.	Function
1	2 GY	120	Fuel Pump Supply Voltage
2	0.5 PU	1589	Fuel Level Sensor Signal (Primary)
3	2 BK	1350	Ground
4	0.5 BN/YE	452	Low Reference
5	--	--	Not Used

Generator X1 (L76)





Connector Part Information

- OEM: 7283-5483-30
- Service: See Catalog
- Description: 2-Way F

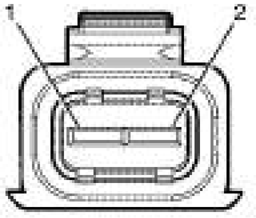
Terminal Part Information

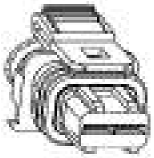
- Terminal/Tray: 1928498056/8
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-561/J-35616-35 (VT)

Generator X1 (L76)

Pin	Wire Color	Circuit No.	Function
1	0.5 OG/WH	225	Generator Turn On Signal
2	0.5 PU/WH	23	Generator Field Duty Cycle Signal

Generator X1 (LY7)





Connector Part Information

- OEM: 7183-5344-30

- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

- Terminal/Tray: 4-964286-1/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

Generator X1 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.5 OG/WH	225	Generator Turn On Signal
2	0.5 PU/WH	23	Generator Field Duty Cycle Signal

Generator X2

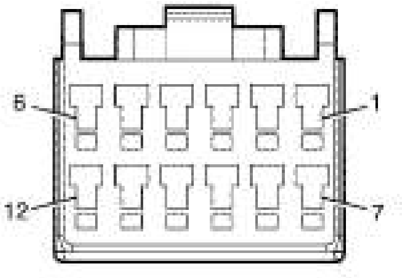
Terminal Part Information

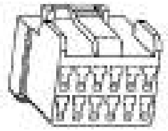
- Terminal: 7003-1190-02-DC
- Core/Insulation Crimp: N/A
- Description: Ring Terminal

Generator X2

Pin	Wire Color	Circuit No.	Function
+	19 RD	2	Battery Positive Voltage
	19 RD	2	Battery Positive Voltage

Headlamp and Panel Dimmer Switch





Connector Part Information

- OEM: 7123-1725-30
- Service: See Catalog
- Description: 12-Way F (BK)

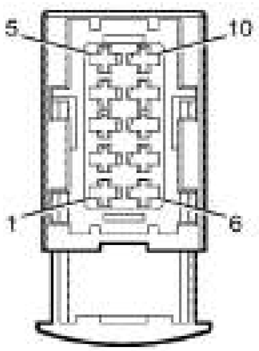
Terminal Part Information

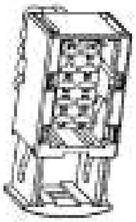
- Terminal/Tray: 173681-2/17
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Headlamp and Panel Dimmer Switch

Pin	Wire Color	Circuit No.	Function
1	0.3 WH	103	Headlamp Switch Headlamps On Signal
2	--	--	Not Used
3	0.3 D-GN	306	Headlamp Switch Headlamps Off Signal
4	0.3 BK	850	Ground
5	0.3 BN/WH	301	Park Lamp Switch On Signal
6	0.3 OG	192	Front Fog Lamp Switch Signal
7	0.3 GY/WH	7389	Headlamp Dimming Switch Down
8	0.3 YE	6817	Interior Lights Dimming Switch
9	--	--	Not Used
10	0.5 PK/BU	1339	Ignition 1 Voltage
11	--	--	Not Used
12	0.3 GY/BU	7388	Headlamp Dimming Switch Up

Headlamp - Left





Connector Part Information

- OEM: 7283-7109-30
- Service: See Catalog
- Description: 10-Way F (BK)

Terminal Part Information

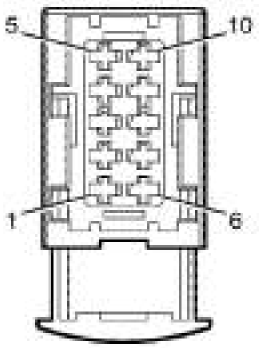
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit

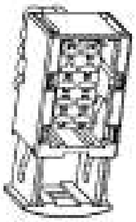
- Release Tool/Test Probe: See Terminal Repair Kit

Headlamp - Left

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	250	Ground (-TT7-TT8)
	1.25 BK	250	Ground (TT7/TT8)
2	2 BK	350	Ground
3	0.5 BK	250	Ground
4-5	--	--	Not Used
6	0.5 PU	709	Left Park Lamp Supply Voltage
7	0.5 YE	712	Left Headlamp Low Beam Supply Voltage (-TT7-TT8)
	1.25 YE	712	Left Headlamp Low Beam Supply Voltage (TT7/TT8)
8	0.5 D-GN/WH	711	Left Headlamp High Beam Supply Voltage
9	0.5 L-BU/WH	1314	Left Front Turn Signal Lamp Supply Voltage
10	--	--	Not Used

Headlamp - Right





Connector Part Information

- OEM: 7283-7109-30
- Service: See Catalog
- Description: 10-Way F (BK)

Terminal Part Information

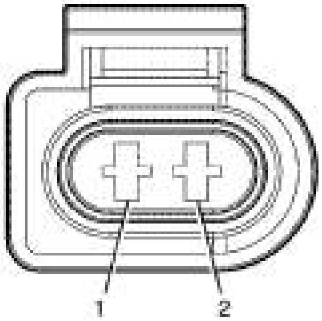
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

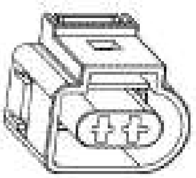
Headlamp - Right

Pin	Wire Color	Circuit No.	Function

1	0.5 BK	250	Ground (-TT7-TT8)
	1.25 BK	250	Ground (TT7/TT8)
2	2 BK	350	Ground
3	0.5 BK	250	Ground
4-5	--	--	Not Used
6	0.5 BN/WH	309	Right Park Lamp Supply Voltage
7	0.5 BN/BK	312	Right Headlamp Low Beam Supply Voltage (-TT7-TT8)
	1.25 BN/WH	312	Right Headlamp Low Beam Supply Voltage (TT7/TT8)
8	0.5 L-GN/WH	311	Right Headlamp High Beam Supply Voltage
9	0.5 D-BU/WH	1315	Right Front Turn Signal Lamp Supply Voltage
10	--	--	Not Used

Headlamp Washer Fluid Pump





Connector Part Information

- OEM: 2-1355200-2
- Service: See Catalog
- Description: 2-Way F

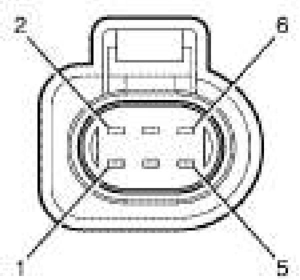
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Headlamp Washer Fluid Pump

Pin	Wire Color	Circuit No.	Function
1	2 BN/WH	6724	Headlamp Washer Fluid Pump
2	0.85 BK	250	Ground

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (LY7)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way

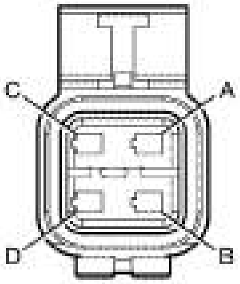
Terminal Part Information

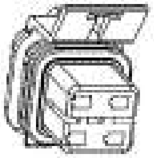
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.5 WH		HO2S Output Pump Current (Bank 1 Sensor 1)
2	0.5 BN/YE		HO2S Low Signal (Bank 1 Sensor 1)
3	0.75 GY/WH		HO2S Heater Low Control (Bank 1 Sensor 1)
4	0.75 PK/BU		Ignition 1 Voltage
5	0.5 L-GN		HO2S Input Pump Current (Bank 1 Sensor 1)
6	0.5 PU/WH		HO2S High Signal (Bank 1 Sensor 1)

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (L98 or HSV)





Connector Part Information

- OEM: 7219-1744-40
- Service: See Catalog
- Description: 4-Way F

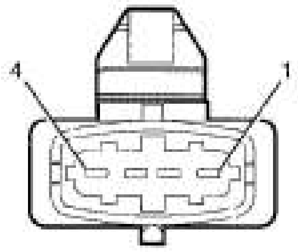
Terminal Part Information

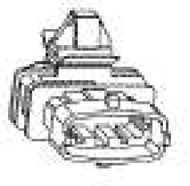
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 1 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/RD	1664	HO2S Low Signal [- Bank 1 Sensor 1]
B	0.5 PU/WH	1665	HO2S High Signal [- Bank 1 Sensor 1]
C	0.5 GY/WH	3113	HO2S Heater Low Control [- Bank 1 Sensor 1]
D	0.8 PK/BK	5293	Ignition 1 Voltage

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (LY7)





Connector Part Information

- OEM: 7182-8145-30
- Service: 88952839
- Description: 4-Way M (BK)

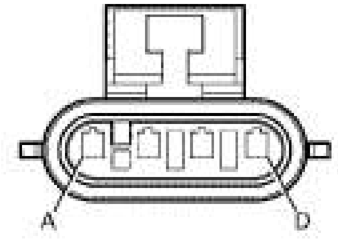
Terminal Part Information

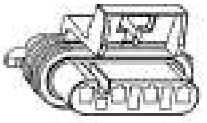
- Terminal/Tray: 1-962915-3/15
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-5 (PU)

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.75 PK/BU	5294	Ignition 1 Voltage
2	0.75 OG/WH	3122	HO2S Heater Low Control (Bank 1 Sensor 2)
3	0.5 BN/RD	3121	HO2S Low Signal (Bank 1 Sensor 2)
4	0.5 PU	3120	HO2S High Signal (Bank 1 Sensor 2)

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (L98 or HSV or LS2)





Connector Part Information

- OEM: 7223-9845-30
- Service: See Catalog
- Description: 4-Way F

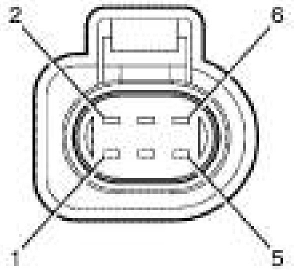
Terminal Part Information

- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Heated Oxygen Sensor (HO2S) Bank 1 Sensor 2 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/WH	1669	HO2S Low Signal [- Bank 1 Sensor 2]
B	0.5 PU/WH	1668	HO2S High Signal [- Bank 1 Sensor 2]
C	0.5 BN	2391	HO2S Heater Low Control [- Bank 1 Sensor 2]
D	0.78 PK/BU	5294	Ignition 1 Voltage

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (LY7)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way

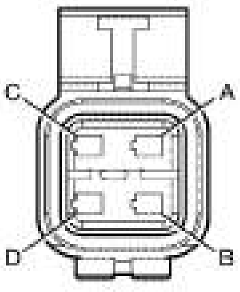
Terminal Part Information

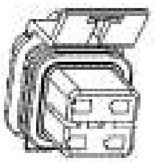
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.5 PU/WH		HO2S Pump Output Current (Bank 2 Sensor 1)
2	0.5 BN/RD		HO2S Low Signal (Bank 2 Sensor 1)
3	0.75 L-GN		HO2S Heater Low Control (Bank 2 Sensor 1)
4	0.75 PK/BU		Battery 1 Voltage
5	0.5 OG		HO2S Input Pump Current (Bank 2 Sensor 1)
6	0.5 PU		HO2S High Signal (Bank 2 Sensor 1)

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (L98 or HSV)





Connector Part Information

- OEM: 7219-1744-40
- Service: See Catalog
- Description: 4-Way F

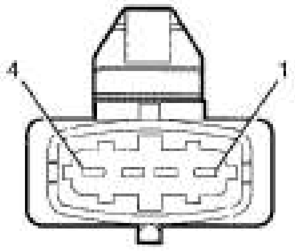
Terminal Part Information

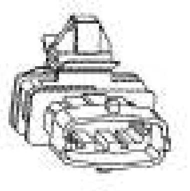
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 1 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/RD	1667	HO2S Low Signal [- Bank 2 Sensor 1]
B	0.5 PU	1666	HO2S High Signal [- Bank 2 Sensor 1]
C	0.5 L-GN	3212	HO2S Heater Low Control [- Bank 2 Sensor 1]
D	0.8 PK/BU	5293	Ignition 1 Voltage

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (LY7)





Connector Part Information

- OEM: 7182-8145-30
- Service: See Catalog
- Description: 4-Way M (GY)

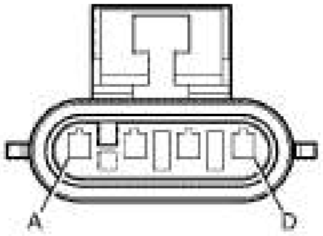
Terminal Part Information

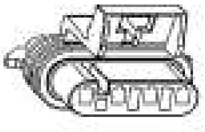
- Terminal/Tray: 1-962915-3/15
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-5 (PU)

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.75 PK/BU	5294	Battery 1 Voltage
2	0.75 GY/WH	3223	HO2S Heater Low Control (Bank 2 Sensor 2)
3	0.5 BN/GN	3221	HO2S Low Signal (Bank 2 Sensor 2)
4	0.5 PU	3220	HO2S High Signal (Bank 2 Sensor 2)

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (L98 or HSV)





Connector Part Information

- OEM: 7223-9845-30
- Service: See Catalog
- Description: 4-Way F

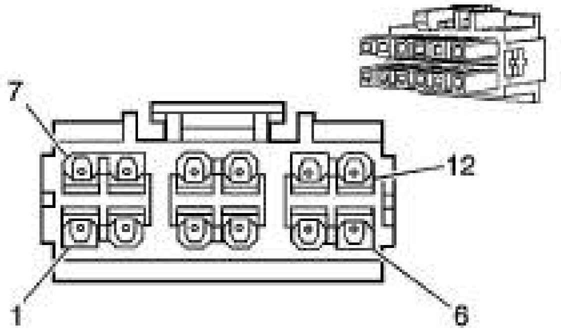
Terminal Part Information

- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Heated Oxygen Sensor (HO2S) Bank 2 Sensor 2 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/WH	1671	HO2S Low Signal [- Bank 2 Sensor 2]
B	0.5 PU	1670	HO2S High Signal [- Bank 2 Sensor 2]
C	0.5 OG/WH	3223	HO2S Heater Low Control (Bank 2 Sensor 2)
D	0.78 PK/BU	5294	Ignition 1 Voltage

Heated Seat Control Module - Driver (KA1)



Connector Part Information

- OEM: 15-97-5121
- Service: See Catalog
- Description: 12-Way F Mini-Fit Series (BK)

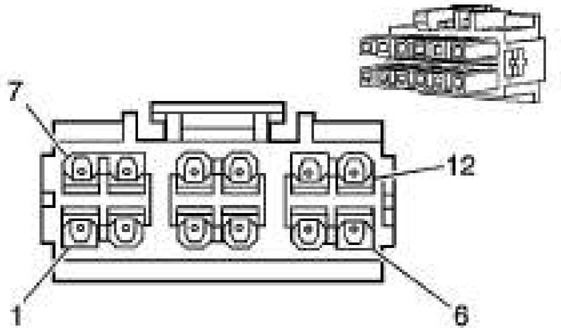
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Heated Seat Control Module - Driver (KA1)

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.5 RD/YE	2050	Low Reference
3	0.5 PK	1339	Ignition 1 Voltage
4	PU/GN	--	Low Reference
5	0.35 BN	1661	Driver Heated Seat High Temperature Indicator Control
6	0.35 OG/BK	6177	Passenger Heated Seat Intermediate Signal
7	--	--	Not Used
8	0.5 D-GN/RD	2077	Heated Seat Cushion Element Supply Voltage
9	0.35 PK/OG	1501	Driver Heated Seat High/Low Signal
10	--	--	Not Used
11	0.35 WH/YE	1662	Driver Heated Seat Low Temperature Indicator Control
12	0.35 WH/BK	2079	Heated Seat Cushion Temperature Sensor Signal

Heated Seat Control Module - Passenger (KA1)



Connector Part Information

- OEM: 15-97-5121
- Service: See Catalog
- Description:12-Way F Mini-Fit Series (BK)

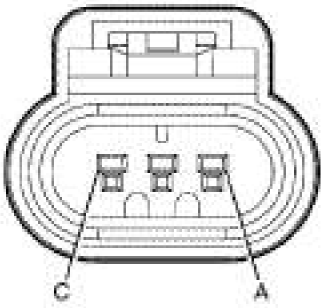
Terminal Part Information

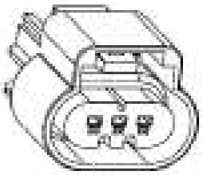
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Heated Seat Control Module - Passenger (KA1)

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.5 RD/YE	2050	Low Reference
3	0.5 PK	1339	Ignition 1 Voltage
4	PU/GN	--	Low Reference
5	0.35 BN	1661	Driver Heated Seat High Temperature Indicator Control
6	0.35 OG/BK	6177	Passenger Heated Seat Intermediate Signal
7	--	--	Not Used
8	0.5 D-GN/RD	2077	Heated Seat Cushion Element Supply Voltage
9	0.35 PK/OG	1501	Driver Heated Seat High/Low Signal
10	--	--	Not Used
11	0.35 WH/YE	1662	Driver Heated Seat Low Temperature Indicator Control
12	0.35 WH/BK	2079	Heated Seat Cushion Temperature Sensor Signal

Hood Ajar Switch





Connector Part Information

- OEM: 7283-6579
- Service: See Catalog
- Description: 3-Way F (BK)

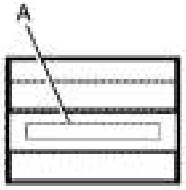
Terminal Part Information

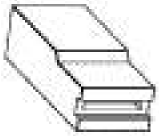
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Hood Ajar Switch

Pin	Wire Color	Circuit No.	Function
A	0.3 PK/BK	109	Hood Ajar Switch Signal
B	0.3 PU	5531	Hood Closed Switch Signal
C	0.3 BK	250	Ground

Horn - Left X1





- OEM: 7183-0073-30
- Service: See Catalog

- Description: 1-Way F (BK)

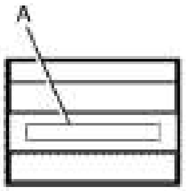
Terminal Part Information

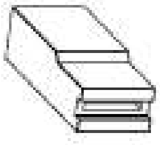
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Horn - Left X1

Pin	Wire Color	Circuit No.	Function
A	0.75 D-GN	1329	Content Left Horn Control

Horn - Left X2





- OEM: 7183-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

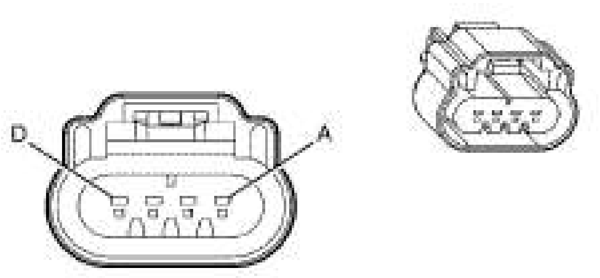
Ignition Coil 1 (LY7)



Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

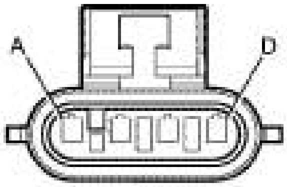
- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

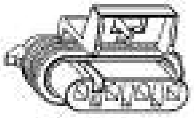
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Ignition Coil 1 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2550	Ground
B	0.5 PU	6413	Low Reference
C	0.5 PU	2121	IC 1 Control
D	0.75 PK/BU	5291	Ignition 1 Voltage

Ignition Coil 1 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

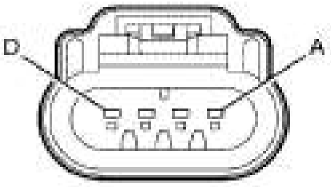
Terminal Part Information

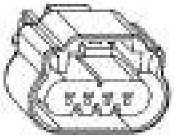
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 1 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN	2129	IC 1 Control
C	0.5 PU	2121	IC 1 Control
D	0.8 PK/BK	39	Ignition 1 Voltage

Ignition Coil 2 (LY7)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

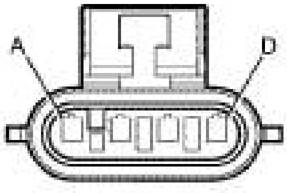
- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

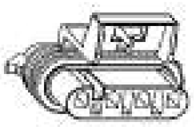
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Ignition Coil 2 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2650	Ground
B	0.5 PK	6414	Low Reference
C	0.5 OG/WH	2122	IC 2 Control
D	0.75 PK	5292	Ignition 1 Voltage

Ignition Coil 2 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

Terminal Part Information

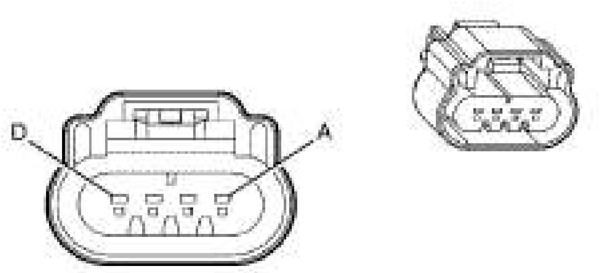
- Terminal/Tray: See Terminal Repair Kit

- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 2 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN/WH	2129	IC 2 Control
C	0.5 OG/WH	2127	IC 2 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 3 (LY7)



Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

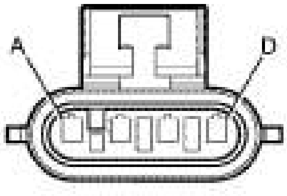
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

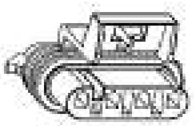
Ignition Coil 3 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2550	Ground
B	0.5 PU	6413	Low Reference

C	0.5 L-BU	2123	IC 3 Control
D	0.75 PK/BU	5291	Ignition 1 Voltage

Ignition Coil 3 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

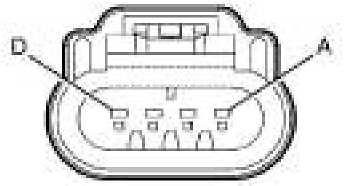
Terminal Part Information

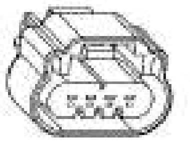
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 3 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN	2129	IC 3 Control
C	0.5 L-BU	2123	IC 3 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 4 (LY7)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

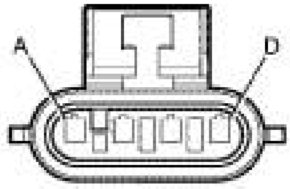
- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

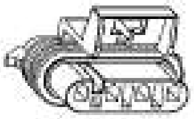
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Ignition Coil 4 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2650	Ground
B	0.5 PK	6414	Low Reference
C	0.5 D-GN/WH	2124	IC 4 Control
D	0.75 PK	5292	Ignition 1 Voltage

Ignition Coil 4 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

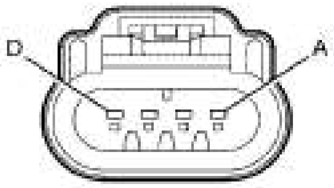
Terminal Part Information

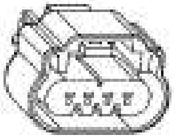
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 4 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN/WH	2129	IC 4 Control
C	0.5 D-GN/WH	2125	IC 4 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 5 (LY7)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

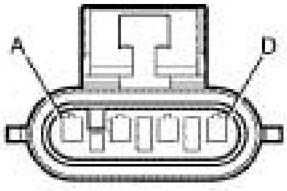
- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

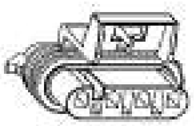
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Ignition Coil 5 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2550	Ground
B	0.5 PU	6413	Low Reference
C	0.5 D-GN/RD	2125	IC 5 Control
D	0.75 PK/BU	5291	Ignition 1 Voltage

Ignition Coil 5 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

Terminal Part Information

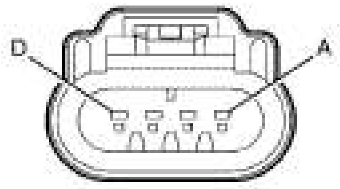
- Terminal/Tray: See Terminal Repair Kit

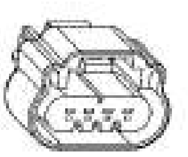
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 5 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN	2129	IC 5 Control
C	0.5 D-GN	2125	IC 5 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 6 (LY7)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

- Pins: A, D
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

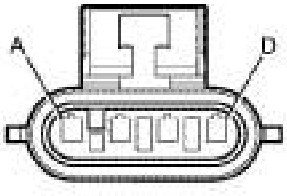
- Pins: B, C
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

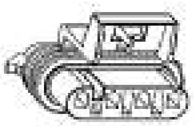
Ignition Coil 6 (LY7)

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	2650	Ground
B	0.5 PK	6414	Low Reference

C	0.5 L-BU/WH	2126	IC 6 Control
D	0.75 PK	5292	Ignition 1 Voltage

Ignition Coil 6 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

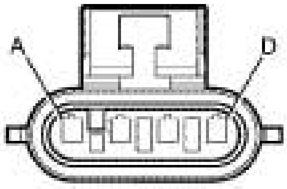
Terminal Part Information

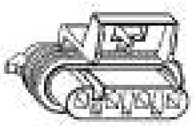
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 6 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN/WH	2129	IC 6 Control
C	0.5 L-BU/WH	2123	IC 6 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 7 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

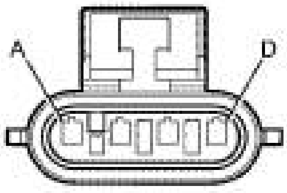
Terminal Part Information

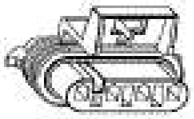
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 7 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN	2129	IC 7 Control
C	0.5 OG	2127	IC 7 Control
D	0.8 PK/BK	39	Ignition 1Voltage

Ignition Coil 8 (L98 or HSV)





Connector Part Information

- OEM: 7283-9394-30
- Service: See Catalog
- Description: 4-Way F

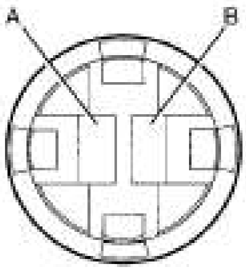
Terminal Part Information

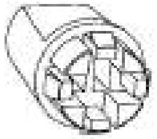
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ignition Coil 8 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
A	0.8 BK	151	Ground
B	0.5 BN/WH	2129	IC 8 Control
C	0.5 PU/WH	2121	IC 8 Control
D	0.8 PK/BK	39	Ignition 1 Voltage

Ignition Key Cylinder Lamp





Connector Part Information

- OEM: 7141-5191-30
- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

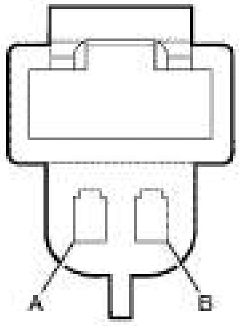
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

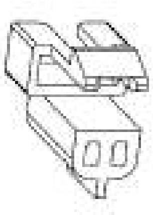
Ignition Key Cylinder Lamp

Pin	Wire Color	Circuit No.	Function

A	0.5 D-BU/WH	149	Courtesy Lamp Supply Voltage
B	0.5 BK	850	Ground

Ignition Lock Cylinder Control Solenoid





- OEM: 7123-9722-30
- Service: 12101825
- Description: 2-Way F (BK)

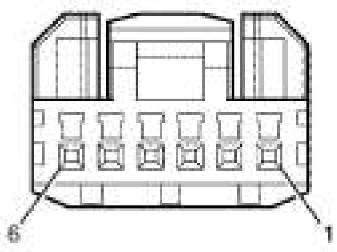
Terminal Part Information

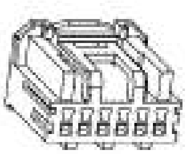
- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Ignition Lock Cylinder Control Solenoid

Pin	Wire Color	Circuit No.	Function
A	0.5 BN	443	Accessory Voltage
B	0.3 PU/WH	1630	Steering Column Key Cylinder Lock Solenoid Control

Ignition Switch





Connector Part Information

- OEM: 7283-9467-30
- Service: See Catalog
- Description: 6-Way F (BK)

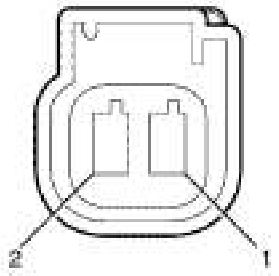
Terminal Part Information

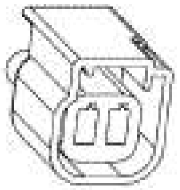
- Terminal/Tray: SHCM-A03T-P025/20
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe: 12094429/J-35616-64B (L-BU)

Ignition Switch

Pin	Wire Color	Circuit No.	Function
1	0.3 PK	3	Run/Crank Voltage
2	0.5 OG/BK	1040	Battery Positive Voltage
3	0.3 BN	4	Ignition 1 Voltage
4	0.3 WH	1390	Ignition Key Resistor Low Reference
5	--	--	Not Used
6	0.3 WH/BK	1073	Ignition Key Resistor Signal

Inflatable Restraint Front End Sensor - Left





Connector Part Information

- OEM: 7283-6291-30
- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

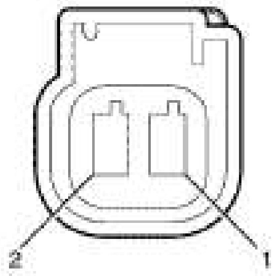
- Terminal/Tray: 7116-4102-08/9
- Core/Insulation Crimp: E/1

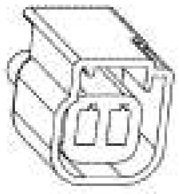
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

Inflatable Restraint Front End Sensor - Left

Pin	Wire Color	Circuit No.	Function
1	0.3 YE	354	Discriminating Sensor - Signal
2	0.3 BN/YE	5045	Discriminating Sensor - Low Reference

Inflatable Restraint Front End Sensor - Right





Connector Part Information

- OEM: 7283-6291-30
- Service: See Catalog
- Description: 2-Way F (BK)

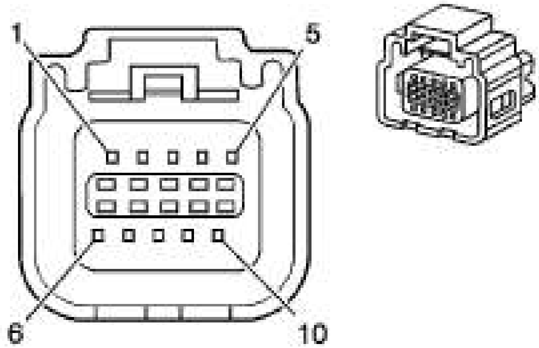
Terminal Part Information

- Terminal/Tray: 7116-4102-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

Inflatable Restraint Front End Sensor - Right

Pin	Wire Color	Circuit No.	Function
1	0.3 D-GN	1409	Discriminating Sensor - Right Signal
2	0.3 GY	5600	Discriminating Sensor - Low Reference

Inflatable Restraint Front Passenger Presence System (PPS) Module X1



Connector Part Information

- OEM: 28032115
- Service: See Catalog
- Description: 10-Way F (BK)

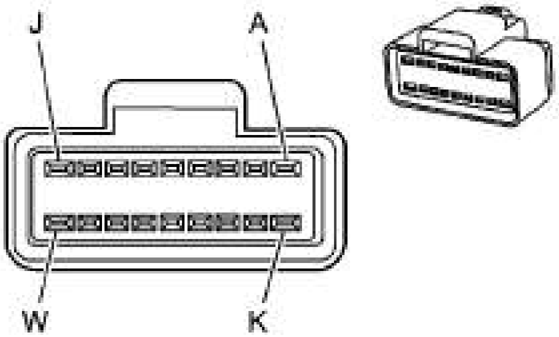
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Front Passenger Presence System (PPS) Module X1

Pin	Wire Color	Circuit No.	Function
1	0.35 WH/PK	3940	PPS Supply Voltage
2	0.5 BK/WH	1751	Ground
3	--	--	Not Used
4	0.35 D-GN/RD	5060	Low Speed GMLAN Serial Data
5-10	--	--	Not Used

Inflatable Restraint Front Passenger Presence System (PPS) Module X2



Connector Part Information

- OEM: 15326082
- Service: Serviced as part of an assembly
- Description: 18-Way F (BK)

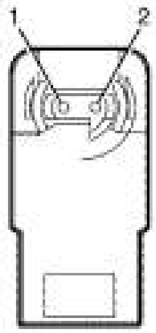
Terminal Part Information

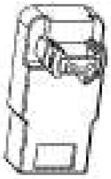
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Front Passenger Presence System (PPS) Module X2

Pin	Wire Color	Circuit No.	Function
1	CLR	--	--
2	CLR	--	--
3	CLR	--	--
4	CLR	--	--
5	CLR	--	--

Inflatable Restraint I/P Module X1





Connector Part Information

- OEM: 7335-4222
- Service: See Catalog
- Description: 2-Way M (YE)

Terminal Part Information

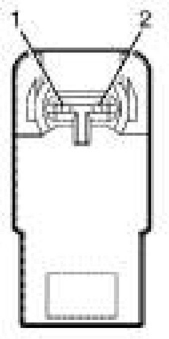
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit

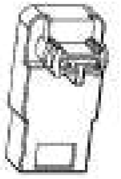
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint I/P Module X1

Pin	Wire Color	Circuit No.	Function
1	0.5 D-BU	3024	I/P Module - Stage 1 - Low Control
2	0.5 YE	3025	I/P Module - Stage 1 - High Control

Inflatable Restraint I/P Module X2





Connector Part Information

- OEM: 7335-4221
- Service: See Catalog
- Description: 2-Way M (GN)

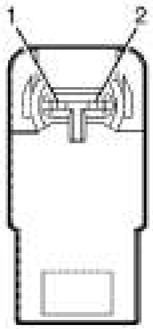
Terminal Part Information

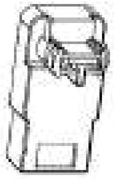
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint I/P Module X2

Pin	Wire Color	Circuit No.	Function
1	0.5 PU	3026	I/P Module - Stage 2 - Low Control
2	0.5 D-GN	3027	I/P Module - Stage 2 - High Control

Inflatable Restraint Roof Rail Module - Left





Connector Part Information

- OEM: 7335-6470
- Service: See Catalog
- Description: 2-Way M (GN)

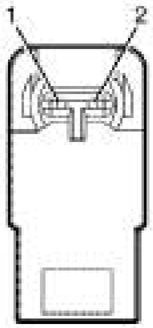
Terminal Part Information

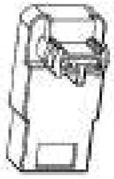
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Roof Rail Module - Left

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/BK	5019	Roof Rail Module - Left - High Control
2	0.5 PK	5020	Roof Rail Module - Left - Low Control

Inflatable Restraint Roof Rail Module - Right





Connector Part Information

- OEM: 7335-6471

- Service: See Catalog
- Description: 2-Way M (GN)

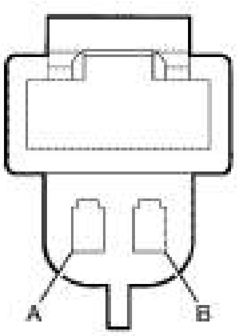
Terminal Part Information

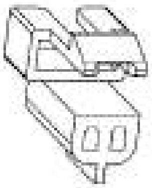
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Roof Rail Module - Right

Pin	Wire Color	Circuit No.	Function
1	0.5 PU/YE	5021	Roof Rail Module - Right - High Control
2	0.5 WH/BK	5022	Roof Rail Module - Right - Low Control

Inflatable Restraint Seat Position Sensor - Driver





Connector Part Information

- OEM: 12052832
- Service: 12052832
- Description: 2-Way F Metri-Pack 150 Series (BK)

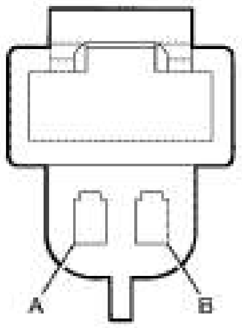
Terminal Part Information

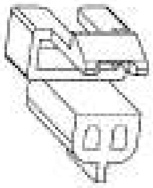
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Seat Position Sensor - Driver

Pin	Wire Color	Circuit No.	Function
A	0.3 PK/BU	5055	Seat Position Sensor- Left - Signal
B	0.3 PU/WH	5057	Seat Belt Switch - Right Front - Low Reference

Inflatable Restraint Seat Position Sensor - Passenger





Connector Part Information

- OEM: 12052832
- Service: 12052832
- Description: 2-Way F Metri-Pack 150 Series (BK)

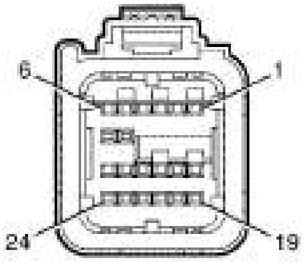
Terminal Part Information

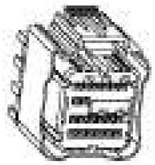
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Seat Position Sensor - Passenger

Pin	Wire Color	Circuit No.	Function
A	0.3 PK/BU	5056	Seat Position Sensor- Right - Signal
B	0.3 PU/WH	5057	Seat Belt Switch - Right Front - Low Reference

Inflatable Restraint Sensing and Diagnostic Module (SDM) X1





Connector Part Information

- OEM: 7287-1849-30
- Service: See Catalog
- Description: 24-Way F (BK)

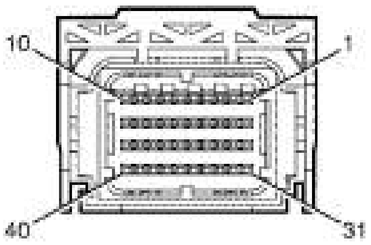
Terminal Part Information

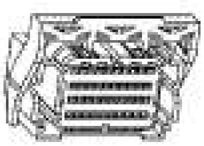
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Sensing and Diagnostic Module (SDM) X1

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	3020	Steering Wheel Module - Stage1 - Low Control
2	0.3 BN/RD	3021	Steering Wheel Module - Stage1 - High Control
3	0.3 WH	3023	Steering Wheel Module - Stage2 - High Control
4	0.3 PK	3022	Steering Wheel Module - Stage2 - Low Control
5	0.3 YE/BK	2138	Side Impact Module -LF - Low Control
6	0.3 BN	2137	Side Impact Module -LF - High Control
7-18	--	--	Not Used
19	0.3 GY	5045	Discriminating Sensor - Low Reference
20	0.3 D-GN	354	Discriminating Sensor - Signal
21	0.5 PK/BU	339	Ignition 1 Voltage
22	0.5 OG/YE	1340	Battery Positive Voltage
23	--	--	Not Used
24	0.5 BK/WH	1751	Ground

Inflatable Restraint Sensing and Diagnostic Module (SDM) X2





Connector Part Information

- OEM: 7287-1850-30
- Service: See Catalog
- Description: 40-Way F (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Sensing and Diagnostic Module (SDM) X2

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/BK	5019	Roof Rail Module - Left - High Control (LHD)
	0.5 PU/YE	5021	Roof Rail Module - Right - High Control (RHD)
2	0.5 PK	5020	Roof Rail Module - Left - Low Control (LHD)
	0.5 WH/BK	5022	Roof Rail Module - Right - Low Control (RHD)
3	0.5 WH/BK	5022	Roof Rail Module - Right - Low Control (LHD)
	0.5 PK	5020	Roof Rail Module - Left - Low Control (RHD)

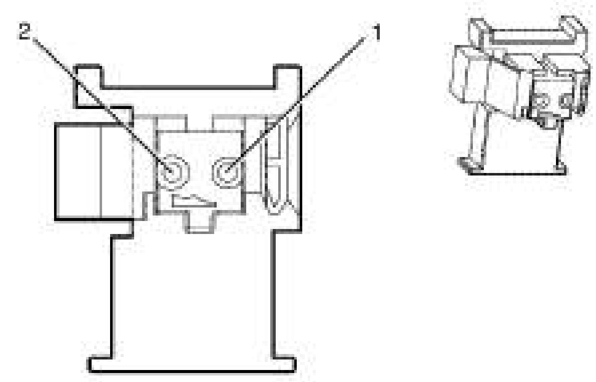
Inflatable Restraint Side Impact Module - Left X1



Connector Part Information

- OEM: CA-252-92-5-Q
- Service: See Catalog
- Description: 2-Way F (YE)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Side Impact Module - Left X1

Pin	Wire Color	Circuit No.	Function
1	0.3 BK/WH	2137	Side Impact Module - Left Front - High Control
2	0.3 L-GN	2138	Side Impact Module - Left Front - Low Control

Inflatable Restraint Side Impact Module - Left X2

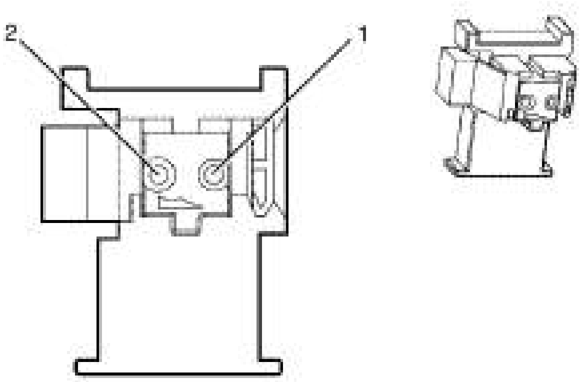
Terminal Part Information

- Terminal:
- Core/Insulation Crimp: N/A
- Release Tool/Test Probe: Ring Terminal

Inflatable Restraint Side Impact Module - Left X2

Pin	Wire Color	Circuit No.	Function
A	0.3 BK/WH	1751	Ground

Inflatable Restraint Side Impact Module - Right X1



Connector Part Information

- OEM: CA-252-92-5-Q
- Service: See Catalog
- Description: 2-Way F (YE)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Side Impact Module - Right X1

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	2135	Side Impact Module - Right Front - High Control
2	0.3 YE/BK	2136	Side Impact Module - Right Front - Low Control

Inflatable Restraint Side Impact Module - Right X2

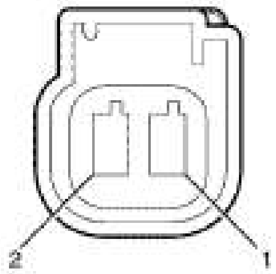
Terminal Part Information

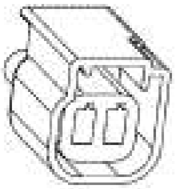
- Terminal:
- Core/Insulation Crimp: N/A
- Release Tool/Test Probe: Ring Terminal

Inflatable Restraint Side Impact Module - Right X2

Pin	Wire Color	Circuit No.	Function
A	0.3 BK/WH	1751	Ground

Inflatable Restraint Side Impact Sensor (SIS) - Left





Connector Part Information

- OEM: 7283-6291-30
- Service: See Catalog
- Description: 2-Way F (BK)

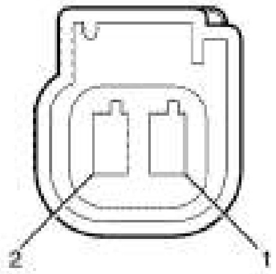
Terminal Part Information

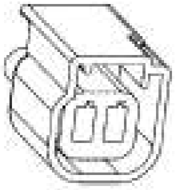
- Terminal/Tray: 7116-4102-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

Inflatable Restraint Side Impact Sensor (SIS) - Left

Pin	Wire Color	Circuit No.	Function
1	0.3 WH	2132	Side Impact Sensing Module - Left - Signal
2	0.3 PU/WH	6628	Side Impact Sensing Module - Left - Low Reference

Inflatable Restraint Side Impact Sensor (SIS) - Right





Connector Part Information

- OEM: 7283-6291-30
- Service: See Catalog
- Description: 2-Way F (BK)

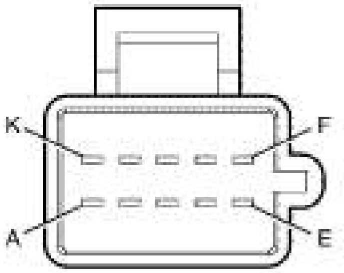
Terminal Part Information

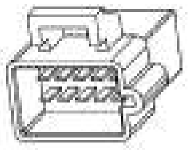
- Terminal/Tray: 7116-4102-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

Inflatable Restraint Side Impact Sensor (SIS) - Right

Pin	Wire Color	Circuit No.	Function
1	0.3 D-GN	2134	Side Impact Sensing Module - Right - Signal
2	0.3 WH/BK	6629	Side Impact Sensing Module - Right - Low Reference

Inflatable Restraint Steering Wheel Module Coil X1





Connector Part Information

- OEM: 7182-6974
- Service: See Catalog
- Description: 10-Way M (NA)

Terminal Part Information

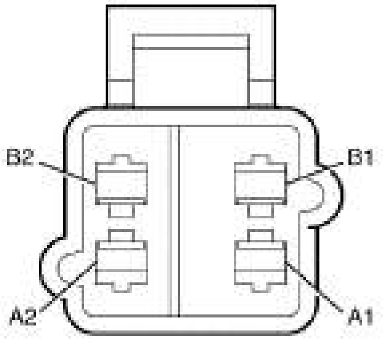
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-3 (GY)

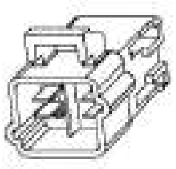
Inflatable Restraint Steering Wheel Module Coil X1

Pin	Wire Color	Circuit No.	Function
A	0.3 GY/BU	7367	Steering Wheel Resistor Ladder Right Signal #2
B	0.3 BN/GN	7364	Steering Wheel Resistor Ladder Right Signal #1

C	0.3 BN	7312	Steering Wheel Resistor Ladder Left Signal #1
D	0.3 L-BU	7313	Steering Wheel Resistor Ladder Left Signal #2
E	0.3 BN/WH	897	DIC Switch Low Reference
F	0.3 OG/BK	5201	Steering Wheel Controls Signal
G	0.3 BK	850	Ground
H	0.3 PU/WH	7005	I/P Dimming Control
J	0.3 BN/BK	28	Horn Relay Control
K	--	--	Not Used

Inflatable Restraint Steering Wheel Module Coil X2 (RHD)





Connector Part Information

- OEM: 7182-7297-70
- Service: See Catalog
- Description: 4-Way M (YE)

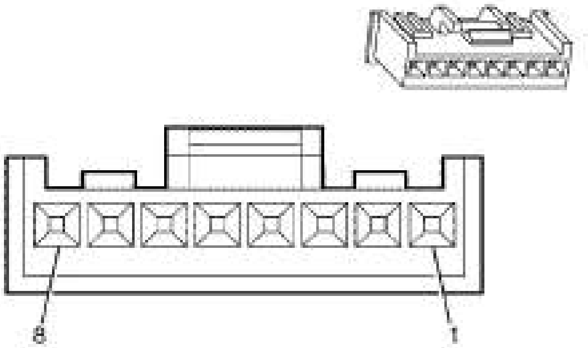
Terminal Part Information

- Terminal/Tray: 12034047/2
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 12094430/J-35616-5 (PU)

Inflatable Restraint Steering Wheel Module Coil X2 (RHD)

Pin	Wire Color	Circuit No.	Function
A1	0.3 BN/RD	3021	Steering Wheel Module - Stage1 - High Control
A2	0.3 BN	3020	Steering Wheel Module - Stage1 - Low Control
B1	0.3 WH	3023	Steering Wheel Module - Stage2 - High Control
B2	0.3 PK	3022	Steering Wheel Module - Stage2 - Low Control

Inflatable Restraint Steering Wheel Module Coil X2 (LHD)



- OEM: XMR-08V
- Service: See Catalog
- Description: 8-Way F (WH)

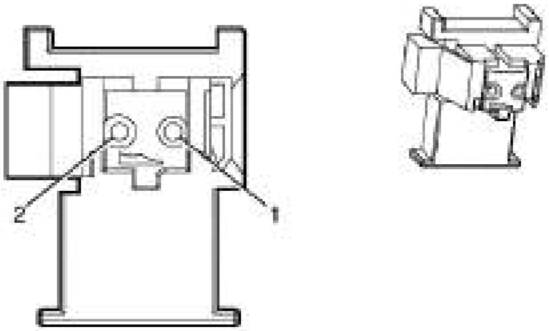
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Steering Wheel Module Coil X2 (LHD)

Pin	Wire Color	Circuit No.	Function
1	0.3 GY/BU	7367	Steering Wheel Resistor Ladder Right Signal #2
2	0.3 YE	7364	Steering Wheel Resistor Ladder Right Signal #1
3	0.3 BN	7312	Steering Wheel Resistor Ladder Left Signal #1
4	0.3 L-BU	7313	Steering Wheel Resistor Ladder Left Signal #2
5	0.3 D-GN	897	DIC Switch Low Reference
6	0.3 OG/BK	5201	Steering Wheel Controls Signal
7	0.3 BK	1551	Ground

Inflatable Restraint Steering Wheel Module X1



Connector Part Information

- OEM: CA-252-92-5-Q
- Service: See Catalog
- Description: 2-Way M (OG)

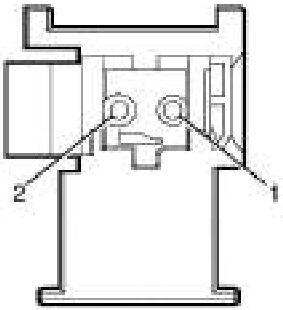
Terminal Part Information

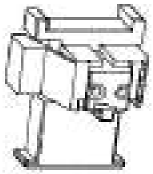
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inflatable Restraint Steering Wheel Module X1

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	3020	Steering Wheel Module - Stage1 - Low Control
2	0.3 TN	3021	Steering Wheel Module - Stage1 - High Control

Inflatable Restraint Steering Wheel Module X2





Connector Part Information

- OEM: CA-252-92-5-Q
- Service: See Catalog
- Description: 2-Way M (BU)

Terminal Part Information

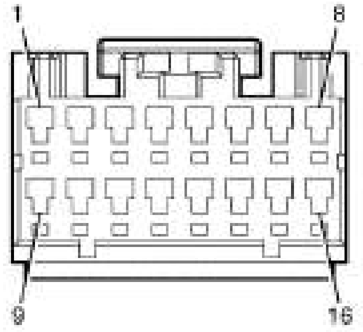
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

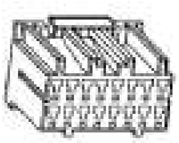
Inflatable Restraint Steering Wheel Module X2

Pin	Wire Color	Circuit No.	Function

1	0.3 PK	3022	Steering Wheel Module - Stage2 - Low Control
2	0.3 WH	3023	Steering Wheel Module - Stage2 - High Control

Inside Rearview Mirror (ISRVM) (UE1)





Connector Part Information

- OEM: 7283-1766-30
- Service: See Catalog
- Description: 16-Way F (BK)

Terminal Part Information

- Terminal/Tray: 175266-5/15
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Inside Rearview Mirror (ISRVM) (UE1)

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.3 D-GN	654	Cellular Telephone Microphone Low Reference
3-7	--	--	Not Used
8	0.3 BK	1450	Ground
9	0.5 L-GN	24	Backup Lamp Supply Voltage

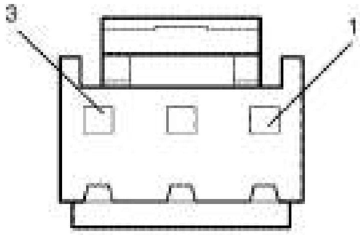
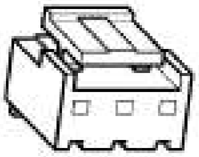
14	0.3 YE/BK	2516	Keypad Green LED Signal
15	0.3 BN/WH	2517	Keypad Red LED Signal
16	--	--	Not Used

Inside Rearview Mirror (ISRVM) (without UE1)





Connector Part Information

- OEM: 12124239
- Service: See Catalog
- Description: 3-Way F

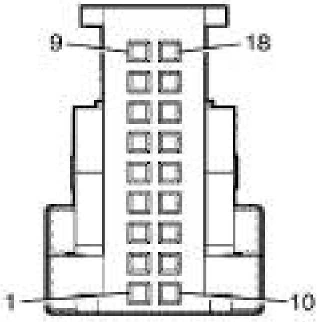
Terminal Part Information

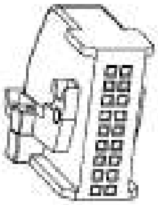
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Inside Rearview Mirror (ISRVM) (without UE1)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	443	Ignition Voltage 1
2	0.3 BK	1450	Ground
3	0.5 L-GN	24	Backup Lamp Supply Voltage

Instrument Panel Cluster





Connector Part Information

- OEM: 7219-1198-30
- Service: See Catalog
- Description: 18-Way F (BK)

Terminal Part Information

- Pins: 1, 9
- Terminal/Tray: 928999-5/15
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe:12094429/J-35616-64B (L-BU)

- Pins: 2-8, 10-18
- Terminal/Tray: 928999-5/15
- Core/Insulation Crimp: H/H
- Release Tool/Test Probe:12094429/J-35616-64B (L-BU)

Instrument Panel Cluster

Pin	Wire Color	Circuit No.	Function
1	0.5 OG/WH	1840	Battery Positive Voltage
2	0.3 GY	728	Security Indicator Control
3	0.3 D-BU	7148	Bluetooth Signal
4	--	--	Not Usedl
5	0.5 BN	185	Low Washer Fluid Indicator Signal
6	0.3 BN	7312	Left Steering Wheel Scroll 1

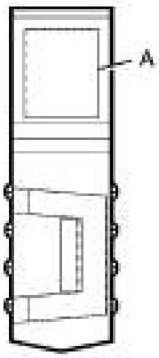
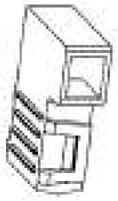
I/P Compartment Lamp X1





Connector Part Information

- OEM: 180984-5
- Service: See Catalog
- Description: 1-Way F

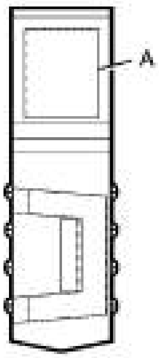
Terminal Part Information

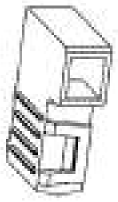
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

I/P Compartment Lamp X1

Pin	Wire Color	Circuit No.	Function
A	0.85 OG	1732	Courtesy Lamps Supply Voltage

I/P Compartment Lamp X2





Connector Part Information

- OEM: 180984-5
- Service: See Catalog

- Description: 1-Way F

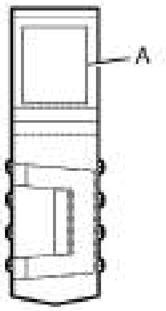
Terminal Part Information

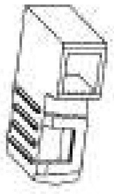
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

I/P Compartment Lamp X2

Pin	Wire Color	Circuit No.	Function
A	0.5 PU	175	Glove Box Lamp Control

I/P Compartment Lamp Switch X1





Connector Part Information

- OEM: 180984-5
- Service: See Catalog
- Description: 1-Way F

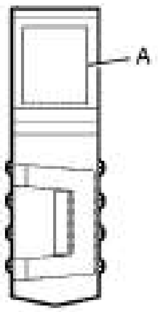
Terminal Part Information

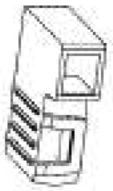
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

I/P Compartment Lamp Switch X1

Pin	Wire Color	Circuit No.	Function
A	0.5 PU	175	Glove Box Lamp Control

I/P Compartment Lamp Switch X2





Connector Part Information

- OEM: 180984-5
- Service: See Catalog
- Description: 1-Way F

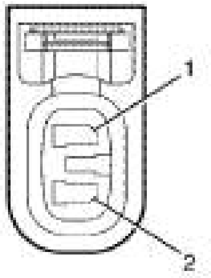
Terminal Part Information

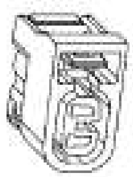
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

I/P Compartment Lamp Switch X2

Pin	Wire Color	Circuit No.	Function
A	0.5 BK/WH	1450	Ground

Intake Manifold Tuning (IMT) Solenoid Valve (LY7)





Connector Part Information

- OEM: 7283-8226-30
- Service: 88988587

- Description: 2-Way F 090 Class II Series Sealed (BK)

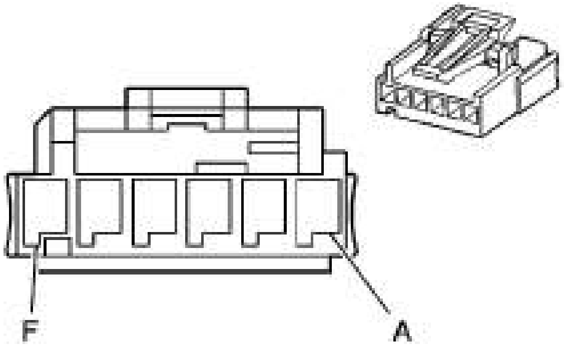
Terminal Part Information

- Terminal/Tray: 7116-4026/11
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 15313892/J-35616-18 (BK)

Intake Manifold Tuning (IMT) Solenoid Valve (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.75 PU/BK	5293	Ignition 1 Voltage
2	0.75 BN	1997	EVAP Canister Vent Solenoid Valve Low Reference

Internal Mode Switch (IMS)



Connector Part Information

- OEM: 15493189
- Service: See Catalog
- Description: 6-Way F (NA)

Terminal Part Information

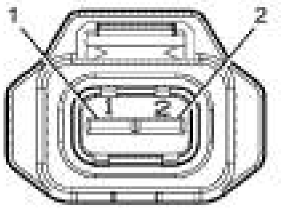
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

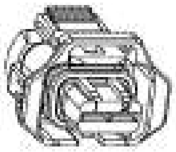
Internal Mode Switch (IMS)

Pin	Wire Color	Circuit No.	Function
A	0.5 BN	1786	Park/Neutral Signal
B	0.5 GY	776	Transmission Range Switch Signal P
C	0.5 BK	772	Transmission Range Switch Signal B
D	0.5 RD	771	Transmission Range Switch Signal A
E	0.5 D-BU	773	Transmission Range Switch Signal C

F	0.5 D-GN	450	Ground

Knock Sensor (KS) 1 (LY7)





Connector Part Information

- OEM: 7283-6205-30
- Service: See Catalog
- Description: 2-Way F (BK)

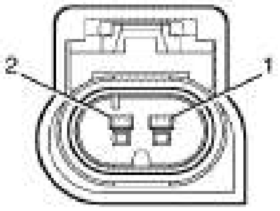
Terminal Part Information

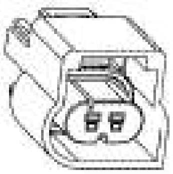
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Knock Sensor (KS) 1 (LY7)

Pin	Wire Color	Circuit No.	Function
1	0.5 D-BU	496	Knock Sensor 1 Signal
2	0.5 GY	1716	Low Reference Knock Sensor Signal Return

Knock Sensor (KS) 1 (L98 or HSV)





Connector Part Information

- OEM: 7283-3954
- Service: See Catalog
- Description: 2-Way F

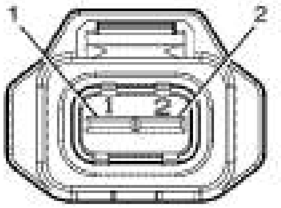
Terminal Part Information

- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Knock Sensor (KS) 1 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
1	0.5 D-BU	496	Knock Sensor 1 Signal
2	0.5 GY	1716	Low Reference Knock Sensor Signal Return

Knock Sensor (KS) 2 (LY7)



Connector Part Information

- OEM: 7283-6205-30
- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

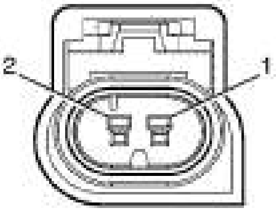
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

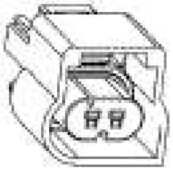
Knock Sensor (KS) 2 (LY7)

Pin	Wire Color	Circuit No.	Function

1	0.5 L-BU	1876	Knock Sensor 2 Signal
2	0.5 BN	407	Low Reference Knock Sensor Signal Return

Knock Sensor (KS) 2 (L98 or HSV)





Connector Part Information

- OEM: 7283-3954
- Service: See Catalog
- Description: 2-Way F

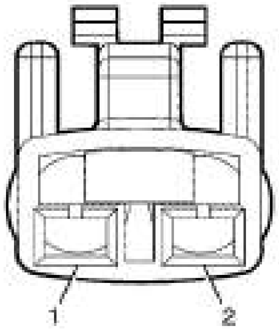
Terminal Part Information

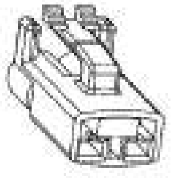
- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Knock Sensor (KS) 2 (L98 or HSV)

Pin	Wire Color	Circuit No.	Function
1	0.5 L-BU	1876	Knock Sensor 2 Signal
2	0.5 TN	407	Low Reference Knock Sensor Signal Return

License Lamp - Left





Connector Part Information

- OEM: 1897280-2
- Service: See Catalog
- Description: 2-Way F (BK)

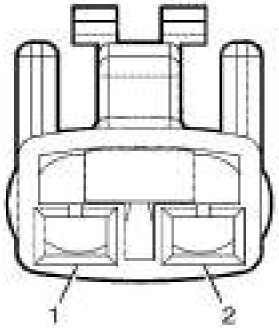
Terminal Part Information

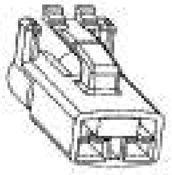
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

License Lamp - Left

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/WH	309	Right Park Lamp Supply Voltage
2	0.5 BK	1350	Ground

License Lamp - Right





Connector Part Information

- OEM: 1897280-2

- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

License Lamp - Right

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/WH	309	Right Park Lamp Supply Voltage
2	0.5 BK	1350	Ground

LPG Control Module

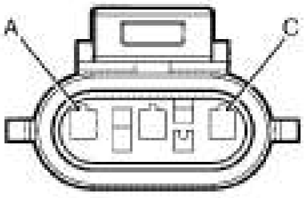
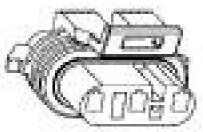
4	0.5 WH	--	Fuel Level Input

Manifold Absolute Pressure (MAP) Sensor (L98)





Connector Part Information

- OEM: 7283-7938-30
- Service: See Catalog
- Description:

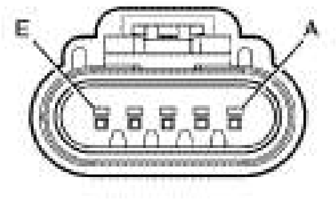
Terminal Part Information

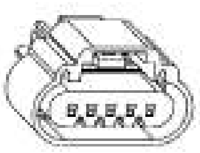
- Terminal/Tray: 1928498056/8
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-561/J-35616-35 (VT)

Manifold Absolute Pressure (MAP) Sensor (L98)

Pin	Wire Color	Circuit No.	Function
A	0.5 OG/BK	469	Low Reference
B	0.5 L-GN	432	MAP Sensor Signal
C	0.5 GY	2704	5-Volt Reference

Mass Air Flow (MAF) / Intake Air Temperature (IAT) Sensor





Connector Part Information

- OEM: 7283-6997-30
- Service: See Catalog
- Description: 5-Way F (BK)

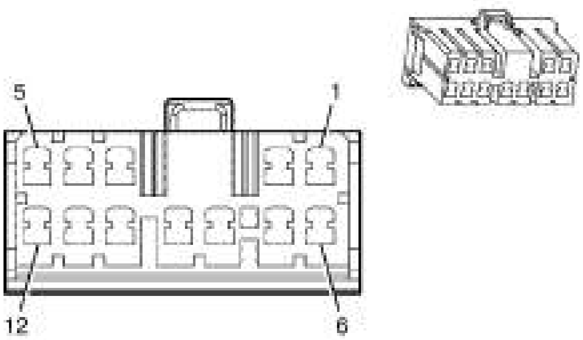
Terminal Part Information

- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Mass Air Flow (MAF) / Intake Air Temperature (IAT) Sensor

Pin	Wire Color	Circuit No.	Function
A	0.5 YE	492	MAF Sensor Signal
B	0.5 PK	439	Ignition 1 Voltage
C	0.5 BK	450	Ground
D	0.5 BN/RD	472	IAT Sensor Signal
E	0.5 BN/WH	2760	Low Reference

Memory Seat Module - Driver X1



Connector Part Information

- OEM: 173851-1
- Service: See Catalog
- Description: 12-Way F

Terminal Part Information

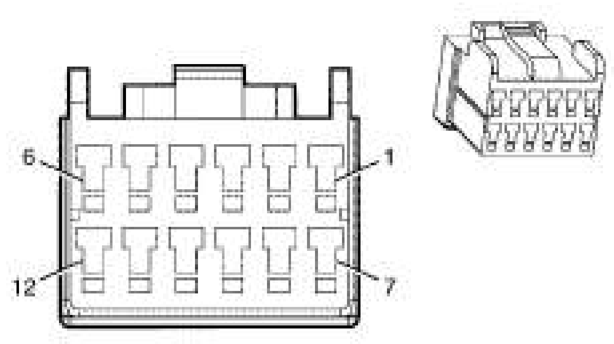
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Memory Seat Module - Driver X1

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.85 GY/RD	285	Driver Seat Horizontal Motor Forward Control
3	0.85 D-BU	283	Driver Seat Rear Vertical Motor Down Control
4	0.85 D-GN/YE	282	Driver Seat Rear Vertical Motor Up Control
5	1.25 RD/BK	4740	Seat Module Supply Voltage
6	--	--	Not Used
7	0.85 BN	286	Driver Seat Front Vertical Motor Up Control
8	0.85 D-BU/RD	287	Driver Seat Front Vertical Motor Down Control
9	0.85 GY	284	Driver Seat Horizontal Motor Rearward Control

10	0.5 BK/OG	1350	Ground
11	1.25 BK	1350	Ground
12	0.3 D-BU/GN	1674	Driver Power Seat Select Switch Signal

Memory Seat Module - Driver X2



Connector Part Information

- OEM: 174045-2
- Service: See Catalog
- Description: 12-Way

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Memory Seat Module - Driver X2

Pin	Wire Color	Circuit No.	Function
1	0.3 D-GN/BN	570	Driver Seat Recline Motor Position Sensor Signal
2-5	--	--	Not Used
6	0.85 YE	276	Recline Forward Switch Signal

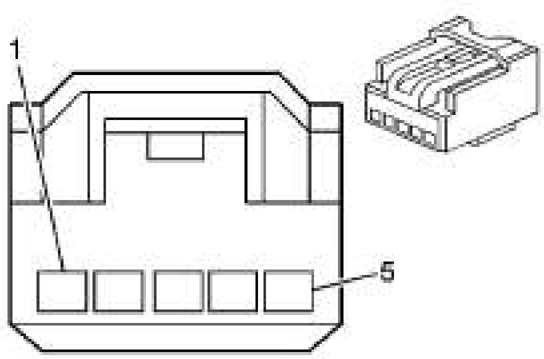
16	0.5 BK/GY	2851	Memory Mirror Ground

Mode Actuator - Left



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

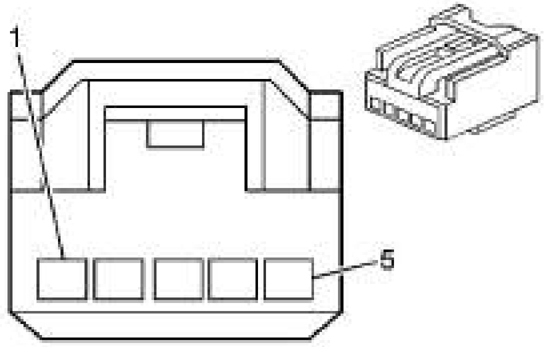
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Mode Actuator - Left

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	2273	Mode Actuator 1 - Power
2	0.3 BK	119	Mode Actuator 1 - Control
3	0.3 D-BU	1791	Low Reference
4	0.3 GY	2275	Mode Actuator 1 - Feedback
5	0.3 D-GN	474	5-Volt Reference

Mode Actuator - Right



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

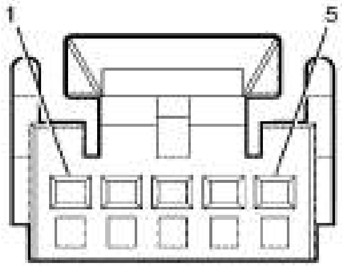
Terminal Part Information

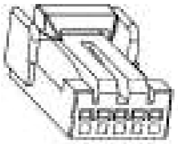
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Mode Actuator - Right

Pin	Wire Color	Circuit No.	Function
1	0.3 L-GN	2210	Mode Actuator 2 - Power
2	0.3 OG	1791	Mode Actuator 2 - Control
3	0.3 L-BU	720	Low Reference
4	0.3 RD	1899	Mode Actuator 2 - Feedback
5	0.3 PK	1236	5-Volt Reference

Mode Actuator - Auxiliary (C63)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 5-Way F

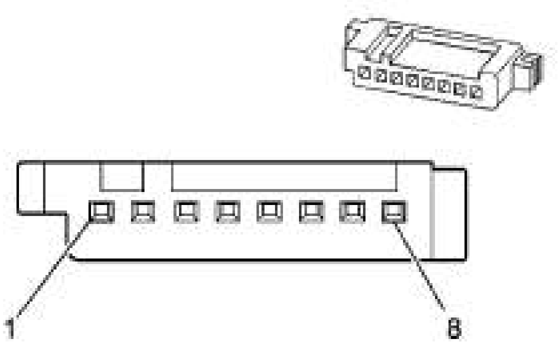
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Mode Actuator - Auxiliary (C63)

Pin	Wire Color	Circuit No.	Function
1	0.3 D-GN/BU	6555	Mode Actuator Rear - Power
2	0.3 D-GN/RD	6556	Mode Actuator Rear - Control
3	0.3 D-GN/YE	645	Low Reference
4	0.3 D-GN/WH	6558	Mode Actuator Rear - Feedback
5	0.3 D-GN/OG	5718	5-Volt Reference

Multifunction Switch - Center Console



Connector Part Information

- OEM: 7119-1306
- Service: See Catalog
- Description: 8-Way F (WH)

Terminal Part Information

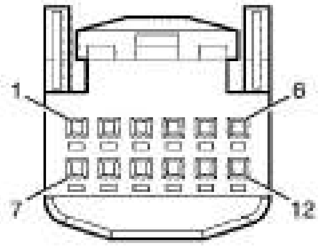
- Terminal/Tray: 928999-5/15
- Core/Insulation Crimp: H/H
- Release Tool/Test Probe: 12094429/J-35616-64B (L-BU)

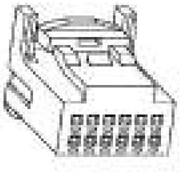
Multifunction Switch - Center Console

Pin	Wire Color	Circuit No.	Function
1	0.3 YE	6817	LED Backlight Dimming Control
2	0.3 BK	850	Ground
3	0.3 L-BU	553	Tow/Haul Switch Signal
4	--	--	Not Used
5	0.3 BN/OG	1571	Traction Control Switch Signal
6	0.3 GY	2555	Object Detection Disable Signal
7	0.3 BN	5852	Instrument Panel Lamp Supply Voltage

8	0.3 PU/WH	6816	Object Detection Disable Signal

Navigation Gateway Module (RHD)





Connector Part Information

- OEM: 1318774-1
- Service: See Catalog
- Description: 12-Way F

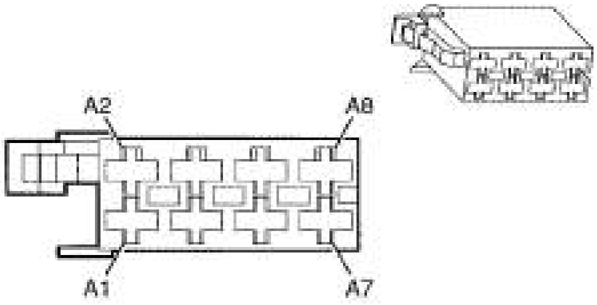
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Gateway Module (RHD)

Pin	Wire Color	Circuit No.	Function
1	0.3 BN	1171	Navigation Display Serial Data High
2	0.3 OG	2354	Navigation Display Serial Data High
3	0.85 OG	5748	Mute Signal
4	--	--	Not Used
5	0.5 L-GN	5060	Low Speed GMLAN Serial Data
6	0.85 OG/WH	2340	Battery Positive Voltage
7	0.3 YE	1219	Navigation Display Serial Data Low
8	0.3 YE	1491	Backlight Lamps Control
9-11	--	--	Not Used
12	0.5 BK/WH	1050	Ground

Navigation Module X1 (RHD)



Connector Part Information

- OEM: 962189-1
- Service: See Catalog
- Description: 8-Way F (GY)

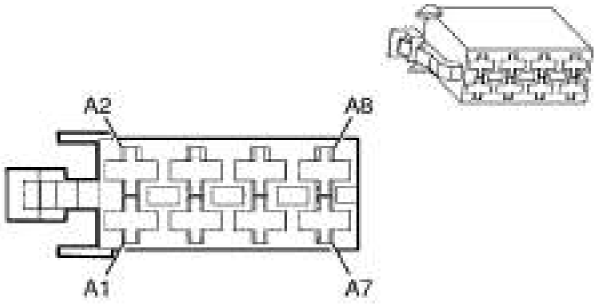
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X1 (RHD)

Pin	Wire Color	Circuit No.	Function
A1-A3	--	--	Not Used
A4	0.85 OG/WH	2340	Battery Positive Voltage
A5	--	--	Not Used
A6	0.3 YE	1491	Backlight Lamps Control
A7	0.3 OG	2354	Navigation Control Signal
A8	0.85 BK/WH	1050	Ground

Navigation Module X2 (RHD)



Connector Part Information

- OEM: 962191-1
- Service: See Catalog
- Description: 8-Way F (TN)

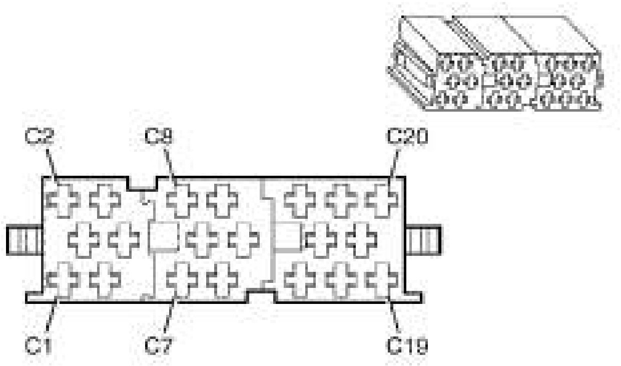
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp:See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X2 (RHD)

Pin	Wire Color	Circuit No.	Function
A1-A4	--	--	Not Used
A5	0.3 PK/BK	2062	Navigation Mono Audio Signal (+)
A6	0.3 OG/BK	2061	Navigation Mono Audio Signal (-)
A7-A8	--	--	Not Used

Navigation Module X3 (RHD)



Connector Part Information

- OEM: 30220317
- Service: See Catalog
- Description: 20-Way F

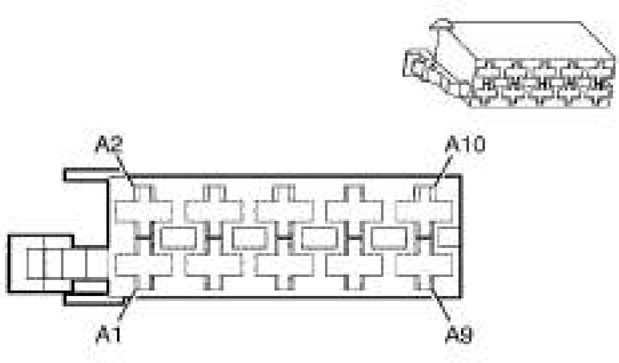
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X3 (RHD)

Pin	Wire Color	Circuit No.	Function
C1-C6	--	--	Not Used
C7	0.3 BN	1171	Navigation Display Serial Data High
C8	0.3 YE	1219	Navigation Display Serial Data Low
C9-C20	--	--	Not Used

Navigation Module X4 (RHD)



Connector Part Information

- OEM: 962190-1
- Service: See Catalog
- Description:10-Way F (BK)

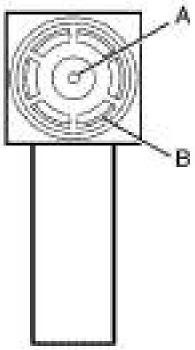
Terminal Part Information

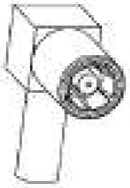
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X4 (RHD)

Pin	Wire Color	Circuit No.	Function
A1-A3	--	--	Not Used
A4	0.85 OG	5748	Mute Signal
A5-A10	--	--	Not Used

Navigation Module X5 (RHD)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way

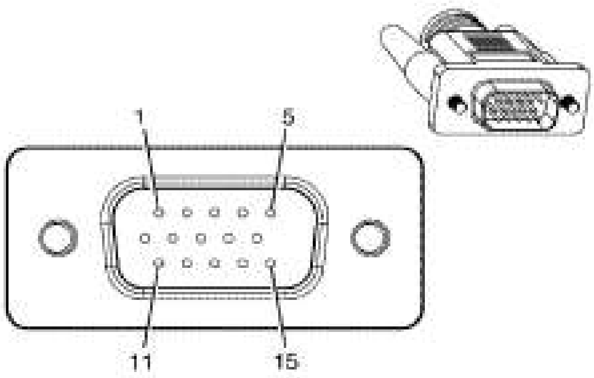
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp:See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X5 (RHD)

Pin	Wire Color	Circuit No.	Function
A	0.5 OG	5174	Antenna Signal
B	0.5 GY	5175	Drain Wire

Navigation Module X6 (RHD)



Connector Part Information

- OEM: 06031501440

- Service: See Catalog
- Description: 15-Way

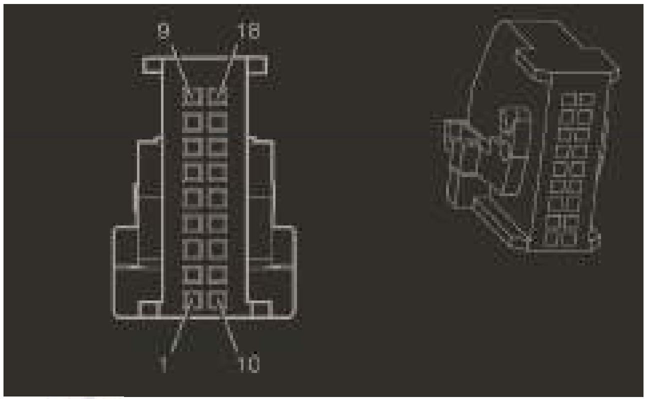
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X6 (RHD)

Pin	Wire Color	Circuit No.	Function
1	0.3 RD	2047	Video Connector - R
2	0.3 D-GN	2048	Video Connector - G
3	0.3 WH	2049	Video Connector - B
4	0.3 BK	5231	Ground
5	0.3 YE	2045	Video Connector - Sync
6	0.3 BK	5346	Drain Wire

Navigation Module X7 (RHD)



Connector Part Information

- OEM: 7219-1198-30
- Service: See Catalog
- Description:

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Navigation Module X7 (RHD)

Pin	Wire Color	Circuit No.	Function
1	0.3 WH		Video Connector - B

2	--	--	Not Used

1	0.3 D-BU	2374	Object Sensor Supply Voltage
2	0.3 GY	2379	Object Sensor Low Reference
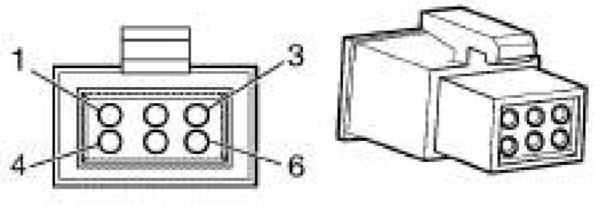
3	0.3 D-GN	2377	RR Middle Object Sensor Signal

Oil Pressure Gauge



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

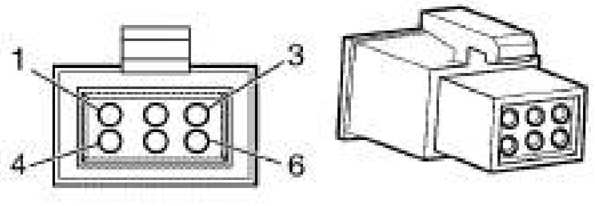
Terminal Part Information

- Terminal/Tray: See Terminal Repai Kit
- Core/Insulation Crimp: See Terminal Repai Kit
- Release Tool/Test Probe: See Terminal Repai Kit

Oil Pressure Gauge

Pin	Wire Color	Circuit No.	Function
1	0.3 YE		Low Speed GMLAN Serial Data
2	0.3 D-BU		Ground
3	0.3 D-BU/RD		Battery Positive Voltage
4	0.3 YE		Low Speed GMLAN Serial Data
5	0.3 D-BU		Ground
6	0.3 D-BU/RD		Battery Positive Voltage

Oil Temperature Gauge



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

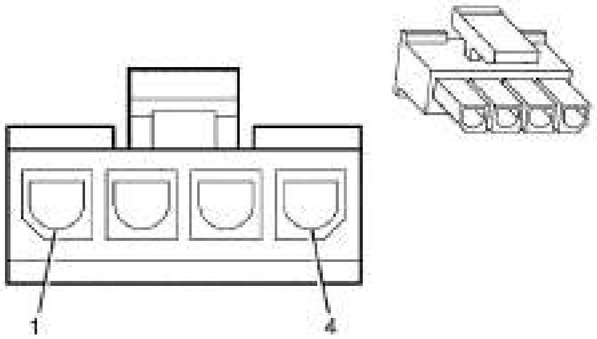
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Oil Temperature Gauge

Pin	Wire Color	Circuit No.	Function
1	0.3 YE		Low Speed GMLAN Serial Data
2	0.3 D-BU		Ground
3	0.3 D-BU/RD		Battery Positive Voltage
4	0.3 YE		Low Speed GMLAN Serial Data
5	0.3 D-BU		Ground
6	0.3 D-BU		Battery Positive Voltage

Outside Moisture Sensor



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 4-Way

Terminal Part Information

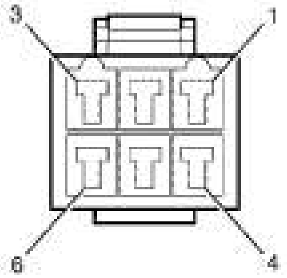
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit

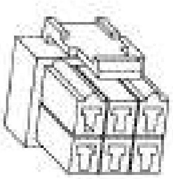
- Release Tool/Test Probe: See Terminal Repair Kit

Outside Moisture Sensor

Pin	Wire Color	Circuit No.	Function
1	0.3 L-GN		Outside Moisture Sensor Signal 2
2	0.3 BN		Outside Moisture Sensor Signal 1
3	0.5 BK/WH		Ground
4	0.5 BN		Ignition Voltage 1

Outside Rearview Mirror - Driver





Connector Part Information

- OEM: 7183-9618
- Service: See Catalog
- Description: 6-Way F (WH)

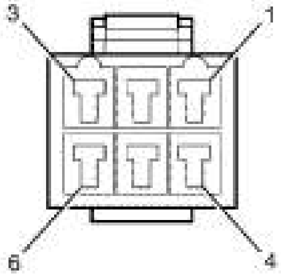
Terminal Part Information

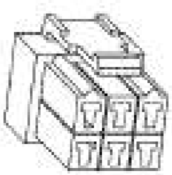
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Outside Rearview Mirror - Driver

Pin	Wire Color	Circuit No.	Function
1	0.5 WH	7391	Power Window Switch Right and Up
2	0.5 WH/BK	81	Driver Mirror Motor Right Control
3	0.5 BN	5998	Puddle Lamp Supply Voltage
4	0.5 L-GN/BK	89	Driver Mirror Motor Down Control
5	--	--	Not Used
6	0.5 BK	2050	Ground

Outside Rearview Mirror - Passenger





Connector Part Information

- OEM: 7183-9618
- Service: See Catalog
- Description: 6-Way F (WH)

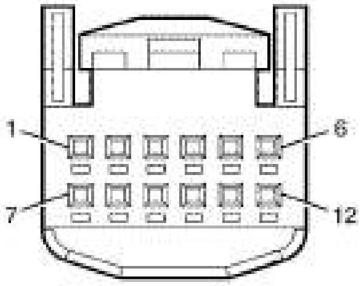
Terminal Part Information

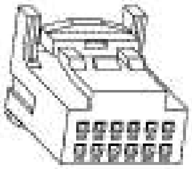
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Outside Rearview Mirror - Passenger

Pin	Wire Color	Circuit No.	Function
1	0.5 WH/BU	7391	Power Window Switch Right and Up
2	0.5 OG/WH	881	Passenger Mirror Motor Right Control
3	0.5 BN	5998	Puddle Lamp Supply Voltage
4	0.5 PU/WH	889	Passenger Mirror Motor Down Control
5	--	--	Not Used
6	0.5 BK	1350	Ground

Outside Rearview Mirror Switch





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 12-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Outside Rearview Mirror Switch

Pin	Wire Color	Circuit No.	Function
1	0.3 YE/GN	7006	Mirror Control Signal
2	--	--	Not Used
3	0.5 WH	1514	Left Mirror Switch Down Signal
4	0.5 D-BU	1513	Right Mirror Switch Right Signal
5	0.5 RD	5477	Switch Voltage
6	0.5 BK	5478	Ground
7	0.5 OG	1512	Left Mirror Switch Right Signal
8	0.3 YE	5636	Left/Right Mirror Selector Switch Signal
9	0.5 D-GN	1515	Right Mirror Switch Down Signal
10	0.5 BK/GN	2851	Memory Mirror Ground
11	--	--	Not Used

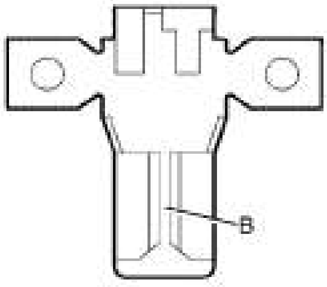
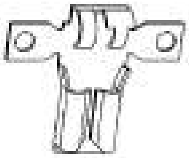
Park Brake Switch





Connector Part Information

- OEM: 175193-1
- Service: See Catalog
- Description: 2-Way F (SR)

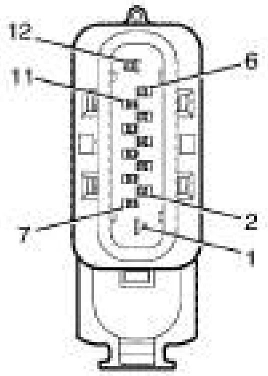
Terminal Part Information

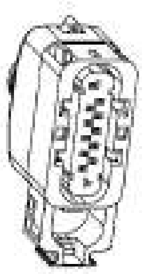
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Park Brake Switch

Pin	Wire Color	Circuit No.	Function
B	0.85 OG/BK	233	Park Brake Switch Signal

Park/Neutral Position (PNP) Switch (M30 or M32)





Connector Part Information

- OEM: 15416722
- Service: See Catalog
- Description: 12-Way F

Terminal Part Information

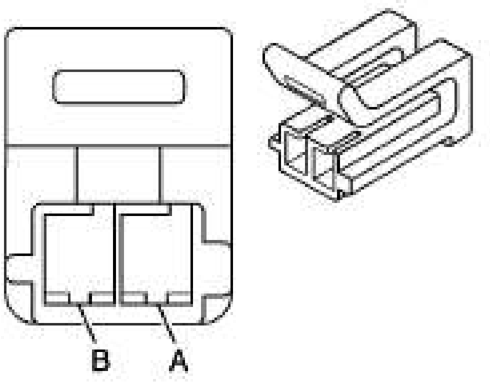
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Park/Neutral Position (PNP) Switch (M30 or M32)

Pin	Wire Color	Circuit No.	Function
1-2	--	--	Not Used
3	0.5 OG/BK	1786	Park/Neutral Signal
4	0.5 YE	772	Transmission Range Switch Signal B
5	0.5 BN/YE	771	Transmission Range Switch Signal A
6	0.5 GY	773	Transmission Range Switch Signal C

7	0.75 BK	450	Ground
8	0.5 WH	776	Transmission Range Switch Signal P
9-12	--	--	Not Used

Pressure Control (PC) Solenoid Valve



Connector Part Information

- OEM: 12146094
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Sealed, Pull To Seat (GY)

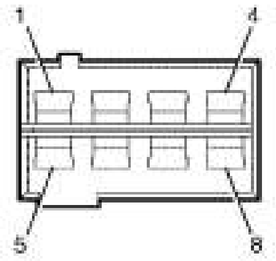
Terminal Part Information

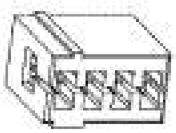
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Pressure Control (PC) Solenoid Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 D-GN	1228	PC Solenoid Valve High Control
B	0.5 WH	1229	PC Solenoid Valve Low Control

Radio X1





Connector Part Information

- OEM: 7183-2325-30
- Service: See Catalog
- Description: 8-Way F (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Radio X1

Pin	Wire Color	Circuit No.	Function
1	0.5 L-BU	115	Right Rear Speaker Output (-) (U65 or UW5)
	0.5 BN/BU	1946	Right Rear Speaker Output (-) (UQ7)
2	0.5 D-GN	117	Right Front Speaker Output (-) (U65 or UW5)

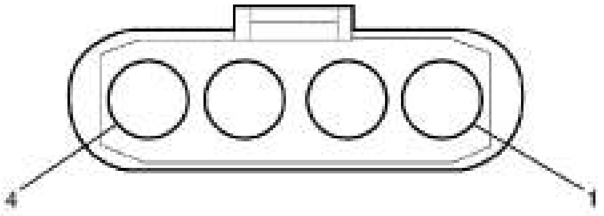
Rail Pressure/Temperature Sensor (LPG)



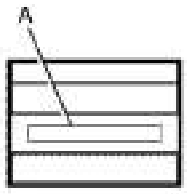
Connector Part Information

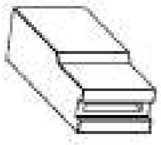
Terminal Part Information

Rail Pressure / Temperature Sensor (LPG)

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	--	Ground
2	0.5 GN	--	Relay Controlled Voltage
3	0.75 RD	--	+5 Voltage Input
4	0.5 WH	--	Gas Temperature Signal

Rear Compartment Courtesy Lamp X1





Connector Part Information

- OEM: 7123-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

Terminal Part Information

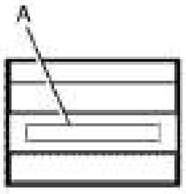
- Terminal/Tray: See Terminal Repair Kit

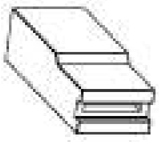
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Compartment Courtesy Lamp X1

Pin	Wire Color	Circuit No.	Function
A	0.85 OG	1732	Courtesy Lamps Supply Voltage

Rear Compartment Courtesy Lamp X2





Connector Part Information

- OEM: 7123-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

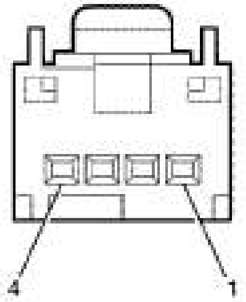
Terminal Part Information

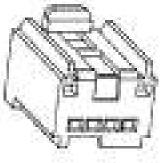
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Compartment Courtesy Lamp X2

Pin	Wire Color	Circuit No.	Function
A	0.5 D-BU	737	Rear Compartment Lamp Control

Rear Compartment Lid Latch





Connector Part Information

- OEM: 7283-9909-30
- Service: See Catalog
- Description: 4-Way F (BK)

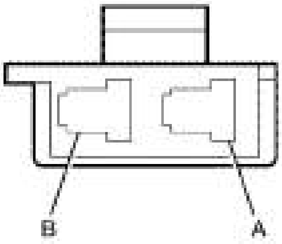
Terminal Part Information

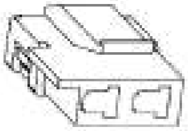
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Compartment Lid Latch

Pin	Wire Color	Circuit No.	Function
1	0.3 OG/BK	744	Rear Compartment Lid Ajar Switch Signal
2	0.5 D-BU	737	Rear Compartment Lamp Control
3	0.85 BN/WH	56	Rear Compartment Lid Release Actuator
4	0.85 BK	1850	Ground

Rear Compartment Lid Release Switch





Connector Part Information

- OEM: 7123-9610
- Service: See Catalog
- Description: 2-Way F (WH)

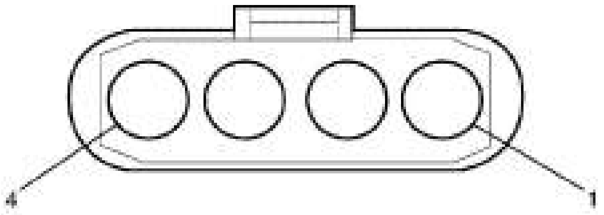
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Compartment Lid Release Switch

Pin	Wire Color	Circuit No.	Function
A	0.5 D-BU	6189	Rear Compartment Relay Switch
B	0.5 BK/WH	1450	Ground

Rear Lock-Off/Service Solenoid Assembly (LPG)



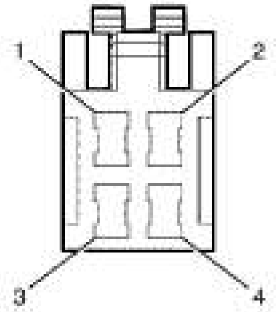
Connector Part Information

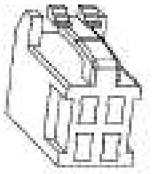
Terminal Part Information

Rear Lock-Off/Service Solenoid Assembly (LPG)

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	--	Ground
2	0.5 GN	--	Relay Controlled Voltage
3	0.75 WH	--	Fuel Level Output
4	0.5 BKGN	--	Rear Lock-Off Control

Rear Object Sensor Control Module Connector





Connector Part Information

- OEM: 7282-1040
- Service: See Catalog
- Description: 4-Way M 090 II Series (NA)

Terminal Part Information

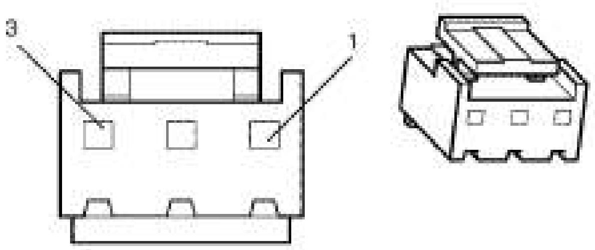
- Pins: 1, 3
- Terminal/Tray: 7114-4020/10
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

- Pin: 2
- Terminal/Tray: 7114-4021/10
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

Rear Object Sensor Control Module Connector

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/BU	343	Accessory Voltage
2	0.85 L-GN	24	Backup Lamp Supply Voltage
3	0.5 BK	1650	Ground
4	--	--	Not Used

Rear Park Assist Module X2



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

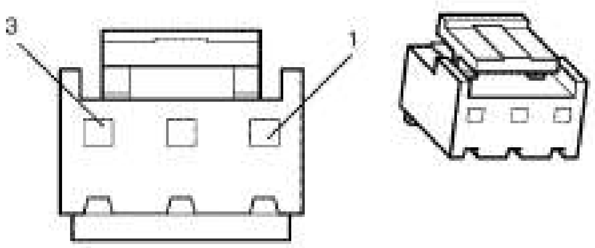
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Module X2

Pin	Wire Color	Circuit No.	Function
1	1 BK		Ground
2	2 RD		Ultrasonic signal
3	--	--	Not Used

Rear Park Assist Module X3



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

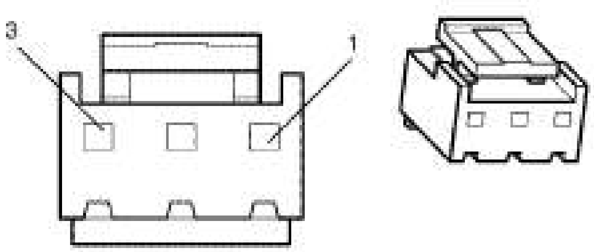
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Module X3

Pin	Wire Color	Circuit No.	Function
1	3 BK		Ground
2	4 RD		Ultrasonic signal
3	--	--	Not Used

Rear Park Assist Module X4



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

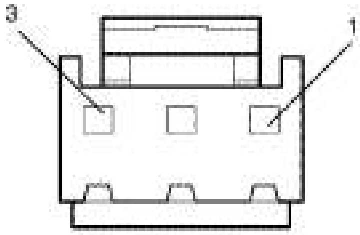
Terminal Part Information

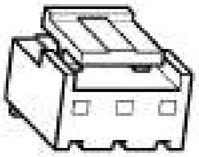
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Module X4

Pin	Wire Color	Circuit No.	Function
1	5 BK		Ground
2	6 RD		Ultrasonic signal
3	--	--	Not Used

Rear Park Assist Module X5





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

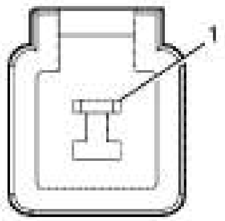
Terminal Part Information

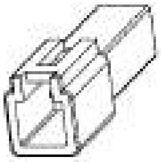
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Module X5

Pin	Wire Color	Circuit No.	Function
1	7 BK		Ground
2	8 RD		Ultrasonic signal
3	--	--	Not Used

Rear Park Assist Ground Connector X1





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 1-Way F

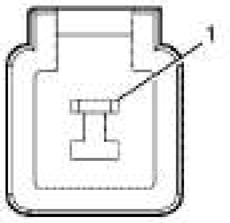
Terminal Part Information

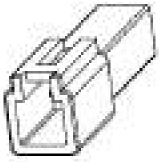
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Ground Connector X1

Pin	Wire Color	Circuit No.	Function
1	8 BK		Ground

Rear Park Assist Ground Connector X2





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 1-Way F

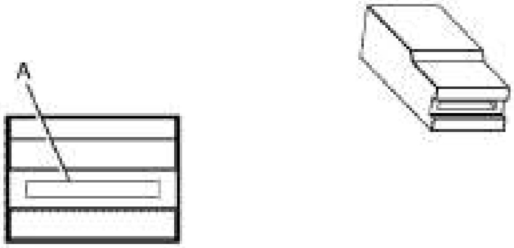
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Park Assist Ground Connector X2

Pin	Wire Color	Circuit No.	Function
1	8 BK		Ground

Rear Window Defogger Grid X1



Connector Part Information

- OEM: 7183-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

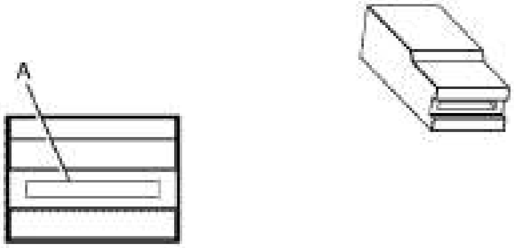
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Window Defogger Grid X1

Pin	Wire Color	Circuit No.	Function
A	3 PU	293	Rear Defog Element Supply Voltage

Rear Window Defogger Grid X2



Connector Part Information

- OEM: 7183-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

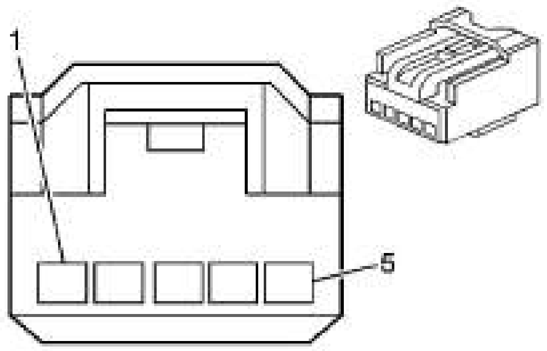
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Rear Window Defogger Grid X2

Pin	Wire Color	Circuit No.	Function
A	3 BK	1650	Ground

Recirculation Actuator



Connector Part Information

- OEM: 7283-5830-30
- Service: See Catalog
- Description: 5-Way F Yazaki (BK)

Terminal Part Information

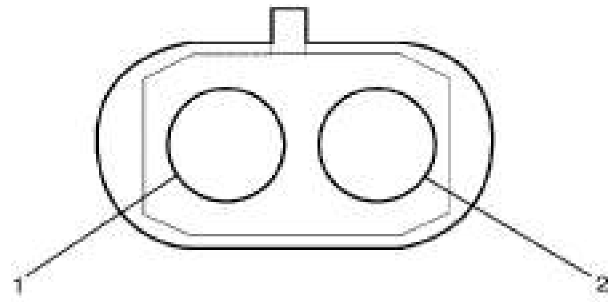
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Recirculation Actuator

Pin	Wire Color	Circuit No.	Function
1	0.3 WH/BU	1614	Recirculation Door Control B
2	0.3 WH/BK	2274	Recirculation Door Control Circuit
3	0.3 D-BU/BK	718	Low Reference
4	0.3 WH/RD	1838	Recirculation Door Position Signal

5	0.3 WH/GN	597	5-Volt Reference

Regulator Temperature Sensor (LPG)



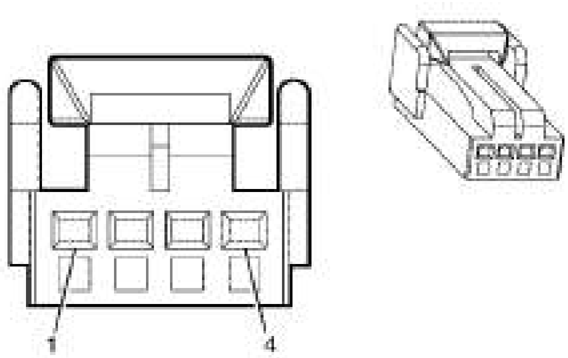
Connector Part Information

Terminal Part Information

Regulator Temperature Sensor (LPG)

Pin	Wire Color	Circuit No.	Function
1	0.5 BU	--	Ground
2	0.5 YE	--	Regulator Temperature Signal

Remote Control Door Lock Receiver (RCDLR)



Connector Part Information

- OEM: 7119-1142-60
- Service: See Catalog
- Description: 4-Way F (GN)

Terminal Part Information

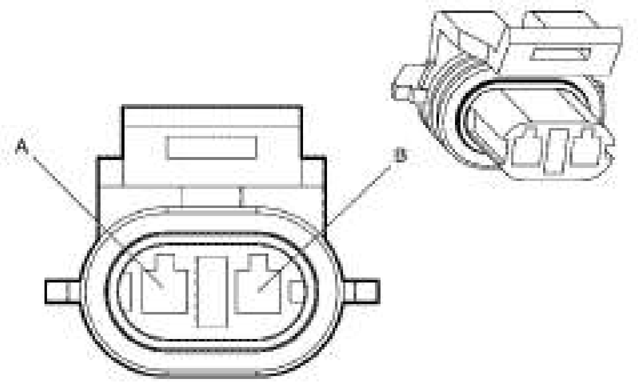
- Pins: 1, 4
- Terminal/Tray: IL-AG5-C1-5000/20
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe: J-38125-211/J-35616-64B (L-BU)

- Pin: 2
- Terminal/Tray: IL-AG5-C1-5000/20
- Core/Insulation Crimp: K/K
- Release Tool/Test Probe: J-38125-211/J-35616-64B (L-BU)

Remote Control Door Lock Receiver (RCDLR)

Pin	Wire Color	Circuit No.	Function
1	0.5 OG/WH	1840	Battery Positive Voltage
2	0.35 D-GN	5060	Low Speed GMLAN Serial Data
3	--	--	Not Used
4	0.5 BK	1650	Ground

Reverse Lockout Solenoid (L98 or HSV)



Connector Part Information

- OEM: 12052646
- Service: See Catalog
- Description: 2-Way F

Terminal Part Information

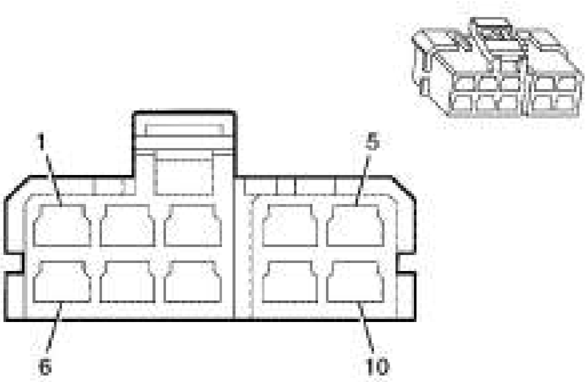
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Reverse Lockout Solenoid (L98 or HSV or LS2)

Pin	Wire Color	Circuit No.	Function

A	0.75 L-GN	1652	Reverse Lockout Solenoid Control
B	0.75 PK/BK	5705	Reverse Lockout Solenoid Battery Power

Seat Adjuster Switch - Driver (AG3 or AGB)



Connector Part Information

- OEM: PH56510040
- Service: See Catalog
- Description: 10-Way F

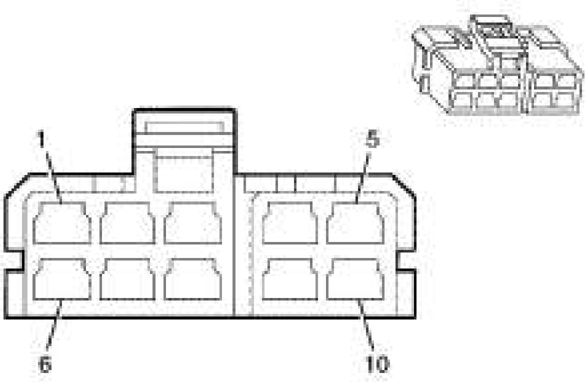
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Adjuster Switch - Driver (AG3 or AGB)

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.3 BN/RD	1269	Driver Seat Recline Motor Forward Control
3	0.3 TN	1522	Driver Seat Horizontal Motor Rearward Control
4	0.3 BN/WH	1270	Driver Seat Recline Motor Rearward Control
5	0.3 BN/GN	1674	Reference Voltage
6	0.3 D-GN/BU	1523	Driver Seat Horizontal Motor Forward Control
7	0.3 RD/WH	1520	Driver Seat Front Vertical Motor Down Control
8	0.3 YE/BU	1521	Driver Seat Rear Vertical Motor Down Control
9	0.3 PK	1519	Driver Seat Rear Vertical Motor Up Control
10	0.3 BK/BU	1518	Driver Seat Front Vertical Motor Up Control

Seat Adjuster Switch - Driver (AH6 or AJ6)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 10-Way

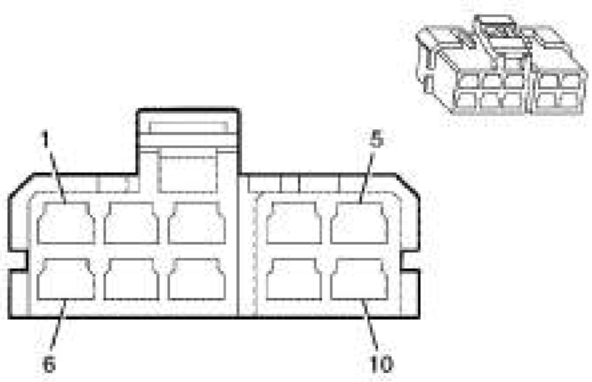
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Adjuster Switch - Driver (AH6 or AJ6)

Pin	Wire Color	Circuit No.	Function
1	2 OG	1140	Battery Positive Voltage
2	2 BK	2050	Ground (LHD)
	2 BK	1350	Ground (RHD)
3	2 D-GN	286	Driver Seat Front Vertical Motor Up Control
4	2 D-BU	287	Driver Seat Front Vertical Motor Down Control
5	2 YE	282	Driver Seat Rear Vertical Motor Up Control
6	2 L-BU	283	Driver Seat Rear Vertical Motor Down Control
7	2 TN	285	Driver Seat Horizontal Motor Forward Control
8	2 L-GN	284	Driver Seat Horizontal Motor Rearward Control
9	2 L-GN	276	Driver Seat Recline Motor Forward Control
10	2 L-BU	277	Driver Seat Recline Motor Rearward Control

Seat Adjuster Switch - Passenger



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 10-Way F

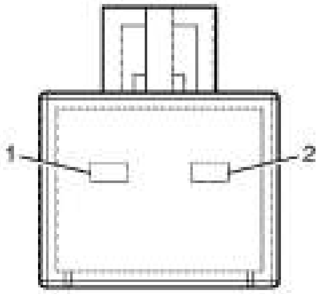
Terminal Part Information

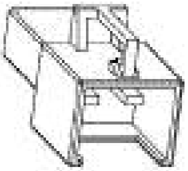
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Adjuster Switch - Passenger

Pin	Wire Color	Circuit No.	Function
1	2 OG	1140	Battery Positive Voltage
2	2 BK	1350	Ground (LHD)
	2 BK	2050	Ground (RHD)
3	2 D-GN	297	Passenger Seat Front Vertical Motor Up Control
4	2 D-BU	298	Passenger Seat Front Vertical Motor Down Control
5	2 YE	288	Passenger Seat Rear Vertical Motor Up Control
6	2 L-BU	289	Passenger Seat Rear Vertical Motor Down Control
7	2 TN	296	Passenger Seat Horizontal Motor Forward Control
8	2 L-GN	290	Passenger Seat Horizontal Motor Rearward Control
9	2 D-GN	76	Passenger Seat Recline Motor Forward
10	2 D-BU	77	Passenger Seat Recline Motor Rearward

Seat Belt Buckle Pretensioner - Driver





Connector Part Information

- OEM: 7183-9857-70
- Service: 15306012
- Description: 2-Way M 280 Series (YE)

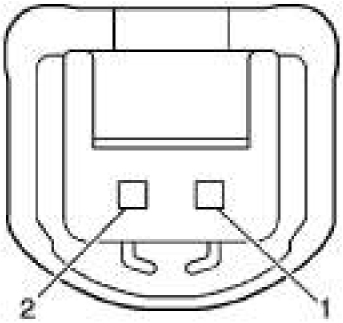
Terminal Part Information

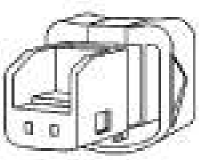
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Belt Buckle Pretensioner - Driver

Pin	Wire Color	Circuit No.	Function
1	0.3 L-GN	2118	Seat Belt Pretensioner - Left - High Control
2	0.3 OG	2119	Seat Belt Pretensioner - Left - Low Control

Seat Belt Retractor Pretensioner - Driver





Connector Part Information

- OEM: 7283-5494-60

- Service: See Catalog
- Description: 2-Way F (GN)

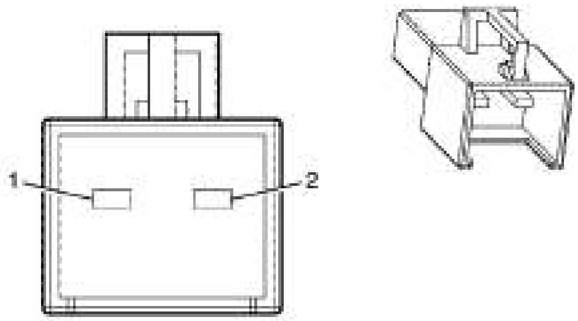
Terminal Part Information

- Terminal/Tray: 1411560-2/25
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-64B (L-BU)

Seat Belt Retractor Pretensioner - Driver

Pin	Wire Color	Circuit No.	Function
1	0.3 WH	7206	Driver Seat Belt Pretensioner Retractor - Low Control
2	0.3 OG/GN	7203	Driver Seat Belt Pretensioner Retractor - High Control

Seat Belt Buckle Pretensioner - Passenger



Connector Part Information

- OEM: 7183-9857-70
- Service: 15306012
- Description: 2-Way M 280 Series (YE)

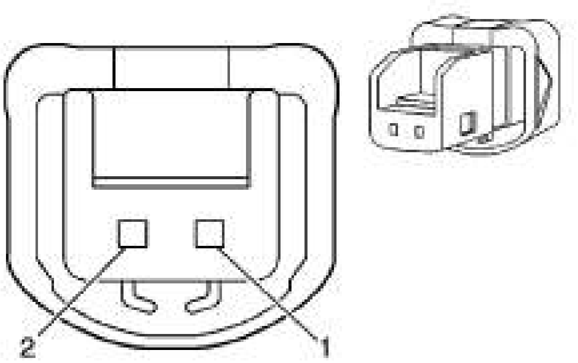
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Belt Buckle Pretensioner - Passenger

Pin	Wire Color	Circuit No.	Function
1	0.3 BK/WH	2116	Seat Belt Pretensioner - Right - High Control
2	0.3 OG/BK	2117	Seat Belt Pretensioner - Right - Low Control

Seat Belt Retractor Pretensioner - Passenger



Connector Part Information

- OEM: 7283-5494-60
- Service: See Catalog
- Description: 2-Way F (GN)

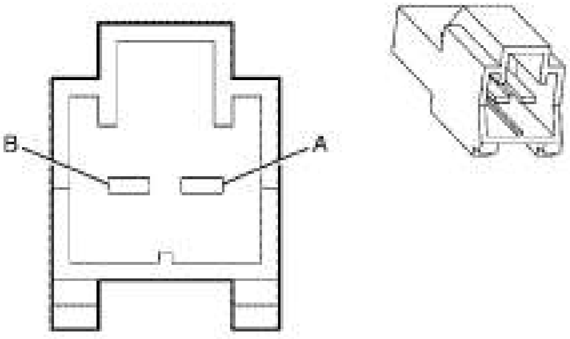
Terminal Part Information

- Terminal/Tray: 1411560-2/25
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-64B (L-BU)

Seat Belt Retractor Pretensioner - Passenger

Pin	Wire Color	Circuit No.	Function
1	0.3 PU/GN	7205	Passenger Seat Belt Pretensioner Retractor - High Control
2	0.3 OG/BU	7204	Passenger Seat Belt Pretensioner Retractor - Low Control

Seat Belt Switch - Driver



Connector Part Information

- OEM: H12
- Service: See Catalog
- Description: 2-Way M (WH)

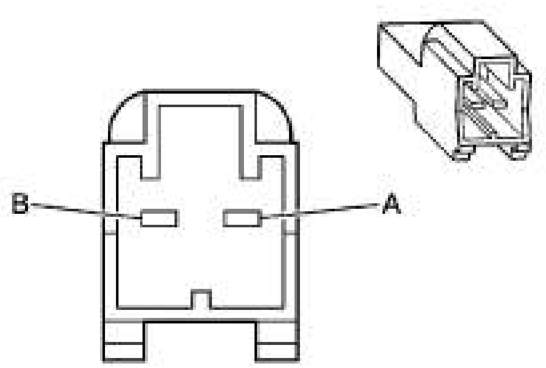
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Belt Switch - Driver

Pin	Wire Color	Circuit No.	Function
A	0.3 D-BU	238	Seat Belt Switch - Left - Low Reference
B	0.3 BK/WH	1363	Seat Belt Switch - Left
	0.3 TN/WH	1363	Seat Belt Switch - Left

Seat Belt Switch - Passenger



Connector Part Information

- OEM: H12
- Service: See Catalog
- Description: 2-Way F (WH)

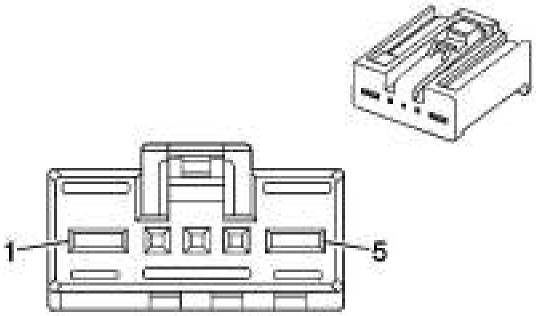
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Belt Switch - Passenger

Pin	Wire Color	Circuit No.	Function
A	0.3 BK/WH	1362	Seat Belt Switch - Right - Signal
B	0.3 BK	1363	Seat Belt Switch - Left - Low Reference

Seat Front Vertical Motor - Driver (AG1 or AG3)



Connector Part Information

- OEM: 0-1379217-4
- Service: See Catalog
- Description: 5-Way F (BK)

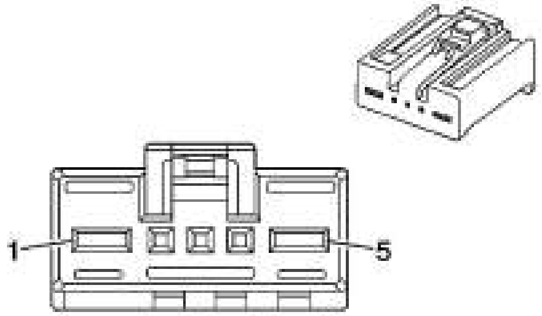
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Front Vertical Motor - Driver (AG1 or AG3)

Pin	Wire Color	Circuit No.	Function
1	0.85 D-BU/RD	287	Driver Seat Front Vertical Motor Down Control (AG3)
	2 D-GN	286	Driver Seat Front Vertical Motor Up Control (AG1)
2	0.3 BK/OG	1350	Ground (AG3)
3	0.3 BN/BU	557	Front Vertical Seat Motor Position Sensor Signal (AG3)
4	0.3 D-GN/WH	3040	Battery Positive Voltage (AG3)
5	0.85 BN	286	Driver Seat Front Vertical Motor Up Control (AG3)
	2 D-BU	287	Driver Seat Front Vertical Motor Down Control (AG1)

Seat Front Vertical Motor - Passenger (AG1)



Connector Part Information

- OEM: 1379218
- Service: See Catalog
- Description: 5-Way F (BK)

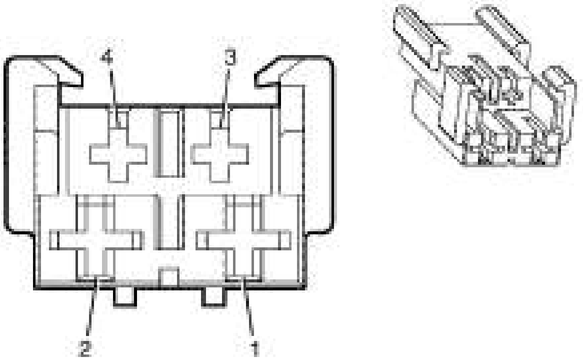
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Front Vertical Motor - Passenger (AG1)

Pin	Wire Color	Circuit No.	Function
1	2 D-GN	297	Passenger Seat Front Vertical Motor Up Control
2-4	--	--	Not Used
5	2 D-BU	298	Passenger Seat Front Vertical Motor Down Control

Seat Horizontal Motor - Driver (AG1 or AG3)



Connector Part Information

- OEM: 0-968182-1
- Service: See Catalog
- Description: 2-Way F (BK)

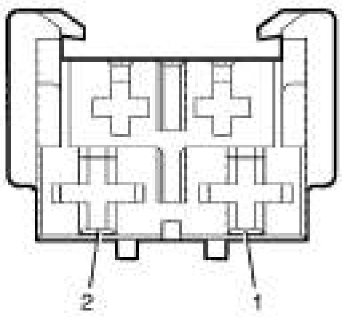
Terminal Part Information

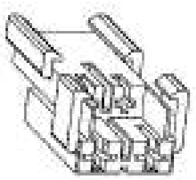
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Horizontal Motor - Driver (AG1 or AG3)

Pin	Wire Color	Circuit No.	Function
1	0.85 GY	284	Driver Seat Horizontal Motor Rearward Control (AG3)
	2 TN	285	Driver Seat Horizontal Motor Forward Control (AG1)
2	0.85 GY/RD	285	Driver Seat Horizontal Motor Forward Control (AG3)
	2 L-GN	284	Driver Seat Horizontal Motor Rearward Control (AG1)
3	0.3 BK/OG	1350	Ground (AG3)
4	0.3 WH/GY	569	Horizontal Seat Motor Position Sensor Signal (AG3)

Seat Horizontal Motor - Passenger (AG1)





Connector Part Information

- OEM: 968182
- Service: See Catalog
- Description: 2-Way F (BK)

Terminal Part Information

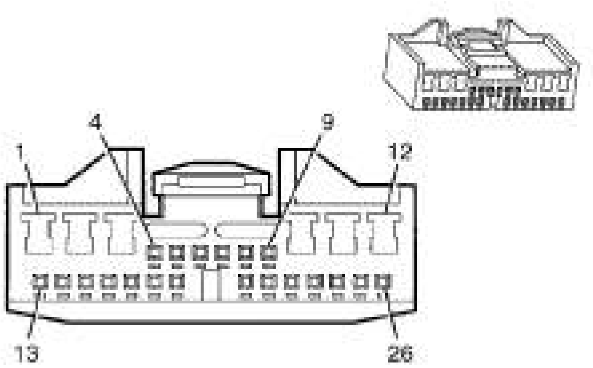
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Horizontal Motor - Passenger (AG1)

Pin	Wire Color	Circuit No.	Function

1	2 TN	296	Passenger Seat Horizontal Motor Forward Control
2	2 L-GN	290	Passenger Seat Horizontal Motor Rearward Control

Memory Seat Module (MSM)



Connector Part Information

- OEM: 173851-1
- Service: See Catalog
- Description: 26-Way

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Memory Seat Module (MSM)

Pin	Wire Color	Circuit No.	Function
1	1.25 RD/BK	4740	Seat Module Supply Voltage
2	0.3 D-BU/WH	1985	5-Volt Reference
3	2 RD	1140	Battery Positive Voltage
4	0.3 WH/BK	2293	Right Front Adaptive Seat Switch / Mirror Dip Signal
5	0.3 PU	615	Memory 1 Switch Signal
6	--	--	Not Used
7	0.3 YE/WH	616	Memory 2 Switch Signal
8	--	--	Not Used

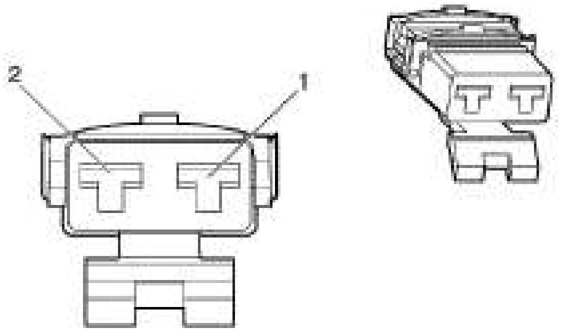
21	0.3 YE/RD	782	Memory 3 Switch Control Signal
22-24	--	--	Not Used
25	0.3 L-GN/BK	5060	Low Speed GMLAN Serial Data
26	--	--	Not Used

Seat Lumbar Motor - Driver X1 (AG3)



Connector Part Information

- OEM: 12020556
- Service: See Catalog
- Description: 2-Way

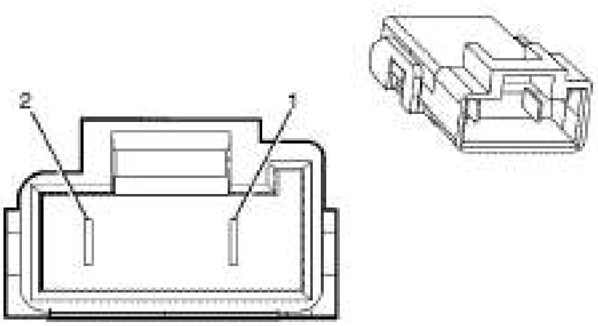
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Lumbar Motor - Driver X1 (AG3)

Pin	Wire Color	Circuit No.	Function
1	0.85 D-GN/RD	767	Driver Seat Lumbar Motor Down Control
2	0.3 RD/YE	768	Driver Seat Lumber Horizontal Position Sensor Signal

Seat Lumbar Motor - Driver X2 (AG3)



Connector Part Information

- OEM: 12034344
- Service: See Catalog
- Description: 2-Way

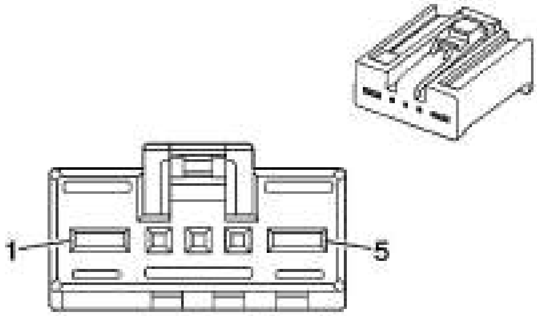
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Lumbar Motor - Driver X2 (AG3)

Pin	Wire Color	Circuit No.	Function
1	0.3 PU/BU	1062	Driver Seat Lumbar Vertical Position Sensor Signal
2	0.85 D-BU/YE	1063	Driver Seat Lumbar Motor Up Control

Seat Rear Vertical Motor - Driver (AG1 or AG3)



Connector Part Information

- OEM: 1379218
- Service: See Catalog
- Description: 5-Way F (WH)

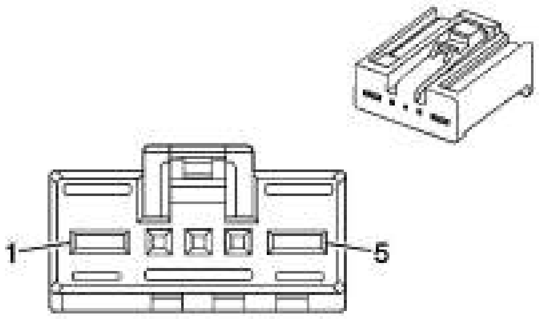
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Rear Vertical Motor - Driver (AG1 or AG3)

Pin	Wire Color	Circuit No.	Function
1	0.85 D-BU	283	Driver Seat Rear Vertical Motor Down Control (AG3)
	2 YE	282	Driver Seat Rear Vertical Motor Up Control (AG1)
2	0.3 BK/OG	1350	Ground (AG3)
3	0.3 RD/GN	568	Rear Vertical Seat Motor Position Sensor Signal (AG3)
4	0.3 D-GN/PU	2940	Battery Positive Voltage (AG3)
5	0.85 D-GN/YE	282	Driver Seat Rear Vertical Motor UP Control (AG3)
	2 L-BU	283	Driver Seat Rear Vertical Motor Down Control (AG1)

Seat Rear Vertical Motor - Passenger (AG1)



Connector Part Information

- OEM: 1379218
- Service: See Catalog
- Description: 5-Way F (WH)

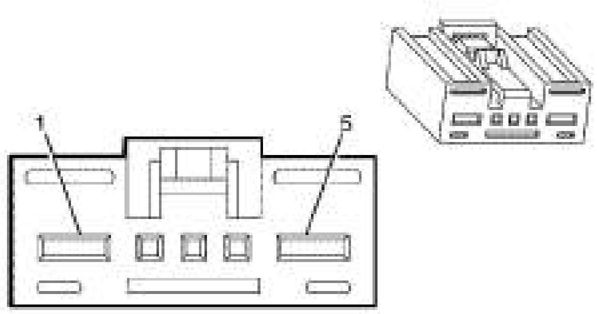
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Rear Vertical Motor - Passenger (AG1)

Pin	Wire Color	Circuit No.	Function
1	2 YE	288	Passenger Seat Rear Vertical Motor Up Control
2-4	--	--	Not Used
5	2 L-BU	289	Passenger Seat Rear Vertical Motor Down Control

Seat Recline Motor - Driver (AG1 or AG3)



Connector Part Information

- OEM: 0-1379217-3
- Service: See Catalog
- Description: 5-Way

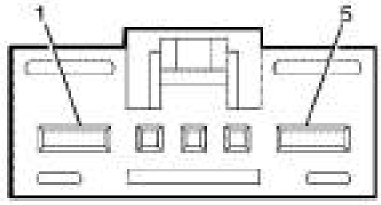
Terminal Part Information

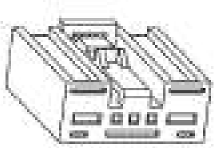
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Recline Motor - Driver (AG1 or AG3)

Pin	Wire Color	Circuit No.	Function
1	0.85 YE	276	Driver Seat Recline Motor Forward Control (AG3)
	2 L-GN	276	Driver Seat Recline Motor Forward Control (AG1)
2	0.3 BK/OG	1350	Ground (AG3)
3	--	--	Not Used
4	0.3 D-GN/BN	570	Driver Seat Recline Motor Position Sensor Signal (AG3)
5	0.85 PU/GN	277	Driver Seat Recline Motor Rearward Control (AG3)
	2 L-BU	277	Driver Seat Recline Motor Rearward Control (AG1)

Seat Recline Motor - Passenger (AG1)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 5-Way

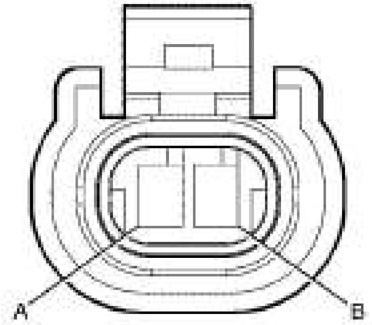
Terminal Part Information

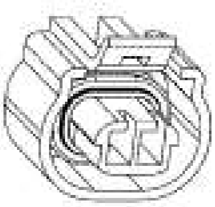
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Seat Recline Motor - Passenger (AG1)

Pin	Wire Color	Circuit No.	Function
1	2 D-GN	76	Passenger Seat Recline Motor Forward
2-4	--	--	Not Used
5	2 D-BU	77	Passenger Seat Recline Motor Rearward

Shock Absorber Actuator - Left Front (HSV)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

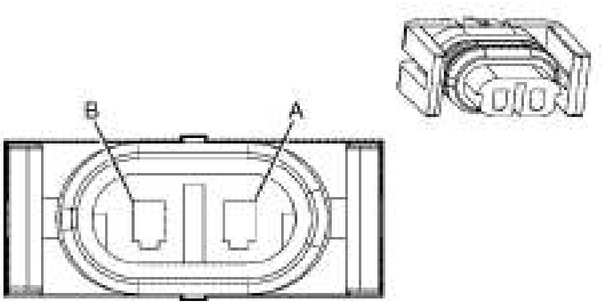
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Shock Absorber Actuator - Left Front (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 PK	1107	Left Front Damper Control
B	0.35 PK/BK	1113	Left Front Damper Low Reference

Shock Absorber Actuator - Left Rear (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

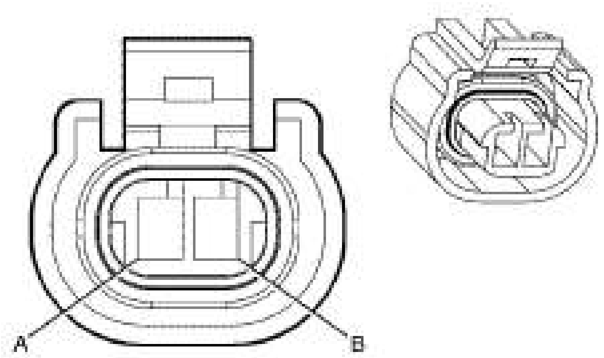
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Shock Absorber Actuator - Left Rear (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 WH/RD	1114	Left Rear Damper Control
B	0.35 WH/BK	1115	Left Rear Damper Low Reference

Shock Absorber Actuator - Right Front (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

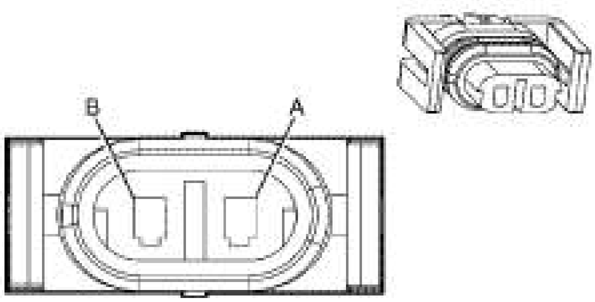
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Shock Absorber Actuator - Right Front (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 PU	1116	Right Front Damper Control
B	0.35 PU/WH	1117	Right Front Damper Low Reference

Shock Absorber Actuator - Right Rear (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 2-Way F

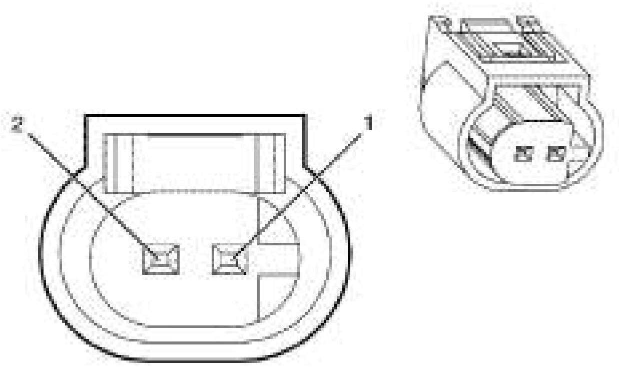
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Shock Absorber Actuator - Right Rear (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 WH/RD	1118	Right Rear Damper Control
B	0.35 WH/BK	1119	Right Rear Damper Low Reference

Side Marker Lamp - Left Front



Connector Part Information

- OEM: 967644-1
- Service: See Catalog
- Description: 2-Way F MQS Series Sealed (BK)

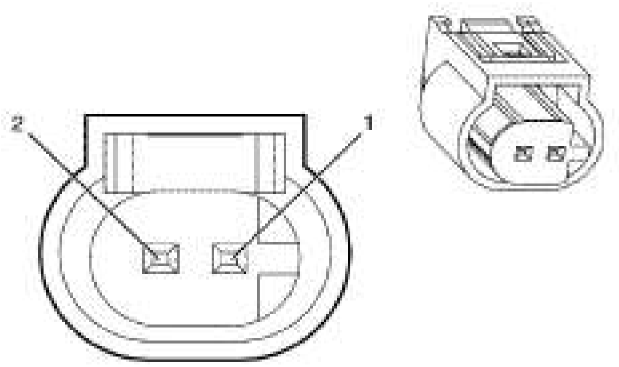
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Side Marker Lamp - Left Front

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	350	Ground
2	0.5 PU	309	Left Park Lamp Supply Voltage

Side Marker Lamp - Left Rear



Connector Part Information

- OEM: 967644-1
- Service: See Catalog
- Description: 2-Way F MQS Series Sealed (BK)

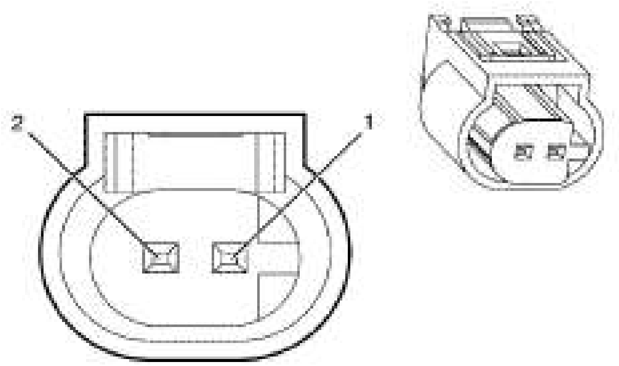
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Side Marker Lamp - Left Rear

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	709	Left Park Lamp Supply Voltage
2	0.5 WH	20	Stop Lamp Supply Voltage

Side Marker Lamp - Right Front



Connector Part Information

- OEM: 967644-1
- Service: See Catalog
- Description: 2-Way F MQS Series Sealed (BK)

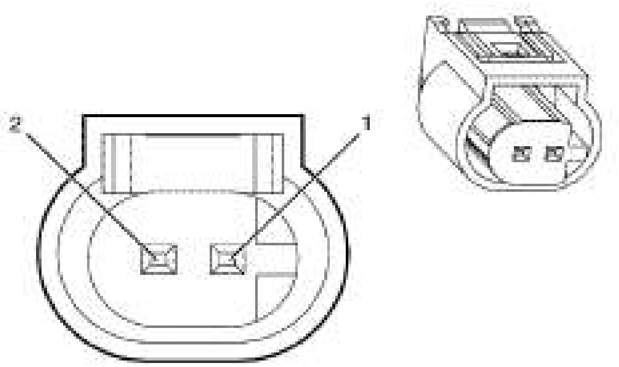
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Side Marker Lamp - Right Front

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	350	Ground
2	0.5 BN/WH	709	Right Park Lamp Supply Voltage

Side Marker Lamp - Right Rear



Connector Part Information

- OEM: 967644-1
- Service: See Catalog
- Description: 2-Way F MQS Series Sealed (BK)

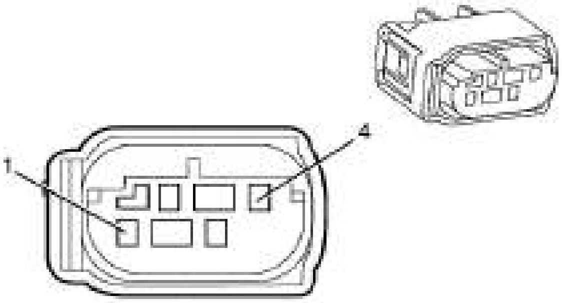
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Side Marker Lamp - Right Rear

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	309	Right Park Lamp Supply Voltage
2	0.5 WH	20	Stop Lamp Supply Voltage

Siren Connector



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 4-Way F

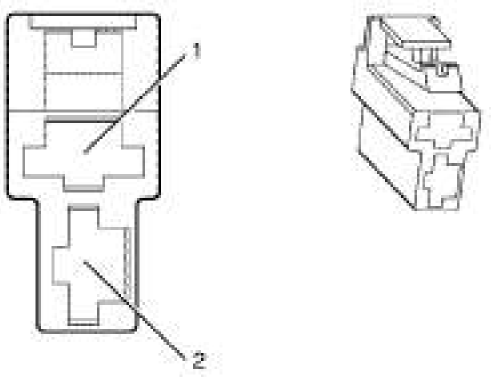
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Siren Connector

Pin	Wire Color	Circuit No.	Function
1	0.35 BK	31	Accessory Power
2	0.35 BK	32	Battery Power
3	0.35 BK	33	Siren Control Signal
4	0.35 BK	34	Ground

Speaker - Center I/P X1 (UW5)



Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

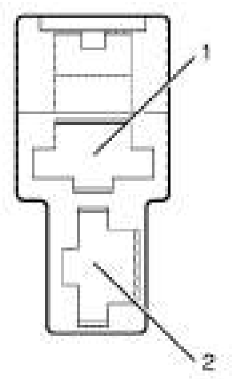
Terminal Part Information

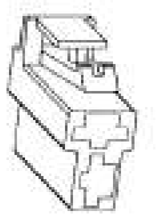
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Center I/P X1 (UW5)

Pin	Wire Color	Circuit No.	Function
1	0.5 GY	118	Left Front Speaker Output (-)
2	0.5 BN	201	Left Front Speaker Output (+)

Speaker - Center I/P X2 (UW5)





Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

Terminal Part Information

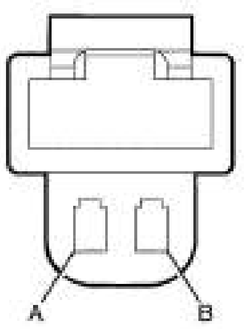
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

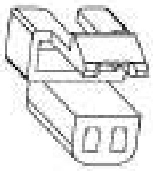
Speaker - Center I/P X2 (UW5)

Pin	Wire Color	Circuit No.	Function

1	0.5 D-GN	117	Right Front Speaker Output (-)
2	0.5 L-GN	200	Right Front Speaker Output (+)

Speaker - Center I/P (without UW5)





Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F

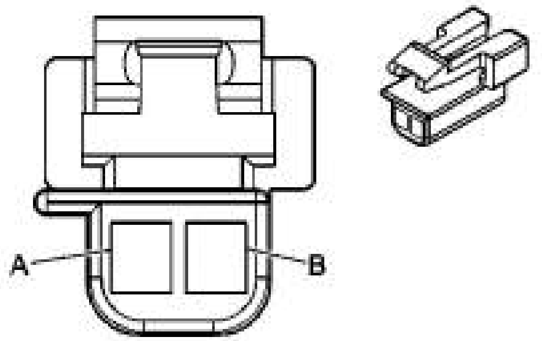
Terminal Part Information

- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Center I/P (without UW5)

Pin	Wire Color	Circuit No.	Function
A	0.5 L-BU	1960	Front Center Speaker Output (-)
B	0.5 YE	1860	Front Center Speaker Output (+)

Speaker - Left Front (UQ7)



Connector Part Information

- OEM: 12064869
- Service: See Catalog
- Description: 2-Way F

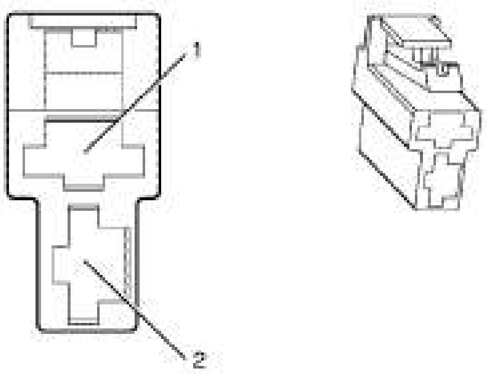
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Left Front (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.5 GY	118	Left Front Speaker Output (-)
B	0.5 BN	201	Left Front Speaker Output (+) (RHD)
	0.5 TN	201	Left Front Speaker Output (+) (LHD)

Speaker - Left Front (UW5 or U65)



Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

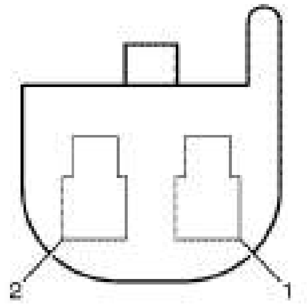
Terminal Part Information

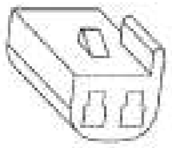
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Left Front (UW5 or U65)

Pin	Wire Color	Circuit No.	Function
1	0.5 GY	118	Left Front Speaker Output (-)
2	0.5 BN	201	Left Front Speaker Output (+)

Speaker - Left Front Tweeter (U65 or UW5)





- OEM: 15493098
- Service: See Catalog
- Description: 2-Way F (BK)

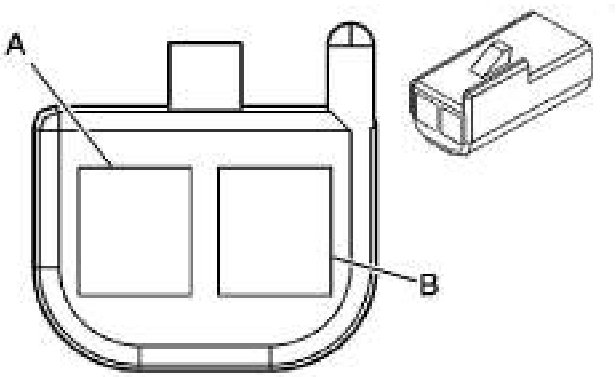
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Left Front Tweeter (U65 or UW5)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	201	Left Front Speaker Output (+)
2	0.3 GY	118	Left Front Speaker Output (-)

Speaker - Left Front Tweeter (UQ7)



Connector Part Information

- OEM: 12047662
- Service: See Catalog
- Description: 2-Way F

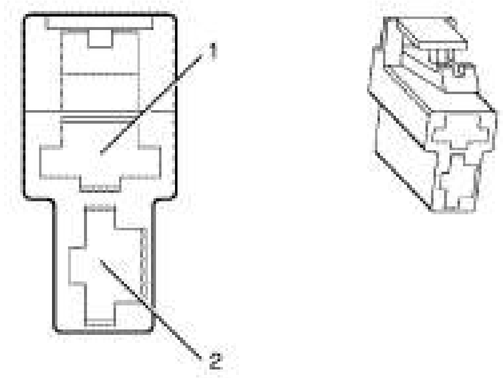
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Left Front Tweeter (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.85 GY	118	Left Front Speaker Output (+)
B	0.85 TN	201	Left Front Speaker Output (-)

Speaker - Left Rear (U65 or UW5)



Connector Part Information

- OEM: 7123-2825

- Service: See Catalog
- Description: 2-Way F (WH)

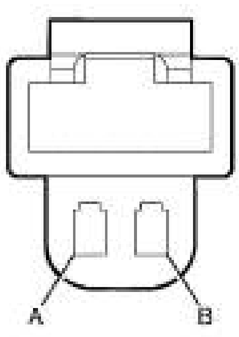
Terminal Part Information

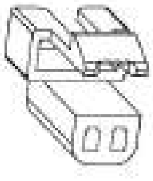
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Left Rear (U65 or UW5)

Pin	Wire Color	Circuit No.	Function
1	0.5 YE/RD	116	Left Rear Speaker Output (-)
2	0.5 BN	199	Left Rear Speaker Output (+)

Speaker - Left Rear (UQ7)





Connector Part Information

- OEM: 15434358
- Service: See Catalog
- Description: 2-Way F

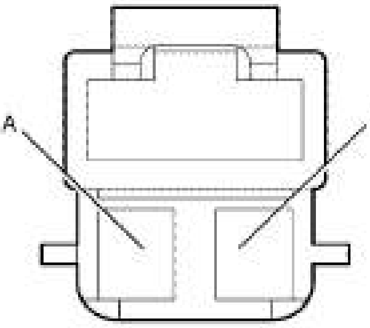
Terminal Part Information

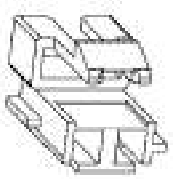
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Left Rear (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.5 YE/RD	116	Left Rear Speaker Output (-)
B	0.5 BN	199	Left Rear Speaker Output (+)

Speaker - Left Subwoofer (UQ7)





Connector Part Information

- OEM: 7283-1020
- Service: See Catalog
- Description: 2-Way F 090 II Series (NA)

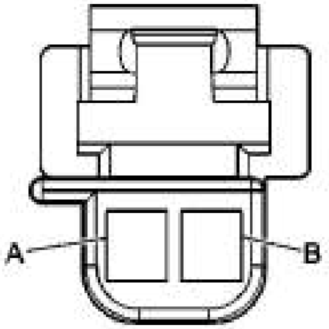
Terminal Part Information

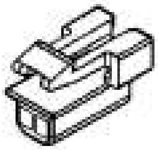
- Terminal/Tray: 7116-4021/11
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Speaker - Left Subwoofer (UQ7)

Pin	Wire Color	Circuit No.	Function
A	1.25 D-BU/WH	346	Left Rear Subwoofer Speaker Output (+)
B	1.25 L-GN/BK	1794	Left Rear Subwoofer Speaker Output (-)

Speaker - Right Front (UQ7)





Connector Part Information

- OEM: 12064869
- Service: See Catalog
- Description: 2-Way F

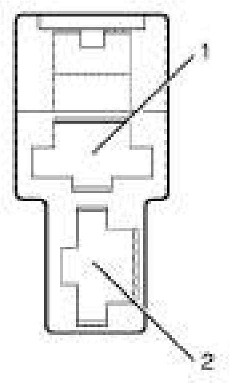
Terminal Part Information

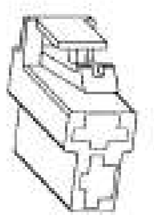
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Right Front (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.5 D-GN	117	Right Front Speaker Output (-)
B	0.5 L-GN	200	Right Front Speaker Output (+) (LHD)

Speaker - Right Front (UW5 or U65)





Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

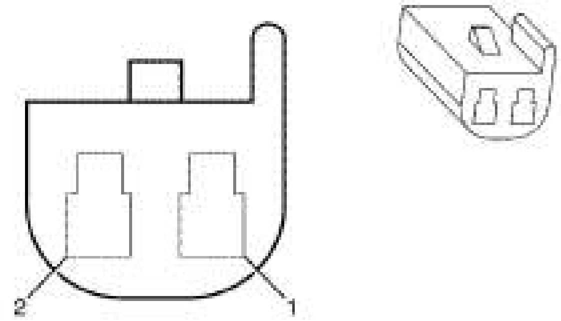
Terminal Part Information

- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Right Front (UW5 or U65)

Pin	Wire Color	Circuit No.	Function
1	0.5 D-GN	117	Right Front Speaker Output (-)
2	0.5 L-GN	200	Right Front Speaker Output (+)

Speaker - Right Front Tweeter (U65 or UW5)



- OEM: 15493098
- Service: See Catalog
- Description: 2-Way F (BK)

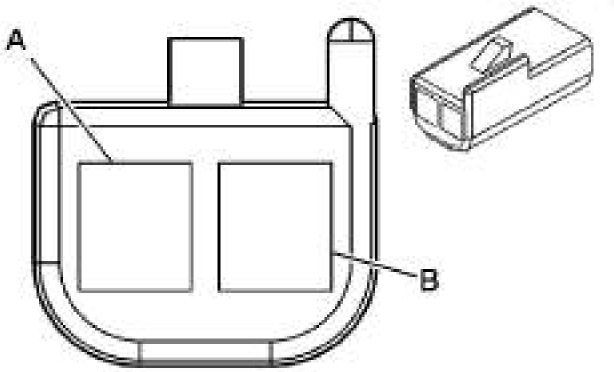
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Right Front Tweeter (U65 or UW5)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	201	Right Front Speaker Output (+)
2	0.3 GY	118	Right Front Speaker Output (-)

Speaker - Right Front Tweeter (UQ7)



Connector Part Information

- OEM: 12047662
- Service: See Catalog

- Description: 2-Way F

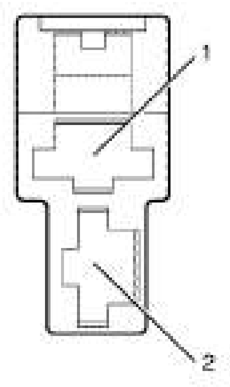
Terminal Part Information

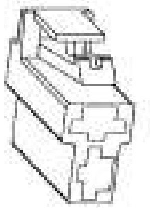
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Right Front Tweeter (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.85 D-GN	117	Right Front Speaker Output (+)
B	0.85 L-GN	200	Right Front Speaker Output (-)

Speaker - Right Rear (U65 or UW5)





Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

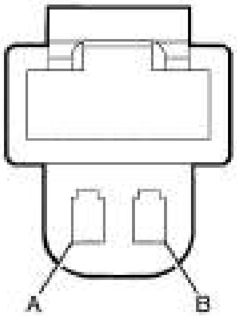
Terminal Part Information

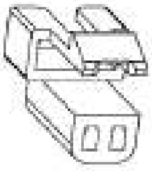
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Speaker - Right Rear (U65 or UW5)

Pin	Wire Color	Circuit No.	Function
1	0.5 L-BU	115	Right Rear Speaker Output (-)
2	0.5 D-BU	46	Right Rear Speaker Output (+)

Speaker - Right Rear (UQ7)





Connector Part Information

- OEM: 15434358
- Service: See Catalog
- Description: 2-Way F

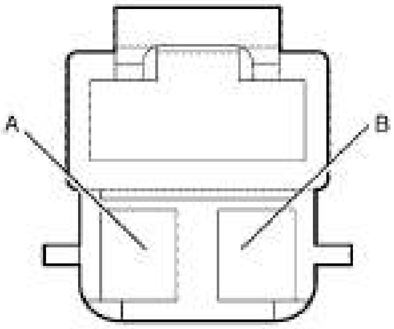
Terminal Part Information

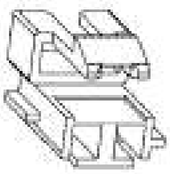
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Speaker - Right Rear (UQ7)

Pin	Wire Color	Circuit No.	Function
A	0.5 L-BU	115	Right Rear Speaker Output (-)
B	0.5 D-BU	46	Right Rear Speaker Output (+)

Speaker - Right Subwoofer (UQ7)





Connector Part Information

- OEM: 7283-1020

- Service: See Catalog
- Description: 2-Way F 090 II Series (NA)

Terminal Part Information

- Terminal/Tray: 7116-4021/11
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Speaker - Right Subwoofer (UQ7)

Pin	Wire Color	Circuit No.	Function
A	1.25 L-BU/BK	315	Right Rear Subwoofer Speaker Output (+)
B	1.25 D-GN	1795	Right Rear Subwoofer Speaker Output (-)

Starter Motor X1

Terminal Part Information

- Terminal: 7009-1333-02
- Core/Insulation Crimp: N/A
- Description: Ring Terminal

Starter Motor X1

Pin	Wire Color	Circuit No.	Function
A	3 PU	6	Starter Solenoid Crank Voltage

Starter Motor X2

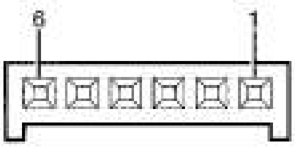
Terminal Part Information

- Terminal: 7003-2601
- Core/Insulation Crimp: N/A
- Description: Ring Terminal

Starter Motor X2

Pin	Wire Color	Circuit No.	Function
A	50 RD	1	Battery Voltage

Steering Angle Sensor



- OEM: 7282-7166
- Service: See Catalog
- Description: 6-Way F (BK)

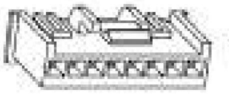
Terminal Part Information

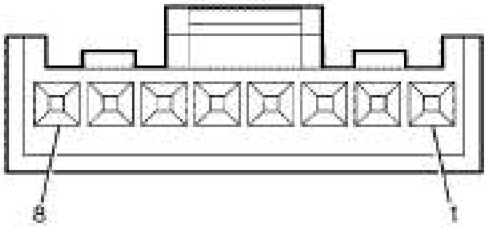
- Terminal/Tray: 7114-4020/10
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

Steering Angle Sensor

Pin	Wire Color	Circuit No.	Function
1	0.5 PU/BN	2501	High Speed GMLAN Serial Data Bus (-) (without HSV)
	0.35 BN	2501	High Speed GMLAN Serial Data Bus- (HSV)
2	0.5 D-BU/BN	2501	High Speed GMLAN Serial Data Bus (-) (without HSV)
	0.35 BN	2501	High Speed GMLAN Serial Data Bus- (HSV)
3	0.5 GY	2500	High Speed GMLAN Serial Data Bus (+) (without HSV)
	0.35 BN/BK	2500	High Speed GMLAN Serial Data Bus+ (HSV)
4	0.5 BN	2500	High Speed GMLAN Serial Data Bus (+) (without HSV)
	0.35 BN/BK	2500	High Speed GMLAN Serial Data Bus+ (HSV)
5	0.5 L-BU	5986	Communication Enable Relay Supply Voltage (without HSV)
	0.5 L-BU	5986	Communication Enable Relay Supply Voltage (HSV)
6	0.5 OG	2088	Steering Wheel Position Sensor Low Reference (without HSV)
	0.5 BK/BU	2088	Steering Wheel Position Sensor Low Reference (HSV)

Steering Wheel Controls Switch Assembly





- OEM: XMR-08V
- Service: See Catalog
- Description: 8-Way F (WH)

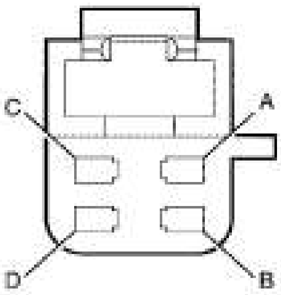
Terminal Part Information

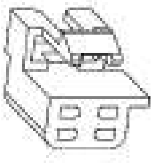
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Steering Wheel Controls Switch Assembly

Pin	Wire Color	Circuit No.	Function
1	0.3 GY/BU	7367	Steering Wheel Resistor Ladder Right Signal #2
2	0.3 YE	7364	Steering Wheel Resistor Ladder Right Signal #1
3	0.3 BN	7312	Steering Wheel Resistor Ladder Left Signal #1
4	0.3 L-BU	7313	Steering Wheel Resistor Ladder Left Signal #2
5	0.3 D-GN	897	Steering Wheel Controls Low Reference
6	0.3 OG/BK	5201	Steering Wheel Controls Signal
7	0.3 BK	1551	Ground
8	0.3 PU	7005	I/P Dimming Control

Sunload Sensor (CJ2 or C63)





Connector Part Information

- OEM: 7123-9843-30
- Service: 12085208
- Description: 4-Way F

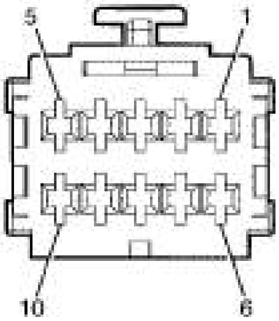
Terminal Part Information

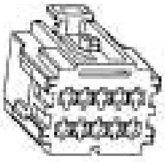
- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Sunload Sensor (CJ2 or C63)

Pin	Wire Color	Circuit No.	Function
A	0.3 L-BU/BK	7425	Left Solar Sensor
B	0.3 GY	7424	Right Solar Sensor
C	0.3 BK	61	Ground
D	0.3 L-GN/BK	1137	DRL Ambient Light Sensor Signal

Sunroof Control Module (RHD)





- OEM: 18101EV
- Service: See Catalog
- Description: 10-Way F

Terminal Part Information

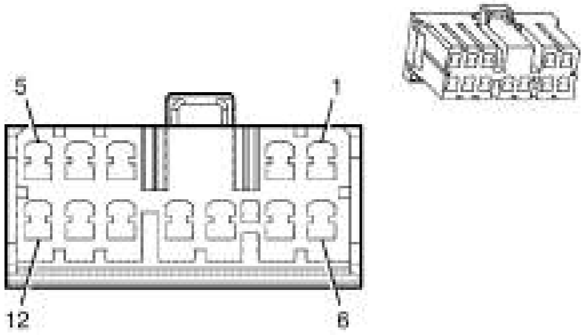
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Sunroof Control Module (RHD)

Pin	Wire Color	Circuit No.	Function

1	0.5 GY		Sunroof Switch Low Reference
2	0.3 D-GN	5027	Sunroof Switch - Data 1
3	0.3 YE	5028	Sunroof Switch - Data 2
4	0.3 OG	5029	Sunroof Switch - Data 3
5	0.3 WH	5030	Sunroof Switch - Data 4
6	--	--	Not Used
7	1.25 OG/BU	3040	Battery Positive Voltage
8	--	--	Not Used
9	0.5 YE	443	Ignition Voltage 1
10	1.25 BK	850	Ground

Sunroof Switch (RHD)



- OEM: 49901221
- Service: 88953365
- Description: 6-Way F 0.635 Series (BK)

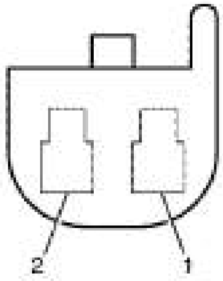
Terminal Part Information

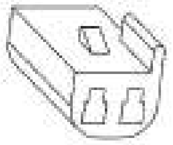
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Sunroof Switch (RHD)

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	850	Ground
2	0.3 D-GN	5027	Sunroof Switch - Data 1
3	0.3 YE	5028	Sunroof Switch - Data 2
4	--	--	Not Used
5	0.3 OG	5029	Sunroof Switch - Data 3
6	0.3 WH	5030	Sunroof Switch - Data 4

Sunshade - Left





- OEM: 12047662
- Service: See Catalog
- Description: 2-Way F (BK)

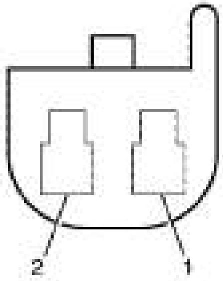
Terminal Part Information

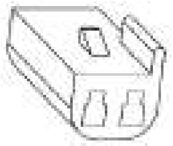
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Sunshade - Left

Pin	Wire Color	Circuit No.	Function
1	0.5 BK/WH	851	Ground
2	0.5 OG	1732	Courtesy Lamps Supply Voltage

Sunshade - Right





- OEM: 12047662
- Service: See Catalog

- Description: 2-Way F (BK)

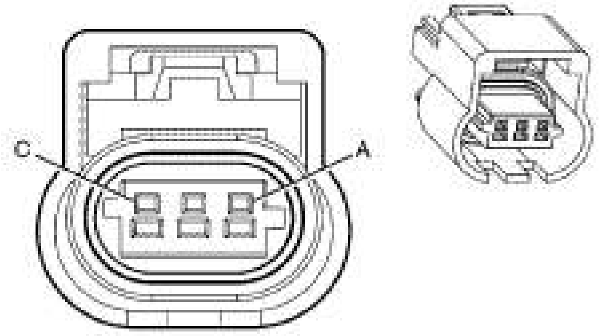
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Sunshade - Right

Pin	Wire Color	Circuit No.	Function
1	0.5 BK/WH	851	Ground
2	0.5 OG	1732	Courtesy Lamps Supply Voltage

Suspension Position Sensor - Left Front (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

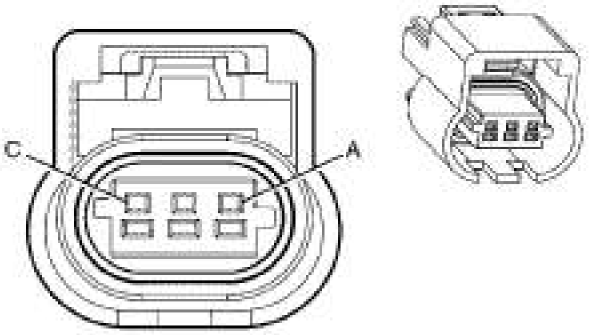
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Suspension Position Sensor - Left Front (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 D-BU/WH	1205	Left Front Suspension Position Sensor Voltage Reference
B	0.35 D-BU	1207	Left Front Suspension Position Sensor Signal
C	0.35 D-BU/BK	1206	Left Front Suspension Position Sensor Low Reference

Suspension Position Sensor - Left Rear (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

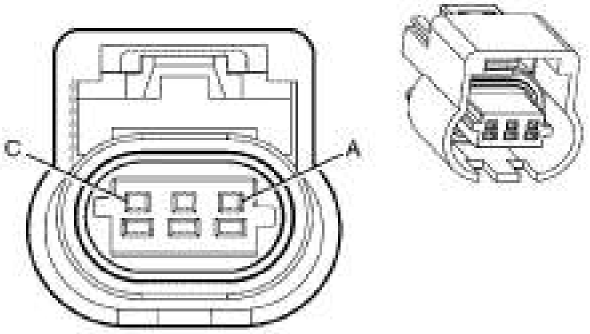
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Suspension Position Sensor - Left Rear (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 GY/WH	1208	Left Rear Suspension Position Sensor Voltage Reference
B	0.35 GY	1210	Left Rear Suspension Position Sensor Signal
C	0.35 GY/BK	1209	Left Rear Suspension Position Sensor Low Reference

Suspension Position Sensor - Right Front (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

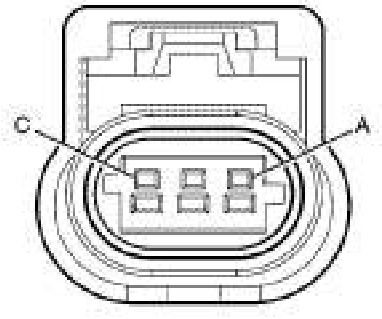
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Suspension Position Sensor - Right Front (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 D-GN/WH	1211	Right Front Suspension Position Sensor Voltage Reference
B	0.35 D-GN	1213	Right Front Suspension Position Sensor Signal
C	0.35 D-GN/BK	1212	Right Front Suspension Position Sensor Low Reference

Suspension Position Sensor - Right Rear (HSV)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 3-Way F

Terminal Part Information

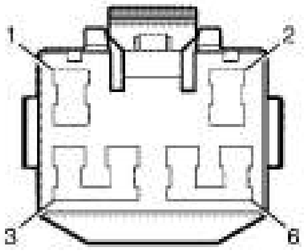
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

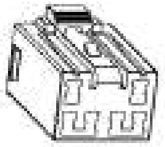
Suspension Position Sensor - Right Rear (HSV)

Pin	Wire Color	Circuit No.	Function
A	0.35 BN/WH	1214	Right Rear Suspension Position Sensor Voltage Reference

B	0.35 BN	1216	Right Rear Suspension Position Sensor Signal
C	0.35 BN/BK	1215	Right Rear Suspension Position Sensor Low Reference

Tail Lamp - Left (without HSV or VXR8)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

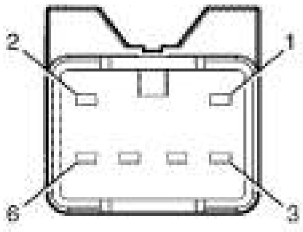
Terminal Part Information

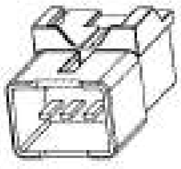
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Tail Lamp - Left (without HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
1	0.85 BK/WH	1851	Ground
2	0.85 BK	1850	Ground
3	0.85 PU	709	Left Park Lamp Supply Voltage
4	0.85 L-BU	20	Stop Lamp Switch Signal
5	0.85 L-GN	24	Backup Lamp Supply Voltage
6	0.85 YE/BK	1334	Left Rear Turn Signal Lamp Supply Voltage

Tail Lamp - Left (HSV or VXR8)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

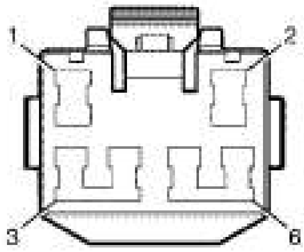
Terminal Part Information

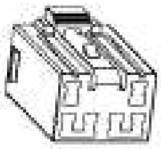
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Tail Lamp - Left (HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
1	0.85 BK/WH	1851	Ground
2	0.85 BK	1850	Ground
3	0.85 PU	709	Left Park Lamp Supply Voltage
4	0.85 L-BU	20	Stop Lamp Switch Signal
5	0.85 L-GN	24	Backup Lamp Supply Voltage
6	0.85 YE/BK	1334	Left Rear Turn Signal Lamp Supply Voltage

Tail Lamp - Right (without HSV or VXR8)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

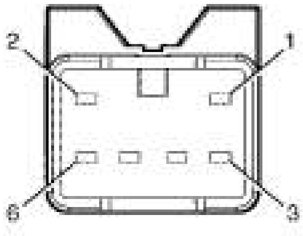
Terminal Part Information

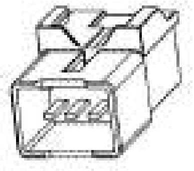
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Tail Lamp - Right (without HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
1	0.85 BK/WH	1851	Ground
2	0.85 BK	1850	Ground
3	0.85 BN/WH	709	Right Park Lamp Supply Voltage
4	0.85 L-BU	20	Stop Lamp Switch Signal
5	0.85 L-GN	24	Backup Lamp Supply Voltage
6	0.85 D-GN/WH	1335	Right Rear Turn Signal Lamp Supply Voltage

Tail Lamp - Right (HSV or VXR8)





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

Terminal Part Information

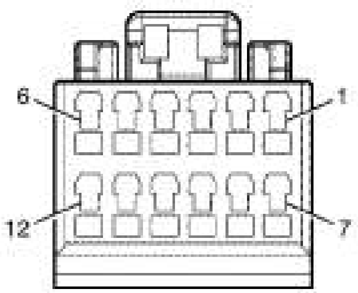
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit

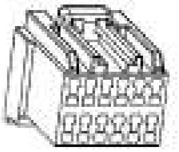
- Release Tool/Test Probe: See Terminal Repair Kit

Tail Lamp - Right (HSV or VXR8)

Pin	Wire Color	Circuit No.	Function
1	0.85 BK/WH	1851	Ground
2	0.85 BK	1850	Ground
3	0.85 BN/WH	709	Right Park Lamp Supply Voltage
4	0.85 L-BU	20	Stop Lamp Switch Signal
5	0.85 L-GN	24	Backup Lamp Supply Voltage
6	0.85 D-GN/WH	1335	Right Rear Turn Signal Lamp Supply Voltage

Telematics Module X1 (RHD)





Connector Part Information

- OEM: 175965-2
- Service: See Catalog
- Description: 12-Way F

Terminal Part Information

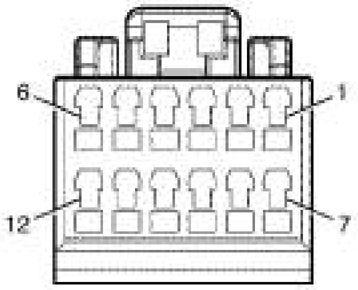
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

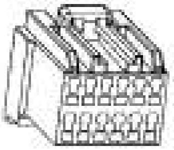
Telematics Module X1 (RHD)

Pin	Wire Color	Circuit No.	Function
1	0.5 BK	1050	Ground
2	--	--	Not Used
3	0.3 L-GN	5060	Low Speed GMLAN Serial Data
4-6	--	--	Not Used
7	0.5 OG/WH	2340	Battery Positive Voltage

8	0.3 YE/BK	2516	Keypad Green LED Signal
9	0.3 BN/WH	2517	Keypad Red LED Signal
10-12	--	--	Not Used

Telematics Module X2 (RHD)





Connector Part Information

- OEM: 175966-2
- Service: See Catalog
- Description: 16-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Telematics Module X2 (RHD)

Pin	Wire Color	Circuit No.	Function
13	0.3 D-GN/WH	2514	Keypad Signal
14	--	--	Not Used
15	0.3 L-BU	1405	Telephone Audio Signal (+)
16	0.3 OG/BK	1406	Telephone Audio Signal (-)
17	0.3 L-BU	1405	Telephone Audio Signal (+)
18	0.3 PK	654	Cellular Telephone Microphone Low Reference
19	0.3 D-GN	655	Cellular Microphone Signal
20	0.5 TN	1860	Left Front Speaker Output (+)
	0.5 OG	1860	Front Center Speaker Output (+)
21	0.3 L-GN/BK	2515	Keypad Supply Voltage
22	0.5 PK	1339	Ignition 1 Voltage
23	0.3 WH	700	Telephone Audio Signal Mute

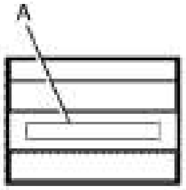
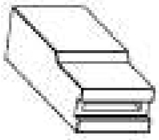
Theft Deterrent Alarm Siren X1





- OEM: 7183-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

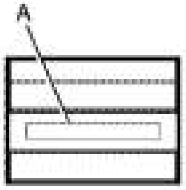
Terminal Part Information

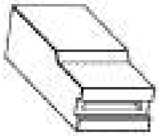
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Theft Deterrent Alarm Siren X1

Pin	Wire Color	Circuit No.	Function
A	0.75 D-GN	1149	Content Theft Horn Control

Theft Deterrent Alarm Siren X2





- OEM: 7183-0073-30
- Service: See Catalog
- Description: 1-Way F (BK)

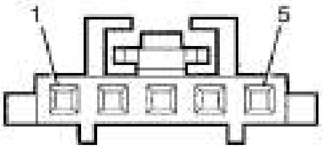
Terminal Part Information

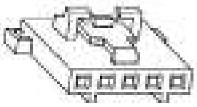
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Theft Deterrent Alarm Siren X2

Pin	Wire Color	Circuit No.	Function
A	0.75 BK	350	Ground

Theft Deterrent Module (TDM)





- OEM: 7183-2179-30
- Service: See Catalog
- Description: 5-Way F (BK)

Terminal Part Information

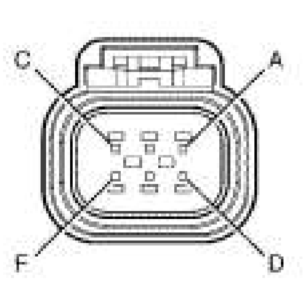
- Terminal/Tray: 16-02-1110/20

- Core/Insulation Crimp: H/H
- Release Tool/Test Probe: J-38125-213/J-35616-64B (L-BU)

Theft Deterrent Module (TDM)

Pin	Wire Color	Circuit No.	Function
1	0.3 OG/BK	1040	Battery Positive Voltage
2	0.3 BN	4	Ignition 1 Voltage
3	0.3 BK	850	Ground
4	--	--	Not Used
5	0.35 D-GN	9206	Low Speed GMLAN Serial Data

Throttle Body



- OEM: 7283-3529-30
- Service: 19115594
- Description: 6-Way F (BK)

Terminal Part Information

- Pins: A, B
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

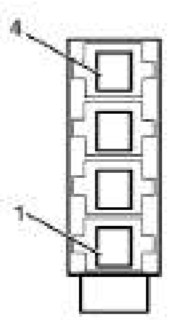
- Pins: C-F
- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

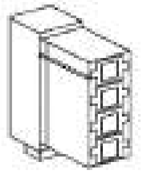
Throttle Body

Pin	Wire Color	Circuit No.	Function
A	0.75 BN	582	TAC Motor Control - 2
B	0.75 YE	581	TAC Motor Control - 1
C	0.5 BN/BK	2752	Low Reference

D	0.5 D-GN	485	TP Sensor 1 Signal
E	0.5 GY	2701	5-Volt Reference
F	0.5 PU	486	TP Sensor 2 Signal

Tilt Sensor





Connector Part Information

- OEM:
- Service: See Catalog
- Description: 4-Way F

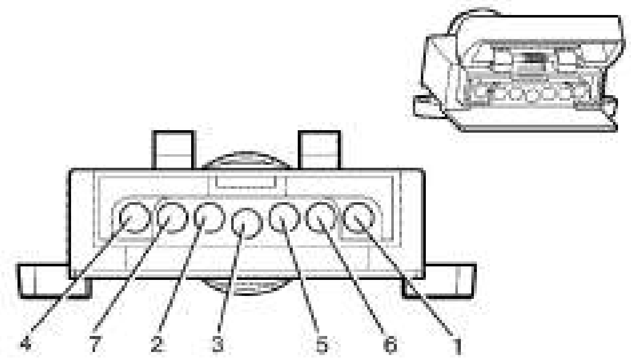
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Tilt Sensor

Pin	Wire Color	Circuit No.	Function
1	0.35 BK	9	Alarm Control Module Power Control
2	--	--	Not Used
3	0.35 BK	4	Inclination Sensor Signal
4	0.35 BK	6	Ground

Trailer Connector



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 7-Way F

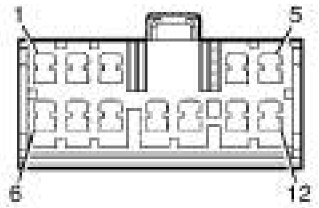
Terminal Part Information

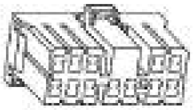
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Trailer Connector

Pin	Wire Color	Circuit No.	Function
1	0.35 YE	1	Left Indicator Output
2	0.35 BK	2	Backup Output
3	0.35 WH	19	Ground
4	0.35 D-GN	19	Right Indicator Output
5	0.35 D-BU	4	Trailer Brake Output
6	0.35 RD	5	Stop Output
7	0.35 BN	6	Park Output
8	0.35 WH	7	Ground
9	0.35 GY	30	Object Detection/Rear Park Assist Ground

Trailer Harness Control Module





Connector Part Information

- OEM: 7123-1423
- Service: See Catalog
- Description: 12-Way F

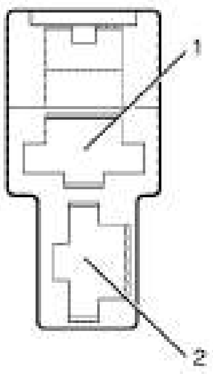
Terminal Part Information

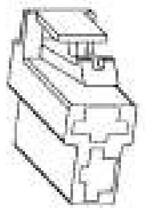
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Trailer Harness Control Module

Pin	Wire Color	Circuit No.	Function
1	0.35 RD	6	Stop Output
2	0.35 BN	7	Park Output
3	0.35 WH	19	Ground
4	0.35 BN/WH	309	Right Park lamp Supply Voltage
5	0.35 L-BU	20	Stop Lamp Supply Voltage
6	0.35 RD/WH	4440	Battery Positive Voltage
7	0.35 D-GN	4	Right Indicator Output
8	0.35 YE	1	Left Indicator Output
9	0.35 YE/BK	1334	Left Rear Turn Signal Lamp Supply Voltage
10	0.35 D-GN/WH	1335	Right Rear Turn Signal Supply Voltage
11	0.35 BK	2	Backup Output
12	0.35 L-GN	24	Backup Supply Voltage

Trailer Patch Harness Electrical Brake Connector





Connector Part Information

- OEM: 7123-2825
- Service: See Catalog
- Description: 2-Way F (WH)

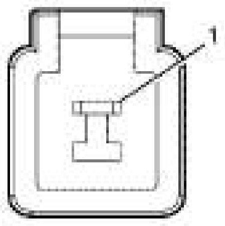
Terminal Part Information

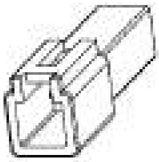
- Terminal/Tray: 7116-2640-02/12
- Core/Insulation Crimp: C/B
- Release Tool/Test Probe: 12094430/J-35616-42 (RD)

Trailer Patch Harness Electrical Brake Connector

Pin	Wire Color	Circuit No.	Function
1	0.35 BK	5	Electric Brakes
2	0.35 RD	6	Trailer Stop

Trailer Presence Conncetor





Connector Part Information

- OEM: 7282-7014

- Service: See Catalog
- Description: 1-Way M (WH)

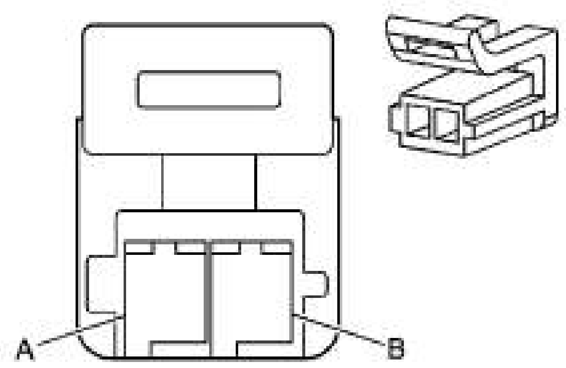
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Trailer Presence Conncetor

Pin	Wire Color	Circuit No.	Function
1	0.35 GY	30	Object Detection/Rear Park Assist Ground

Torque Converter Clutch (TCC) Pulse Width Modulation (PWM) Solenoid Valve



Connector Part Information

- OEM: 12162202
- Service: See Catalog
- Description: 2-Way F Metri-Pack 150.2 Series, Pull To Seat (BU)

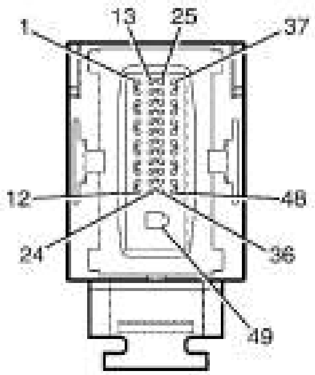
Terminal Part Information

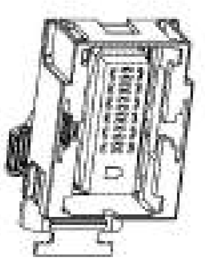
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Torque Converter Clutch (TCC) Pulse Width Modulation (PWM) Solenoid Valve

Pin	Wire Color	Circuit No.	Function
A	0.5 YE	418	TCC PWM Solenoid Valve Control
B	0.5 WH	1525	Clutch Pressure Control Solenoid Valve 1 High Control

Transmission Control Module (TCM) (M30 or M32)





- OEM: 15463921
- Service: See Catalog
- Description: 49-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Transmission Control Module (TCM) (M30 or M32)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN	418	TCC PWM Solenoid Valve Control
2	0.5 L-GN	1222	Shift Solenoid A Valve Control
3	0.5 OG	1983	Transmission Turbine Speed Switch Signal
4-5	--	--	Not Used

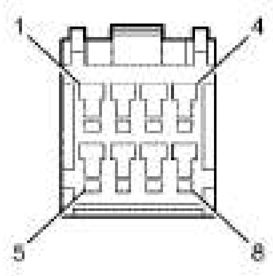
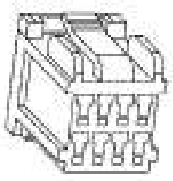
7	0.5 BN/BK	2500	High Speed GMLAN Serial Data Bus+
8-10	--	--	Not Used
11	0.5 D-BU	5985	TCM Accessory Signal
12-13	--	--	Not Used
14	0.5 WH/GN	687	3-2 Shift Solenoid Valve Control
15	--	--	Not Used
16	0.5 L-GN/BK	822	OSS Low Signal
17	0.5 L-BU/WH	1229	PC Solenoid Valve Low Control
18-19	--	--	Not Used
20	0.5 YE/BK	1223	Shift Solenoid B Valve Control
21-22	--	--	Not Used
23	0.5 GY	773	Transmission Range Switch Signal C
24	0.5 PK	1224	Transmission Fluid Pressure Switch Signal A
25	0.5 BN/OG	422	TCC Solenoid Valve Control
26-28	--	--	Not Used

29	0.5 BN/YE	771	Transmission Range Switch Signal A
30	0.5 BN/WH	2762	Low Reference
31	0.5 PK	439	Ignition 1 Voltage
32	0.75 OG/YE	3640	Battery Positive Voltage
33	0.5 OG	1226	Transmission Fluid Pressure Switch Signal C
34	--	--	Not Used
35	0.5 YE/BK	1227	TFT Sensor Signal
36	--	--	Not Used
37	0.5 BN	2501	High Speed GMLAN Serial Data Bus-
38	0.5 BN/BK	2500	High Speed GMLAN Serial Data Bus+
39	0.5 WH	776	Transmission Range Switch Signal P
40	0.5 OG/BK	1228	PC Solenoid Valve High Control
41	0.5 PU/WH	821	OSS High Signal
42	0.5 WH/BU	17	Stop Lamp Switch Signal
43	--	--	Not Used
44	0.5 D-BU	1225	Transmission Fluid Pressure Switch Signal B
45	0.5 L-BU	1984	Transmission Turbine Speed Switch Low Reference
46	0.5 YE	772	Transmission Range Switch Signal B
47-48	--	--	Not Used
49	0.75 BK	450	Ground

Turn Signal/Multifunction Switch





Connector Part Information

- OEM: 7123-1685
- Service: See Catalog
- Description: 8-Way F 040 Multilock Series (WH)

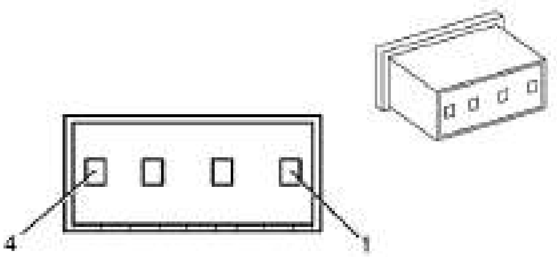
Terminal Part Information

- Terminal/Tray: 173681-2/17
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Turn Signal/Multifunction Switch

Pin	Wire Color	Circuit No.	Function
1	0.3 BK	850	Ground
2	0.3 BN/RD	1356	Flash To Pass Switch Signal
3	0.3 PU/YE	524	Headlamp Dimmer Switch High Beam Signal
4	0.3 BK	850	Ground
5	0.5 GY	1884	Cruise Control Switch Signal
6	0.3 PU	1375	Steering Wheel Control Supply Voltage
7	0.3 D-BU/WH	1415	Right Front Turn Signal Switch Signal
8	0.3 L-BU/WH	1414	Left Front Turn Signal Switch Signal

Ultrasonic Sensor Control Module



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 4-Way F

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Ultrasonic Sensor Control Module

Pin	Wire Color	Circuit No.	Function
1	0.35 BK	9	Alarm Control Module Power Control
2	0.35 BK	7	Intrusion Sensor Signal

3	0.35 BK	6	Gound
4	--	--	Not Used

Valve Lifter Oil Manifold (VLOM) Assembly

Connector Part Information

- OEM: 7287-1418
- Service: See Catalog
- Description: 5-Way F

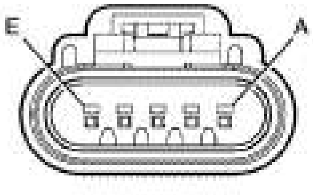
Terminal Part Information

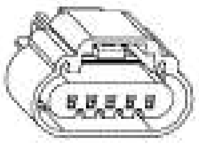
- Terminal/Tray: 12124075/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12180559-1/J-35616-14 (GN)

Valve Lifter Oil Manifold (VLOM) Assembly

Pin	Wire Color	Circuit No.	Function
A	0.75 OG	5494	Cylinder Shut Off Solenoid 4
B	0.75 GY	5493	Cylinder Shut Off Solenoid 3
C	0.75 D-BU	5491	Cylinder Shut Off Solenoid 1
D	0.75 D-GN/BK	5492	Cylinder Shut Off Solenoid 2
E	0.75 PK/BU	5293	Ignition 1 Voltage

Variable Intake Manifold (VIM) Module





Connector Part Information

- OEM: 7283-6997-30
- Service: See Catalog
- Description: 5-Way F (BK)

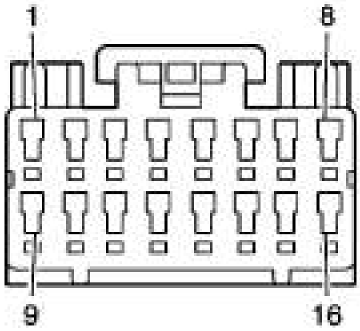
Terminal Part Information

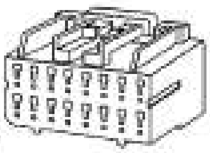
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-2A (GY)

Variable Intake Manifold (VIM) Module

Pin	Wire Color	Circuit No.	Function
A	0.75 PK/BU		Ignition 1 Voltage
B	0.75 BN		PWM_OUT
C	0.75 PU/BK		PWR_RTN
D	0.75 L-BU/WH		PWM
E	0.75 BK		Ground

Vehicle Communication Interface Module (VCIM) X1





Connector Part Information

- OEM: 7283-1766
- Service: See Catalog
- Description: 16-Way F (WH)

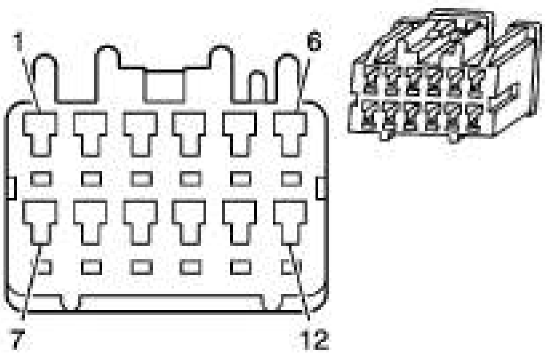
Terminal Part Information

- Terminal/Tray: 175266-5/15
- Core/Insulation Crimp: K/K
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Vehicle Communication Interface Module (VCIM) X1

Pin	Wire Color	Circuit No.	Function
1	0.35 D-GN	5060	Low Speed GMLAN Serial Data
2	0.3 BN/WH	2517	Keypad Red LED Signal
3	0.3 YE/BK	2516	Keypad Green LED Signal
4-5	--	--	Not Used
6	0.3 L-GN/BK	2515	Keypad Supply Voltage
7	0.5 BK	1050	Ground
8-9	--	--	Not Used
10	0.5 BN/BK	9008	High Speed GMLAN Serial Data Bus+
11	0.3 GN/WH	2514	Keypad Signal
12	0.5 BN	9009	High Speed GMLAN Serial Data Bus-
13	0.5 YE/BK	950	VCIM Battery Low Reference
14	0.5 BN/WH	9940	VCIM Battery Power
15	0.5 OG	3340	Battery Positive Voltage
16	--	--	Not Used

Vehicle Communication Interface Module (VCIM) X2



Connector Part Information

- OEM: 7283-8621
- Service: See Catalog
- Description: 12-Way F (WH)

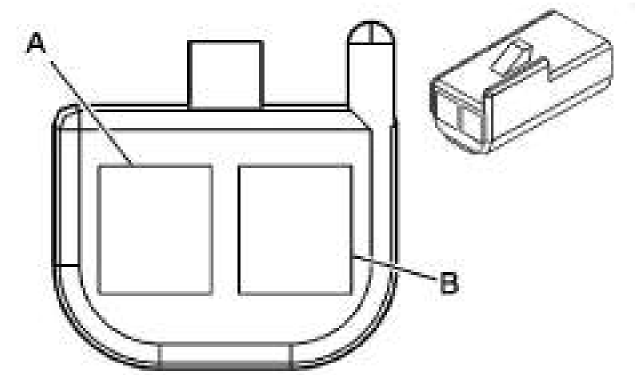
Terminal Part Information

- Terminal/Tray: 175266-5/15
- Core/Insulation Crimp: J/J
- Release Tool/Test Probe: 15315247J-35616-16 (L-GN)

Vehicle Communication Interface Module (VCIM) X2

Pin	Wire Color	Circuit No.	Function
1	0.3 D-BU	658	Cellular Telephone Voice Signal
2	0.3 L-BU	659	Cellular Telephone Voice Low Reference
3	0.5 BN/BK	9010	High Speed GMLAN Serial Data Bus+
4	0.5 BN	9011	High Speed GMLAN Serial Data Bus-
5-7	--	--	Not Used
8	0.5 BK	--	Ground
9	0.3 D-GN	0655	Cellular Microphone Signal
10	0.3 BK	1782	Drain Wire
11	--	--	Not Used
12	0.3 WH	700	Telephone Audio Signal Mute

Vehicle Communication Interface Module (VCIM) Battery



Connector Part Information

- OEM: 7123-8328-30
- Service: 12085535

- Description: 2-Way F (BK)

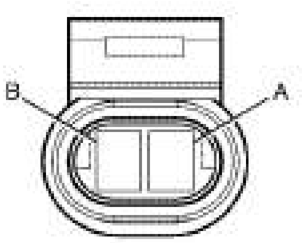
Terminal Part Information

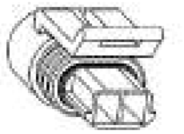
- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Vehicle Communication Interface Module (VCIM) Battery

Pin	Wire Color	Circuit No.	Function
A	0.5 BN/WH	9940	VCIM Battery Power
B	0.5 YE/BK	950	VCIM Battery Low Reference

Vehicle Speed Sensor (VSS)





Connector Part Information

- OEM: 12162195
- Service: See Catalog
- Description: 2-Way F

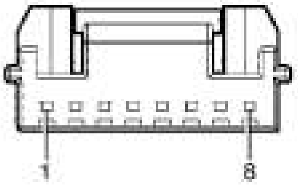
Terminal Part Information

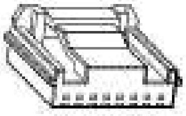
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Vehicle Speed Sensor (VSS)

Pin	Wire Color	Circuit No.	Function
A	0.5 PU/WH	821	OSS High Signal
B	0.5 L-GN/BK	822	OSS Low Signal

Video Display





Connector Part Information

Connector Part Information

- OEM: 902970-00
- Service: See Catalog
- Description: 6-Way F

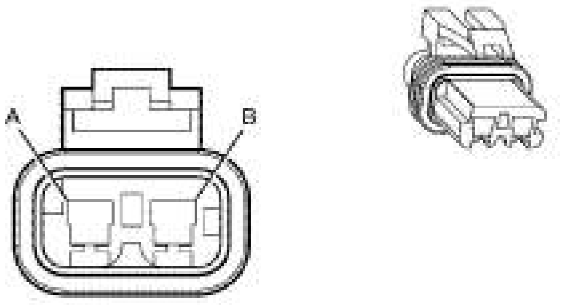
Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Window Motor - Driver (AXC)

Pin	Wire Color	Circuit No.	Function
1	0.5 BN/RD	1300	Power Window Master Switch Left Front Up Signal
2	0.5 D-GN	1301	RAP [X] Fuse Supply Voltage
3	2 RD/WH	1540	Battery Positive Voltage
4	0.5 BK	2050	Ground
5	--	--	Not Used
6	0.5 GY/BU	1136	Power Window Motor Left Front Down Control

Window Motor - Left Rear



Connector Part Information

- OEM: 7283-2176-40
- Service: 88988609
- Description: 2-Way F Metri-Pack 280 Series Flexlock Sealed (GY)

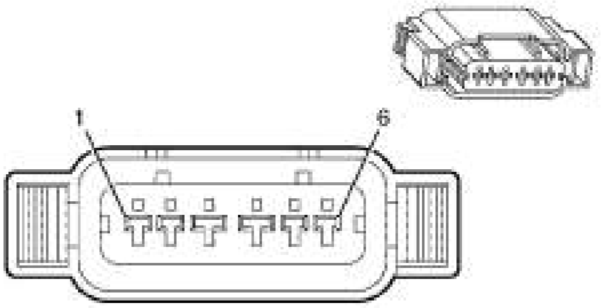
Terminal Part Information

- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Window Motor - Left Rear

Pin	Wire Color	Circuit No.	Function
A	2 BN	669	Power Window Motor Left Rear Down Control
B	2 D-BU	668	Power Window Motor Left Rear Up Control

Window Motor - Passenger (AXB)



Connector Part Information

- OEM:
- Service: See Catalog
- Description: 6-Way F

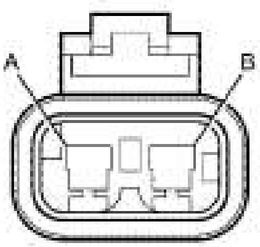
Terminal Part Information

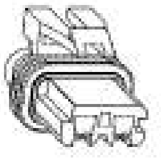
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Window Motor - Passenger (AXB)

Pin	Wire Color	Circuit No.	Function
1	0.5 L-BU	166	Power Window Master Switch Right Front Up Signal
2	0.5 D-GN	1301	RAP [X] Fuse Supply Voltage
3	2 RD/WH	1540	Battery Positive Voltage
4	2 BK	1350	Ground
5	--	--	Not Used
6	0.5 D-GN/BK	167	Power Window Master Switch Right Front Down Signal

Window Motor - Passenger (AXC)





Connector Part Information

- OEM: 7283-2176-40
- Service: See Catalog
- Description: 2-Way F Metri-Pack 280 Series Flexlock Sealed (GY)

Terminal Part Information

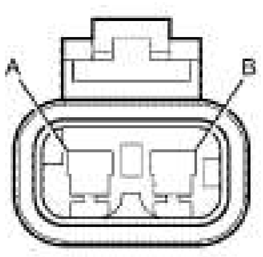
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

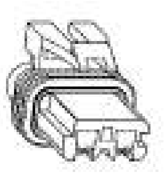
Window Motor - Passenger (AXC)

Pin	Wire Color	Circuit No.	Function

A	2 BN	667	Power Window Motor Right Front Down Control
B	2 D-BU/WH	666	Power Window Motor Right Front Up Control

Window Motor - Right Rear





Connector Part Information

- OEM: 7283-2176-40
- Service: 88988609
- Description: 2-Way F Metri-Pack 280 Series Flexlock Sealed (GY)

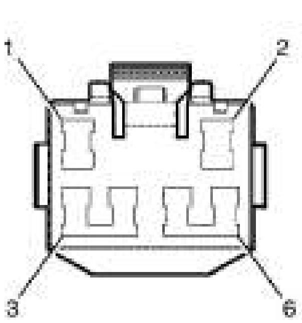
Terminal Part Information

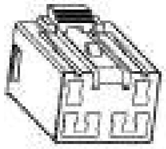
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Window Motor - Right Rear

Pin	Wire Color	Circuit No.	Function
A	2 BN	671	Power Window Motor Right Rear Down Control
B	2 D-BU	670	Power Window Motor Right Rear Up Control

Window Switch - Left Rear





Connector Part Information

- OEM: 7283-1060
- Service: See Catalog
- Description: 6-Way F (WH)

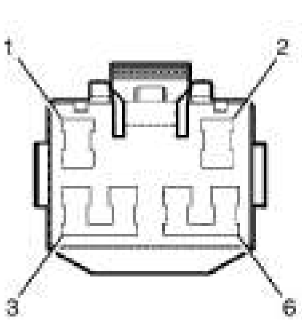
Terminal Part Information

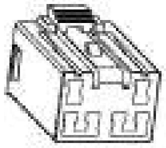
- Terminal/Tray: 7116-4022/11
- Core/Insulation Crimp: 4/A
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Window Switch - Left Rear

Pin	Wire Color	Circuit No.	Function
1	2 D-BU	668	Power Window Motor Left Rear Up Control
2	0.3 BK		Ground
3	2 D-GN	168	Power Window Master Switch Left Rear Up Signal
4	2 D-BU	1307	Power Window Master Switch Lockout Signal
5	2 BN	669	Power Window Motor Left Rear Down Control
6	2 PU	169	Power Window Master Switch Left Rear Down Signal

Window Switch - Right Rear





Connector Part Information

- OEM: 7283-1060
- Service: See Catalog
- Description: 6-Way F (WH)

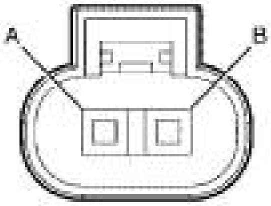
Terminal Part Information

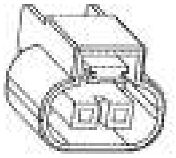
- Terminal/Tray: 7116-4022/11
- Core/Insulation Crimp: 4/A
- Release Tool/Test Probe: 15315247/J-35616-18 (BK)

Window Switch - Right Rear

Pin	Wire Color	Circuit No.	Function
1	2 D-BU	670	Power Window Motor Right Rear Up Control
2	0.3 BK		Ground
3	2 L-GN	170	Power Window Master Switch Right Rear Up Signal
4	2 D-BU	1307	Power Window Master Switch Lockout Signal
5	2 BN	671	Power Window Motor Right Rear Down Control
6	2 PU/WH	171	Power Window Master Switch Right Rear Down Signal

Windshield Washer Fluid Level Switch (TT7 or TT8 or EF7)





Connector Part Information

- OEM: PB625-02027
- Service: See Catalog
- Description: 2-Way F

Terminal Part Information

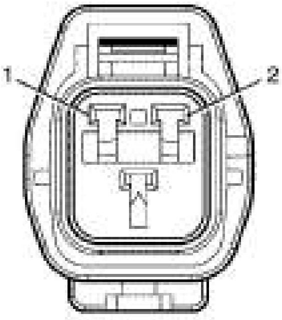
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit

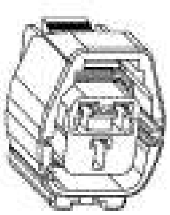
- Release Tool/Test Probe: See Terminal Repair Kit

Windshield Washer Fluid Level Switch (TT7 or TT8 or EF7)

Pin	Wire Color	Circuit No.	Function
A	0.3 BK	250	Ground
B	0.3 BN	185	Low Washer Fluid Indicator Signal

Windshield Washer Fluid Pump





Connector Part Information

- OEM: 7283-7031-10
- Service: See Catalog
- Description: 2-Way F (BK)

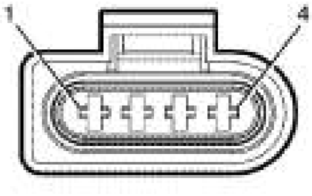
Terminal Part Information

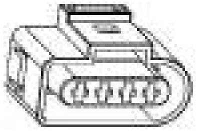
- Terminal/Tray: 7116-4026/11
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 15313892/J-35616-18 (BK)

Windshield Washer Fluid Pump

Pin	Wire Color	Circuit No.	Function
1	0.75 OG	228	Windshield Washer Pump Control
2	0.75 BK	250	Ground

Windshield Wiper Motor





Connector Part Information

- OEM: 7283-2043-30
- Service: See Catalog
- Description: 4-Way F (BK)

Terminal Part Information

- Pins: 1-2
- Terminal/Tray: 4-964273-1/15
- Core/Insulation Crimp: C/5
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

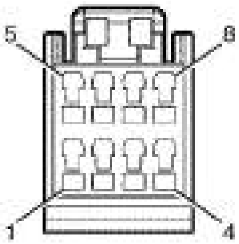
- Pin: 3
- Terminal/Tray: 4-964273-1/15
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

- Pin: 4
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Windshield Wiper Motor

Pin	Wire Color	Circuit No.	Function
1	2 YE	196	Windshield Wiper Motor Park Switch Signal
2	2 BK	350	Ground
3	1.25 BN/WH	92	Windshield Wiper Motor High Speed
4	0.3 D-GN	95	Windshield Wiper Motor Low Speed

Windshield Wiper / Washer Switch



Connector Part Information

- OEM: 7283-7387-30
- Service: See Catalog
- Description: 8-Way F (BK)

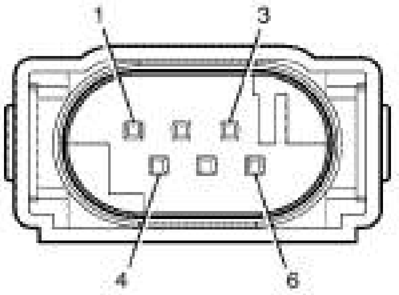
Terminal Part Information

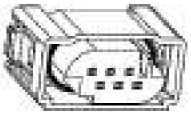
- Terminal/Tray: 173681-2/17
- Core/Insulation Crimp: E/4
- Release Tool/Test Probe: 15315247/J-35616-16 (L-GN)

Windshield Wiper/Washer Switch

Pin	Wire Color	Circuit No.	Function
1	--	--	Not Used
2	0.3 OG	94	Windshield Washer Switch Signal (LHD)
3	0.3 L-BU	1714	Windshield Wiper Switch Low Signal (LHD)
4	0.3 BK/WH	1715	Windshield Wiper Switch High Signal (RHD)
	0.3 L-GN	1715	Windshield Wiper Switch High Signal (LHD)
5	--	--	Not Used
6	0.3 OG	94	Windshield Washer Switch Signal (RHD)
7	0.3 L-BU	1714	Windshield Wiper Switch Low Signal (RHD)
8	0.3 BK/WH	1251	Ground (RHD)
	0.3 L-GN	1251	Windshield Wiper Switch High Signal (LHD)

Yaw and Lateral Accelerometer Sensor





Connector Part Information

- OEM: 7219-1764-30
- Service: See Catalog
- Description: 6-Way F (BK)

Terminal Part Information

- Terminal/Tray: 962885-5/15
- Core/Insulation Crimp: 6/6
- Release Tool/Test Probe: 12094429/J-35616-64B (L-BU)

Yaw and Lateral Accelerometer Sensor

Pin	Wire Color	Circuit No.	Function
1	0.5 D-GN	2087	5-V Reference
2	0.5 L-GN/BK	5352	Yaw Rate Sensor Test Control
3	0.5 L-BU	5986	Communication Enable Relay Supply Voltage
4	0.5 BN/WH	2086	Yaw Rate Signal
5	0.5 PU/WH	1699	Combined Vehicle Inertial Sensor Signal
6	0.5 BK/BU	2088	Low Reference

Inline Harness Connector End Views

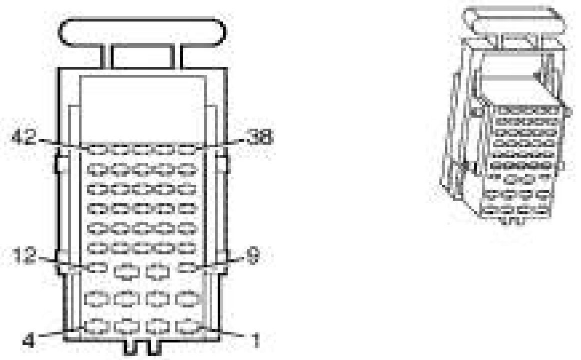
Connector 1: X102 Front Body Harness to Engine Harness
Connector 2: X103 Forward Lamp Harness to the Engine Harness
Connector 3: X104 Front Body Harness to I/P Harness
Connector 4: X106 Forward Lamp Harness to the Front Body Harness
Connector 5: X107 Forward Lamp Harness to the Front Compartment Harness
Connector 6: X108 Fog Lamp Harness to the Front Body Harness
Connector 7: X110 Engine Harness to the Front Body Harness
Connector 8: X112 Engine Harness to the Ignition Coil Harness (L98)
Connector 9: X113 Engine Harness to the Ignition Coil Harness (L98)
Connector 10: X114 Engine Harness to the Fuel Injector Harness (LY7)
Connector 11: X115 Forward Lamp Harness to the Left Headlamp
Connector 12: X116 Forward Lamp Harness to the Right Headlamp
Connector 13: X160 Left Front Wheel Speed Sensor Harness to the Front Body Harness
Connector 14: X161 Right Front Wheel Speed Sensor Harness to the Front Body Harness
Connector 15: X162 Forward Lamp Harness to the Cooling Fan Assembly
Connector 16: X165 Front Body Harness to the I/P Harness
Connector 17: X175 Engine Harness to the Automatic Transmission (M82)
Connector 18: X200 I/P Harness to the Front Body Harness
Connector 19: X201 I/P Harness to the Front Body Harness
Connector 20: X202 I/P Harness to the Body Harness
Connector 21: X204 I/P Harness to the Front Body Harness
Connector 22: X205 Glove Box Assembly to the I/P Harness
Connector 23: X206 Front Body Harness to the Body Harness
Connector 24: X207 I/P Harness to the Body Harness
Connector 25: X208
Connector 26: X210 Rear Body Harness to the Rear Latch Assembly Harness
Connector 27: X212 Headliner Harness to the I/P Harness
Connector 28: X213 Headliner Harness to the Instrument Panel Harness
Connector 29: X218 Body Harness to the Body Harness
Connector 30: X220 I/P Harness to the Body Harness (LHD)
Connector 31: X223 I/P Harness to the Console Ground
Connector 32: X225
Connector 33: X226 Gauge Assembly to the I/P Harness (HSV)
Connector 34: X227 Steering Angle Sensor Assembly to the I/P Harness
Connector 35: X228 I/P Harness to the I/P Harness
Connector 36: X229 I/P Harness to the I/P Harness
Connector 37: X236 Electronic Suspension Assembly to the Body Harness (HSV)
Connector 38: X237 Electronic Suspension Assembly to the I/P Harness (HSV)
Connector 39: X238 Indicator Assembly to the I/P Harness (HSV)
Connector 40: X241 I/P Harness to the Driver Information Center Harness

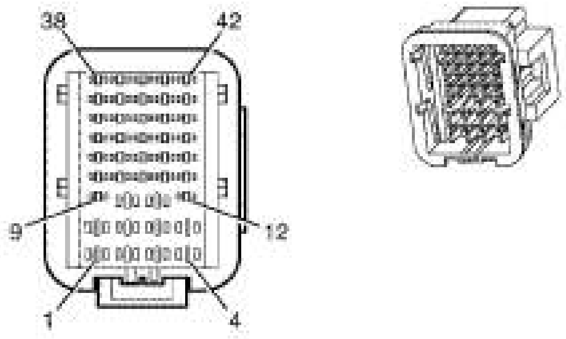
Connector 41: X253 I/P Harness to the Body Harness
Connector 42: X254 I/P Harness to the Body Harness
Connector 43: X255 Digital Video Disc (DVD) Control Module to the Video Display
Connector 44: X305 Body Harness to the Fuel Tank Harness
Connector 45: X306 Driver Seat Harness to the Body Harness (A45)
Connector 46: X307 Body Harness to the Left Front Door Harness
Connector 47: X308 Body Harness to the Right Front Door Harness
Connector 48: X309 Body Harness to the I/P Harness
Connector 49: X310 Passenger Seat Harness to the Body Harness
Connector 50: X311 Driver Seat Harness to the Body Harness
Connector 51: X312 Body Harness to the Passenger Seat Harness
Connector 52: X313 Body Harness to the Passenger Seat Harness
Connector 53: X314 Body Harness to the Driver Seat Harness
Connector 54: X315 Body Harness to the Driver Seat Harness
Connector 55: X316 Body Harness to the Digital Video Disc (DVD) Control Module
Connector 56: X317 Body Harness to the Body Harness
Connector 57: X319 Headliner Harness to the Digital Video Disc (DVD) Control Module
Connector 58: X322 Passenger Seat Harness to the Body Harness
Connector 59: X324 Driver Seat Back to the Driver Seat Harness (AH5)
Connector 60: X324 Driver Seat Back to the Driver Seat Harness (AGB)
Connector 61: X330 Left Seat Harness to the Body Harness
Connector 62: X331 Right Seat Harness to the Body Harness
Connector 63: X332 Video Display to the Right Seat Harness
Connector 64: X333 Left Seat Harness to the Body Harness
Connector 65: X335 Video Display Assembly to the Body Harness
Connector 66: X344 Inside Rearview Mirror Harness to the I/P Harness
Connector 67: X355 Body Harness to the Driver Seat Harness
Connector 68: X356 Body Harness to the Passenger Seat Harness
Connector 69: X360 Body Harness to the Rear Wheel Speed Sensors
Connector 70: X361 Rear Axle Harness to the Body Harness
Connector 71: X402 Body Harness to the Decklid Harness
Connector 72: X403 Rear Body Harness to the Body Harness
Connector 73: X404 Body Harness to the Rear Body Harness
Connector 74: X405 X405 Body Harness to the Rear Compartment Harness (F19)
Connector 75: X405 Body Harness to the Rear Compartment Harness (F69 without T79)
Connector 76: X408 Battery Cable to the Body Harness
Connector 77: X412 Rear Body Harness to the Rear Body Harness
Connector 78: X413 Electronic Stability Control Harness to the Fuel Tank Harness (HSV)
Connector 79: X415 (HSV) (Pigtail?)
Connector 80: X416 (HSV) (Pigtail?)
Connector 81: X433 Rear Fascia Harness to the License Lamp Harness (WM)
Connector 82: X450 Rear Body Harness to the Right Rear Tail Lamp Assembly
Connector 83: X451 Rear Body Harness to the Left Rear Tail Lamp Assembly
Connector 84: X500 Body Harness to the Left Front Door Harness
Connector 85: X600 Body Harness to the Right Front Door Harness

Connector 86: X700 Body Harness to the Left Rear Door Harness

Connector 87: X800 Body Harness to the Right Rear Door Harness

X102 Front Body Harness to Engine Harness





Connector Part Information

- OEM: 7283-9911-30
- Service: See Catalog
- Description: 42-Way F (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

Connector Part Information

- OEM: 7282-0680-30
- Service: See Catalog
- Description: 42-Way M (BK)

Terminal Part Information

- Pins: 1-6, 8, 10, 11
- Terminal/Tray: 1-962915-3/15
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-5 (PU)

- Pins: 9, 12-24, 25-28, 31-42
- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

X102 Front Body Harness to Engine Harness

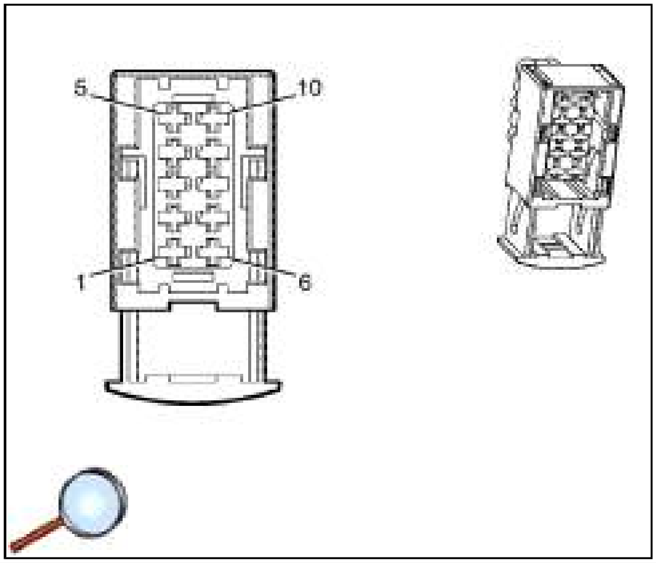
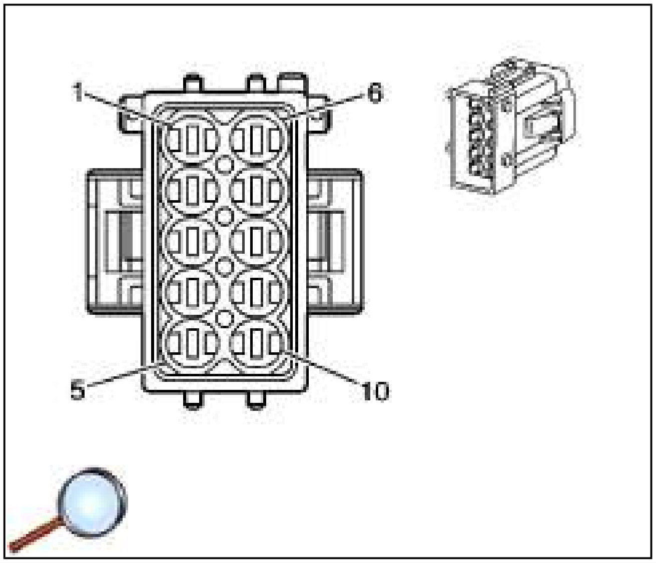
X116 Forward Lamp Harness to the Right Headlamp





Connector Part Information

- OEM: 7283-7109-30
- Service: See Catalog
- Description: 10-Way F (BK)

Terminal Part Information

- Terminal/Tray: 4-964286-1/16
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12093647/J-35616-4A (PU)

Connector Part Information

- OEM: 1-962352-1
- Service: Non Serviceable
- Description: 10-Way M (BK)

Terminal Part Information

- Terminal/Tray: See Terminal Repair Kit
- Core/Insulation Crimp: See Terminal Repair Kit
- Release Tool/Test Probe: See Terminal Repair Kit

X404 Body Harness to the Rear Body Harness

Connector Part Information

- OEM: 7283-1128
- Service: See Catalog
- Description: 12-Way F (WH)

Terminal Part Information

- Pin: 1
- Terminal/Tray: 7116-4021/10
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

- Pins: 2-8
- Terminal/Tray: 7116-4021/10
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

- Pins: 11, 12
- Terminal/Tray: 7116-4020/10
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

Connector Part Information

- OEM: 7282-1128
- Service: See Catalog
- Description: 12-Way M 090 II Series (WH)

Terminal Part Information

- Pin: 1
- Terminal/Tray: 7114-4021/10
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

- Pins: 2-3, 5, 6, 8
- Terminal/Tray: 7114-4021/10
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

- Pins: 4, 7, 11, 12
- Terminal/Tray: 7114-4020/10
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 15315247/J-35616-19 (BK)

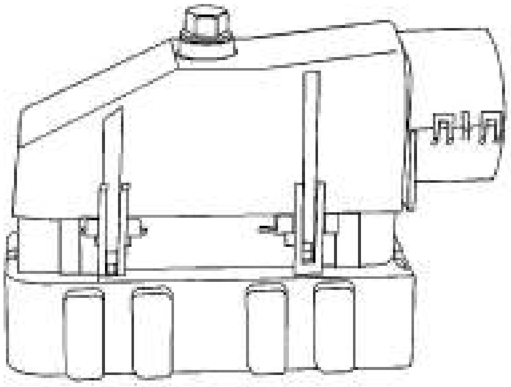
AFL / EPC Connectors

Special Tools

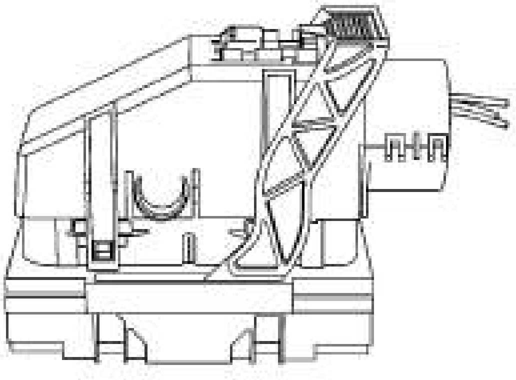
For equivalent regional tools, refer to Special Tools.

Removal Procedure

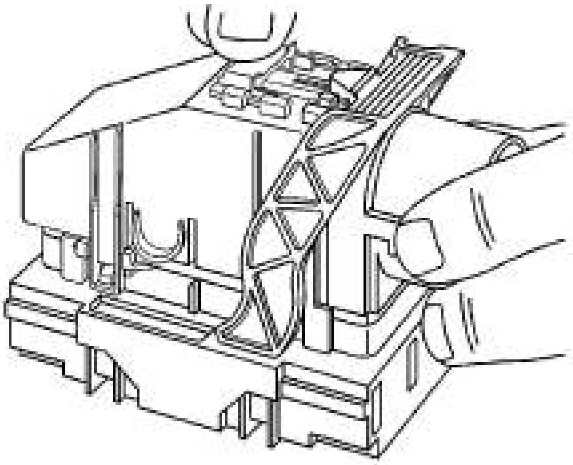
Follow the steps below in order to remove terminals from the connector.



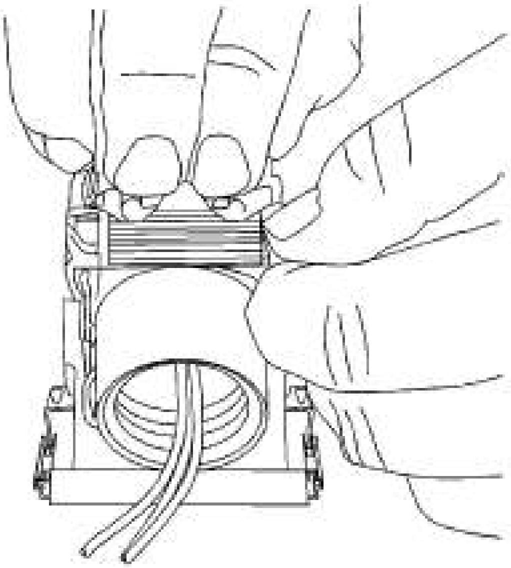
1. For connectors with a bolt in the dress cover, turn the bolt counterclockwise to remove the connector from the component.



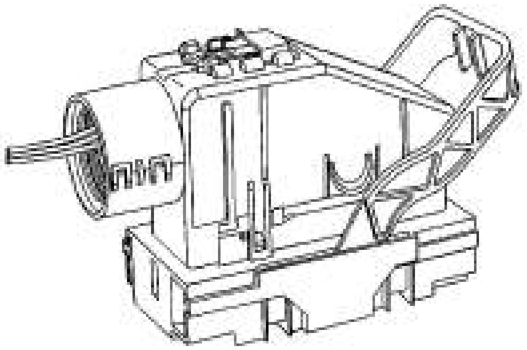
2. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.



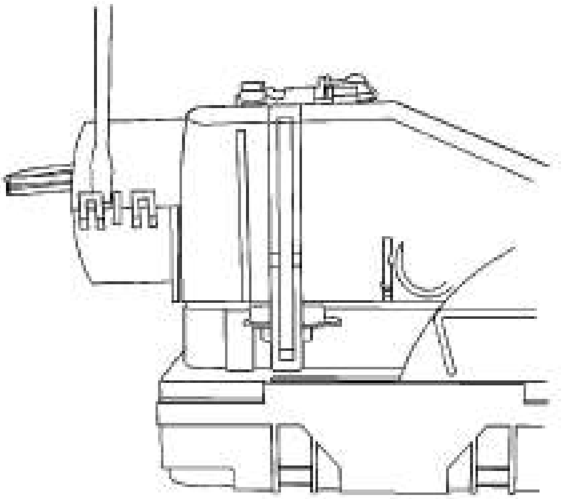
3. Slide the lever lock forward while pressing down on the lever lock release tab.



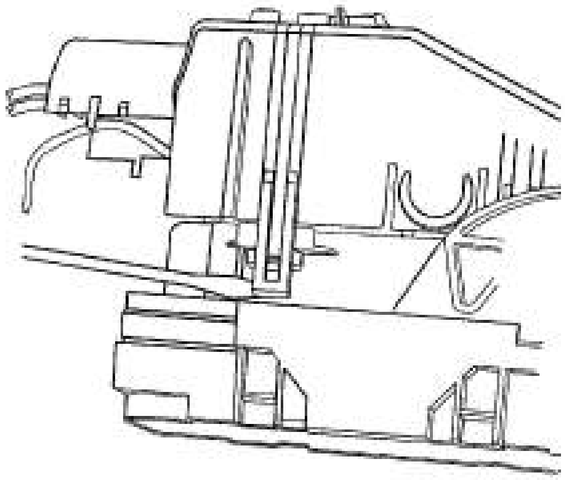
4. View showing depressing of the lever lock release tab.



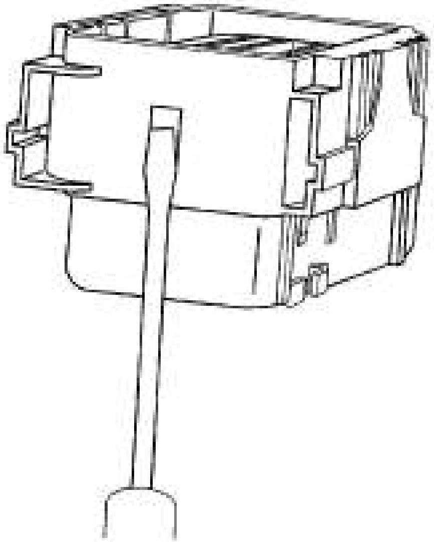
5. View of connector in released position.
6. Disconnect the connector from the component.
7. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.



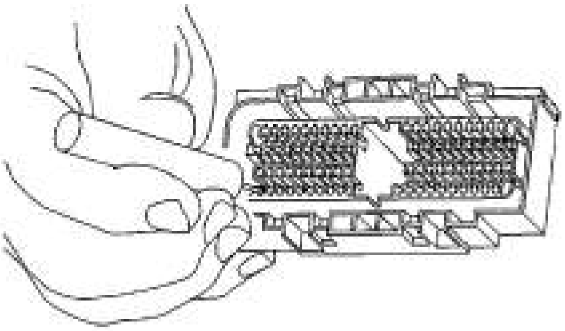
8. Release the rear lower half of the wiredress cover.



9. Release the tabs that are holding the wiredress cover to the connector body.
10. Remove the nose piece by inserting a small flat-blade tool into the slots on both ends of the connector body. Gently pry the nose piece out of the connector. EL-38125-216 can also be used to remove the nose piece.



11. Use the EL-38125-12A tool to release the terminals by lifting the terminal retaining tabs on the inside of the connector.



12. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Repair Procedure

Use the appropriate terminal / terminated lead.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | **Document ID: 2166714**

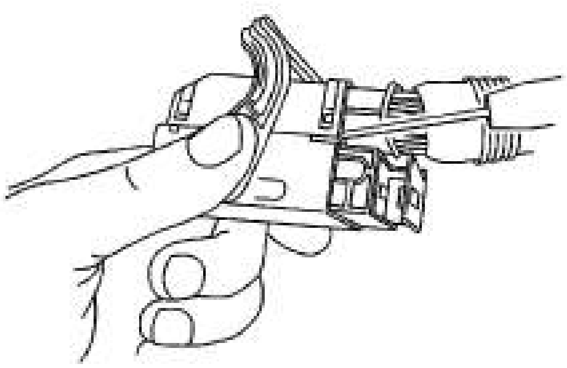
Bosch Connectors (0.64)

Special Tools

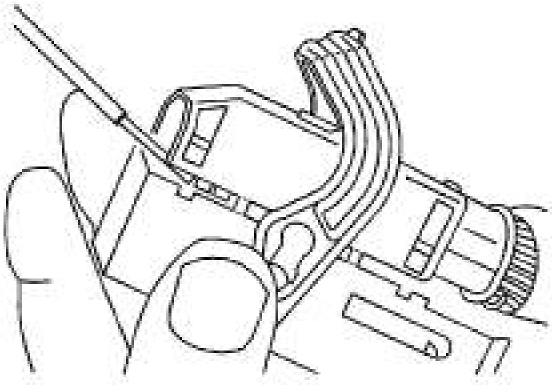
For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

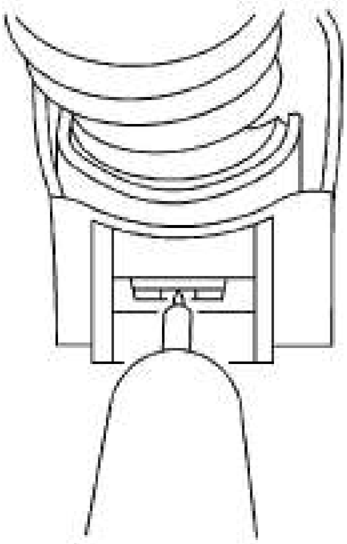
1. Locate the lever lock on the wire dress cover. While pressing the lock, pull the lever over and past the lock until the lever is at the end of its travel.
2. Disconnect the connector from the component.
3. Pull the rubber boot that covers the wires back to expose the end of the connector dress cover.
4. Place the connector locking lever in the center of the connector.



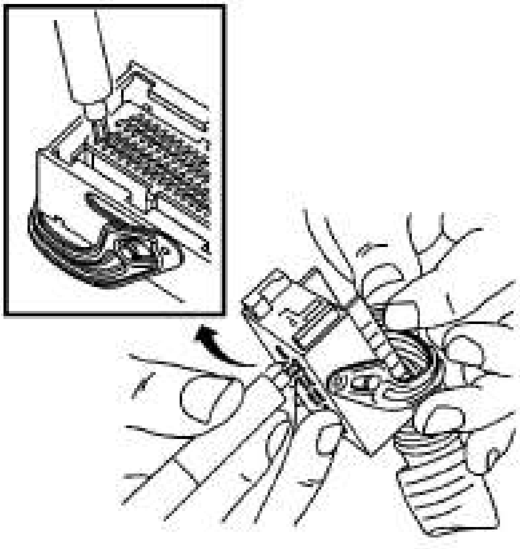
5. Locate the 2 dress cover locking tabs that are on the wire end of the connector. Insert a small flat-bladed tool between the cover and connector body and pry up.



6. Locate the 2 dress cover locking tabs located on the opposite side of the connector. Insert a small flat-bladed tool between the cover at the connector end and pry up.
7. Remove the dress cover.
8. Cut the tie wrap on the wire bundle.



9. Remove the terminal position assurance (TPA) by inserting a small flat-bladed tool into the small slot in the end of the slider and pushing on the TPA until it comes out of the connector. When the TPA exits the opposite side of the connector, gasp the TPA and pull it completely out of the connector.
10. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

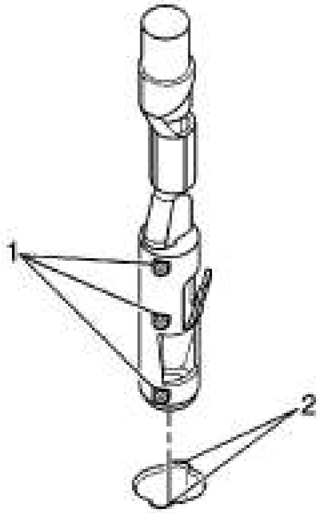


11. Insert the EL-38125-560 into the 2 triangular cavities on each side of the terminal at the front of the connector.
12. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Terminal Replacement Procedure



1. Prior to installation the terminal must be aligned so the (1) coding lugs align with the (2) coding grooves on the connector.
2. Once the terminal is aligned, slide the terminal into the cavity until the retainer has engaged in the cavity of the connector.
3. Slide the TPA in the connector body and seat it using a small flat bladed tool. The TPA is seated when it is flush with the contact housing.
4. Secure the wires to the connector body using a tie wrap and replace the dress cover and grommet.

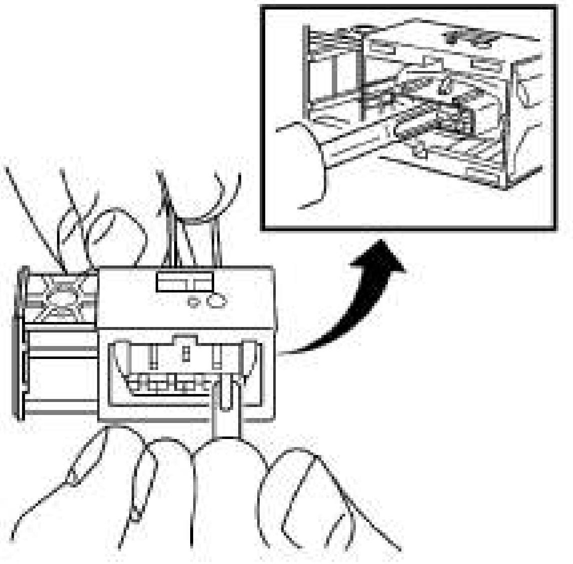
Bosch Connectors (2.8 JPT)

Special Tools

For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

1. Pull out the slider on the connector position assurance (CPA) until it is at the end of its travel.
2. Disconnect the connector from the component.
3. Remove the wire dress cover, if necessary.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.



5. Insert the EL-38125-557 into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
6. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

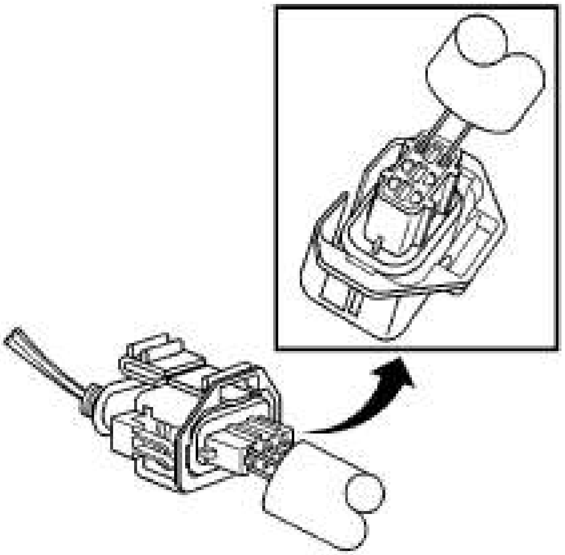
Bosch Connectors (BSK)

Special Tools

For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

1. Disconnect the connector from the component.
2. Remove the wire dress cover, if necessary.
3. Push the wire side of the terminal that is being removed toward the connector and hold it in position.



4. Insert the EL-38125-561 tool into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
5. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.

Terminated Lead Repair

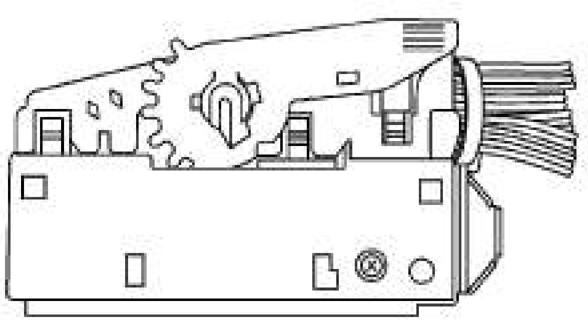
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Bosch Connectors (ECM)

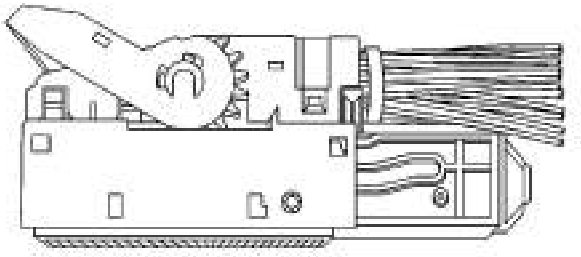
Special Tools

For equivalent regional tools, refer to Special Tools.

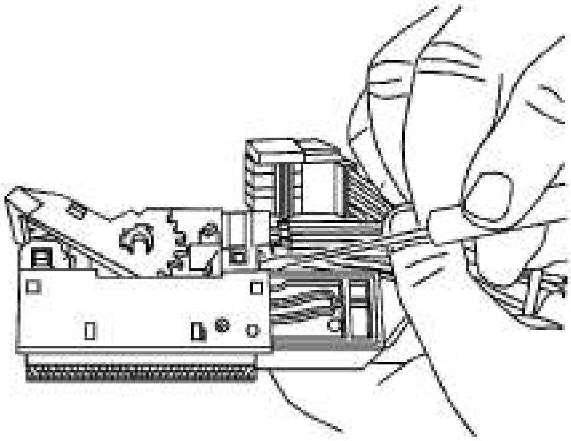
Removal Procedure



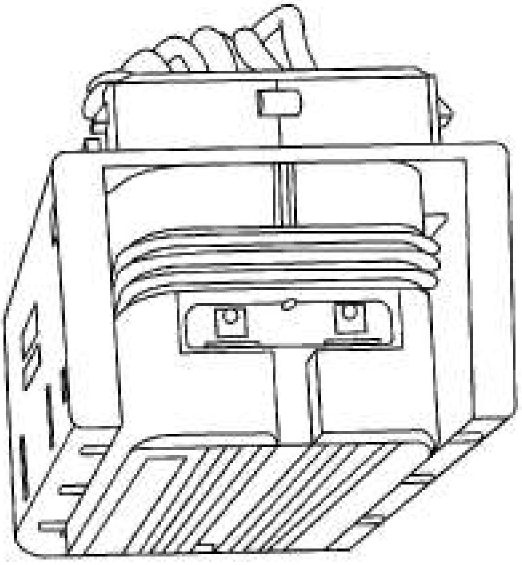
1. Locate the assist lever on the top of the connector. Move the assist lever to the forward position.



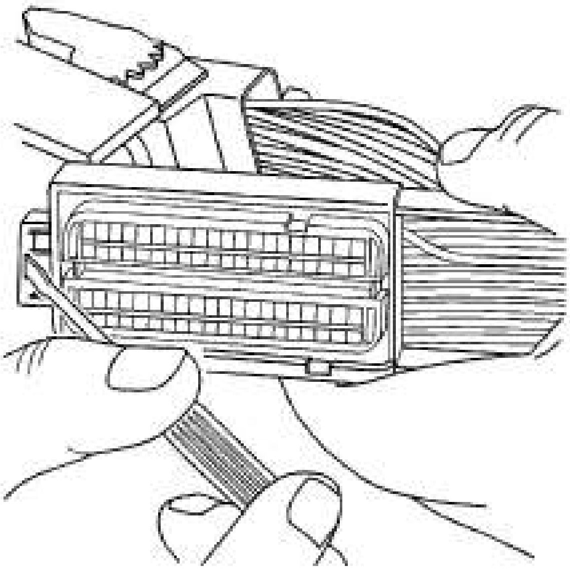
2. Disconnect the connector from the component.



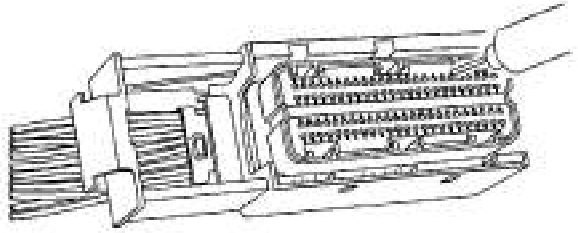
3. Locate the dress cover locking tabs at the corners of the connector. Use a small flat-blade tool to release the locking tabs and remove the dress cover.



4. The terminal positive assurance (TPA) is located in the front of the connector.

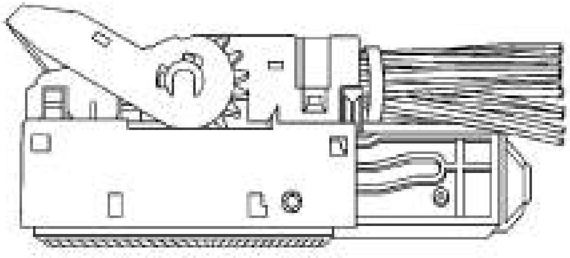


5. Use a small flat-blade tool to remove TPA from the connector.



6. Use the EL-38125-213 or the EL-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair



Note: Ensure that the dress cover and connector body are both in the released position before reassembling. Failure to do so may cause damage to the connector and component.

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Checking Aftermarket Accessories

Caution: Refer to SIR Caution in the Preface section.

Notice: The OBD II symbol is used on the circuit diagrams in order to alert the technician that the circuit is essential for proper OBD II emission control circuit operation. Any circuit which fails and causes the malfunction indicator lamp (MIL) to turn ON, or causes emissions-related component damage, is identified as an OBD II circuit.

Do not connect aftermarket accessories into the following circuits:

- SIR circuits, all such circuits are indicated on circuit diagrams with the SIR symbol.
- OBD II circuits, all such circuits are indicated on circuit diagrams with the OBD II symbol.

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Possible causes of vehicle problems related to aftermarket accessories include:

- Power feeds connected to points other than the battery
- Antenna location
- Transceiver wiring located too close to vehicle electronic modules or wiring
- Poor shielding or poor connectors on antenna feed line
- Check for recent service bulletins detailing installation guidelines for aftermarket accessories.

Circuit Protection - Circuit Breakers

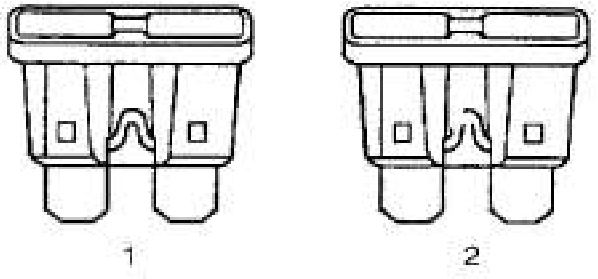
A circuit breaker is a protective device that is designed to open the circuit when a current load is in excess of the rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. Two types of circuit breakers are used.

Circuit Breaker: This type opens when excessive current passes through it for a period of time. It closes again after a few seconds, and if the cause of the high current is still present, it will open again. The circuit breaker will continue to cycle open and closed until the condition causing the high current is removed.

Positive Temperature Coefficient (PTC) Circuit Breaker: This type greatly increases its resistance when excessive current passes through it. The excessive current heats the PTC device, as the device heats its resistance increases. Eventually the resistance gets so high that the circuit is effectively open. Unlike the ordinary circuit breaker the PTC unit will not reset until the circuit is opened, by removing the voltage from its terminals. Once the voltage is removed the circuit breaker will re-close within a second or 2.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures |
Document ID: 303635

Circuit Protection - Fuses



The fuse is the most common method of an automotive wiring circuit protection. Whenever there is an excessive amount of current flowing through a circuit the fusible element will melt and create an open or incomplete circuit. Fuses are an one time protection device and must be replaced each time the circuit is overloaded. To determine if a fuse is open, remove the suspected fuse and examine the element in the fuse for an open (2). If not broken (1), also check for continuity using a DMM or a continuity tester. If the element is open or continuity is suspect, replace the fuse with one of equal current rating.

Fuse Types

Current Rating Amperes	Color
Auto Fuses, Mini Fuses	
2	Gray
3	Violet
5	Tan
7.5	Brown
10	Red
15	Blue
20	Yellow
25	White or Natural
30	Green
Maxi Fuses	

20	Yellow
30	Light Green
40	Orange or Amber
60	Blue
50	Red
J-Case Fuses	
20	Blue
30	Pink
40	Green
50	Red
60	Yellow

Circuit Protection - Fusible Links

Fusible link is wire designed to melt and break continuity when excessive current is applied. It is often located between or near the battery and starter or electrical center. Use a continuity tester or a DMM at each end of the wire containing the fusible link in order to determine if it is broken. If broken, it must be replaced with fusible link of the same gage size.

Repairing a Fusible Link

Note: Fusible links cut longer than 225 mm (approximately 9 in) will not provide sufficient overload protection.

Circuit Testing

The Circuit Testing section contains the following diagnostic testing information. Using this information along with the diagnostic procedures will identify the cause of the electrical malfunction.

- Using Connector Test Adapters
- Probing Electrical Connectors
- Troubleshooting with a Digital Multimeter
- Troubleshooting with a Test Lamp
- Using Fused Jumper Wires
- Measuring Voltage
- Measuring Voltage Drop
- Measuring Frequency
- Testing for Continuity
- Testing for Short to Ground
- Testing for a Short to Voltage
- Testing for Intermittent Conditions and Poor Connections
- Inducing Intermittent Fault Conditions
- Testing for Electrical Intermittents
- Scan Tool Snapshot Procedure
- Circuit Protection - Fuses
- Circuit Protection - Circuit Breakers
- Circuit Protection - Fusible Links

Connector Position Assurance Locks

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of the connector. CPAs are used in various connectors throughout the vehicle. CPAs are also used in all SIR system electrical connectors. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals, of the connector.

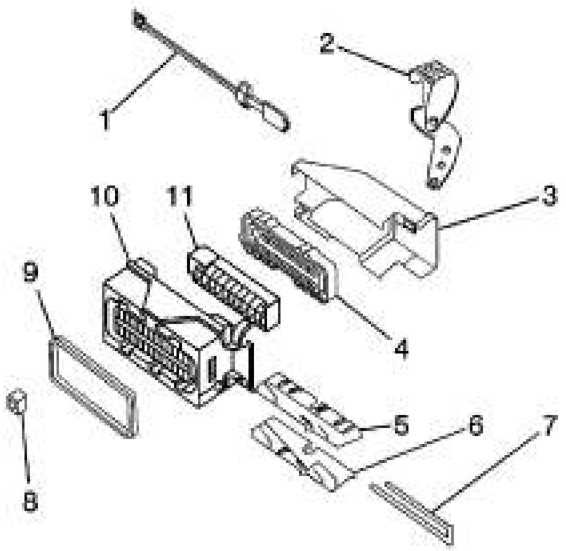
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures |
Document ID: 1465833

Connector Repairs

Connector Repairs contains a list of all connector repairs. The connector repairs are listed by the connector manufacturer and then by connector type. If the technician cannot identify the manufacturer of the connector, refer to Identifying Connectors below. Knowing the connector manufacturer will assist in finding the correct connector repair from the following list:

- Connector Position Assurance Locks
- Terminal Position Assurance Locks
- Bosch Connectors
- Delphi Connectors
- Tyco/AMP Connectors
- Yazaki Connectors
- Repairing Connector Terminals

Connector Anatomy



(1) Connector Positive Assurance (CPA)
(2) Assist Lever
(3) Wiredress Cover
(4) Seal Strain/Relief
(5) Slide Left Hand
(6) Slide Right Hand
(7) Terminal Positive Assurance (TPA)

(8) Terminal Positive Assurance (TPA)
(9) Connector Seal
(10) Connector Housing
(11) Inner Connector

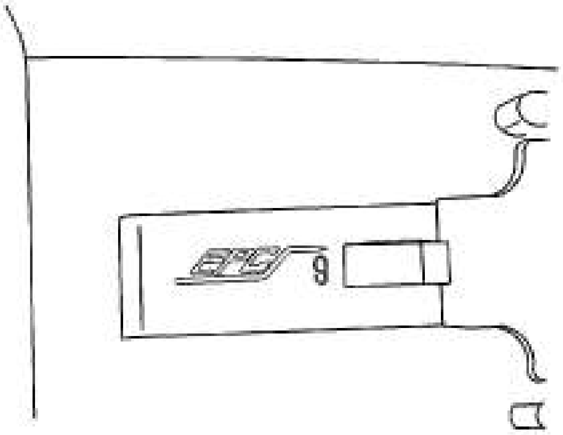
Identifying Connectors

Knowing the connector manufacturer is helpful when trying to locating the correct connector repair procedure. There are many different connector designs used on GM vehicles and it is sometimes difficult to identify the connector manufacturer. The information in this document should help with the identification of connector manufactures.

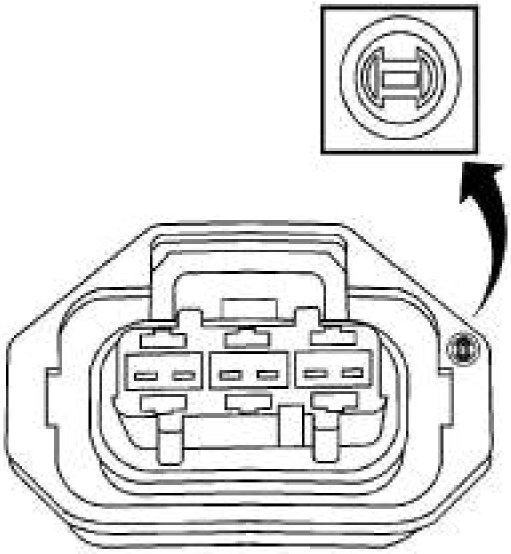
The following connector manufacturers make most of the connectors found in GM vehicles:

- AFL/EPC (Alcoa Fujikura Ltd./Engineered Plastics Components)
- Bosch
- Delphi
- FCI (Framatome Connectors International)
- JAE (Japan Aviation Electronics)
- JST (Japan Solderless Terminals)
- Kostel
- Molex
- Sumitomo
- Tyco/AMP
- Yazaki

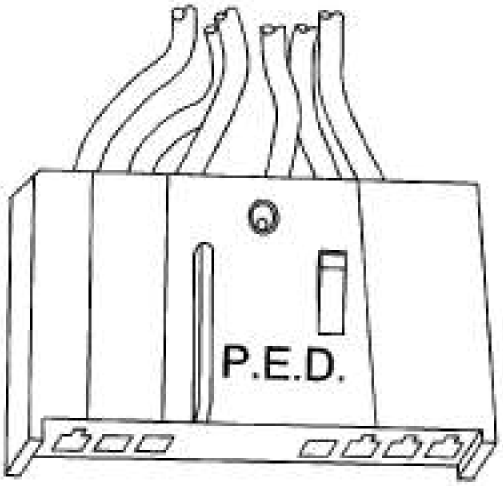
Identifying the manufacturer of a connector is often difficult. When trying to determine the manufacturer of a connector, look for specific identifying marks that are unique to that connector supplier. Most of these identify marks are hard to find or see. Check the connector carefully and refer to the information below for pictures and descriptions of connector identification markings.



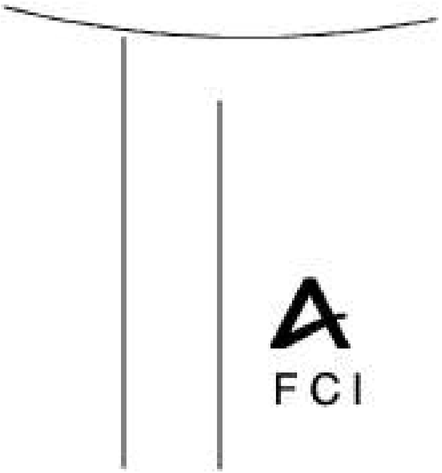
- Most of AFLs connectors have EPC on their connector body. Some of the smaller connectors will not have any markings on them.



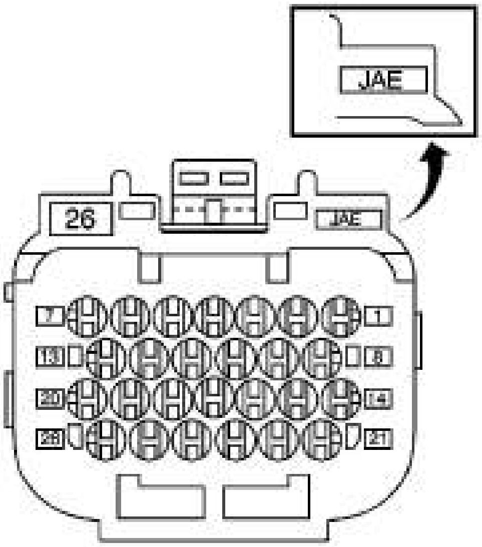
- In some cases Bosch will actually be printed on the connector. If Bosch does not appear on the connector, look for the Bosch logo. The Bosch logo is a circle with a blunted arrow inside. This logo can appear anywhere on the connector and is often very small.



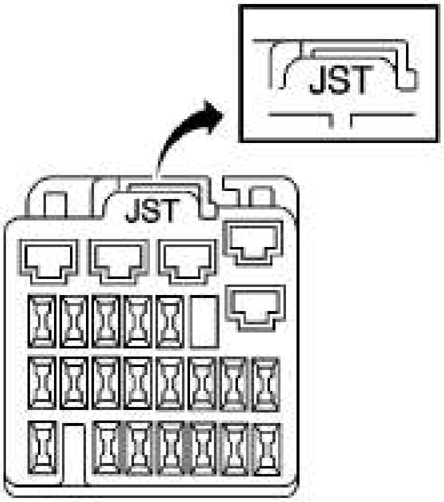
- In some cases Delphi will actually be printed on the connector. If Delphi is not printed on the connector, look for PED. In both cases there is no specific orientation for Delphi or PED and they can appear anywhere on the connector.



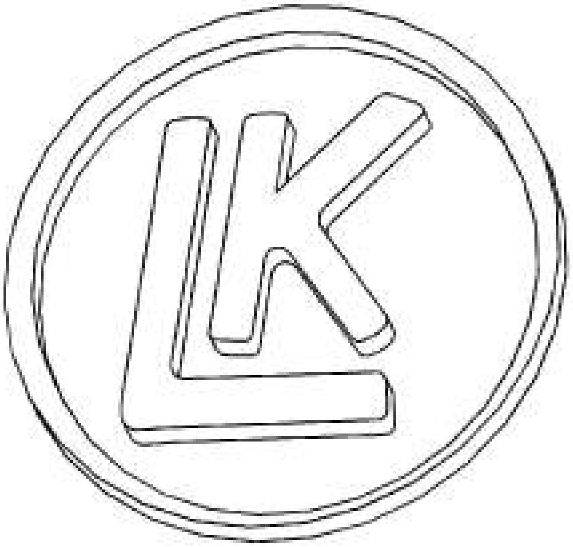
- FCI connectors may have the FCI logo on their connectors. The logo is the letters FCI with an "A" above it.



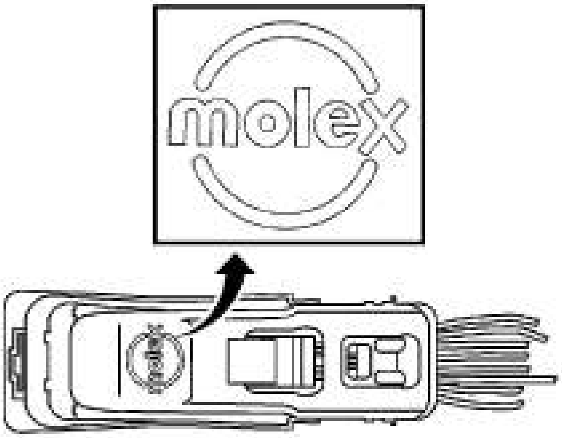
- JAE connector have JAE in small letters on their connectors.



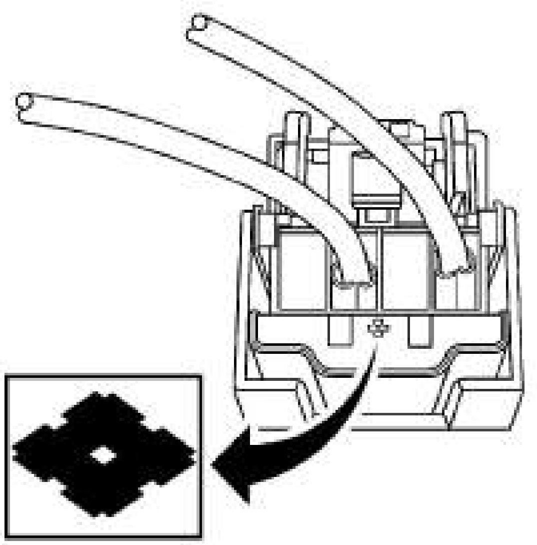
- JST connectors have JST in small letters on their connectors, similar to that above. The location of the logo will vary with the connector size and style.



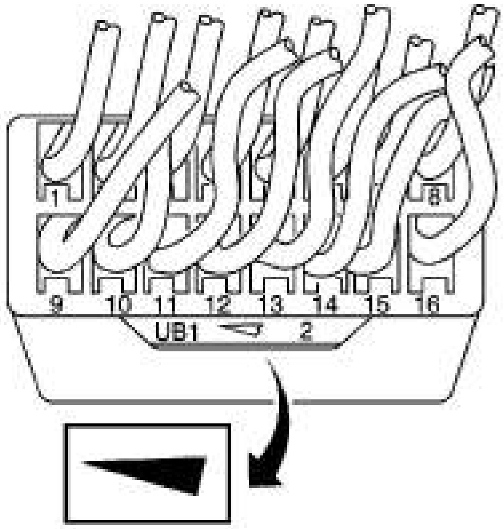
- Kostel has an "LK" with a circle around it. These connector are usually used as a transmissions connection.



- Most Molex connectors will have the Molex logo on the dresscover of the connector. In some cases the connectors may have MX followed by another letter. The third letter indicates where the connector was made. A connector with MXD is a Molex connector made in Detroit.



- Sumitomo has a unique symbol on their connector and possibly a part number. The symbol is similar to that of a diamond lying on its side, similar to that shown. The logo could appear anywhere but the most common place is at the wire side of the housing.
- Tyco/AMP has many different and unique connector designs. Some may or may not have identifiable marks on them.



- Yazaki has a wedge or arrow shape, similar to that shown.

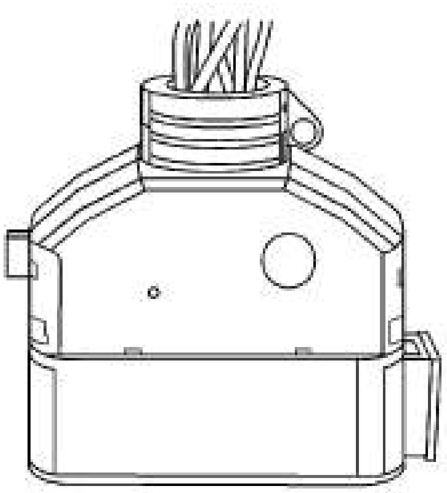
Delphi Connectors (12-Way)

Special Tools

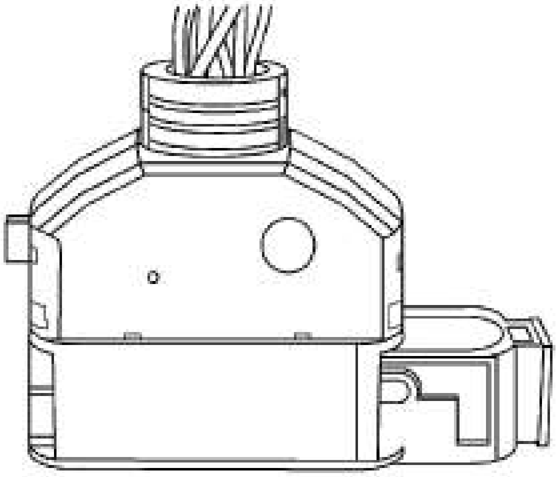
For equivalent regional tools, refer to Special Tools.

Removal Procedure

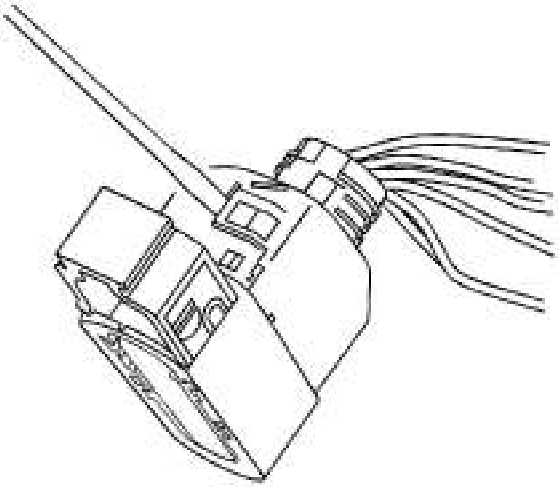
Follow the steps below in order to remove terminals from the connector.



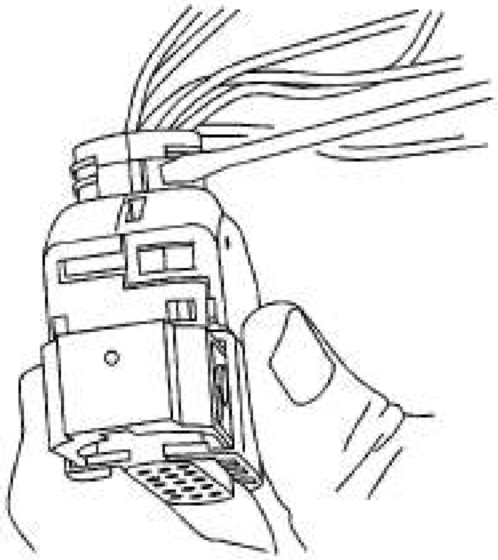
1. Locate the lever lock on the wire dress cover. Remove the connector position assurance (CPA) and slide the lever lock away from the connector body.
2. Disconnect the connector from the component.



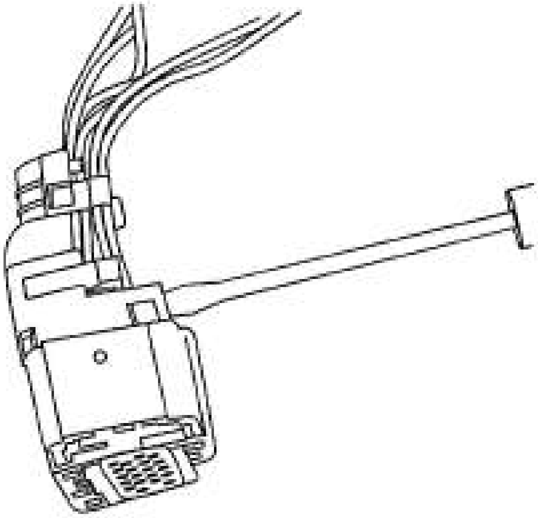
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.



4. Release the lower wire dress cover locking tab.

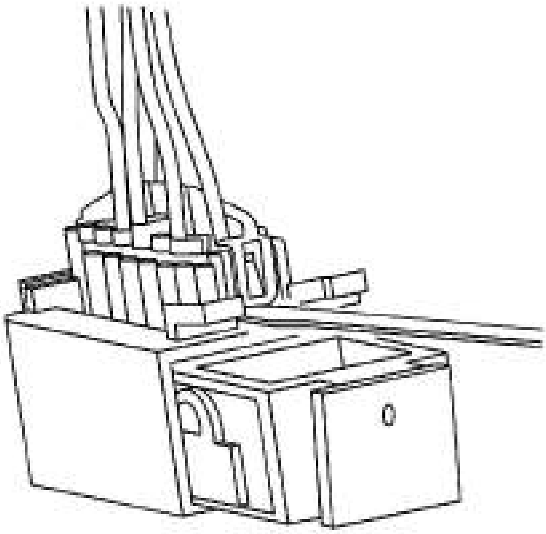


5. Release the upper wire dress cover locking tab.
6. Once the locks are unlocked, lift the dress cover off.

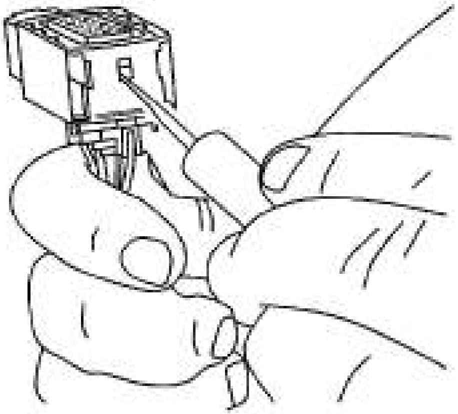


Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

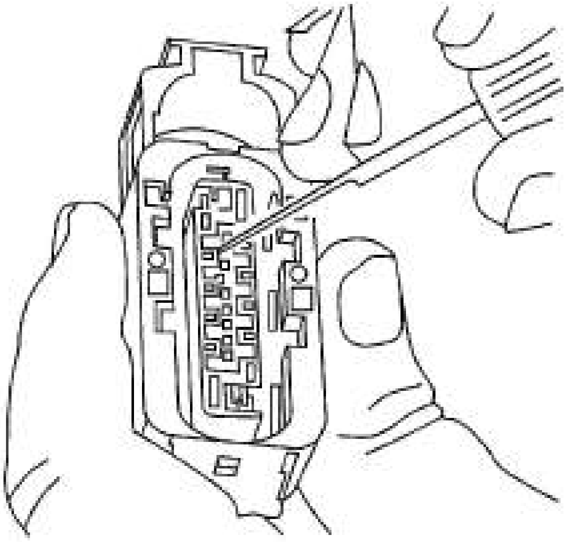
7. Remove the TPA by inserting a small flat-blade tool into the locking tabs on both sides of the TPA. Gently pry the TPA out of the connector.



8. Remove the nose piece by inserting a small flat-blade tool into the locking tabs on both sides of the nose piece. Gently pry the nose piece out of the connector.



9. Insert the EL-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.



10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | Document ID: 2166400

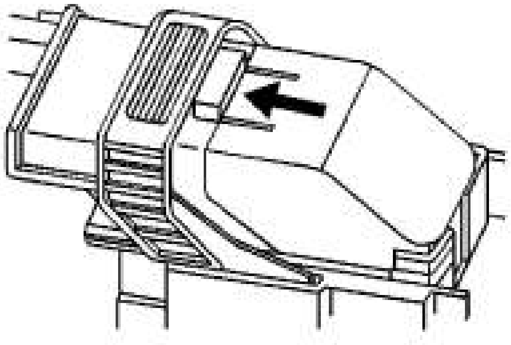
Delphi Connectors (Micro .64)

Special Tools

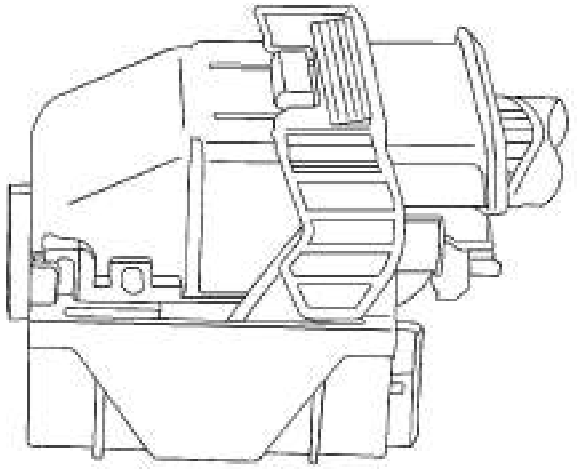
For equivalent regional tools, refer to Special Tools.

Removal Procedure

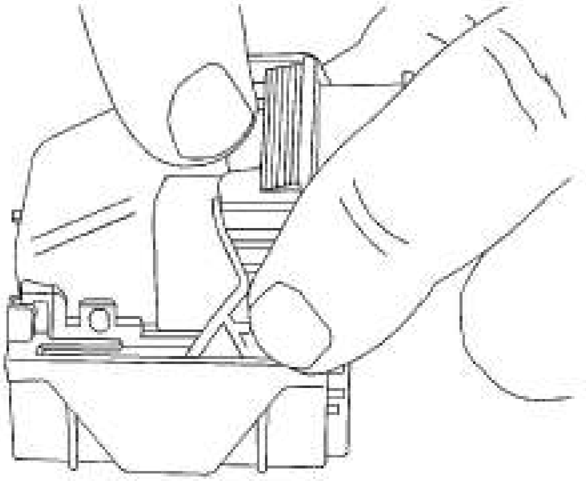
Follow the steps below in order to remove terminals from Micro .64 connectors.



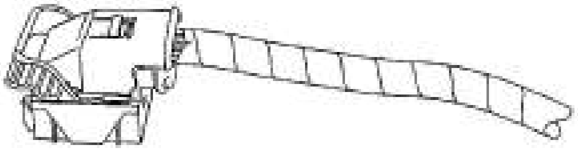
1. Locate the lever lock on the wire dress cover. While depressing the lock, pull the lever over and past the lock. The lever lock may be located on the top or sides of the wire dress cover.



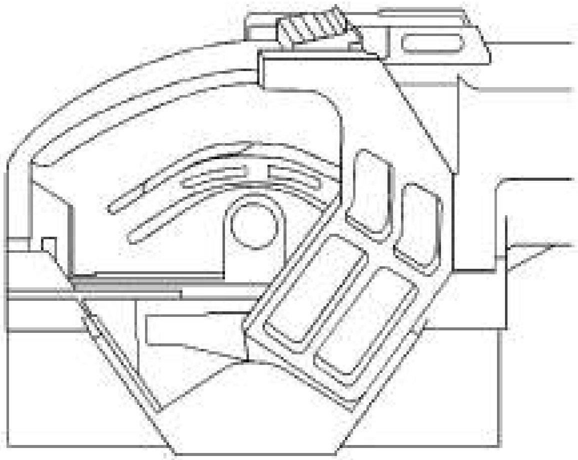
2. View of a typical Micro 64 connector.



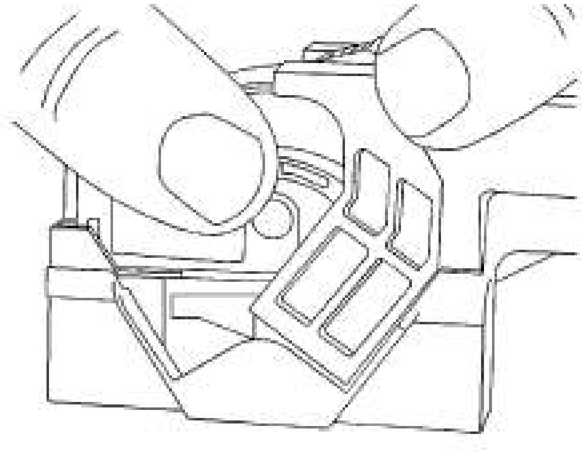
3. Depress the lock and pull the lever over and past the lock.



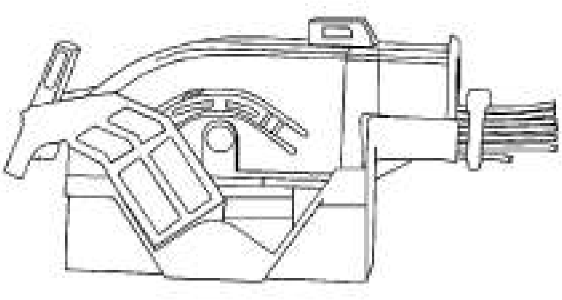
4. View of the connector when released from the component.



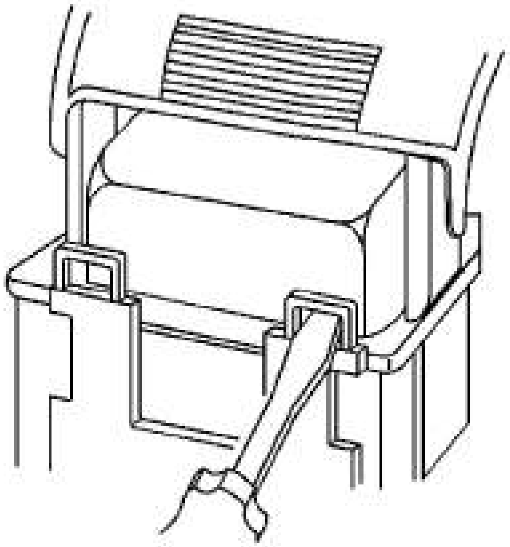
5. View of another type of Micro 64 connector.



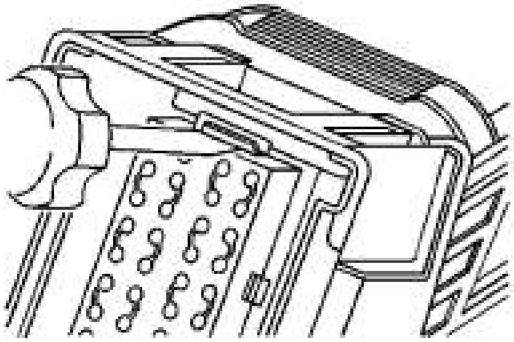
6. Depress the locks that are located on both sides of the wire dress cover and pull the lever over and past the locks.



7. View of the connector when released from the component.
8. Disconnect the connector from the component.

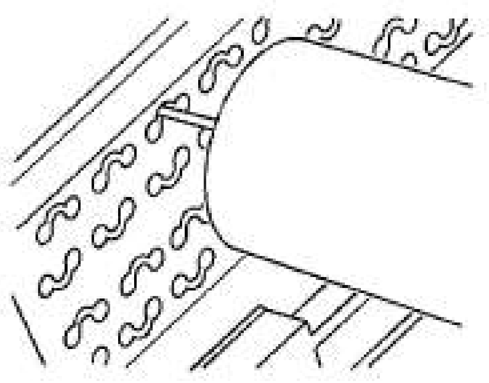


9. Locate the dress cover locking tabs at the front of the connector. Using a small flat-blade tool push down on one of the locking tabs and pull the cover up until the dress cover releases. Repeat this procedure for the other locking tab.
10. Once the front 2 locks are unlocked, lift the front of the dress cover and pull it forward.



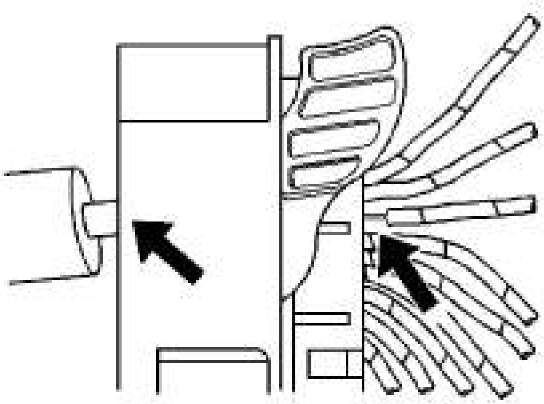
Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

11. Remove the TPA by inserting a small flat-blade tool into the small slot on the TPA and pushing down until the TPA releases. Gently pry the TPA out of the connector.



Note: Be careful not to angle or rock the EL-38125-21 tool when inserting it into the connector or the tool may break.

12. Insert the EL-38125-21 tool into the round canal between the terminals cavities at the front of the connector.



13. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.

3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

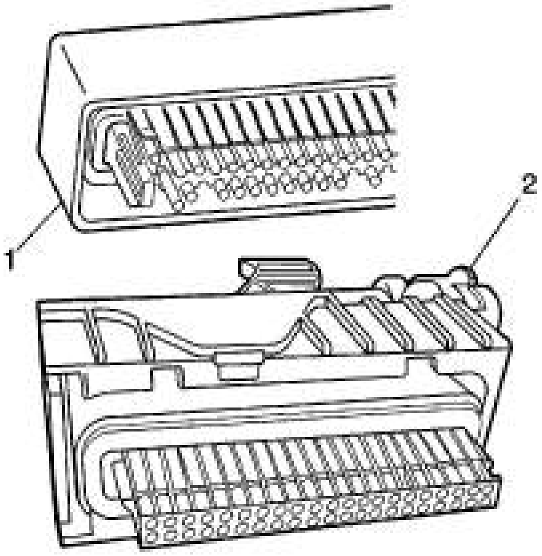
Delphi Connectors (Micro-Pack 100W)

Special Tools

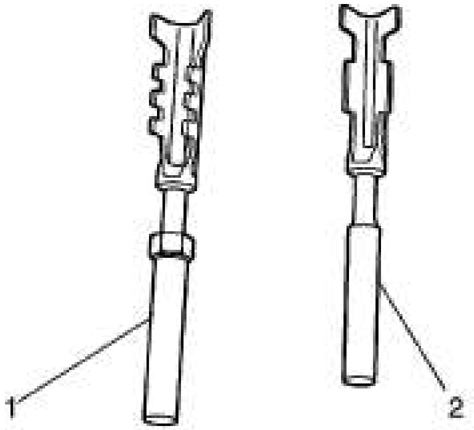
For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

There are 2 styles of Micro-Pack 100W connectors. These connectors are very similar but use different terminals and have some minor physical differences also.



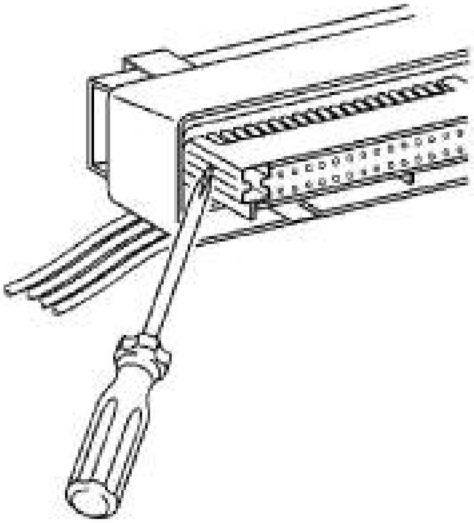
The first connector design of the Micro-Pack 100W (1) has a white connector interface that holds the terminals. The second design of the Micro-Pack 100W (2) has a gray interface to hold the terminals. Also, the first design has terminal cavities that are further apart (3 mm centerline) and offset from the other row of terminal cavities in the connector. The second design has terminals cavities that are closer together (2.54 mm centerline) and aligned vertically. One other way to identify the second design is the thin strip of material that runs along the outside of the cavities.



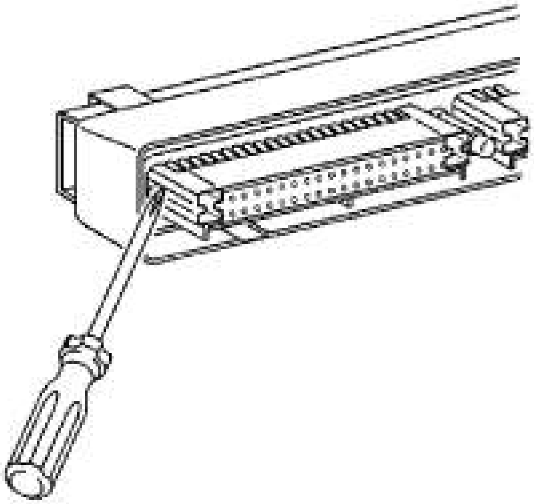
Note: There are 2 styles of Micro-Pack 100W terminals which are very similar. Ensure that you have the correct terminal before crimping the new terminal to the wire. The first design connector uses the longer terminal (1) that has a raised area in front of the recess in the terminal. The second design connector uses the shorter terminal without the raised area.

Follow the steps below in order to remove terminals from Micro-Pack 100W connectors. Some Micro-Pack 100W connector disassembly procedures will vary. Use this procedure as a guide.

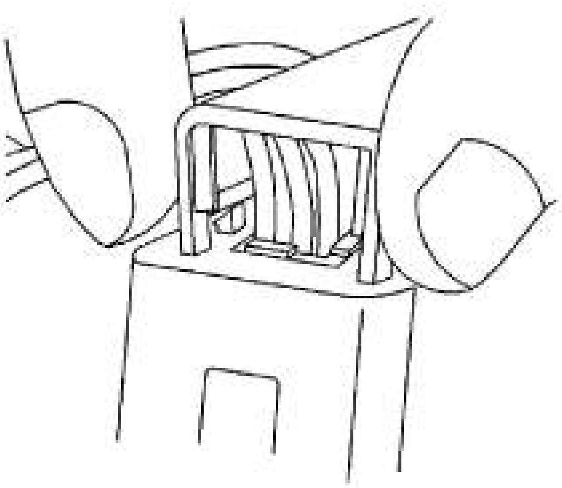
1. Disconnect the connector from the component.



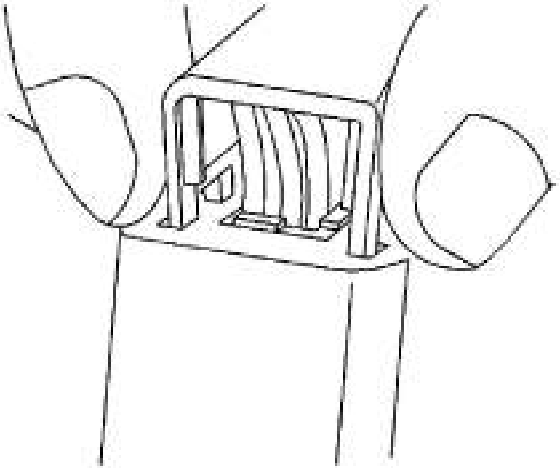
2. Locate the nose piece locking tabs that are positioned on the side of the connector nose piece. The connector nose piece acts as a terminal positive assurance (TPA) and may be referred to as such.



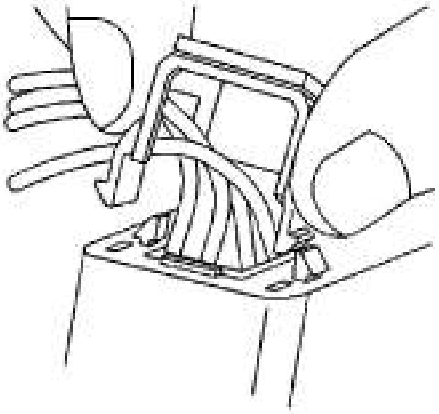
3. Use a small flat-blade tool to push in one of the locking tabs while gently pulling on the same side of the nose piece.
4. Repeat the procedure for the other locking tab and remove the nose piece.
5. Remove the wire dress cover. The following is a general procedure for wire dress cover removal. Use this procedure as a guide, some dress cover removal procedures may vary.



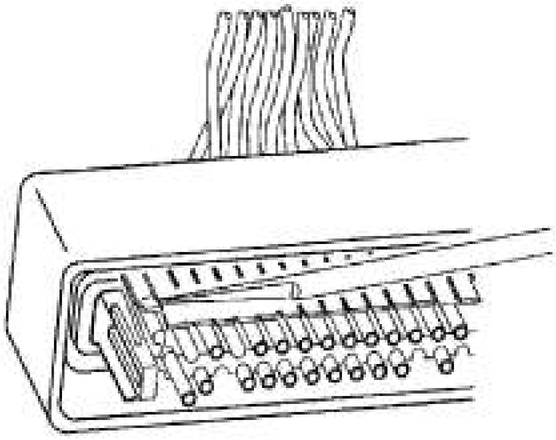
6. Use fingers to squeeze the 2 locking legs of the cover.



7. Apply pressure and gently rock the cover until one locking leg is unseated.



8. Continue to apply pressure and rock the cover until the second locking leg is unseated. Repeat procedure for the other side of the dress cover and remove the cover.



9. Use EL-38125-12A to gently lift the terminal retaining tab while gently pulling the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. If the terminal is severely bent or damaged, it may be possible on some connectors to push the wire out of the front of the connector instead of pulling it through. This will prevent damage to the internal seals of the connector. Once the terminal is pushed out of the connector, cut the wire as close to the terminal as possible and pull the wire through the connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Terminal Replacement Procedure

After the terminal is crimped to the wire perform the following procedure in order to replace Micro-Pack 100 terminals.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the Terminal Removal Procedure.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | Document ID: 2166323

Delphi Connectors (Pull To Seat)

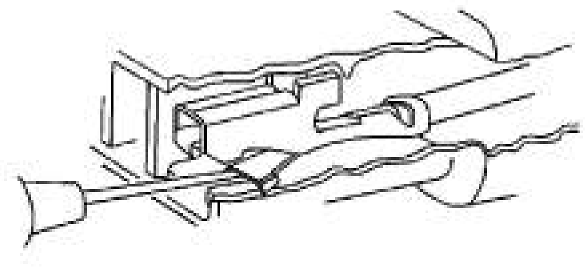
Special Tools

For equivalent regional tools, refer to Special Tools.

Terminal Removal

If the terminal is visibly damaged or is suspected of having a faulty connection, the terminal should be replaced.

Follow the steps below in order to repair pull-to-seat connectors:



1. Remove the connector position assurance (CPA) device and/or the secondary lock.
2. Disconnect the connector from the component or separate the connectors for in-line connectors.
3. Remove the terminal position assurance (TPA) device.
4. Insert the proper pick or removal tool into the front of the connector body.

   Note: On connectors with more than one terminal the service loop may not be large enough to remove the terminal and crimp on a new one. If the terminal wire does not have a large enough service loop for removal, cut the wire 5 cm (2 in) behind the connector before removal.

5. Grasp the wire at the back of the connector body and gently push the terminal out the front of the connector body.

Terminal Repair

1. If the wire needed to be cut in order to remove the terminal, gently push a small length of the same size wire through the back of the connector cavity until there is enough wire exposed in order to crimp on a new terminal. If the wire was not cut, cut the existing wire as close to the old terminal as possible.
2. Strip 5 mm (3/16 in) of insulation from the wire.
3. Crimp a new terminal to the wire.
4. Solder the crimp with rosin core solder.

Terminal Installation

1. Align the terminal and pull the wire from the back of the connector in order to seat the terminal.
2. If necessary, cut the new wire to proper length and splice with existing circuit. Refer to Splicing Copper Wire Using Splice Sleeves.
3. If the connector is outside of the passenger compartment, apply dielectric grease to the connector.
4. Install the TPA, CPA, and/or the secondary locks.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Delphi Connectors (Push To Seat)

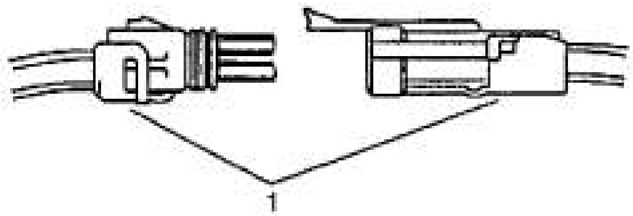
Special Tools

For equivalent regional tools, refer to Special Tools.

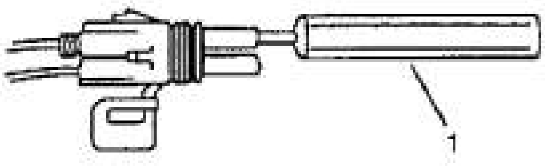
Terminal Removal

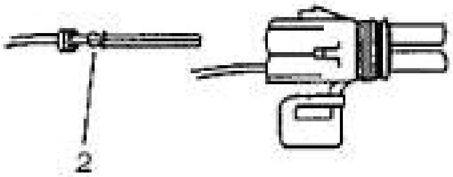
Follow the steps below in order to repair push to seat connectors.

1. Remove the terminal position assurance (TPA) device, the connector position assurance (CPA) device, and/or the secondary lock.

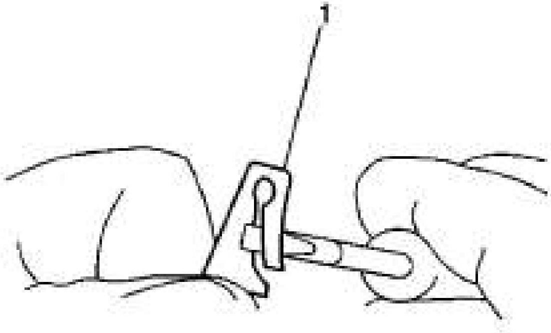


2. Separate the connector halves (1).





3. Use the proper pick or removal tool (1) in order to release the terminal.
4. Gently pull the cable and the terminal (2) out of the back of the connector.



5. Re-form the locking device if you are going to reuse the terminal (1).
6. To repair the terminal, refer to Terminal Repair.

Reinstalling Terminal

1. In order to reuse a terminal or lead assembly, refer to Wiring Repairs.
2. Ensure that the cable seal is kept on the terminal side of the splice.
3. Insert the lead from the back until it catches.
4. Install the TPA, CPA, and/or the secondary locks.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual |
Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures |

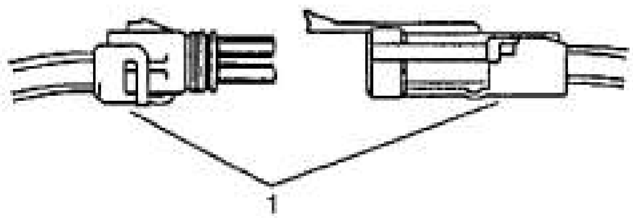
Document ID: 2166297

Delphi Connectors (Weather Pack)

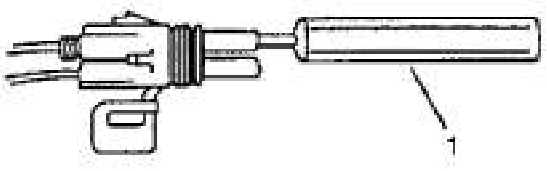
Special Tools

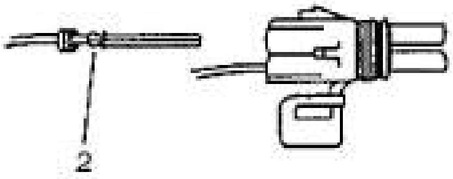
For equivalent regional tools, refer to Special Tools.

The following is the proper procedure for the repair of Weather Pack® Connectors.



1. Separate the connector halves (1).
2. Open the secondary lock. A secondary lock aids in terminal retention and is usually molded to the connector (1).
3. Grasp the wire and push the terminal to the forward most position. Hold the wire in this position.





4. Insert the Weather Pack® terminal removal tool EL-38125-10A into the front (mating end) of the connector cavity until it rests on the cavity shoulder (1).
5. Gently pull on the wire to remove the terminal through the back of the connector (2).

   Note: Never use force to remove a terminal from a connector.

6. Inspect the terminal and connector for damage. Repair as necessary. Refer to Repairing Connector Terminals.
7. Reform the lock tang (2) and reset terminal in connector body.
8. Close secondary locks and join connector halves.
9. Verify that circuit is complete and working satisfactorily.
10. Perform system check.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Diagnostic Starting Point - Wiring Systems and Power Management

Begin the system diagnosis with Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which are not communicating.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check - Vehicle will identify the correct procedures to begin vehicle diagnosis. These must be performed before system DTC or symptom diagnosis.

DTC B1370-B1379, B1380-B1389, or B1440-B1443

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

1. Power Mode Mismatch. Different specific symptoms may occur depending on the vehicle operating conditions when the fault occurred.
2. Vehicle may not start.
3. The B+ circuit fuse to the ignition switch may be open.
4. May lose communication with other module(s).
5. The ignition switch may not return to the OFF position and the key may not come out of the ignition.
6. SIR system may retain DTC B1370 06 as current.
7. Vehicle will start and continue to run after the ignition key is removed.

Circuit/System Description

The vehicle power mode master (PMM) is the body control module (BCM). The ignition switch is a low current switch with multiple discrete circuits to the BCM. The BCM logic uses the ignition switch positions to identify the operator's desired power mode and activate specific discrete signals, and serial data messages for the operation of different subsystems as necessary. Other modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can detect from its own connections.

The PMM will activate relays and other direct outputs of the PMM as needed according to the calculated power mode. Some relays controlled by the BCM are switched ignition voltage outputs that are pass through circuits within the BCM directly from the ignition switch. If these circuits short to ground, the B+ circuit fuse to the ignition switch will open.

Conditions for Running the DTC

B1370 01, B1380 01

Ignition switch is in the RUN or CRANK positions.

B1370 06, B1380 06

Ignition switch is in the RUN or ACCESSORY positions.

B1440 00

Ignition switch is in the RUN position.

B1441 01, B1441 06

Ignition switch is in the CRANK position.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition circuit is open.
- Ignition, accessory, or off/run/crank circuit shorted to ground.
- B+ circuit of the ignition switch is open or shorted to ground.
- Ignition relay control circuit open, including relay coil and ground.

B1380 01

Accessory circuit is shorted to voltage.

B1380 06

- Accessory circuit is open.
- Ignition, accessory, or off/run/crank circuit shorted to ground.
- B+ circuit of the ignition switch is open or shorted to ground.

B1440 00

BCM detects an open or short to voltage on the off/run/crank signal circuit when both ignition ACCESSORY/RUN and ignition RUN/CRANK parameters are active.

BCM detects an open on the B+ circuit to the ignition switch while the engine is running.

B1441 01

Off/run/crank signal circuit is shorted to voltage.

B1441 06

Off/run/crank signal circuit is open.

Actions Taken When the DTC Sets

- The BCM operates in a fail-safe power mode dependent on the last valid power mode detected and the state of the engine run flag data on the serial data communications circuits.
- The other modules on the vehicle operate in a fail-safe power mode dependent on the last

valid power mode transmitted by the BCM and the state of the engine run flag on the serial data communications circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that DTC U1814 or B1428 is not set.
   If any of the DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. With a scan tool, access BCM, Power Mode data display list and compare all parameters listed with the corresponding ignition key position. The BCM Power Mode Parameters table below illustrates the correct state of these input parameters in correspondence to the ignition switch position. The circuits which the individual parameters are related to are in parentheses.
   If any parameters are incorrect in any key position, proceed to the Circuit/System Testing or Component Testing.

BCM Power Mode Parameters

Ignition Switch Position	Standard Power Mode	Ign. Off/Run/Crank (Ignition Switch, Terminal 4)	Ignition Accessory/Run (Ignition Switch, Terminal 3)	Ignition Run/Crank (Ignition Switch, Terminal 1)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key Out/ACC	Active	Inactive
Run	Run	Run	Active	Active
Start	Crank	Cranking	Inactive	Active

Circuit/System Testing

1. Disconnect the harness connector at the ignition switch.
2. Verify that a test lamp illuminates between B+ circuit terminal 2 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the ignition circuits listed below for a short to ground.

   Note: To help isolate a short to ground, it may be necessary to disconnect modules that are connected to the following circuits:

   - terminal 1
   - terminal 3
   - terminal 4
   - terminal 6
   - BCM terminal 19, X4
   - BCM terminal 21, X4
3. Connect the harness connector at the ignition switch.
4. Ignition OFF, key out, disconnect the X1 harness connector at the BCM. Verify that a test lamp does not illuminate between the ignition circuit terminals listed below and ground:
   - terminal 2
   - terminal 14
   - terminal 21

   If the test lamp illuminates, test the ignition circuits for a short to voltage. If the circuit tests normal, replace the ignition switch.
5. Ignition in the ACCESSORY position, verify that a test lamp illuminates between the terminal 21 and ground.

   If the test lamp does not illuminate, test the ignition circuit for an open/high resistance. If the circuit tests normal, replace the ignition switch.
6. Ignition in the CRANK position, verify that a test lamp illuminates between terminal 14 and ground.

   If the test lamp does not illuminate, test the ignition circuit for an open/high resistance. If the circuit tests normal, replace the ignition switch.
7. If all of the circuits test normal, replace the BCM.

Component Testing

Ignition Switch

1. Ignition OFF, disconnect the harness connector at the ignition switch.
2. Verify the resistance between the terminals listed below match for each ignition switch position.

   If not the specified value, replace the ignition switch.

Resistance Test

Ignition Switch Position	Terminals 1 and 2	Terminals 2 and 3	Terminals 2 and 4	Terminals 2 and 6	Terminals 4 and 6
Off Key Out	Infinite	Infinite	Infinite	Infinite	Infinite
Off Key IN	Infinite	Infinite	< 5.0 Ω	Infinite	Infinite
Accessory	Infinite	< 5.0 Ω	Infinite	Infinite	Infinite
Run	< 5.0 Ω	< 5.0 Ω	Infinite	Infinite	< 5.0 Ω
Start	< 5.0 Ω	Infinite	Infinite	Infinite	1275-1325 Ω

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Ignition and Start Switch Replacement
- Control Module References for BCM replacement, setup, and programming.

DTC B1428

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1428 00: Ignition Switched Power Relay 1 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Relay Coil B+	B1380 06, B1428 00, U0100-U0299, 1, 2	P0628 00, 1, 3, 4	B1440 00, 5	--
Ignition Relay Switch B+	1, 2, 3, 4	1, 2, 3, 4	--	--
Ignition Relay Control	1, 2, 3, 4	1, 2, 3, 4	--	--
Ignition Relay Ground	--	1, 2, 3, 4	--	--

1. Some modules may lose communication and/or be inoperable.
2. The B+ circuit fuse to the ignition switch may be open.
3. SIR system may retain DTC B1370 06 as current.
4. Vehicle may not start.
5. Vehicle will continue to run after the ignition key is removed.

Circuit/System Description

The body control module (BCM) controls the R14 IGN relay through the run/crank ignition circuit by applying voltage to the circuit. The R14 IGN relay is energized when the ignition switch is in the RUN or CRANK position, or when a remote start is requested.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The ignition 1 relay control output is active.

Conditions for Setting the DTC

The BCM detects a short to ground on the ignition circuit.

Action Taken When the DTC Sets

The BCM disables the ignition output driver.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the R14 IGN relay.
2. Test for less than 10 Ω between the ground circuit terminal 86 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the B+ circuit terminal 85 and the ground circuit terminal 86.
4. Command the Run/Crank Relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the B+ circuit for a short to voltage. If the circuit tests normal, replace the BCM.

If the test lamp is always OFF, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

5. If all circuits test normal, test or replace the R14 IGN relay.

Component Testing

1. Ignition OFF, disconnect the R14 IGN relay.
2. Test for 60 - 180 Ω between the B+ terminal 85 and the ground terminal 86 of the R14 IGN relay.

   If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If not the specified value, replace the relay.
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

   If greater than specified range, replace the relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for BCM replacement, setup, and programming

DTC B1433

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1433 00: Ignition Switched Power Relay 2 Circuit

Circuit/System Description

The body control module (BCM) supplies B+ to terminal 13, X5. For vehicles equipped with a Run relay, the BCM controls the Run relay through the coil control circuit by applying voltage to the coil side of the relay. The Run relay is energized when any of the following conditions are true:

- Ignition Switch is in ACCESSORY or RUN.
- The vehicle is remote started.
- The vehicle is in retained accessory power (RAP) mode.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

The DTC will set only when the module requests the output and there is a short to ground at BCM terminal 13, X5 or a short to ground in the Run relay coil control circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- DTC B1433 00 will not cause any symptoms.
- Diagnose all other DTCs and symptoms first as this code may be set as a result of other concerns.
- BCM replacement is not necessary for this DTC.

Circuit / System Testing

1. Ignition OFF, disconnect the X5 harness connector at the BCM.
2. Verify there are not any aftermarket components wired into terminal 13.
3. If terminal 13 is empty, clear the code as there are not any further circuits to diagnose.

DTC B1475

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1475 00: Retained Accessory Power Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
RAP Relay Switch B+	1	1	--	--
RAP Relay Coil B+	B1475 00, 1	1	--	--
RAP Relay Control	1	1	1	--
RAP Relay Ground	--	1	--	--
1. Retained Accessory Power (RAP) Malfunction				

Circuit/System Description

The body control module (BCM) controls the RAP relay through the RAP relay coil voltage circuit by applying voltage to the coil side of the relay. The RAP relay is energized when any of the following conditions are true:

- Ignition switch is in the ACCESSORY or RUN position.
- The vehicle was remote started.
- The vehicle is in RAP mode.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The output is actively being requested by the module.

Conditions for Setting the DTC

The BCM detects a short to ground in the RAP relay coil voltage circuit.

Action Taken When the DTC Sets

The BCM will shut down voltage to the circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

The radio RAP mode is a separate function and will still operate properly. The radio RAP function is controlled by serial data and the specific module. These functions are not effected by the BCM RAP relay circuits.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the RAP relay.
2. Test for less than 5 Ω between the ground circuit terminal 86 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Connect a test lamp between the relay control circuit terminal 85 and ground.
4. Cycle the ignition ON and OFF. The test lamp should turn ON and OFF when changing ignition switch positions.

   If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.

   If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the RAP relay.

Component Testing

1. Ignition OFF, disconnect the RAP relay.
2. Test for 70 - 150 Ω between the B+ terminal 85 and the ground terminal 86 of the relay.

   If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If not the specified value, replace the relay.
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

   If greater than the specified range, replace the relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for BCM replacement, setup, and programming.

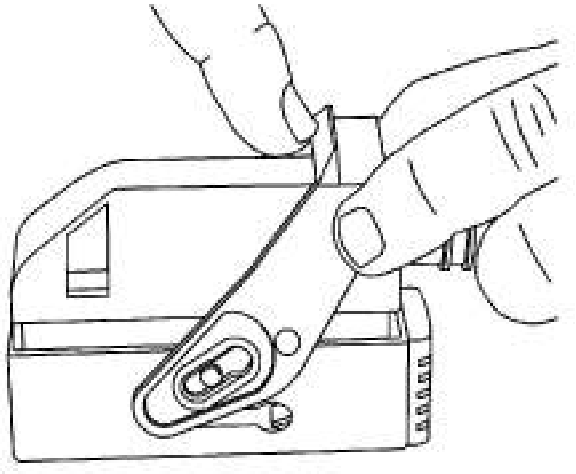
Special Tools

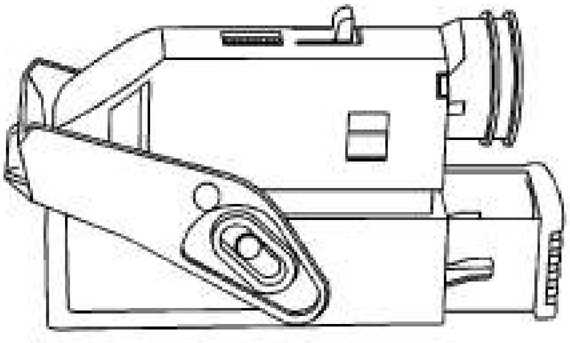
For equivalent regional tools, refer to Special Tools.

Removal Procedure

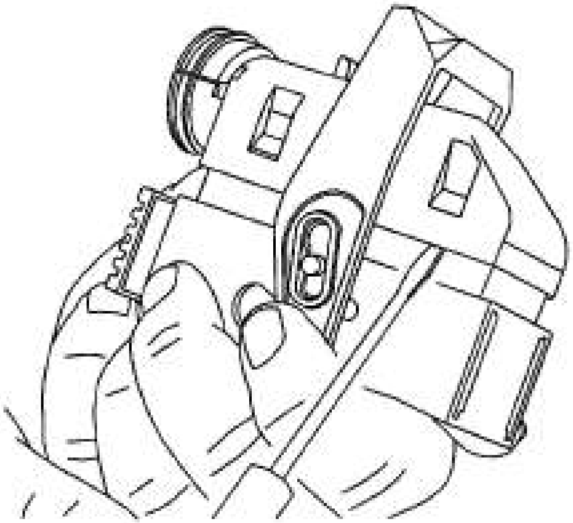
Follow the steps below in order to remove terminals from the connector.



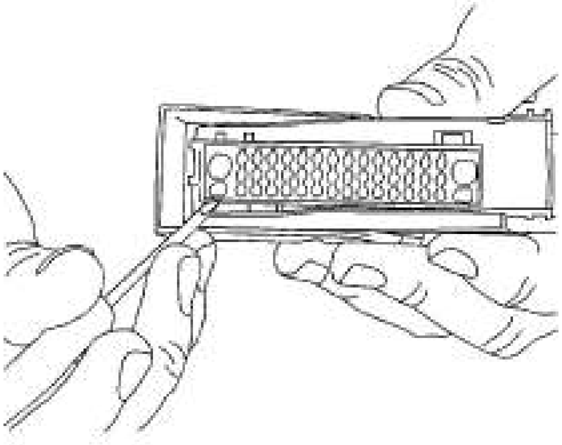
1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. The release tab is located on the top of the wiredress cover.



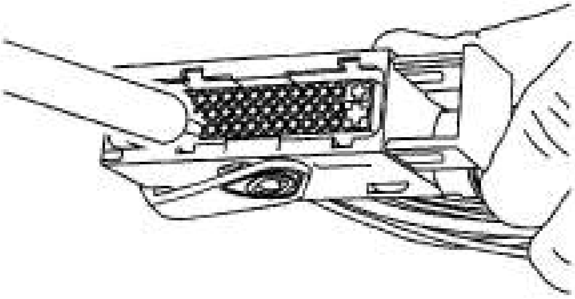
3. View of connector in released position.
4. Disconnect the connector from the component.
5. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.



6. Use a small flat-blade tool to slide the terminal position assurance (TPA) up one notch on both ends of the connector. The TPA is located underneath the wire dress cover.



7. For the larger terminals insert the EL-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the EL-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.



8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Document ID: 2102021

Flat Wire Repairs

Caution: The flat wire within the flex wiring harness is not serviceable. If an open or short exists within the flex wiring harness the complete harness must be replaced.

General Electrical Diagnosis

Basic Knowledge Required

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in the service manual. You should understand the basic theory of electricity, and know the meaning of voltage (V), current (A), and resistance (Ω). You should also be able to read and understand a wiring diagram, as well as understand what happens in a circuit with an open or a shorted wire.

GMLAN Wiring Repairs

Special Tools

- DuraSeal splice sleeves
- A wire stripping tool
- EL-38125-10 Splice Sleeve Crimp Tool
- EL-38125-5 Ultra Torch Special Tool

For equivalent regional tools, refer to Special Tools.

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

Note: When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to Data Link Communications Description and Operation.

GMLAN Connector Terminal Repair

Note: A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to Connector Repairs for the appropriate connector repair procedure.

GMLAN Wire Repair

Note: Refer to Wiring Repairs in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gage size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and EL-35125-10 splice sleeve crimping tool. Use the following wiring repair procedures in order to ensure the integrity of the DuraSeal splice sleeves.

Splice Sleeve Color	Crimp Tool Nest Color	Wire Gage mm² / (AWG)
Salmon (Yellow-Pink) 12089189	Red (1)	0.035-0.8/(18-20)
Blue 12089190	Blue (2)	1-2/(14-16)
Yellow 12089191	Yellow (3)	3-5/(10-12)
Green 88988379	Red (1)	0.22-0.35/(22-26)

Note: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
   - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
   - Use the DuraSeal splice sleeves on all types of insulation except tefzel and coaxial.
   - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

   Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
   - When adding a length of wire to the existing harness, use the same size wire as the original wire.
   - Perform one of the following items in order to find the correct wire size:
     - Find the wire on the schematic and convert to regional wiring gage size.
     - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
   - Strip approximately 7.5 mm (0.313 in) of insulation from each wire to be spliced.
   - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
   - If the wire is damaged, repeat this procedure after removing the damaged section.
4. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table
